FOREWORD

6th International Eurasian Conference on Science, Engineering and Technology (EurasianSciEnTech 2025) was successfully held on June 25-27, 2025 with a great participation from many countries

The objective of *EurasianSciEnTech 2025* was to bring leading academicians, researchers, scholars as well as industrial professionals together from all over the world to exchange and share their experiences and research results to discuss the practical challenges encountered and the solutions adopted. In this context, we welcomed precious scientists and the greatest appreciation goes to all participants whose contributions have made this conference a success. I would like to thank the organizing committee and the scientific committee for providing this intense and high quality scientific environment.

I believe that the *EurasianSciEnTech 2025* has made important contributions to you at large and hope to see you at the *7th International Eurasian Conference on Science, Engineering and Technology* (*EurasianSciEnTech 2026*).

Prof. Dr. Muhittin DOĞAN

Chairman of *EurasianSciEnTech 2025*

Synthesis of sulfamethoxazole surface imprinted core-shell magnetic nanoparticles for selective detection of sulfamethoxazole in poultry by an electrochemical biosensor

Pwadubashiyi Coston Pwavodi [1*] (*https://orcid.org/0000-0002-4486-4703)*

[*1]Cyprus International University, Faculty of Engineering, Department of Biomedical/Medical Engineering/Bioengineering. Haspolat, 99258, Nicosia, North Cyprus, Türkiye.

Abstract

Foodborne illness poses a threat to both human and animal health. Campylobacter and Salmonella spp. are the most frequent causes of human foodborne bacterial diseases connected to poultry in recent years. Sulfamethoxazole (SMX) is administered into poultry products' diets as a preventive treatment technique for future illnesses to ensure the long-lasting availability of poultry products. Unfortunately, they have been abusively used, and due to the extensive, abusive use of antibiotics over many years, the dissemination of antibiotic-resistant strains of different bacterial organisms, such as Carbapenem-Resistant Acinetobacter, have been introduced to the environment. Sulfamethoxazole was determined using a unique sensitive voltammetric sensor presented in this study. The developed sensor uses a carbon paste electrode modified with Sulfamethoxazole surface imprinted core-shell magnetic nanoparticles as a recognition element. For the electrosensitive determination of SMX, a carbon paste electrode with a non-imprinted polymer (NIP) modification was also created. Electrochemical techniques such as Cyclic Voltammetry (CV), Differential Pulse Voltammetry (DPV), and Electrochemical Impedance Spectroscopy (EIS) were used to evaluate the electrochemical behaviour of Sulfamethoxazole at a modified carbon paste electrode. Integrating Fe_3O_4 nanoparticles into the CPE sensor resulted in a sensor with exceptional sensitivity, repeatability, selectivity, reproducibility, stability, and low preparation cost. The Limit of detection LOD and the Limit of quantification LOQ are 6.45788 $x10^{-8}$ M and 2.1311 $x10^{-8}$ M, respectively. The concentration of SMX in actual tap water samples was determined using the modified electrochemical sensor.

Abstract

Cold creams can be used in cosmotics as moisturizer and pharmaceutically for many purposes as;, antiacne, antimicrobial and to treat skin injuries. The aim of this study was to design a moisturizing cold cream containing essential oils extracted from herbal plants to be used as a way to moisturize and nourish the skin. Using clevanger appartus the essential oil was obtained by hydrodistillation of *Lavandula stoechas* growing in Northern Cyprus. The cream material included liquid vaseline, borax powder, distilled water, white bees wax, and citric acid. Tests for physical characteristics, stability, pH balance, washability, ease of application, and irritant potential were all part of the evaluation procedure. The cream's smooth texture, light creamy color, and non-greasy application were all according to the standard conditions. Under normal storage settings, stability tests verified that the cream's chemical and physical characteristics were preserved for two months. Microbial analyses verified the product's safety and resistance to contamination, while irritation testing revealed no adverse effects either. The results show the possibility of using herbal skin care products with essential oils are safe and efficient. The cold cream with a lavender oil basis effectively mixes the advantages of natural skincare with visual appearance. It is a good candidate for consumer usage due to its formulation, physical characteristics, and stability. To improve its competitiveness in the market, future research should concentrate on scalability and increasing its functional purpose.

Abstract

This comprehensive study investigates the optimization of U-bending process parameters for 1.5 mm thick AISI 304L austenitic stainless-steel sheets through an integrated experimental and computational approach. The research methodology was conducted in three primary phases: material characterization, experimental forming trials, and data-driven optimization. In the initial phase, quasi-static uniaxial tensile tests were performed at room temperature (23°C) following ASTM E8 standards to determine the fundamental mechanical properties of the material, including yield strength, ultimate tensile strength, and elongation at fracture. These properties served as critical inputs for subsequent numerical analysis and process optimization. The experimental phase involved systematic U-bending trials conducted under displacement-controlled conditions (5 mm/min) using a universal tensile testing machine. A full factorial experimental design was implemented, varying three key process parameters: die radius (ranging from 2, 4, 6, 8), punch radius (4, 6, 8, 13.2), and punch-die clearance (2 to 5.6). Post-forming metrology included precise measurements of springback angles using optical coordinate measurement and thickness reduction analysis through micrometer gauging at predetermined locations. Statistical analysis of variance (ANOVA) was performed to quantify parameter significance and interaction effects. For the optimization framework, the experimental dataset was enhanced through Gaussian noise injection ($\sigma = 0.05$ mm) during interpolation to account for process variability and improve model robustness. The augmented dataset was processed using a customized Python workflow incorporating NumPy and Pandas for data manipulation, followed by implementation of a multi-layer perceptron (MLP) neural network with Bayesian hyperparameter optimization. The neural network architecture featured three hidden layers with ReLU activation functions and was trained to predict springback and thinning responses based on input parameter combinations. Preliminary validation results demonstrate the neural network's capability to accurately capture the complex nonlinear relationships between process parameters and forming outcomes. The Gaussian noise interpolation proved particularly effective in preventing model overfitting while maintaining prediction accuracy within experimental error bounds. This research establishes a methodological framework that effectively combines traditional metal forming analysis with modern data science techniques, providing valuable insights for industrial process optimization.

Keywords: U-bending, 304L stainless steel, springback prediction, Gaussian process interpolation, neural network optimization, metal forming process control.

Abstract

The accurate modeling of deformation-induced martensitic transformation in metastable austenitic steels is crucial for predicting and optimizing mechanical performance in engineering applications. This study presents a comparative evaluation of several nonlinear predictive models designed to estimate the martensite volume fraction as a function of magnetic flux density in 304L stainless steel. Motivated by the limitations of classical phase quantification techniques such as X-ray diffraction (XRD) and Electron Backscatter Diffraction (EBSD), we developed a data-driven methodology combining physical modeling with advanced optimization algorithms inspired by artificial intelligence. Six mathematical models, including the Olson-Cohen, Koistinen-Marburger, Modified Avrami, Saturation-type, Gompertz, and a custom hybrid exponential model, were investigated. Each model was calibrated using six optimization strategies: Levenberg–Marquardt, Genetic Algorithm, Particle Swarm Optimization, Differential Evolution, Simulated Annealing, and Grey Wolf Optimizer. The evaluation criteria included mean squared error (MSE), coefficient of determination (R^2), residual distribution, parameter sensitivity, and computation time. Results indicate that the choice of optimization algorithm significantly affects model accuracy and stability. The best-performing models were characterized by low residuals, narrow confidence intervals, and high predictive correlation with experimental data derived from XRD and magnetic measurements. This work demonstrates the effectiveness of AI-based optimization in refining physically meaningful models for phase transformation and provides a robust framework for future integration of machine learning techniques in smart materials characterization.

Özet

$InTe$-Cr_2Te_3 ($CoTe_2$, $TlGaTe_2$, $TlInSe_2$, $CuGaTe_2$, $Bi_{1.3}Sb_{0.7}Te_3$, $CuCr_2Te_4$, Cu_2ZnSnS_4) sisteminin sekiz faz diyagramı incelendi ve oluşturuldu. Başlangıç bileşenleri arasındaki fizikokimyasal etkileşimin karmaşık bir doğası, InTe'ye dayalı sınırlı katı çözeltilerin oluşumu ile ortaya çıktı. İncelenen sistemlerdeki etkileşimin doğasının karmaşıklığı, bir yandan yapının kusurlu olmasıyla, diğer yandan çok bileşenli kompozisyon ve sentezlenen yarı iletken malzemelere dahil edilen elementlerin farklı konfigürasyonlarıyla ilişkilidir.
Fonon termal iletkenliğinin mikro sertliğe bağımlılığından, indiyum monotellürid temelinde elde edilen katı çözelti alaşımlarında kimyasal bağ mukavemetinin zayıflaması belirlendi. İkinci etkileşimli bileşenlerde, krom içeren bileşenlerden kobalt içeren bileşenlere doğru hareket edildiğinde, InTe'ye dayalı katı çözeltiler bölgesinin genişliğinin arttığı, bunun da görünüşe göre kromun elektron konfigürasyonunun diğer 3d elementlere kıyasla kararlılığıyla ilişkili olduğu bulundu. Ana termodinamik parametrelerin hesaplanması, InTe'ye dayalı elde edilen alaşımların kararlı düzenli katı çözeltiler olduğunu gösterdi.

Abstract

We study the existence, uniqueness, and multiplicity of positive solutions for a system of Hadamard fractional differential equations which contain fractional integral terms, and it is defined on a finite interval. This system is supplemented with general coupled nonlocal boundary conditions encompassing Hadamard fractional derivatives and Riemann-Stieltjes integrals. To establish the main results, we apply several fixed point theorems, including the Banach contraction mapping principle, the Schauder fixed point theorem, the Guo-Krasnosel'skii fixed point theorem, and the Leggett-Williams fixed point theorem.

Keywords: Hadamard fractional differential equations, nonlocal coupled boundary conditions, existence, uniqueness, multiplicity, positive solutions.

[2] "Gheorghe Asachi" Technical University, Department of Computer Science and Engineering, Iasi, Romania.

Abstract

We explore the existence, uniqueness, and multiplicity of positive solutions to a system of fractional q-difference equations that includes fractional q-integrals. This investigation is carried out under coupled multi-point boundary conditions featuring q-derivatives and fractional q-derivatives of various orders. The proofs of our principal findings employ a range of fixed point theorems, including the Guo-Krasnosel'skii fixed point theorem, the Leggett-Williams fixed point theorem, the Schauder fixed point theorem, and the Banach contraction mapping principle.

Keywords: fractional q-difference equations, fractional q-integrals, coupled multi-point boundary conditions, positive solutions, existence, uniqueness, multiplicity.

Exploring Alcohol-Related Metabolites in Bone: A Pilot Study Using NMR Spectroscopy

Pong Pornjarernpong (*ORCID: https://orcid.org/0009-0004-7301-6350*), Churdsak Jaikang (*ORCID: https://orcid.org/0000-0002-9262-0404*), Yutti Amornlertwatana (*ORCID: https://orcid.org/0000-0002-0619-1333*)

Department of Forensic Medicine, Faculty of Medicine, Chiang Mai University, Chiang Mai 50200 Thailand

Abstract

Alcohol is a widely consumed psychoactive substance worldwide. In forensic investigations, alcohol levels are typically assessed using blood or vitreous fluid samples. However, in decomposed bodies, alternative specimens must be considered. This study aimed to investigate ethanol metabolites in bone and their correlation with blood alcohol concentration (BAC) using nuclear magnetic resonance (NMR)-based metabolomics in deceased individuals. Bone samples (n = 79) were collected, and ethanol metabolites were analyzed using proton nuclear magnetic resonance (^1H-NMR) spectroscopy. All samples showed the presence of ethanol-related metabolites, including ethanol, ethyl oleate, ethyl cis-9-octadecenoate, ethyl glucuronide, ethyl sulfate, N-acetyl taurine, acetic acid, acetaldehyde, acetone, 5-hydroxyindoleacetic acid (5-HIAA), and 5-hydroxytryptophol (5-HTOL). Samples were categorized into two groups—BAC-positive and BAC-negative—based on blood alcohol concentration. No significant differences in metabolite levels were observed between the two groups, and no correlations were found between individual metabolite levels and BAC. These results suggest that the detected metabolites may reflect chronic alcohol consumption rather than acute intake. These preliminary findings highlight the potential of bone metabolomics as a tool for retrospective assessment of alcohol use, particularly in cases where conventional specimens are unavailable. Further research with larger sample sizes is needed to validate and refine this approach.

Abstract

Leishmaniasis is one of the most neglected tropical diseases caused by intracellular parasite belongs to genus Leishmania affecting both humans and animals. Approximately, it affected 350 million people worldwide every year precisely in the undeveloped and developing countries. In animals, dogs are considered to be the main reservoir of zoonotic leishmaniosis and the seroprevalence reported in the Mediterranean Basin ranges from 5 % to 30 % depending on the region. Various chemical drugs are used to treat and control this disease including pentavalent antimonial and antimicrobial. However, this chemotherapy has several limitations such as toxic side effects, high costs, frequent relapses, the development of resistance, and the requirement for long-term treatment. Therefore, there is a pressing need for drug discovery to treat this particular disease. In this scenario, microbial natural products are emerging as an interesting source for new antileishmanial drugs. This study aims to evaluate the antileishmanial potency of fractions of an endophytic fungi extract sheltered by a Cameroonian medicinal plant. Five fractions isolated from AMrb9 extract were screened against promastigotes stage of *Leishmania donovani* MHOM/SD/62/1S strain in a terminally differentiated THP1 (Human Acute Monocytic Leukemia) cell line and their cytotoxicity was also evaluated on the same cell line. Thereafter, the chemical composition of active fractions was determined using GC-MS analysis. Graphpad prism 8.0 was used to determine Inhibitory Concentration 50 (IC_{50}) and Cytotoxic Concentration 50 (CC_{50}) and Microsoft excel 2016 to calculate Selectivity Indexes (SI).Three fractions exhibited antileishmanial activity with IC_{50} values ranging from 3.40 -6.54 µg/mL. Globally, no active fraction showed cytotoxicity with significant SI greater than 40. GC-MS analysis of the three selective fractions revealed broad-spectrum antileishmanial compounds such as Endo-Borneol, Alpha terpineol, 1- oxo- forskolin, 3,5-octadione 2,2,7 trimethyl and alloaromadendrene being the most abundant. These findings suggest that three of the five fractions used in this study have the potential to produce antileishmanial molecules and can be used as starting point of new drugs to cure this disease and therefore improve treatment outcomes for patients and animals with leishmaniasis, reducing morbidity and mortality rates associated with the disease.

Abstract

Background and Objectives :Obesity in the female population represents a significant public health concern. It is particularly associated with adverse outcomes during pregnancy, increasing the risk of various maternal and fetal complications. During the COVID-19 pandemic, a notable association was observed between elevated body mass index (BMI) and SARS-CoV-2 infection, contributing to an increased incidence of unfavorable maternal and perinatal outcomes. The aim of this study is to examine the association between obesity, elevated body mass index (BMI), and COVID-19 severity, including the risk of developing severe complications requiring intensive care among pregnant women. Material and Methods: A retrospective study was conducted at a leading women's health hospital, including pregnant women with confirmed positive cases of SARS-CoV-2. Participants were classified into three groups based on their pre-pregnancy body mass index (BMI): obesity (BMI ≥ 30), overweight (BMI 25–29.9), and normal weight (BMI 18.5–24.9). An association was observed between elevated BMI and the presence of symptoms, obstetric characteristics, and the occurrence of complications such as sepsis, antimicrobial resistance, and other adverse outcomes in pregnant women Results: A total of 83 pregnant women with confirmed SARS-CoV-2 infection and documented pre-pregnancy BMI were included in the analysis. Obesity was significantly associated ($P < 0.01$), with an increased risk of severe maternal complications, including sepsis ,acute respiratory distress syndrome and the need for mechanical ventilation . Multivariate regression analysis confirmed obesity as an independent predictor of adverse perinatal outcomes. Conclusion:Overweight and obesity were associated with more severe clinical courses of COVID-19 during pregnancy, as well as with higher rates of maternal and perinatal complications. These findings underscore the importance of targeted monitoring and management of pregnant women with elevated BMI during infectious disease outbreaks

Metabolomic Characterization of Human Vitreous Fluid Using ^{1}H-NMR Spectroscopy

Thanakrit Trichag, Churdsak Jaikang, Kanicnan Intui

Chiang Mai University, Faculty of Medicine, Department of Forensic Medicine, Chiang Mai, 50200 Thailand.

Abstract

Vitreous humor serves as a critical biological matrix in forensic investigations due to its biochemical stability and resistance to postmortem changes. It facilitates the reconstruction of circumstances surrounding death by allowing accurate analysis of substances such as drugs, alcohol, glucose, and electrolytes. This makes it a valuable alternative specimen in cases where traditional samples like blood are decomposed or contaminated. Despite its recognized forensic value, the comprehensive chemical profiling of compounds contained in vitreous humor remains limited. This study aims to advanced analytical studies to explore the full spectrum of endogenous and exogenous compounds in vitreous humor, which may enhance its utility in forensic diagnostics. Vitreous humor samples (n=87) were typically collected postmortem from the eye and lyophilized. The samples were analyzed using ^{1}H-NMR spectroscopy. A total of 218 biochemical compounds were identified in vitreous fluid. The most organic compounds contained in vitreous humor are organic acids and their derivatives (41.8%), organic oxygen compounds (, and organoheterocyclic compounds, respectively. These compounds and the ^{1}H-NMR technique highlight the potential for further application in forensic investigations.

Keywords: vitreous fluid, biochemical compounds, ^{1}H-NMR, forensic investigations

Abstract

This study presents the first ethnobotanical exploration aimed at documenting the traditional medicinal use of plants with therapeutic potential in the Marghazar Valley, located in the Hindukush Range, Pakistan. A total of 25 respondents, including local residents of both genders and traditional healers, were interviewed using semi-structured and open-ended questionnaires. The collected data were analyzed using quantitative ethnobotanical indices such as Use Value (UV), Frequency of Citation (FC), Relative Frequency of Citation (RFC), and Family Use Value (FUV). In total, 108 medicinal plant species from 56 families were recorded as being used to treat various human ailments. The most represented family was **Asteraceae** (9 species), followed by **Lamiaceae** (7 species). Herbs comprised the most common life form (56%), and leaves were the most frequently used plant part. Decoctions were the most commonly used method of remedy preparation, with several different modes of administration reported. The RFC values ranged from 0.08 to 0.76, with *Justicia adhatoda* having the highest RFC (0.76). Other notable plants with high RFC values included *Ficus palmata*, *Geranium collinum*, *Acacia nilotica*, and *Hyoscyamus niger*. *Justicia adhatoda* was the most frequently cited plant, commonly used for treating cough, swelling, rheumatism, snake bites, and eye infections. Plants with the highest UVs were *Justicia adhatoda* (1.36) and *Cichorium intybus* (1.24). Among families, **Acanthaceae** showed the highest FUV (1.36), followed by **Zygophyllaceae** (1.08), while **Aspleniaceae** and **Polygalaceae** had the lowest FUV*s* (0.16). Notably, families with fewer species but high UVs often had relatively high FUV*s*. For example, a decoction prepared from the whole plant of *Asplenium dalhousiae* is traditionally used to treat gonorrhea, tuberculosis, and hepatitis. The high UVs of certain plants identified in this study suggest the potential presence of valuable phytochemicals, highlighting the need for further pharmacological investigations to discover new therapeutic agents.

Abstract

Vegetation patterns in a region are shaped by a complex interplay of environmental factors, including climate, soil characteristics, and anthropogenic influences. This study investigates the influence of edaphic (soil-related) factors on vegetation structure and plant community dynamics in the dry temperate region of the Ojhor Valley, Eastern Hindu Kush, Pakistan. The study area was stratified into four ecological zones based on altitudinal gradients, climatic conditions, species composition, and vegetation physiognomy. Vegetation sampling was conducted using the transect and quadrat method, with quadrat sizes of 20 × 20 m for trees, 10 × 10 m for shrubs, and 2 × 2 m for herbs. Data were compiled in Microsoft Excel and analyzed using multivariate statistical techniques. PCORD version 5 was employed to classify plant species into four distinct communities, named after their most dominant species. These included: *Salix tetrasperma–Crataegus songarica–Rheum tibeticum* community (elevation: 6,500–7,800 ft; Galeh-Hinjil-Dronil), *Populus alba–Hippophae rhamnoides–Arenaria griffithii* community (8,000–9,000 ft; Breshgram), *Onobrychis cornuta–Cousinia pineticola* community (9,000–10,500 ft; Susoom), and *Berberis calliobotrys–Ranunculus hirtellus* community (11,000–14,000 ft; Susoom). To examine species-environment relationships, Detrended Correspondence Analysis (DCA) and Canonical Correspondence Analysis (CCA) were performed using CANOCO version 4.5. The results highlighted that key edaphic factors—electrical conductivity (EC), calcium carbonate ($CaCO_3$), organic matter (OM), pH, phosphorus (P), and potassium (K)—played significant roles in shaping the distribution and composition of plant communities. This study underscores the importance of soil properties in determining vegetation patterns and provides a scientific basis for ecological conservation and land-use planning in the dry temperate zones of the Eastern Hindu Kush.

Abstract

This study investigates the effect of different materials on mechanical stress in rotors, with an emphasis on materials that are commonly used in rotor design while keeping consistent density. The objective is to determine how material properties affect stress distribution and identify optimal materials for mechanical stress. Several materials were analysed under equal operating conditions, and the results demonstrating that M19-24 has the lowest mechanical stress when compared to its equivalents. Specifically, the M19-24 material reduces mechanical stress by approximately 34.2% when compared to other evaluated materials. These findings highlight the importance of material selection in rotor design, suggesting that M19-24 could improve rotor durability and performance by reducing stress-induced failures. The study offers significant data for engineers when choosing materials to improve rotor mechanical integrity.

Keywords: Rotor mechanical stress, rotor disposition, material properties.

Abstract

The cold chain is critical for ensuring food security and preservation and comprises multiple stages, including pre-cooling, freezing, cold storage, refrigerated transportation, distribution, and domestic refrigeration. The refrigerated truck is one of the essential components of refrigerated transportation. Refrigerated trucks can be classified into four groups based on refrigeration technology: mechanical refrigerated trucks, cold plate refrigerated trucks, liquid nitrogen/dry ice refrigerated trucks, and liquefied natural gas (LNG) refrigerated trucks[1]. Phase change materials (PCMs) are used in cold plate refrigerated trucks, enabling heat preservation, temperature control, and refrigeration with improved energy efficiency. PCMs are able to store or release heat during phase change in response to temperature variations, thereby reducing temperature fluctuations and enhancing system performance. Thus, there are lots of studies focused on incorporating PCMs into cooling systems. In this study, the efficiency of the cooling system operating between 4 ºC and 12 ºC [2] was evaluated with novel mixtures of lauric acid and caprylic acid as PCMs to identify a suitable option for mechanical refrigerated trucks. The results demonstrated that the total energy consumption of the system over a 24-hour running period could be reduced by up to 27.8% using a solution composed of 86.6 wt.% caprylic acid and 13.4 wt.% lauric acid. This reduction further increased with the addition of acetone. The energy savings reached 32.2% with a solution containing 90.0 wt.% caprylic acid, 9.0 wt.% lauric acid, and 1.0 wt.% acetone, and were maximized at 38.6% using a solution of 90.0 wt.% caprylic acid and 10.0 wt.% acetone. Furthermore, the electricity cut-off was simulated following the running period in the cases with and without PCMs. The time required for the air inside the cabinet to reach the ambient temperature was approximately 1.6 times longer with solutions containing aceton, compared to the case without PCM. In contrast, this value was 1.4 times longer with the solution composed of 86.6 wt.% caprylic acid and 13.4 wt.% lauric acid. In conclusion, while acetone-containing solutions showed better performance in reducing energy consumption and maintaining product temperature for a longer duration during power failures in mechanical refrigerated trucks, the 86.6 wt.% caprylic acid–13.4 wt.% lauric acid solution can be recommended as a non-toxic alternative PCM, offering a practical balance between effectiveness and safety.

Abstract

In the context of a pandemic, a principal challenge in antiviral drug development lies in identifying novel virus-host interactions and concerning drug efficacy and safety. These critical needs have highlighted the potential utility of phytochemicals derived from commonly used herbs and spices as antiviral agents and immunomodulatory compounds. The aim of this study was to investigate the potential antiviral activity and immunomodulatory effects of *Hypericum perforatum* against SARS-COVCoV-2 using in vitro systems, with the goal of supporting its potential application as a therapeutic agent. To comprehensively evaluate the effects of *H. perforatum* extract on cellular functions, a series of in vitro assays were performed using HEK293T, Vero E6, Caco-2, and Calu-3 cell lines. These included the MTT assay for assessing cell viability, Hematoxylin and Eosin (H&E) staining for morphological analysis, Annexin V/PI/Hoechst staining for the detection of apoptosis, and the DCFDA assay for quantifying intracellular oxidative stress. To investigate the antiviral potential of *H. perforatum* extract, high-throughput screening was conducted to evaluate its ability to inhibit the binding of the SARS-CoV-2 receptor-binding domain (RBD) to the ACE2 receptor using an ELISA, and pseudovirus S1 neutralization assay as well as its inhibitory activity against the viral main protease (Mpro) via a Fluorescence Resonance Energy Transfer (FRET) assay. The results indicated that *H. perforatum* extract exhibited notable antioxidant capacity and demonstrated substantial antiviral activity, achieving up to 34% neutralization of SARS-CoV-2 infection at a concentration of 100 µg/mL. Additionally, it inhibited SARS-CoV-2 main protease (Mpro) activity by 75% to 81% at 5 - 500 µg/mL. Furthermore, the extract displayed significant immunomodulatory effects by downregulating key proinflammatory cytokines, including TNF-α, IL-1β, IL-6, and IL-8. These findings highlight *H. perforatum* as a promising therapeutic candidate, either used alone or in combination with antiviral drugs, for the management of viral infections.

Abstract

Hydrogels offer many advantages in wound dressing applications. The moist environment of the hydrogels accelerates the cellular wound healing process and makes them suitable for treating dry and necrotic wounds. Additionally, hydrogel matrices can transport therapeutic materials such as drugs, antibiotics, antioxidants, and growth factors into the wound site [1-2]. In this study, we prepared antibacterial and antioxidant hydrogels using sustainable natural polymers, silk sericin, keratin, and a synthetic polymer, Pluronic F127. Silk sericin was extracted by autoclaving silk cocoons in deionized water at 120°C for 30 minutes. Keratin was obtained from wool by peracetic acid oxidation. The methacrylated forms of keratin and F127 were synthesized using methacrylic anhydride (MA). Hydrogel formulations containing silver at different concentrations, sericin, keratin-MA, and Pluronic F127-MA were prepared. These formulations were crosslinked under UV light using Irgacure as a photoinitiator to form self-supporting hydrogels. The swelling ratios of the hydrogels were similar and approximately 15 ± 3. All hydrogels maintained their structural integrity for more than 5 days in PBS. The addition of silver accelerated hydrogel degradation. Antibacterial tests using the disc diffusion method indicated that all silver-containing hydrogels exhibited antibacterial activity against *E. coli* and *S. aureus*. Antioxidant activities of hydrogels were determined using DPPH assay and attributed to sericin in the hydrogel composition. Cytotoxicity analysis with L929 cells confirmed that all hydrogels have acceptable cytotoxicity (above 75 %). The *in vitro* wound healing potential of the hydrogels was evaluated using the scratch test. The hydrogel extracts exhibited wound closures between 35 % and 82 %, depending on the composition. Thus, our results suggest that these antioxidant and antibacterial hydrogel formulations have potential in wound healing applications.

Abstract

Fluorescent probes play a pivotal role in biological imaging due to their ability to visualize and track biomolecules in real time. However, a significant limitation of conventional fluorophores lies in their absorption and emission within the visible spectrum, which often leads to inadequate tissue penetration, high levels of background autofluorescence, and light scattering issues. These drawbacks hinder the efficacy of imaging in complex biological environments. Near-infrared (NIR) fluorophores exhibit minimal interference from endogenous autofluorescence, resulting in clearer and more accurate imaging outcomes [1]. Among NIR fluorophores, chromenylium-cyanine dyes have gained considerable attention due to their high fluorescence quantum yields, large molar absorption coefficients, and tunable optical properties. These characteristics make them highly suitable for a range of biological and environmental sensing applications. These dyes exhibit dynamic spirolactam ring-opening and -closing behavior in response to environmental factors such as pH or target analytes, thereby offering potential as responsive chemosensors. The inclusion of the indolinium ring enhances their resonance stabilization, promoting efficient NIR absorption and emission. With their unique combination of high sensitivity, environmental responsiveness, and favorable photophysical characteristics, chromenylium-cyanine fluorophores are poised to become powerful tools in the fields of bioimaging and chemosensor development [2]. For this purpose, a novel chromenylium-cyanine-based compound containing an indole ring (**INIR10**) was synthesized and characterized using conventional techniques such as ^{1}H NMR, ^{13}C NMR, FTIR, and HRMS.

Abstract

Mercury (Hg^{2+}) pollution poses a serious threat to environmental and human health due to its bioaccumulative and toxic nature, necessitating the development of rapid, selective, and cost-effective detection methods. In this study, a novel phenylthiourea-based indoline-fused chromenylium-cyanine dye (**INIR2**) was synthesized and employed as a chemodosimetric probe for the selective detection of Hg^{2+} ions through colorimetric, fluorometric, and smartphone-based approaches. The **INIR2** probe was synthesized by reacting **ICSH** with phenyl isothiocyanate in DMF at room temperature, followed by extraction and purification via column chromatography (yield: 69%). Structural characterization was confirmed by FT-IR, ^{1}H-NMR, ^{13}C-NMR, and HRMS. For the sensing study, **INIR2** was reacted with $HgCl_2$ to form **INIR2H**, a green-colored product isolated after purification. HRMS data confirmed the formation of **INIR2H** with a mass peak at m/z 672.33276, consistent with the expected loss of HgS. Spectral shifts and NMR data supported the proposed spirolactam ring-opening and imidazole formation mechanism upon Hg^{2+} interaction. **INIR2** exhibited a fast response (10 s), broad working pH range (3–9), and high selectivity towards Hg^{2+} over other competing species. Spectral studies revealed exceptionally low limits of detection (LOD) at 0.11 nM (UV-Vis), 0.18 nM (fluorescence), and 33.3 nM (smartphone method), with the latter achieving the highest sensitivity reported to date for mobile-based Hg^{2+} sensing. The probe's applicability was validated in real samples including drinking, tap, and lake water, as well as corn and rice matrices, with recovery rates close to 100%. The findings highlight **INIR2** as a powerful, versatile platform for Hg^{2+} monitoring in environmental systems.

Abstract

Today, climate change and increasing carbon emissions are among the most important problems faced by humanity. In the context of reducing carbon emissions, green energy transition is of vital importance. Since green energy is obtained from natural resources, it has less harmful effects on the environment compared to fossil fuels and has the capacity to reduce carbon emissions. Green energy technologies include advanced solar panels, energy storage systems, smart grids, carbon capture and storage systems, and hydrogen energy. These innovations in green energy technologies offer great promise for the future of sustainable energy. Future urban planning needs to be considered together with this transformation. In this study, recent and new developments in sustainable buildings and environment, transportation systems, waste management and reduction of pollutant emissions in cities in the context of green energy were examined. Additionally, the difficulties encountered in the development and implementation of green energy in cities and solution proposals were compared.

Keywords: Climate change, carbon emissions, green energy, sustainable systems

Abstract

Golden grass, named after its golden yellow color "*Helichrysum arenarium*" in Latin, is a herbaceous plant that blooms yellow flowers that are 50-60 centimeters long. It is also known by different names among the public: Golden flower, immortelle flower, sun flower, bee flower, etc. and its homeland is Europe. It grows in Eastern Anatolia in our country. The flower of *Helichrysum arenarium* has many biological activities, especially antibacterial, antiviral, antifungal, anti-inflammatory, antiproliferative, antimicrobial, antiallergic, antioxidant, antiradical, cholinergic, hepatoprotective and detoxification activities. In this study, hybrid nanoflower synthesis was carried out using *Helichrysum arenarium* L. plant and Cu(II) metal ion. Then, characterization process was carried out with SEM, EDX, XRD, FTIR, Mapping and NTA. Anticancer activities of synthesized hybrid nanoflowers were carried out on MCF7 cell line. As a result, it was observed that anticancer activity increased when the plant extract was converted into hybrid nanoflower form.

Electrochemical Surface Modification of Screen-Printed Gold Electrodes for Enhanced Performance and Kinetics

Turgut Sönmez (https://orcid.org/0000-0002-3927-2551)

Karabük University, Faculty of Science, Department of Chemistry, Karabük, Turkey

e-mail: turgutsonmez@karabuk.edu.tr

Abstract

Screen-printed electrodes (SPEs) as a sensing platform have gained popularity as an alternative to the classical three-electrode electrochemical setup (which typically consists of a carbon working electrode (WE), a platinum counter electrode (CE), and an Ag/AgCl reference electrode (RE) in a glass cell).[1, 2] This shift is driven by several advantages, including low cost, ease of fabrication, mass production capability, and disposability.[1-3] As shown in the left figure, the three electrodes are integrated onto the same flat substrate through the combination of various layers, forming a compact chip of just a few cm^2.[1] SPEs can be used for the detection and quantification of analytes in a wide range of applications, including environmental analysis, heavy metal detection, pesticides, oxygen concentration, glucose monitoring, and DNA analysis.[3, 4] To optimize surface performance, sensitivity, and stability, a surface activation process is essential. Therefore, electrochemical surface modification in an acidic environment is of great interest.

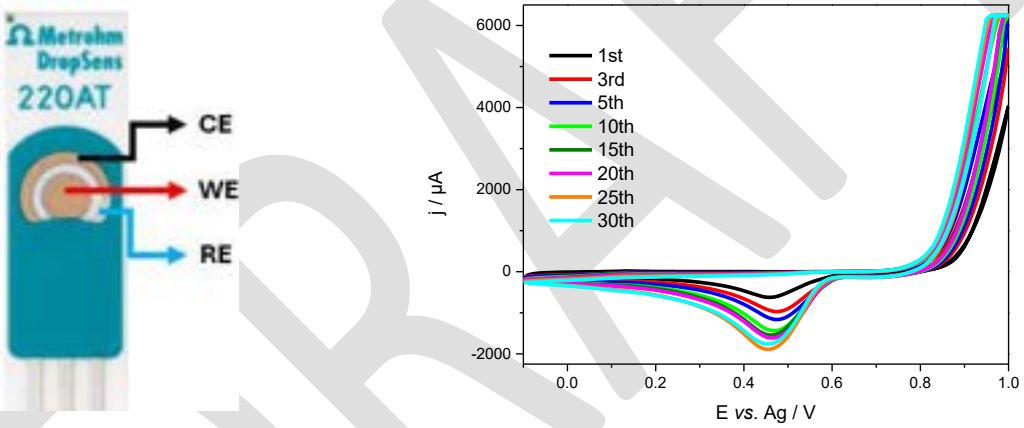

Figure. *Image of the screen-printed gold electrode (SPGE) (left) and cyclic voltammograms of SPGE (right) recorded in 0.5 M HCl at 25 °C. 1st - 30th scan. 100 mV/s.*

In this study, we performed electrochemical surface modification of a screen-printed gold electrode (SPGE) in 0.5 M HCl using cyclic voltammetry (CV). As shown in Figure (right), the reduction peak current at approximately 0.45 V *vs.* Ag increases steadily until the 25th scan, after which the activity stabilizes. The current exhibits more than a three-fold increase between the 1st and 25th scans. Our results demonstrate that the sensing activity of the SPGE in HCl has been enhanced nearly 100 times compared to our recent report[3] of SPGE performance in H_2SO_4. Surface-modified and unmodified SPGEs were subsequently used for O_2 detection, with their performance and kinetics compared. The underlying mechanisms responsible for the enhanced surface activity were also investigated.

Keywords: Screen Printed Electrodes, Biosensors, Surface Modification, Cyclic Voltammetry

Özet

Sanayi ve kentleşme faaliyetlerinin artmasıyla beraber atıksu arıtma tesislerinin artması ve buna bağlı olarak yüzeysel sulara atıksu deşarjlarının artması sonucunda nehir, göl ve denizlerde dip çamurları oluşmaktadır. Kanalizasyon deşarjları, tarımsal uygulamalar, inşaat ve hafriyat atıkları gibi birçok insan faaliyetleri sonucunda da organik ve inorganik maddeler (patojenler, ağır metaller, organik kirleticiler ve diğer toksik maddeler) dip çamurunda birikmektedir. Bu durum insan ve suda yaşayan organizmaların sağlıklarını tehdit etmektedir. Dip çamurunun susuzlaştırıldıktan sonra tasfiye edilmesi veya tekrar kullanılması hem ekonomi hem de çevre sağlığı için oldukça önemlidir. Çamurların susuzlaştırılmasında genellikle mekanik yöntemler kullanılmaktadır. Fakat mekanik yöntemlerin etkinliğini geliştirmek için çamura polielektrolit eklenerek çamurun susuzlaştırılma kapasitesinin daha iyi hale getirilmesi gereklidir. Dip çamurunun susuzlaştırılması üzerine yapılan araştırmalar genellikle geo-tekstil ve poliakrilamid ilaveli susuzlaştırma metodlarını içermektedir. Bu çalışmada, Türkiye'de gerçekleştirilen deniz dibi tarama faaliyetlerinden elde edilen çamurların alternatif bertaraf yöntemleri sunulmuş ve bu faaliyetlerin çevresel potansiyel etkileri vurgulanmıştır. Deniz tarama faaliyetleri sonucu elde edilen dip çamurlarının ağır metal içeriği göz önünde bulundurularak susuzlaştırıldıktan sonra bertaraf alternatifleri için mevcut olan yöntemler incelenmiştir. Türkiye'de dip çamurlarının ham madde olarak kullanımı veya geri kazanımıyla ilgili olarak az sayıda çalışma yapılmıştır. Bazı çalışmalarda dip çamurlarının bağlayıcılık özelliği iyi olan çeşitli malzemelerle karıştırılıp, inşaat malzemesi olarak hafif agrega yapımında veya yol yapımında dolgu malzemesi olarak kullanılabilirliği araştırılmıştır. Dip çamurlarının dolgu malzemesi olarak kullanılabilmesi için karayolları teknik şartnamesinde verilen limit değerler göz önünde bulundurulmalıdır. Dip çamurunun çevresel etkilerinin değerlendirildiği çalışmalarda ''Atık Yönetimi Yönetmeliği (AYY) (02.04.2015-R.G.29314)''ye göre ''tehlikesiz atık (atık kodu 17 05 06)'' sınıfında olup olmadığını belirtilmelidir. Yapılan araştırmalar sonucunda dip çamurlarının susuzlaştırılması için hangi yöntemlerin kullanılabileceği, dip çamurunun bertaraf edilmesinden kaynaklanan çevresel risklerin azaltılması için uygun teknolojilerin nasıl seçileceği vurgulanmıştır.

Anahtar Kelimeler: Bertaraf yöntemleri, dip çamuru tarama, çevresel etkiler.

Abstract

In contemporary cities, transportation systems are no longer limited to facilitating mobility alone; they are increasingly re-evaluated in line with multidimensional goals such as sustainability, accessibility, and quality of urban life. In this context, transport-oriented urban models have emerged as frameworks with the potential to reshape urban space across varying scales and planning paradigms. Although models such as the 15-Minute City, Net Zero Carbon City, and Transit-Oriented Development (TOD) have been implemented in various urban contexts, studies that comparatively analyze these approaches remain limited. In particular, there appears to be a lack of systematic evaluation in the literature concerning their planning principles, sustainability dimensions, and contextual adaptability. This study aims to address this gap by providing a comparative conceptual analysis of the aforementioned three approaches. Within a conceptual framework, the research will examine the fundamental principles, transportation visions, and implementation challenges of each model based on academic literature, international policy documents, urban strategy reports, and exemplary cases. Through a qualitative comparative method, the study will identify and interpret the advantages, limitations, and contextual adaptability of each approach. Ultimately, the study seeks to contribute to the academic discourse by offering an integrated understanding of transport-oriented urban approaches and to provide a conceptual foundation for strategic syntheses that may be applicable in developing countries such as Türkiye.

Keywords: Sustainable urban mobility, Urban planning models, Comparative analysis

Özet

Bu çalışmada Hatay ili Arsuz bölgesi topraklarının molibden içeriğinin belirlenmesi ve toprak içerisindeki bazı ağır metaller ile ilişkilerinin saptanması amaçlanmıştır. Bu amaç için Arsuz ilçesi topraklarını temsil edecek şekilde 0-30 cm derinlikten ve 70 noktadan olmak üzere toplamda 70 toprak örneği alınmıştır. Alınan toprak örneklerinde; Kadmiyum (Cd), Cobalt (Co), Krom (Cr), Nikel (Ni), Demir (Fe) ve Molibden (Mo) içerikleri belirlenmiştir. Araştırma sonuçlarına göre; toprakların Cd içerikleri 0.01-0.03 µg/kg; Co içeriği 0.02-2.96 µg/kg; Cr 0.01-0.85 µg/kg, Ni içerikleri 0.35-17.60 mg/kg; Fe içerikleri 1.65-18.72 mg/kg ve Mo içerikleri 0.01-0.18 µg/kg arasında bulunmuştur. Toprakların Mo ile Cd, Co ve Fe içerikleri arasında pozitif önemli ilişkiler belirlenmiştir. Aynı zamanda Cd ile Co, Ni, Fe ve Co ile Ni ve Fe aralarında ise pozitif önemli ilişkiler belirlenmiştir. Bölge topraklarının ağır metal içerikleri sınır değerler ile karşılaştırıldığında herhangi bir ağır metal kirliliğine rastlanmamıştır.

Anahtar kelimeler: molibden içeriği, Arsuz ilçesi, ağır metaller

Abstract

In recent years, the Additive Manufacturing method has gained an important place in the industry by facilitating the production of complex geometry parts that are difficult to manufacture with traditional production methods. This method offers various advantages in today's production sectors where lightweight structures and raw material savings are essential. Polyetheretherketone (PEEK), an advanced engineering material with high melting temperature, and chemical and wear resistance, provides both functional and economical solutions when combined with Additive Manufacturing technologies. In this study, test specimens with Ø10x25 mm dimensions were produced with the Additive Manufacturing method using PEEK material in different layer thicknesses (50, 75, and 100 µm). In order to examine the wear behavior of the samples, three different loads (20, 40, and 60 N) and two different sliding speeds (0.5 and 1.0 m/s) were used in a dry environment disk-on-pin wear test setup. The test samples were produced at an 80% fill rate. The results obtained show that the layer thickness in samples produced from PEEK material does not have a significant effect on both volume loss and average friction coefficient, but the wear resistance decreases with the increase in applied load and sliding speed. It was also determined that the increase in sliding speed affects the average friction coefficient.

Keywords: PEEK, additive manufacturing, layer thickness, wear.

Abstract

This study reports on the sintering of Al-10 wt.% Si-x($Hf_{0.2}Ti_{0.2}Zr_{0.2}V_{0.2}Ta_{0.2}$)$B_2$ (x= 1, 2, 5, 10, 15 wt.%) composites by traditional powder metallurgy methods. Firstly, high entropy ($Hf_{0.2}Ti_{0.2}Zr_{0.2}V_{0.2}Ta_{0.2}$)$B_2$ diboride (HEB) ceramics were synthesized via planetary ball milling (6 h) assisted spark plasma sintering (2000 °C, 30 MPa). After the prealloying of Al-10 wt.% Si (Al10Si) matrix during 4 h, HEB ceramics were milled down to particles and then incorporated into the matrix at five different weight ratios with in the presence of stearic acid. Next, prepared powder mixtures were mechanically alloyed for 6 h. The powders were cold pressed and debinded at 420 °C during 2 h and then pressureless sintered at 630 °C during 2 h. X-ray diffractometer (XRD), scanning electron microscope/energy dispersive spectrometer (SEM/EDS), Archimedes' density, hardness (50 g, 10 sec) and dry sliding wear tests were conducted as characterization studies. In addition to Al, Si and HEB phases, Fe contamination originating from the milling media was also detected. The composite containing 15 wt.% HEB reinforcement had the highest Archimedes' density of 2.84 g/cm^3 had the highest hardness value of nearly 3.87 GPa and the 10 wt.% HEB reinforcement composites had the lowest wear rate of approximately 2.14x10^{-4} mm^3/Nm.

Keywords: High entropy diborides, microstructure, mechanical alloying, hardness, phase analysis, Al-matrix composites.

Özet

Kolon kanseri, dünya çapında önemli bir morbidite ve mortalite nedenidir. Son yıllarda, bağırsak mikrobiyotasının kolon kanseri patogenezindeki rolü giderek daha fazla araştırılmaktadır. Mikrobiyota bileşimindeki değişiklikler (disbiyozis), kronik inflamasyon, genotoksik metabolit üretimi ve immün modülasyon yoluyla kolon karsinogenezini tetikleyebilmektedir. Bu çalışma ön çalışma olup, kolon kanseri mikrobiyotasının yeni nesil dizileme (NGS) yöntemi ve metagenomik analiz kullanılarak belirlenmesi amaçlanmıştır. Kolon CA (+) klinik tanısı almış 10 hastadan alınan doku örneklerinden QIAamp DNA Micro Kiti kullanılarak DNA izolasyonu gerçekleştirilmiştir. Toplam DNA örneklerinden, bakteriyel 16S rRNA gen bölgesi polimeraz zincir reaksiyonu (PZR) kullanılarak amplifiye edilmiş ve oluşturulan kütüphanelerin sekans analizleri Illumina platformunda yeni nesil dizileme (NGS) yöntemiyle yapılmıştır. Metagenomik analizlerde incelenen 10 kolon kanseri mikrobiyota örneğinde, cins seviyesinde baskın türün *Enterococcus* olduğu gözlemlenmiş; bunu sırasıyla *Escherichia/Shigella* ve *Staphylococcus* izlemiştir. Literatürde *Enterococcus*'un (özellikle *E. faecalis*), kolon kanserinde artış gösterdiği, ROS üretimi, DNA hasarı ve kronik inflamasyon yoluyla tümör oluşumunu tetikleyebildiği, *Escherichia/Shigella*'nın (özellikle pks+ *E. coli*), kolon kanserinde artış gösterdiği, kolibaktin toksini ile DNA hasarı yaparak ve kronik inflamasyonu tetikleyerek tümör oluşumunu desteklediği, *Staphylococcus*'un kolon kanserinde artış gösteren bakterilerden olduğu, biyofilm oluşturarak kronik inflamasyona ve immün modülasyona yol açtığı, toksinleriyle epitel bariyeri bozabildiği, ancak direkt kanserojen etkisinin tartışmalı olduğu bildirilmiştir. Bu bakterilerin artışı, sağlıklı mikrobiyota dengesinin (örn. *Faecalibacterium prausnitzii* gibi anti-inflamatuvar türlerin) bozulmasıyla ilişkilendirilmektedir. Mikrobiyota modülasyonu (pro/prebiyotik uygulamaları, fekal transplantasyon ve spesifik antibiyotik tedavileri) kolon kanseri tedavisinde yeni terapötik seçenekler sunmaktadır. Mikrobiyota profilleme teknikleri ise hastalığın erken evre tanısında potansiyel biyobelirteçler olarak umut vaat etmektedir.

Anahtar Kelimeler: Bağırsak mikrobiyotası, Disbiyozis, Kolon kanseri.

Damping–mixing enthalpy relationship in Mg-Ca and Mg-Ni alloys: Influence of short-range order

Yiğit Türe[1*] (*https://orcid.org/0000-0002-5238-2624*)

[*1]Eskisehir Technical University, Information Technologies Vocational School, Electronics and Automation Department, Eskisehir, Turkey.

*Corresponding author e-mail: yture@eskisehir.edu.tr

Abstract

In addition to their high specific strength, magnesium (Mg) and its alloys exhibit notable damping capacity. However, the type and concentration of alloying elements must be carefully considered. In Mg-based alloys, the relationship between damping behavior and mixing enthalpy can offer valuable insights into the fundamental mechanisms that govern material properties. This study investigates this relationship using two alloy systems: one containing calcium (Ca), which is soluble in Mg, and the other containing nickel (Ni), which is insoluble in Mg. Damping test data at low strain amplitude levels (relevant to ride comfort) were utilized to establish the correlations. These data were obtained from previously published studies in the literature. Given the importance of solubility, the effect of short-range order (SRO) was also examined within the main framework of the study. The results revealed that the correlation between damping capacity and mixing enthalpy exhibited a similar decreasing trend in both alloy systems as the concentration of the alloying element increased. The pronounced reduction in damping observed in Ca-containing alloys was attributed to the formation of SRO structures.

Keywords: Magnesium alloy, damping, enthalpy of mixing, short range order

Özet

Plastik atıkların çevresel etkilerini azaltmak amacıyla biyobozunur ambalaj malzemelerine olan ilgi giderek artmaktadır. Bu doğrultuda, gıda ürünlerinin raf ömrünü uzatmada kullanılabilecek, çevre dostu ve antimikrobiyel özelliklere sahip polimer esaslı yeni nesil ambalaj çözümleri geliştirilmektedir. Bu çalışmada, biyolojik olarak parçalanabilir poli(bütilen adipat-ko-tereftalat) (PBAT) esaslı nanokompozit filmler, titanyum dioksit (TiO_2) ve indirgenmiş grafen oksit (rGO) nano dolgu maddeleriyle katkılandırılarak hazırlanmıştır. Filmler, çözelti döküm yöntemiyle üretilmiş ve saf PBAT ile birlikte PBAT/TiO_2, PBAT/rGO ve PBAT/TiO_2-rGO kompozitleri elde edilmiştir. Hazırlanan filmlerin karakterizasyonu; yüzey morfolojisini incelemek için atomik kuvvet mikroskobu (AFM), kimyasal yapı analizleri için Fourier dönüşümlü kızılötesi spektroskopisi (FTIR), yüzeyin hidrofilik/hidrofobik doğasını değerlendirmek için temas açısı ölçümleri ve nem ile etkileşimini belirlemek üzere su absorplama testleri ile gerçekleştirilmiştir. Özellikle rGO ve TiO_2 nano dolgu maddelerini birlikte içeren filmler, daha düşük su absorplama oranları ve daha homojen yüzey yapılarıyla dikkat çekmiştir. Filmlerin gıda ambalajı olarak uygulanabilirliğini değerlendirmek üzere, 28 gün süren kiraz domates raf ömrü testi gerçekleştirilmiştir. Domatesler düzenli aralıklarla izlenmiş, ağırlık kaybı oranları hesaplanmış ve yüzey bozulmaları değerlendirilmiştir. PBAT/TiO_2-rGO kompozit film ile sarılan domateslerin 28. güne kadar görünür mikrobiyal bozulma göstermediği ve ağırlık kaybının %15'in altında kaldığı gözlemlenmiştir. Bu bulgular, geliştirilen PBAT/TiO_2-rGO kompozit filmin çevre dostu ambalaj uygulamaları için potansiyel taşıdığını göstermektedir.

Anahtar kelimeler: Poli(bütilen adipat-ko-teraftalat), İndirgenmiş grafen oksit, Titanyum dioksit, Kiraz domates, Nanokompozit film

A New Role for Cyclobenzaprine: Cytotoxic Effects in Lung Cancer Cells

Asli ELDEM[1] (https://orcid.org/0000-0003-3510-6748)

Department of Analytical Chemistry, Faculty of Pharmacy, İzmir Kâtip Çelebi University, İzmir, Turkiye

*Corresponding author e-mail: aslierdem45@gmail.com

Abstract

Cyclobenzaprine is a tricyclic compound commonly used as a muscle relaxant, but its anticancer potential has not been sufficiently explored. In this study, the cytotoxic and antiproliferative effects of cyclobenzaprine on the human lung adenocarcinoma cell line A549 were investigated following 24 hours of treatment. Cell viability was evaluated using the MTT assay, while long-term proliferative capacity was assessed via the colony formation assay. Cyclobenzaprine was applied at various concentrations (1, 5, 10, 12.5, 15, 20, 50 µM), and based on dose–response analysis, the IC_{50} value was determined to be 22.3 µM. At this concentration, a significant reduction in cell viability was observed. Furthermore, colony formation ability was notably inhibited. Both the number and size of colonies were found to be significantly lower in the treated groups compared to the control group ($p < 0.05$). These results indicate that cyclobenzaprine effectively suppresses the viability and clonogenic potential of A549 cells. The findings suggest that cyclobenzaprine may directly affect cell proliferation and could be considered a potential anticancer agent. This study also presents a novel perspective on the repurposing of cyclobenzaprine for oncological applications beyond its conventional therapeutic roles. In conclusion, further research is proposed to elucidate the underlying mechanisms of its antiproliferative effects, particularly focusing on apoptosis, cell cycle regulation, and related signaling pathways. These future studies may provide deeper insights into cyclobenzaprine's mechanism of action and strengthen the rationale for its potential use in cancer therapy. Overall, these findings highlight the promise of cyclobenzaprine as an anticancer compound and provide a foundation for more extensive preclinical investigations.

Abstract

Bread is one of the most widely consumed food products worldwide and constitutes an essential part of the daily diet. Due to its frequent consumption, improving the nutritional and functional value of bread offers a practical approach to supporting public health. In this context, the use of natural ingredients rich in bioactive compounds has gained increasing attention. Aronia (*Aronia melanocarpa*) is a fruit known for its high content of phenolic compounds such as anthocyanins and flavonoids, and for its strong antioxidant capacity. In this study, the effect of incorporating aronia juice at levels of 50% and 100% in bread formulations was investigated in terms of its contribution to the product's bioactive profile. The enrichment of bread with aronia juice led to a remarkable increase in both phenolic content and antioxidant potential compared to the control. Specifically, phenolic content increased by approximately 176% and 393%, while antioxidant activity improved by 89% and 228% in the 50% and 100% juice formulations, respectively. The results demonstrate that aronia juice can serve as a natural source of phenolics and antioxidants in cereal-based products. Its inclusion in bread formulations significantly enhances both nutritional and functional properties. These findings suggest that the utilization of fruit-derived bioactive components may contribute to the development of novel functional bakery products with potential health-promoting effects.

Abstract

Aronia melanocarpa is a rich source of polyphenols, particularly anthocyanins, flavonoids, and procyanidins, known for their potent antioxidant and health-promoting properties. The incorporation of Aronia melanocarpa juice (AMJ) into bread dough presents a novel strategy to improve its nutritional content. However, its influence on dough rheology has not been fully clarified. Therefore, this study aimed to investigate the effects of substituting water with 0% (control), 50% (50-AMJ), and 100% (100-AMJ) AMJ on dough rheology using farinograph, SMS/Kieffer dough and gluten extensibility, and SMS/Chen-Hoseney stickiness analyses. Farinograph results revealed significant increases ($P < 0.05$) in water absorption, rising from 63.80% in the control to 65.60% and 68.70% in 50-AMJ and 100-AMJ, respectively. Dough stability decreased markedly, from 10.0 min (control) to 7.7 min (50-AMJ) and 1.2 min (100-AMJ), while softening values increased from 1.0 BU to 4.00 and 47.02 BU. The SMS/Kieffer analysis showed dose-dependent increases in maximum resistance (Rmax) and area (A), with Rmax values of 25.11, 30.80, and 72.47 g, and A values of 356.66, 548.66, and 751.00 gxmm for control, 50-AMJ, and 100-AMJ, respectively. Extensibility (Ext) decreased with increasing AMJ ratio. While dough stickiness and strength were similar between control and 50-AMJ, notable increases were observed at 100-AMJ. Overall, partial substitution of water with AMJ (up to 50%) can enrich bread dough with bioactive compounds without adversely affecting its rheological behavior and may support the development of functional bakery products.

Abstract

The skin is the human body's largest organ, accounting for approximately 15% of total adult body weight and covering a surface area of about 1.5-2 m². One of its primary functions is to act as a mechanical barrier against harmful pathogens. Additionally, it plays a critical role in vital physiological processes such as preventing transepidermal water loss, thermoregulation, and vitamin synthesis. Therefore, maintaining and strengthening skin health is of vital importance. In recent years, skin aging and various skin issues such as dryness, pigmentation, acne, and a weakened skin barrier have garnered significant attention in both scientific and cosmetic circles. Increasing concerns about the long-term adverse effects of chemical-based products have sparked a growing interest in natural and microbiome-friendly skincare solutions. Recent studies have emphasized the importance of probiotics in maintaining skin health and supporting dermatological treatments. Probiotics are live microorganisms that confer health benefits to the host when administered adequately. They contribute to restoring skin microbiota balance through their immunomodulatory, anti-inflammatory, and antimicrobial properties. Furthermore, they support ceramide synthesis, strengthen the skin barrier, increase moisture retention, and reduce oxidative stress. These effects help treat various skin conditions, including acne, dermatitis, eczema, and psoriasis. Given the previously mentioned benefits, probiotics appear promising for enhancing skin health and promoting sustainable cosmetic production. In response to rising consumer demand, the global market for probiotic-based skincare products, valued at USD 320.3 million in 2023, is projected to grow to USD 981.3 million by 2034, with a compound annual growth rate of 11%. The present study will evaluate the use of probiotics in modern skincare and cosmetic applications as microbial allies in light of the recent findings.

Keywords: Probiotics, skinhealth, microbiome, probiotics in cosmetic application

Ev tekstili kumaşların ıslanma davranışı analizi için yöntem geliştirilmesi

Mehmet Tiritoglu (*ORCID: https://orcid.org/0000-0002-2316-0782*)

Bursa Uludağ Universitesi, Mühendislik Fakültesi, Tekstil Mühendisliği Bölümü, Bursa, Türkiye.

mtiritoglu@uludag.edu.tr

Özet

Ev tekstili ürünlerinde tüketici beklentileri yalnızca estetik kaygılarla sınırlı kalmamakta, aynı zamanda ürünün kullanım konforu, hijyenik performansı ve dayanıklılığı gibi teknik parametreleri de ön plana çıkmaktadır. Özellikle sıvı emme kapasitesi, havlu, perde, yatak örtüsü ve döşemelik kumaş gibi pek çok ev tekstili ürününde ürünün fonksiyonel kalitesini doğrudan etkileyen kritik bir özelliktir. Ancak, konvansiyonel sıvı emme test yöntemleri (örneğin dikey ve yatay kılcallık testleri), ölçüm doğruluğunu etkileyebilecek pek çok dış faktöre (ortam sıcaklığı, nem, operatör etkisi vb.) bağlı olarak değişkenlik göstermektedir. Bu çalışmada, sıvı emme analizlerinde karşılaşılan sınırlamaları ortadan kaldırmak amacıyla termal kamera destekli yenilikçi bir analiz yöntemi geliştirilmiştir. Farklı dokuma yapılarına ve elyaf içeriklerine sahip ev tekstili kumaşlarına uygulanan bu yöntem, sıvının kumaş içerisindeki ilerleyişini emisivite ısı farkları üzerinden tespit ederek, hem dikey hem de yatay kılcallık testlerinde daha hassas ve gözle görülemeyen nüfuz bölgelerinde dahi ölçüm imkânı sunmaktadır. Analiz sonucunda, sıvı emilimi fazla olan kumaşların termal kamera görüntülerinde de fazla emilimin görüldüğü, az emilime sahip kumaşlardaki termal görüntülerin de yine az miktarda olduğu tespit edilmiştir. Ayrıca, doku ve renk yapısı nedeniyle (çok açık veya ok koyu kumaşlar) ıslanmanın tespit edilememesi sorunun termal kamera görüntülerinde yaşanmadığı görülmüştür. Termal görüntüleme ile elde edilen veriler, analizlerin kullanıcı bağımsız, tekrarlanabilir ve objektif bir biçimde yürütülmesini mümkün kılmıştır. Sonuçlar, geliştirilen termal kamera destekli yöntemin geleneksel test metotlarına göre daha yüksek güvenilirlik sağladığını ve ev tekstili alanında fonksiyonel performans analizlerinde yeni bir perspektif sunduğunu göstermektedir. Bu yaklaşım, özellikle Ar-Ge süreçlerinde ve kalite kontrol aşamalarında standartlaştırılabilir ölçüm ihtiyacına etkin bir çözüm sunmaktadır.

Anahtar Kelimeler: Kılcallık, kumaşlarda ıslanma davranışı, termal kamera

Abstract

Outdoor (also known as ambient) air pollution is a major environmental and public health concern, affecting millions of people worldwide. It also plays a significant role in climate change by altering atmospheric composition and radiative forcing. Outdoor air pollution arises from both natural and anthropogenic sources, including industrial emissions, vehicular exhaust, biomass burning, and natural dust. In a broader perspective, air pollutants can be classified as gaseous pollutants (e.g. CO, SO2, NO2, VOCs and O3) and suspended particles. Suspended particles, also known as Particulate matter (PM), is composed of a heterogeneous mixture of tiny liquid droplets and solid particles. Therefore, PM is considered as a complex mixture with variable and dynamic chemical composition and physical characteristics. In general PM is classified based on its size: $PM_{2.5}$ (particles with diameters ≤ 2.5 µm) and PM_{10} (particles with diameters ≤ 10 µm). Many of the individual species and mixtures present in PM have been classified by the International Agency for Research on Cancer (IARC) as Group 1 "carcinogenic to humans" (e.g. benzene, benzo[a]pyrene, chromium (VI), diesel particulate matter, and dioxin) and Group 2A "probably carcinogenic" carcinogens. Therefore, monitoring and evaluation of PM chemical composition is very important in terms of public health concern. In this study, the health risk of PM10 due to diesel particulate matter (DPM) was assessed using elemental carbon (EC) as surrogate of DPM measurements. Outdoor EC concentrations in daily PM10 samples (collected on quartz filters by a high-volume sampler between 2023 and 2024 years) were determined by the thermal-optical methods. DPM concentrations were calculated and accepted as the ambient DPM concentration assuming EC concentration contributes to 50-85% of the total DPM mass. Using USEPA risk assessment methodology and exposure to outdoor concentrations over a lifetime of 70 years, the cancer risk due to inhalation of DPM have been quantified between 9.90x10-5 and 1.91x10-4 for the Artvin city. This preliminary study showed that the cancer risk threshold of 10^{-6} has been exceeded when EC was used as surrogate for DPM.

Keywords: Air pollution, Cancer Risk, Diesel Particulate Matter, Elemental Carbon, Particulate matter.

Abstract

Boron (B) and salinity stress are among the most important abiotic stress factors that reduce productivity in agricultural production. The B concentrations of soils are generally higher in saline soils and irrigated with saline well water. In order to alleviate this negative situations on agricultural production, more tolerant plant species can be selected and obtained succesfull results to combat stress factors with the application of salicilic acid, humic acid, melathonine, PGPR, biochar, silicon (Si) and selenium (Se). Nano-fertilizers are among the materials that can be evaluated for this purpose. In this study, various nano-hydroxyapatite (nHAP) forms were applied (0.1 g L^{-1}) to barley plants grown in hydroponic conditions under combined B and salinity stress and the effects of applications on plant growth were investigated. In order to create toxicity conditions, 10 mg L^{-1} B and 40 mM NaCI were applied to pots. According to the results obtained from the study, while the plant growth deteriorate with the stress condition, with the help of nWHAP and nCHAP alleviate this negative situation. While all nHAP forms generally enhanced the phosphorus (P) concentrations of shoot and root, nHAP and nWHAP increased the potassium (K) concentration of shoots. The most effective application on shoot and root B concentration were nWHAP and all nHAP forms except nCHAP increased the sodium (Na) concentration of shoot compared to control. The effects of the nHAP forms used in the study on plant growth and mitigating stress conditions were found to be different, and it was determined that similar studies should be conducted in different climatic conditions and plants.

Abstract

The Gökova and Datça–Bozburun Special Environmental Protection Areas, among the most important protected areas in Turkey, also encompass designated no-fishing zones. The spread of alien invasive species on all our coasts triggered by global climate change poses a threat to existing native species and habitats. Aquatic invasive species are known to harm both biodiversity and the fishing economy. Small-scale fisheries and recreational fisheries are carried out in the two protected areas where the study was conducted. This study was conducted to evaluate the status of alien invasive species in protected areas and to determine their impacts on fishing activities. The study was carried out with underwater monitoring activities lasting 4 seasons in selected no-fishing zones and fishing zones within both SEPAs in the autumn 2023-summer 2024 period. In addition, face-to-face interviews were conducted with professional fishers in the region to obtain information about the interaction of fishers with these species and their effects on fishing activities. Underwater visual censuses conducted in the study area, it was determined that the alien species *Siganus luridus, Siganus rivulatus, Pterois miles, Parupeneus forsskali* were represented with high abundance values. In addition to these, invertebrate species *Diadema setosum* and *Synaptula reciprocans* were observed in the study area. It was determined that the species *Pterois miles*, *Siganus rivulatus*, *Parupeneus forsskali*, and *Diadema setosum* exhibited the highest abundance during the autumn. The results showed that the abundance of invasive alien species was higher in fishing zones than in no-fishing zones. The invasive alien fish species *Siganus* spp. contribute to the local fishing economy and are among the species preferred by local communities for consumption. *Pterois miles* has also begun to be consumed, and its economic significance in fisheries is increasing steadily.

Keywords: Alien species, no-fishing zone, marine protected area, small-scale fisheries, *Pterois miles*, *Siganus* spp.

Özet

Ultrasonografi, radyasyon içermemesi, gerçek zamanlı görüntüleme sunması ve yumuşak doku kontrastını etkin biçimde ortaya koyması nedeniyle oftalmolojik değerlendirmelerde öncelikli tercih edilen görüntüleme yöntemlerinden biridir. Rutin oftalmolojik muayenelerin ardından intraoküler yapıların değerlendirilmesi için ultrasonografiye sıkça başvurulur. Veteriner oftalmolojide göz ultrasonografisi (USG), göz içi yapıların değerlendirilmesine imkan sağlayan, invaziv olmayan ve tekrarlanabilir bir görüntüleme yöntemidir. Bu sunumda, kedi ve köpeklerde göz ultrasonografisinin tanısal doğruluğunu artırmak amacıyla normal anatomik yapıların sistematik değerlendirilmesi ve görüntüleme tekniklerine yönelik pratik önerilerin sunulması amaçlanmıştır. Kornea, anterior kamara, iris, lens, vitreus, retina ve optik sinir gibi yapılar yüksek frekanslı lineer prob (7.5–12 MHz) ile değerlendirilmektedir. Yüksek çözünürlüklü prob teknolojilerinin gelişmesiyle birlikte, göz içi yapıların daha detaylı olarak görüntülenebilmesi mümkün hale gelmiş, bu da tanısal doğruluk oranlarını belirgin şekilde artırmıştır. Ultrason probunun pozisyonu, gözün transversal ve longitudinal düzlemlerde görüntülenmesini sağlamalıdır. Göz içi yapıların normal ultrasonografik görünümünün detaylı bilinmesi, patolojik bulguların doğru yorumlanması açısından kritik öneme sahiptir. Sonuç olarak, göz ultrasonografisinde uygun Teknik ile yaklaşım, doğru prob seçimi ve göz içi yapıların detaylı anatomik bilgisi, tanısal doğruluğu artırmakta ve patolojik süreçlerin daha erken ve doğru bir şekilde tespit edilmesine olanak tanımaktadır. Bu sayede, göz içi hastalıkların yönetimi ve tedavi planlaması daha etkili hale gelmekte, operatif müdahale gereksinimi olan olgular daha doğru bir şekilde belirlenebilmektedir. Ayrıca, göz ultrasonografisi, rutin klinik değerlendirmelerde de değerli bir tamamlayıcı araç olarak kullanılmakta, veteriner hekimlere daha kapsamlı bir tanısal yaklaşım sunmaktadır.

Anahtar Kelimeler: Ultrasonografi, Görüntüleme Yöntemi, Veteriner Oftalmoloji.

Özet

Veteriner oftalmolojide göz ultrasonografisi (USG), oküler ve orbital hastalıkların tespiti için kritik bir tanı aracıdır. Bu sunumda, kedi ve köpeklerde sık karşılaşılan göz içi patolojilerin ultrasonografik değerlendirilmesi, olgu görüntüleri üzerinden ele alınmıştır. Kornea opasiteleri, lens luksasyonu, uveitis, retinal dekolman, glakoma bağlı gelişen değişiklikler, vitreal patolojiler, optik nöritis ve neoplaziler gibi patolojik bulgular, ultrasonografi ile ayrıntılı olarak incelenebilmektedir. Özellikle göz içi yapılarda opasite artışı bulunduğu durumlarda göz içi yapıların oftalmoskop ile değerlendirilmesi zorlaşırken ultrasonografi ile kolaylıkla gözlemlenebilmektedir. Lens luksasyonunda, lensin konumu ve şekli ultrasonografi ile net bir şekilde belirlenebilirken, retina dekolmanında hiperekoik çizgiler ve retinal ayrılmalar ultrasonografik olarak tespit edilebilmektedir. Göz ultrasonografisinin tanısal doğrulukta oynadığı rol ve medikal veya operatif müdahale öncesi hastalık prognozu üzerinde önemli bir etkisi olduğu gözlemlenmiştir. Sonuç olarak, göz ultrasonografisi, göz içi patolojilerin tanısında güvenilir bir görüntüleme yöntemi olmakla birlikte doğru medikal/cerrahi tedavi planlaması için gerekli bilgileri sağlamaktadır. Göz ultrasonografisi ile elde edilen görüntüler üzerinden yapılan değerlendirmeler, veteriner hekimlere göz hastalıklarının tanı ve yönetiminde, klinik değeri ve tanısal güvenilirliği yüksek katkılar sunmaktadır.

Abstract

Electrochemical reduction of CO_2 is an emerging and current issue for its conversion in to valuable product upon minimization of its atmospheric level for contribution of maintaining within the range of permissible limit. Among plenty of electro-catalysts copper-based specifically copper and nickel electrocatalysts are efficient and effective catalysts, which are synthesized and applicable for this research work. The two metal catalysts were prepared in inert and open air environment with different compositions through co-reduction process from their corresponding precursors. The bimetallic nanoparticels are coupled/supported on new composite oxide material i.e. and tetratitanium heptoxide (Ti_4O_7), that able to enhance conductivity, stability, selectivity and activity of the reduction process of CO_2. The catalytic performance of CO_2 reduction without Ti_4O_7 for each composition was performed and resulted an outstanding catalytic activity with generation of high current density and high faradaic efficiency of products with less onset potential i.e less than -0.8V vs. RHE. The catalytic performance, compositions, morphologies, structure and geometric arrangements were evaluated by electrochemical analysis (LSV, impedance, chronoamperometry & tafel plot), EDS, SEM and XAS respectively. The composite metals showed better selectivity of products and faradaic efficiencies due to the synergetic effects of the combined nano-particles in addition to the impact of grain size in reduction of CO_2. Carbon monoxide, hydrogen, formate and ethanol are the reduction products, which are detected and quantifiable by chromatographic techniques considering their physical state of each product.

Abstract

Mathematical modelling of a multi-layer film flows used in many technologies is studied using an approximate long-wave model. It is shown that there is the nonuniqueness of steady-travelling wave regimes exploited in heat and mass transfer technologies. To select the regimes developed in real-life problems, systematic transient computations have been carried out to create a map of the regimes, so-called dominating waves, which can be used to compute heat and mass transfer parameters.
Examples of solutions at real-life values of the similarity parameters are shown.

Özet

İnternet ve teknolojinin gelişimi, kullanıcıların ürün ve hizmetlere dair değerlendirmelerini çevrimiçi ortamda paylaşmalarına olanak tanımış ve bu durum büyük bir bilgi yığını oluşturmuştur. Bu bilgi bolluğu her ne kadar faydalı görünse de, kullanıcıların doğru bilgiye ulaşma sürecini uzatarak zaman kaybına ve memnuniyetsizliğe yol açabilmektedir. Bu sorunun önüne geçmek için geliştirilen öneri sistemleri, kullanıcıların ilgi alanlarına uygun anlamlı tavsiyeler sunarak hem zaman kazandırmakta hem de kaliteli hizmet almalarını sağlamaktadır. Kimi zaman kullanıcılar, bireysel değil, grup hâlinde karar verme durumunda kalabilir. Bu doğrultuda geliştirilen grup öneri sistemleri, ortak özellikler taşıyan kullanıcıların eğilimlerini analiz ederek grup memnuniyetini en üst düzeye çıkaracak tavsiyeler üretmeyi hedefler. Grup önerilerinin kalitesi, kullanıcılar hakkında toplanan detaylı verilerle doğrudan ilişkilidir. Çok ölçütlü grup öneri sistemleri bu noktada devreye girerek, kullanıcıların birden fazla kriterdeki değerlendirmelerini dikkate alıp daha kişiselleştirilmiş öneriler sunar. Grup öneri sistemlerinde her ne kadar oldukça başarılı tavsiyeler üretilsede, bu tavsiyelerde çoğunlukla popüler ürünlerin yer alması kullanıcılar için problem oluşturabilmektedir. Popülerlik yanlılığı olarak bilinen bu problemde, kullanıcıya sıklıkla bilinen ve popüler olan ürünler önerilirken, daha az bilinen popüler olmayan niş ürünler göz ardı edilmektedir. Oysa bu popüler olmayan ürünlerin (uzun kuyruk) önerilmeleri, keşfedilmeleri zor olduğundan işletmeler için oldukça büyük önem taşımaktadır. Dolayısıyla bu çalışmada, çok ölçütlü sistemlerde grup önerisi üzerinden popülerlik yanlılığı problemi ele alınması amaçlanmıştır. Bu sistemde yer alan kullanıcılar ve ürünlerle ilgili eğilimlerinin doğru tespitinin, popülerlik üzerindeki etkisi incelenerek çok ölçütlü öneri sistemlerindeki popülerlik yanlılığı alanında literatürdeki boşluk doldurulacaktır.

Keywords: Çok ölçütlü sistemler, Grup öneri sistemleri, Popülerlik yanlılığı, Uzun kuyruk, Eğilim

Abstract

Accurate classification of diabetes is critical for early clinical intervention and management. In this study, we evaluate the performance of support vector machine (SVM), random forest (RF), and multilayer perceptron (MLP) models on the Pima Indians Diabetes Dataset, comprising 768 patient records with eight clinical features. Data preprocessing included normalization and imputation of missing values. Models were trained using 10-fold cross-validation and hyperparameters optimized via grid search. Synthetic results indicate that the MLP achieved the highest classification accuracy of 86.51%, with a sensitivity of 88.23% and specificity of 85.62%, followed by RF (85.22% accuracy, 87.11% sensitivity, 83.21% specificity) and SVM (83.88% accuracy, 84.92% sensitivity, 82.09% specificity). The area under the ROC curve (AUC) was 0.925 for MLP, 0.883 for RF, and 0.869 for SVM. Feature importance analysis revealed that plasma glucose concentration, body mass index, and age were the most predictive variables. These findings demonstrate the potential of deep learning approaches for reliable diabetes prediction and underscore the need for further validation on larger, diverse cohorts. The proposed framework can be integrated into clinical decision support systems to assist healthcare professionals in risk assessment.

The Biotechnological Importance of Keratin and its Isolation Process from Waste Hair Samples

Özlem BİÇEN ÜNLÜER (*ORCID: https://orcid.org/0000-0002-5524-4593*)

Eskişehir Technical University, Chemistry Department, Eskişehir, Türkiye

e-mail:obicen@eskisehir.edu.tr

Abstract

Keratin, a fibrous protein that can be extracted from human hair, is an inexpensive and readily available resource. Its exceptional properties make it a valuable biomaterial for various applications, especially in the biomedical field. Its mechanical strength, elasticity, and biocompatibility are crucial for tissue engineering applications. The rigidity of keratin is primarily attributed to the proline in its structure, which stabilizes the helical configuration of the protein. Its composition, rich in cysteine amino acids, contributes to forming numerous disulfide bonds and enhances its structural stability. The ability to reduce or break these disulfide bonds offers the potential for keratin immobilization, a key feature for tailoring its properties in tissue engineering. This unique combination of strength, stability, and versatility allows keratin to be effectively utilized in developing scaffolds, hydrogels, and other biomaterials in biotechnological areas [1,2].
Keratin can be extracted from waste human hair which is an inexpensive and readily available resource. Various methodologies and applications highlighting the significance of keratin are used for keratin isolation. When isolating keratin from biological sources such as hair, feathers, or wool, two common methods used are urea extraction and sodium sulfide extraction [3-4]. Each method has its distinct advantages and limitations based on its mechanism, efficiency, and impact on the quality of the extracted keratin.
This study focuses on the comparison of urea and sodium sulfide extraction methods for keratin isolation.

Keywords: Keratin, biological importance, isolation methods.

Abstract

Photocatalysis is considered as simple, green, and the best strategy for elimination of hazardous organic contaminants from wastewater. Herein, new broad spectrum photocatalysts based on pure and Sm-CuO/ZnO/$CuMn_2O_4$ ternary composites were simply prepared by co-precipitation approach. The X-ray diffraction results proved the formation of a composite structure. The transmission electron microscope (TEM) images displayed that most particles have a spherical shape with average mean sizes within 26–29 nm. The optical properties of both samples signified that the addition of Sm ions significantly improves the harvesting of the visible light spectrum of CuO/ZnO/$CuMn_2O_4$ ternary composites. The photocatalytic study confirmed that 97% of norfloxacin and 96% of methyl green pollutants were photo-degraded in the presence of the Sm-CuO/ZnO/$CuMn_2O_4$ catalyst after 50 and 40 min, respectively. The total organic carbon analysis revealed the high mineralization efficiency of the Sm-CuO/ZnO/$CuMn_2O_4$ catalyst to convert the norfloxacin and methyl green to carbon dioxide and water molecules. During three cycles, this catalyst presented a high removal efficiency for norfloxacin and methyl green contaminants. As a dielectric energy storage material, the Sm-CuO/ZnO/$CuMn_2O_4$ ternary composite has large dielectric constant values, mainly at low frequencies, with low dielectric loss compared to a pure CuO/ZnO/$CuMn_2O_4$ composite. he obtained data confirmed that 98% of norfloxacin and 96% of methyl green were removed from contaminated water during 40–60 min for Sm-CuO/ZnO/$CuMn_2O_4$. Furthermore, Sm- CuO/ZnO/$CuMn_2O_4$ ternary composite has shown giant dielectric constant values, mainly at low frequencies, with low dielectric loss compared to a pure CuO/ZnO/$CuMn_2O_4$ composite.

Abstract

In recent years, it has been shown that foods called functional foods can protect against certain types of cancer, cardiovascular diseases and cognitive dysfunction. Studies have shown that flavonoids (apigenin, chrysin, luteolin), a subclass of flavonoids, have antioxidant, anti-inflammatory, anti-allergic, neuroprotective and cardioprotective effects and have been presented as a current treatment method in the treatment of some diseases. A systematic study of various experimental conditions, such as electrode pretreatment, pH, nature of the supporting electrolytes, accumulation variables, and surfactant on the adsorptive stripping response, were examined by using square-wave voltammetry. The electroanalytical method developed using adsorptive stripping voltammetry with a plain GC electrode was analyzed with very good sensitivity and selectivity for Apigenin in pH 2.0 BR buffer solution and anionic surfactant. An oxidation signal at around +1.2 V in Britton-Robinson buffer at pH 2.0 containing 5×10^{-5} mol L^{-1} sodium dodecyl sulfate allowed to the adsorptive stripping voltammetric determination of Apigenin (after 30 s accumulation step at open-circuit condition). The process could be used in the concentration range from 0.5 to 8.0 µg mL^{-1} with a detection limit equal to 0.025 µg mL^{-1}. The relative standard deviation of intraday repeatability was calculated as 2.89%. This shows the sensitivity of the method and its low cost since it does not require expensive apparatus. In addition, the short sample preparation and analysis time and the simplicity of the method make it a suitable alternative for the determination of Apigenin in biological samples.

Abstract

In recent years, as has been observed in many sectors, there has been an increase in the use of natural inhibitors for the protection of metals against corrosion. The primary rationales for this phenomenon pertain to the superior safety of natural inhibitors in comparison to their synthetic counterparts, both in terms of environmental impact and human health. Additionally, natural inhibitors are readily available and possess the attribute of bio-renewability. This study investigates the corrosion inhibitory effect of the extract obtained from Papaver somniferum L. (PS) seed and outer bark on mild steel (MS) in a 1 M HCl medium. The inhibition performance of PS seed and shell extract was evaluated using various electrochemical techniques. In addition, scanning electron microscopy (SEM) and atomic force microscopy (AFM) techniques were used for the surface morphology of MS both with and without inhibitors. The experimental results demonstrated that PS extract, at a concentration of 1000 ppm, provided 96.5% and 98.8% protection after 1 and 120 hours of exposure, respectively. The findings revealed that PS seed and shell extract exhibited mixed inhibitory properties. Surface adsorption analyses showed that the inhibitor molecules fit the Langmuir isotherm model. In addition, thermodynamic parameters related to the adsorption process were calculated and the adsorption free energy (ΔG^{o}_{ads}) value was determined as -24.24 kJ/mol, indicating that the adsorption on the MS surface was both physical and chemical and spontaneous.

Abstract

Common carp is one of the most important and fourth most farmed freshwater species in the world due to their good adaptability to changing environmental conditions, a high reproductive rate, and a differential feeding habit, decent level of protein source to humans. The aim of this study, aquaculture production of common carp (*Cyprinus carpio*) from past to present have been investigated with comparative evaluation in a global level. The data set belonging to 2002-2022 was used in the research. The data shows in 2022, Asia farmed 3.159.801 TLW (tones- live weight) of common carp. with the leading of China with 2.843.157 TLW while Europe has 132.902 TLW, Africa 49.945 TLW, America 1.931 TLW and Oceania has only one country, Papua New Guinea with 350 TLW of production of common carp. After the pandemic, 2020 there is a decrease in a production quantity all around world.
This study will be useful to see the total statistical production quantities of the countries and continents.

Abstract

In recent years, there has been considerable interest in the medicinal properties of many plants. In particular, antioxidants from plants have been reported to play an important role in the prevention of cancer, heart disease and age-related diseases caused by oxidative stress. Salvia officinalis L. is one of the most popular species in the genus Salvia. The health benefits of sage have been known since ancient times. In traditional medicine, the plant is used as an antiseptic and anti-inflammatory, an adjuvant in the treatment of stress, anxiety, paranoia, anxiety and depression. The plant Salvia officinalis was extracted with 70% methanol using classical and ultrasound-assisted extraction methods. The phenolic contents and antioxidant activities of the extracts obtained were compared. The antioxidant potentials of these extracts were characterised by DPPH, FRAP and CUPRAC tests. Phenolic compounds of the extracts were analysed by high performance liquid chromatography. Gallic acid, caffeic acid, protocatechuic acid, vanillic acid, apigenin, kaempferol and quercetin were detected in the extracts. The ultrasonic extraction method had higher phytochemical content and showed higher antioxidant activity compared to the classical extraction method. Conclusions has shown that this plant is worthy of further study for its therapeutic uses.

Abstract

E-commerce has gained significance owing to advancements in internet technologies. Consumers must evaluate extensive information to select appropriate items from millions of accessible products. Recommender systems assist consumers in making educated choices by proposing products, delivering individualized information, summarizing community perspectives, and offering evaluations. These systems employ data mining methodologies to ascertain similarities among extensive datasets, with collaborative filtering (CF) being a prevalent technique utilized by online retailers. CF systems have achieved considerable success; yet, their extensive use has uncovered significant problems. The primary challenges are protecting privacy and being vulnerable to shilling attacks. The present study will address the impact of privacy and shilling attacks on recommender systems, in addition to the measures employed to surmount these challenges. Privacy is essential for CF systems to deter users from submitting inaccurate information or withholding data. In the absence of privacy protections, the collection of high-quality user data becomes challenging, resulting in suboptimal suggestions and erroneous predicts. Furthermore, CF systems are susceptible to profile injection attacks, wherein malicious users or service providers can alter data to artificially increase or decrease popularity. Privacy-preserving methodologies in recommender systems seek to deliver personalized recommendations while protecting users' sensitive information. The random perturbation technique (RPT) is advocated for its simplicity and exceptional precision. The RPT approach randomly perturbs users' private data, preventing CF systems from acquiring knowledge of users' information. However, CF systems continue to generate precise predictions on the perturbed data. Numerous recommendation algorithms that exhibit more resilience against shilling attacks have been presented in the literature, including SVD, clustering techniques, feature reduction, and PCA algorithms. Moreover, techniques such as classification and clustering have been employed to identify shilling attacks. This study presents a general analysis of the methods used to overcome the problems of secrecy and shilling attacks.

EMI Shielding and Life Cycle Assessment

Guler Bengusu TEZEL[a]

[a] Bolu Abant İzzet Baysal University, Faculty of Engineering, Department of Chemical Engineering, Bolu, Turkey

Abstract

As the proliferation of electronic devices across various sectors continues to accelerate, the need for effective electromagnetic interference (EMI) shielding materials has become increasingly critical. In defense, aerospace, automotive, and consumer electronics industries, EMI can significantly compromise the functionality, safety, and reliability of sensitive equipment. Traditionally, metallic materials such as copper and aluminum have been widely used due to their excellent conductivity; however, these materials present significant drawbacks, including high weight, corrosion susceptibility, and environmental impact. In response, lightweight and corrosion-resistant alternatives such as carbon-based composites and polymeric materials have gained attention for their effective shielding performance and versatility in complex applications.

While the functional benefits of advanced EMI shielding materials are well-documented, their broader environmental impacts throughout the product life cycle remain less explored. Life cycle assessment (LCA) provides a systematic framework to evaluate the environmental footprint of these materials from raw material extraction and manufacturing to usage and end-of-life disposal. LCA enables comparison between traditional and emerging shielding materials in terms of energy consumption, greenhouse gas emissions, resource depletion, and potential for recyclability or reuse.

This study provides an integrated analysis of EMI shielding materials through the lens of life cycle assessment, with particular focus on recent developments in carbon-based silicone composites and conductive polymers. By combining performance evaluation with environmental metrics, the paper highlights the trade-offs and synergies between functionality and sustainability. The results emphasize the importance of considering environmental criteria alongside technical performance in the material selection process for EMI shielding. Ultimately, incorporating LCA into material design and selection can guide the development of more sustainable and efficient shielding solutions, contributing to the broader goals of green electronics and responsible manufacturing practices.

Abstract

Coffee is the second most traded commodity in the world after petroleum. According to the International Coffee Organization (ICO), the average global coffee production between 2017 and 2022 was approximately 170 million bags per year (1 bag = 60 kg), resulting in a substantial amount of spent coffee grounds (SCG). Given this vast scale of coffee production and consumption, significant quantities of coffee waste are generated, offering a low-cost and sustainable feedstock for biodiesel production due to its high oil content. The oil content in SCG ranges from 11% to 20% by weight, with an average of around 15%, which is comparable to conventional biodiesel feedstocks such as soybean, rapeseed, and palm oil. Following the oil extraction process, the remaining SCG can be further valorized through hydrochar production.

In this study, both raw and oil-extracted SCG were subjected to hydrothermal carbonization (HTC) to evaluate their potential as coal alternatives and sources for biochemical production. Oil content (13.259 ± 1.303%) was extracted using a n-hexane/isopropyl alcohol mixture (1:1 v/v) for biodiesel applications. Hydrochars were produced from raw and oil-extracted SCG under varying process conditions, including temperatures (180°C, 220°C, and 260°C), residence times (60, 90, and 120 minutes), and biomass-to-water ratios (0.2, 0.6, and 1 w/v). The yields and higher heating values (HHVs) of the resulting hydrochars were determined. The highest HHV, 33.14 MJ/kg, was achieved at 260°C, 90 minutes, and a biomass-to-water ratio of 1 w/v, comparable to that of conventional coal. The chemical functionalities and surface morphologies of the hydrochars were analyzed using Fourier-transform infrared spectroscopy (FT-IR) and scanning electron microscopy (SEM), respectively. A Box–Behnken experimental design was employed to interpret the results and identify optimal operating conditions. Temperature and biomass-to-water ratio were found to be the most significant parameters affecting the HHV of the hydrochars.

Abstract

For orthopedic applications, osseointegration is an important property that needs to be improved for biomedical alloys. For this purpose, novel biomedical alloys as well as new surface treatment methods are being developed. Among these, TiTaHfNbZr alloys; which belong to the class of high entropy alloys with superior mechanical properties are biomedically promising as well. For the novel surface modification methods applied to biomedical alloys, femtosecond laser surface treatment stands out as an effective method for enabling controllable patterns of homogeneous topography, while not causing problems such as melting and phase transformation with their short-term interaction with the material. The motivation of the current study is modifying the surface of the novel TiTaHfNbZr alloy with a femtosecond laser in order to obtain surfaces with different topographic properties and investigate the effect of the obtained surfaces on biocompatibility both at the *ex-situ* and *in vitro* levels. Overall, the aim is to contribute to the development of novel biomedical alloys with improved surface properties for better osseointegration.

A Study on Awareness and Cryptographical Solutions Against Sim Swapping Attack

Ezgi Ersan[1*] (*ORCID: https://orcid.org/0000-0001-9975-7713*), Mehmet Emin Dalkılıç[1] (*ORCID: https://orcid.org/0000-0003-3932-5155*)

Abstract

A SIM swap attack is a cybersecurity threat in which an attacker transfers a victim's phone number to a SIM card under their control. Typically, the attacker first acquires the victim's personal information through phishing or similar methods. Using this data, the attacker impersonates the victim and requests a new SIM card from the telecom operator, which is then activated on the attacker's device. As a result, sensitive data such as banking verification codes becomes accessible to the attacker. Current protection methods developed against SIM swap attack predominantly focus on enhancing the protection of user data and reinforcing the security of telecom operators' SIM replacement procedures. In this study, we propose a cryptographic security solution specifically designed to counter SIM swap attack. The proposed solution is activated in the second factor of the two-factor authentication mechanism. The solution examines the interaction between the secure storage environment of mobile devices and phone-based services, exemplified through the communication process between the Android Keystore System and a banking application. First, a unique RSA public-private key pair is generated in the user's Android Keystore. During banking registration, the public key is sent to and stored by the bank. In the login phase, a number used only once (nonce) generated by the bank is signed using the user's private key stored in the Android Keystore and then sent back to the bank. The bank verifies the signature using the stored public key and grants access only if validation is successful. In a SIM swap scenario, the attacker cannot access the private key stored in the victim's Android Keystore, making it impossible to sign the nonce. Thus, the authentication process fails. This method adds a strong cryptographic layer of security against unauthorized access resulting from SIM swap attack.

e-mail: ysuzen@eskisehir.edu.tr

Abstract

Because of the versatility of these side groups, phosphazenes can be altered to exhibit certain characteristics, making them suitable for a range of uses. Early research on phosphazenes, which were discovered in the 19th century, concentrated on their potential as lubricants and flame retardants. It wasn't until the latter half of the 20th century that significant advancements in their synthesis and characterization were made, which led to a surge in interest in their possible applications in energy storage, biomedicine, and novel materials, among other fields. Phosphazenes are among the most intriguing compounds due to their exceptional thermal and chemical stability, which is a result of the strong P=N bonds in their backbone. Phosphazenes can be made to have a variety of properties, such as hydrophilic to hydrophobic, glassy to elastomeric, and insulating to conducting, due to their stability and adaptability. An essential starting reagent for the synthesis of partially and fully substituted polyphosphazene derivatives is octachlorocyclotetraphosphazene (N4P4Cl8, tetramer). The sequential replacement reactions of N4P4Cl8 with monofunctional nucleophiles, such as primary and secondary acyclic/cyclic amines, methoxides, and phenoxides, were thoroughly investigated and resulted in partially and completely replaced cyclic tetrameric products. However, the spectroscopic and crystallographic properties of tetrameric molecules and their applications in various fields have been extensively studied. $N_4P_4Cl_8$ condensation processes involving asymmetric bifunctional ligands are also quite rare, according to a review of the literature. In this work, cyclomatrix tetrameric polyphosphazenes generated from octopamine are synthesized and characterized. The produced cyclomatrix polyphosphazene nano/microspheres were characterized.utilizing SEM, FT-IR, ^{31}P-NMR and XRD techniques.

Keywords: Tetrameric polyphosphazenes, Octopamine, Cyclomatrix polyphosphazene nano/microsphenes, Spectral techniques

Abstract

In this study, a tractor part was machined using face milling, which is commonly used in the automotive and agricultural machinery industries. The effects of different cutting parameters on surface roughness and cutting zone temperature were thoroughly investigated. In the experiments, two different material types, namely AISI 1040 and forged AISI 1040 steels; two different cutting environments, namely dry and Minimum Quantity Lubrication (MQL); three different cutting speeds (150, 200 and 250 m/min) and three different feeds (0.1, 0.15 and 0.2 mm/tooth) were used. All experiments kept the cutting depth constant at 1 mm, and environmentally friendly natural peanut oil was preferred for the MQL system. The MQL method provided effective cooling and lubrication by injecting a very low amount of oil into the cutting zone. According to the results obtained, it was observed that the surface roughness increased as the feed increased in all experiments. In contrast, the surface roughness decreased as the cutting speed increased in AISI 1040 steel, while an increase in surface roughness was observed in forged AISI 1040 steel when the cutting speed exceeded 200 m/min. While the lowest surface roughness in AISI 1040 steel was measured as 0.13 µm in MQL environment with 250 m/min cutting speed and 0.1 mm/tooth feed, 0.12 µm surface roughness was obtained in forged AISI 1040 steel with 200 m/min cutting speed in the same environment and feed. It was observed that the MQL system effectively reduced the surface roughness compared to the experiments in a dry environment. The temperature analyses recorded increased temperature values as the feed and cutting speeds increased in both environments. Higher temperature values were observed, mainly due to the hard surface of the forged AISI 1040 steel. However, it was determined that the MQL system had a temperature-reducing effect on both materials.

Keywords: AISI 1040, Forged steel, Face milling, MQL, Surface roughness, Cutting zone temperature.

Abstract

The European sprat (*Sprattus sprattus*) is a key pelagic species in the Black Sea ecosystem, holding significant economic and ecological importance. However, information on the environmental factors influencing the distribution of its early life stages (eggs and larvae) remains limited. This study aimed to determine the spatiotemporal distribution of *S. sprattus* eggs and larvae, as well as the environmental parameters influencing this distribution, through monthly sampling conducted in Sinop Bay between October 2023 and June 2024. Sampling was conducted at three stations using a standard plankton net (50 cm mouth diameter, 112 µm mesh size) with vertical hauls. Concurrent measurements of environmental parameters, including temperature, salinity, and dissolved oxygen, were also taken. Sprat eggs and larvae were observed to be present from November to April, with peak abundance recorded in December (at temperature 14.5°C and salinity 18.3 psu). The overall mean abundance throughout the study period was 645 eggs/10m² and 255 larvae/10m², respectively. The analyses revealed no significant differences among stations, whereas differences between months approached critical significance levels (Kruskal-Wallis test, eggs: $\chi^2 = 10.98$, $p = 0.52$; larvae: $\chi^2 = 10.87$, $p = 0.54$). Spearman correlation analysis showed a moderate positive relationship between salinity and sprat eggs and larvae density (respectively, r=0.56, r=0.53, $p<0.05$). This study provides a dataset on the early life stages of Sprat along the southern Black Sea coast. It is also believed to provide a basis for monitoring potential changes in species distribution resulting from climate change.

Keywords: Ichthyoplankton, environmental parameters, Sinop, Black Sea.

Abstract

Due to population growth and the decrease in arable land, it has become inevitable to increase crop production and yields globally by 2050. In order to achieve this goal, it is necessary to develop high-yielding agricultural practices and at the same time to fight poverty and hunger on a global scale. Today, the use of chemical fertilisers continues to be indispensable in meeting the increasing need for food. The increasing use of fertilisers to achieve targeted plant yields has led to the overuse of chemical fertilisers, which is a global economic and environmental problem. The application of nano-fertilizers offers a potential solution to this issue. An important advantage of nano-fertilizers over conventional fertilizers is their nutrient delivery system, which allows the regulation of nutrient availability in crops through a controlled release mechanism. This is made possible by the small size effect, large specific surface area, and unique adsorption properties of nanomaterials, which facilitate the slow release of nutrients. Calcium (Ca) is an essential plant nutrient that plays a structural role in cell walls and membranes and regulates growth and development. In the present study, CaO and nano-sized synthesized CaO-NP were applied to broad bean plants grown under soilless and soil conditions, both from soil and media and from leaves. The total Ca content in old and young leaves and grains of broad bean plants was determined, and the effects of CaO and CaO-NP on Ca transport in both growing conditions were investigated. According to the results obtained, it was determined that fresh and dry weights and total Ca concentrations of different parts of broad bean plants increased in both conditions.

Abstract

The citrus mealybug, *Planococcus citri* (Hemiptera: Pseudococcidae), is a significant pest in agricultural systems due to its sap-sucking behavior and its role in promoting sooty mold growth. Rising resistance to chemical insecticides and increasing environmental concerns have driven interest in biological alternatives such as entomopathogenic nematodes (EPNs). This study investigated the efficacy of two locally isolated EPN species, *Heterorhabditis bacteriophora* and *Steinernema glaseri*, against adult female *P. citri* under controlled laboratory conditions.

Bioassays were performed using 24-well plates filled with sterilized sand. Adult female *P. citri* were introduced into each well, followed by the application of 100 infective juveniles (IJs) of either *H. bacteriophora* or *S. glaseri*, suspended in 100 µL of distilled water. Control wells received the same volume of distilled water without nematodes to maintain consistent moisture levels. All plates were incubated at 25 °C to support nematode activity and host susceptibility.

The results showed that *H. bacteriophora* caused 75% mortality of the mealybugs, while *S. glaseri* achieved 67% mortality. No mortality was recorded in the control wells, confirming the nematodes' pathogenicity. These findings highlight the potential of locally isolated EPNs as effective biocontrol agents against female *P. citri*.

This study supports the use of indigenous EPN isolates as part of integrated pest management (IPM) strategies targeting *P. citri*. Further investigations in field conditions are recommended to evaluate their practical application and long-term effectiveness in agricultural settings.

Abstract

Colorectal cancer remains one of the leading causes of cancer-related morbidity and mortality worldwide, and a better understanding of the molecular responses to pathogen-associated stimuli may contribute to improved therapeutic approaches. This study aims to evaluate the effects of lipopolysaccharide (LPS) and SARS-CoV-2 spike protein on the expression of key RAS-related genes (ACE2, EGFR and IGF2R) in colon cancer cells (COLO205) and healthy colon epithelial cells (CRL-1831). Both cell lines were treated with LPS and spike protein for 12, 48, and 72 hours. Gene expression levels were evaluated using qPCR method and significant time and cell type–dependent differences were observed. Results showed that ACE2 expression decreased in the cancer cell group at 12 hours following both treatments, whereas an increase was observed in the healthy cell group under the same conditions. EGFR expression was reduced in the healthy cells at 72 hours after both LPS and spike treatments, while a significant increase was detected in the cancer cells at the same time point. IGF2R expression was upregulated in the cancer group at 12 hours for both treatments compared to the control. At 48 hours, spike protein treatment led to increased IGF2R expression in healthy cells, while causing a significant decrease in the cancer cells. These findings suggest that LPS and spike protein elicit differential gene expression responses depending on the cell type and duration of exposure. The results emphasize the importance of cellular context in understanding pathogen-related signaling alterations and highlight the need for tailored therapeutic approaches in infection-associated conditions, particularly in cancer biology.

Abstract

Antibacterial materials are designed to inhibit or kill bacterial growth, making them essential in various applications where hygiene and infection control are crucial such as wound care and medical devices. Carbon dots (CD) are nano-scale materials with unique optical properties, chemical stability, biocompatibility, with ease of synthesis and functionalization. The properties of the carbon dots are dictated by the precursors used in the synthesis. In this study carbon dots were synthesized using antibacterial precursors, curcumin and lysine, via the furnace method. Structural and optical properties of the CDs were determined. The synthesized CDs exhibit mild antibacterial activity against common wound pathogens, including Staphylococcus aureus and Escherichia coli. The promising results highlight the potential of antibacterial carbon dots as an effective, safe, and multifunctional therapeutic agent for wound healing. Future work will focus on optimizing the synthesis process and evaluating the biocompatibility and antioxidant activity of these CDs.

Abstract

In this study, the Spark Plasma Sintering (SPS) technique was utilized for the production of tungsten carbide (WC) composites, offering significant advantages over conventional sintering methods, such as shorter processing times, lower sintering temperatures, and improved control over microstructural evolution. The research focused on evaluating the influence of varying cobalt binder contents on the mechanical and tribological properties of WC-based composites sintered at a relatively low temperature. Within the scope of this research, tungsten carbide (WC) samples containing 3 wt.% and 6 wt.% cobalt binder were sintered at a relatively low temperature of 1100 °C using the SPS technique. The mechanical and tribological behaviors of the resulting materials were systematically evaluated. The tribological tests conducted under dry conditions revealed surface morphologies through profilometer profiles, and both the coefficient of friction and wear rates were determined. The study showed that samples with a higher cobalt content exhibited a lower coefficient of friction and more stable wear behavior. This improvement in tribological behavior is attributed to the enhanced toughness and plasticity provided by the increased metallic binder phase, which helps to better accommodate stress and reduce crack propagation during sliding.

Keywords: Tungsten carbide-cobalt; cemented carbide; powder processing; spark plasma sintering; wear.

Abstract

The process of esterification generally refers to the chemical reaction between a carboxylic acid and an alcohol, resulting in the formation of esters along with water as a by-product. Esters are chemical compounds characterized by their distinctive sweet odor. In the chemical structure of esters, represented as R–COOR', R and R' denote organic groups (alkyl and/or aryl groups), while -COO represents the carboxyl group. Esterification reactions proceed very slowly in the absence of a catalyst; therefore, a catalyst is required to accelerate the reaction and shift the equilibrium toward the product side. Esterification reactions play a crucial role in both industrial and biological systems, serving as fundamental processes in the production of pharmaceuticals, polymers, and specialty chemicals. The esterification of polyethylene glycols (PEGs) with chloroacetic acid (CAA) is particularly important due to its applications in biocompatible materials, surfactants, and controlled drug delivery systems. In this study, the esterification reaction of PEGs with different molecular weights (PEG200, PEG300, and PEG400) and chloroacetic acid was investigated using both conventional and microwave (MW) methods. In the conventional method, p-toluenesulfonic acid (p-TSA) was used as a catalyst. To observe the temperature dependence of the esterification reaction between PEGs and CAA, the reactions were conducted at different temperatures. For each temperature, the progress of the reaction was monitored and the conversion was calculated. Structural confirmation of the synthesized products was carried out using Fourier Transform Infrared Spectroscopy (FTIR) and Nuclear Magnetic Resonance (NMR) spectroscopy. The FTIR spectra confirmed that the targeted structural transformations had occurred and that characteristic functional groups (C–Cl, C=O, C–O) had formed. Signals specific to the ester structure were also detected in the ^{1}H-NMR spectra. These findings indicate that the compound was successfully synthesized in the desired structure.

Abstract

In this study, the microstructure and hardness properties of hot rolled commercial 16MnCr5 steel were investigated after normalization and austenitization processes and subsequent hot forming processes. First, the steel was subjected to normalization process at 1000°C for 40 minutes to ensure homogeneous distribution of ferritic-pearlitic microstructure along the rolling direction. Then, austenitization was performed at 950°C for 10 minutes in accordance with the TTT diagram and the material was shaped under varying die pressures (25 kN, 50 kN, 75 kN, 100 kN) and then controlled cooling was performed. The cooling rate was aimed to be sufficient to promote martensitic transformation. Hardness measurements were performed using the Zwick/Roell ZHV 10 device by taking five measurements for 15 seconds under a load of 5 kgf for each sample and the average values were calculated. Although an increase in the cooling rate was observed, the expected linear increase in hardness values was not obtained. This was attributed to the fact that the austenitizing temperature of 950°C was insufficient for complete austenite formation, as evidenced by the presence of a small amount of ferrite phase in the microstructure. Microstructure analyses revealed similarities with dual phase (DP) steels with high martensite content. It was concluded that the austenitizing temperature should be increased to 1000°C or higher to obtain a fully martensitic structure and higher hardness values.

Özet

Antimikrobiyal direnç, özellikle çoklu ilaç direnci, antimikrobiyallerin aşırı kullanımı ve dirençli mikroorganizmaların artışı nedeniyle giderek daha ciddi bir halk sağlığı sorunu haline gelmiştir ve mevcut antibiyotiklere alternatif olarak yeni kemoterapötik ajanlara duyulan ihtiyaç da her geçen gün artmaktadır. Son yıllarda bu alanda amino asit türevleri ile ilgili yapılan çalışmalar dikkat çekicidir. Bu nedenle bu çalışmada, L-Alanin, L-İzolösin, ve L-Valin Metil Esterlerinin *Bacillus subtilis* ATCC 6633, *Candida albicans* ATCC 10231, *Escherichia coli* ATCC 35218, *Klebsiella pneumoniae* MTCC 109, *Pseudomonas aeruginosa* ATCC 27853 ve *Staphylococcus aureus* ATCC 25923 suşlarına karşı antimikrobiyal etkilerinin araştırılması amaçlanmıştır. Test edilen esterlerin Minimum İnhibisyon Konsantrasyonu (MİK) ve Minimum Mikrobisidal Konsantrasyonu (MMK) değerleri Sıvı Dilüsyon Yöntemi ile, inhibisyon zon çapları (ZOI) ise Disk Difüzyon (DD) Yöntemi ile belirlendi. Çalışmamızın sonuçlarına göre, L-Alanin Metil Ester, *B. subtilis* ATCC 6633 (MİK: 50 mg/mL), *S. aureus* ATCC 25923 (MİK: 100 mg/mL) ve *K. pneumoniae* MTCC 109 (MİK: 100 mg/mL) suşlarına karşı en etkili antimikrobiyal madde olarak belirlendi. Ayrıca, L-İzolösin Metil Ester'in *E. coli* ATCC 35218 (MİK: 100 mg/mL; ZOI: 9.3 ± 0.6 mm) ve *K. pneumoniae* MTCC 109 (MİK: 200 mg/mL; ZOI: 7.7 ± 0.6 mm) suşlarına karşı da antimikrobiyal aktivite gösterdiği tespit edildi. Bunun yanı sıra, L-Alanin Metil Ester ve L-İzolösin Metil Esterin düşük düzeyde de olsa *C. albicans* ATCC 10231 suşuna karşı antifungal aktivite sergilediği gözlenirken, *P. aeruginosa* ATCC 27853 suşuna karşı test edilen tüm metil esterlerin benzer antimikrobiyal etki gösterdikleri saptandı (MİK: 200 mg/mL). Elde edilen bulgular, L-Alanin Metil Ester ve L-İzolösin Metil Ester'in, çalışmamızda test edilen tüm mikroorganizmalara karşı antimikrobiyal potansiyele sahip olduğunu göstermektedir.

Anahtar Kelimeler: Antimikrobiyal Direnç, Antimikrobiyal Etki, Amino Asit Alkil Ester, Minimum İnhibisyon Konsantrasyonu (MİK), İnhibisyon Zonu Çapı (ZOI)

Abstract

Wound dressing materials are of critical importance for accelerating the wound healing process, reducing infection risks, and improving the quality of recovery. In this study, a UV-curable emulsion hydrogel system was developed, modified with polyvinyl alcohol (PVA) and maleic anhydride (MAH), combined with gelatin, and emulsified with lavender oil. Lavender oil was utilized in this system due to its natural antibacterial properties, aimed at preventing infection and accelerating the healing process. The chemical structure of the resulting hydrogel was analyzed using Fourier Transform Infrared Spectroscopy (FTIR) to investigate the interactions of functional groups. The surface morphology and porosity were examined using Scanning Electron Microscopy (SEM) to assess the structural integrity and biological activity of the system. Antibacterial activity was tested against common wound infection pathogens such as *Staphylococcus aureus* and *Escherichia coli*. FTIR analyses confirmed the successful modification of PVA–MAH and the interaction with gelatin, as well as the effective encapsulation of lavender oil into the system. SEM images revealed that the UV-cured hydrogel possessed a smooth surface structure and adequate porosity. These features suggest that the hydrogel was designed to improve water absorption capacity. Antibacterial tests demonstrated that lavender oil exhibited high activity against both bacterial strains, confirming that the system could significantly reduce infection risk when used as a wound dressing.

Abstract

Over the past fifty years, marine biodiversity has significantly declined due to overfishing, pollution, climate change, and other anthropogenic pressures. In response to these threats, the number of marine protected areas has rapidly increased globally over the past two decades, and these protected areas are now considered effective tools for conserving biodiversity and mitigating human impacts. The IUCN Red List of Threatened Species assesses the conservation status of species based on their population trends, distribution, ecological characteristics, and the threats they face. *Epinephelus marginatus* (dusky grouper) was listed as an endangered species on the IUCN Red List in 1996. However, its fishing has been completely banned along the Turkish coasts since 2016. In our study, we aimed to monitor the endangered *Epinephelus marginatus* in the Karaburun-Ildır Special Environmental Protection Area in the Aegean Sea using various non-destructive methods. The presence, abundance, and size structure of the species were recorded for the first time using baited remote underwater video systems (BRUVs), while underwater visual census (UVC) methods were applied in darker and more complex habitats where BRUVs were less effective. A total of 50 successful BRUV deployments were conducted during the study. In addition, 15 UVC surveys, each lasting 15 minutes at depths between 25 and 35 meters, were performed. Furthermore, to assess the status of the species before and after the 2016 fishing ban, face-to-face interviews were conducted with local stakeholders, including recreational and industrial fishers, spear fishers, and divers. Based on the collected data, it was concluded that the grouper population in the region has increased following the 2016 fishing ban. However, follow-up conversations after the spear fisher surveys suggested that some individuals may still be illegally targeting the species. These findings indicate that human pressure on the species continues within the protected area.

Abstract

The microwave-assisted synthesis method is one of the green chemistry methods, and its importance is increasing daily. It is an environmentally friendly method compared to conventional synthesis methods, where microwave radiation is used as a heat source. It has become a preferred method compared to other methods in terms of using less solvent, significantly shortening the reaction time (from days to minutes), saving energy, increasing the reaction efficiency, and obtaining pure product. It reduces the carbon footprint since it reduces the amount of waste formed at the end of the reaction and creates less toxic products. In this study, to compare conventional and microwave synthesis methods, derivatives previously synthesized by the conventional method were synthesized using the microwave-assisted approach. Based on the active substance flurbiprofen ((±)-2-fluoro-α-methyl-(1,1'-biphenyl)-4-acetic acid), a non-steroidal anti-inflammatory drug, various thioether derivatives previously synthesized by a conventional method were synthesized by the microwave method (Gökoğlan et al., 2023). The impurity controls of the synthesized derivatives were carried out using TLC and melting point analysis, while their structures were confirmed by the FT-IR spectroscopic method. Conventional and microwave-assisted synthesis methods were compared in terms of reaction time and reaction percentage yields. As a result of the study, it was observed that the product was obtained in a much shorter time and with a higher yield using the microwave-assisted synthesis method.

Abstract

The mechanical properties of NASICON-type solid electrolytes, $Li_{1.3}Al_{0.3}Ti_{1.7}(PO_4)_3$ (LATP) and its indium-doped derivative $Li_{1.3}Al_{0.3}In_{0.1}Ti_{1.6}(PO_4)_3$ (LATIP), were systematically investigated via first-principles density functional theory (DFT). Elastic stiffness tensors (C_{ij}) reveal that indium incorporation significantly enhances lattice rigidity. LATP exhibits calculated bulk, shear, and Young's moduli of 95.1 GPa, 68.23 GPa, and 155.43 GPa, respectively, whereas LATIP shows higher values of 127.32 GPa, 83.64 GPa, and 172.83 GPa. The Poisson's ratio increases from 0.26 (LATP) to 0.274 (LATIP), indicating improved ductility. Moreover, Pugh's ratio (B/G) rises from 1.79 to 1.88, surpassing the brittle–ductile threshold (1.75) and confirming enhanced mechanical plasticity. These improvements are critical for resisting lithium dendrite penetration and ensuring stable electrode–electrolyte interfaces. The superior combination of rigidity, ductility, and mechanical robustness makes LATIP a promising candidate for high-performance solid-state lithium batteries.

Abstract

In Turkey, it is commonly prepared and consumed as stuffed mussels or fried dishes mussels. As an alternative to the aforementioned processing methods, a third method was considered, which involved the application of two traditional methods. In the study, it was aimed to use the incense gun, which has recently been adopted by many food groups in the food industry. The marinade was prepared by smoking mussels using cherry and oak wood shavings with an incense gun. A comprehensive examination encompassing sensory, chemical (pH, aromatic compounds), physical (colour, cooking loss, water holding capacity (WHC) and microbiological qualities (total viable count and yeast-mould)) attributes was conducted during the storage period. The mussels as frozen obtained from a local supplier in İzmir, Türkiye, were meticulously thawed, and then divided into three groups. The experimental design entailed the allocation of mussels to one of three groups: a control group, and two groups that were exposed to fumigants, with cherry shavings or oak shavings serving as the fumigants. Subsequent to the smoking process, three groups were subjected to marinating with 14% apple cider vinegar and 14% salt at the previously determined ratios. Subsequent to the maturation process of the mussels being completed, they were placed in sunflower oil with rosemary in jars and stored at 0-4°C.

Abstract

Bio-oil derived from microalgae pyrolysis holds significant potential as a renewable, sustainable, and environmentally friendly energy source. Utilizing pyrolysis technology to convert Spirulina platensis microalgae into energy offers a promising solution to future energy demands. This study investigates the thermodynamics and non-isothermal kinetics of Spirulina platensis within a temperature range of 30 to 600 °C. Thermogravimetric analysis (TGA) was conducted at heating rates of 5, 10, and 20 °C/min to examine the thermal decomposition behavior. The kinetic parameters were evaluated using the model-fitting Coats-Redfern method. The thermal degradation process revealed three main stages: dehydration, active pyrolysis, and passive pyrolysis. The activation energy (Ea) calculated using the Coats-Redfern method was approximately 55.0 kJ/mol.

Keywords: Microalgae, pyrolysis, TGA kinetics, Coats-Redfern method.

Abstract

Coenzyme Q10 (CoQ10) is a fat-soluble, vitamin-like benzoquinone compound synthesized endogenously from tyrosine. Its potential health benefits have led to a growing consumer demand, making it the third most popular dietary supplement after multivitamins and fish oil [1]. However, the lack of standardized regulations in the production and labelling of dietary supplements raises concerns regarding product quality [2]. Since official market controls are infrequent, particularly for non-vitamin supplements, consumers are unable to verify the actual CoQ10 content, thereby increasing the risk of misleading practices. This study aimed to assess the accuracy of CoQ10 content labelling in dietary supplements available in the Turkish market. Ten CoQ10-containing supplements, in the form of soft gels, tablets, or sachets, were purchased from various sales channels, including pharmacies and non-pharmacy markets. The CoQ10 content was analysed using High-Performance Thin-Layer Chromatography (HPTLC) to determine compliance with the declared amounts. Results showed that within the generally accepted 90%-110% label compliance range, only 50% (5/10) of the samples met the label claims. One sample (10%) contained less CoQ10 than declared, while four (40%) exceeded the stated content. These findings indicate significant deviations in half of the analysed supplements, which could impact efficacy and safety. Given that CoQ10's bioavailability depends on formulation and individual metabolism, deviations from the recommended dose may result in pharmacokinetic inconsistency and unexpected physiological effects. In conclusion, stricter quality control measures as well as regulatory oversight are necessary to ensure dietary supplements meet label claims. Regular inspections and standardized international guidelines should be implemented to enhance consumer safety and minimize inconsistencies in supplement content.

Abstract

Merge algorithms are so widely used today that they are incorporated even into standard programming libraries. The problem of merging two distinct sorted arrays, comprising a total of N elements, is conventionally addressed by allocating an auxiliary buffer of size N – an approach employed in the Merge Sort algorithm. However, this additional memory requirement constitutes a significant drawback compared to in-place merging algorithms that perform the merge without extra storage.
Since Kronrod's seminal work in 1969 (Kronrod, 1969), computer scientists have devoted over fifty years to devising an efficient merge method that obviates auxiliary space (Pardo, 1977; Dvorak & Durian, 1987; Huang & Langston, 1988; Symvonis, 1995; Ellis & Markov, 2000; Kim & Kutzner, 2004; Dalkilic et al., 2011; Mergen & Moreira, 2017; Salah et al., 2020), yet a fully satisfactory solution remains elusive.
In this study, an alternative perspective on the array-merging problem is proposed. By leveraging the inherent time–memory trade-off—sacrificing a modest amount of extra memory to reduce execution time—a new merging algorithm was designed and implemented. This merge algorithm based on time-space trade-off has been implemented in the C++ programming language and the performance of the algorithm has been tested for different problem lengths (N) created with the rand() function and different additional memory lengths (k). Experimental results demonstrate that as the buffer size increases (constant, log N, $(\log N)^2$, …, N), the algorithm's time complexity correspondingly decreases.
It is concluded that this time–memory trade-off-based merging algorithm is highly practical: allocating a small additional buffer accelerates the merge process, and the algorithm's straightforward implementation ensures its suitability for real-world applications.

Abstract

Microfluidic chips are coin biotechnology research[1]. Microfluidic chip technology offers a promising, low-cost, and easy-to-implement platform for developing efficient seperation methodologies[2]. This study presents a separation method based on two different microfluidic chip designs. As compact microfluidic designs offer advantages in speed, efficiency and cost[3] . Implementation of three inlets with usage of an applied electric current enables a separation based on molecular charge or mobility, allowing for precise and active control during the process. On this current based chip middle inlet introduces plant extract, with other inlets adding reagents. To achive the optimum conditions for seperation different voltages are utilized. The other chip features two inlets and contains a PET membrane placed between two separate channels, enabling passive separation through selective diffusion without the need for external forces. The membrane-based design offers a simple and cost-effective alternative, suited for small-scale laboratory applications. In membrane-based design dilute acid solution—either HCl or phosphoric acid—was introduced into the second inlet. Flow rates of 0.5 µL/min, 1 µL/min, and 2 µL/min were used during testing. To evaluate the method's effectiveness, a plant extract from Viola ignobilis, collected in Iran's West Azerbaijan province used in both design applications. Cyclotides are the target compounds in the plant extract. They are small, highly stable cyclic peptides of interest for their potential biomedical applications[4].

Keywords: microfluid. microfluidic chip. seperation. cyclotide.

Abstract

Iron supplements are important supports used to complete the deficient iron levels in the body and to eliminate problems such as anemia. Iron tablets are one of the most effective solutions for iron lack anemia. Nowadays, it is common to repackage medicines used for both supplementation and medication, which can cause serious problems. Therefore, fast and reliable analytical methods for the detection of these situations are very important. In this study, expired (in 2023) and non-expired (in 2028) commonly used iron tablets obtained from local pharmacies were used. Each capsule contains 567.7 mg of iron (II)-glycinesulfate-complex equivalent to 100 mg Fe^{+2}. The powder samples in the capsule were analyzed using a FTIR-ATR spectrometer. Spectra were obtained in the mid-infrared region (4000-550 cm^{-1}) with 16 scans and a resolution of 4 cm-1. Peak analysis was performed on the raw peak data with Origin Pro 2018 software. After Savitzky-Golay correction, the 2nd order derivative of the data point was calculated. All peaks of the 2nd order derivative curve were found using the Local Maximum method. The Savitzky-Golay technique was used to remove noise and background effects from the spectra. Using the 2nd derivative of the FTIR spectrum, overlapping peaks in the raw spectrum were distinguished. Furthermore, baseline errors were eliminated and peak visibility was improved. In the spectrum, O-H stretching at 3239 cm^{-1}, O=S=O stretching at 1140 cm^{-1}, C=S at 1096 cm^{-1}, C-S at 585 cm^{-1} and S-O stretching peaks at 600-700 cm^{-1}. The band range of 1020-628 cm^{-1} belongs to the Fe-O peak. C-N bending peak at 1300 cm^{-1}, C-H stretching peak at 1490 cm^{-1} and C-H bending peak at 1387 cm^{-1} were also observed. This study showed that derivatized FTIR spectra of expired drugs improved the peaks and can be used in chemometric methods for better discrimination.

Keywords: FTIR-ATR, Savitzky-Golay technique, tablet

Abstract

Ternary PtCuNi alloys have attracted significant attention recently due to their magnetic properties and catalytic performance. The superparamagnetic behaviour of these alloys arises from the random orientation of magnetic moments induced by thermal energy due to the nanosize, which provides notable advantages in magnetic sensitivity and various applications [1]. In particular, PtCuNi nanostructures have been reported to exhibit unique magnetic properties and stability, demonstrating superparamagnetic characteristics that make them promising candidates for a wide range of applications, from magnetic sensors to biomedical uses [2, 3]. In this study, the PtCuNi material was synthesized using the polyol method. The structural and morphological properties were investigated using X-ray diffraction, scanning electron microscopy, and energy dispersive X-ray spectroscopy analyses. The structural and morphological analyses revealed that the PtCuNi material possesses a face-centered cubic crystal structure with spherical morphology, with an 8.89 nm in particle size. We measured the magnetization of $Pt_{17}Cu_{14}Ni_{69}$ nanoparticles (NPs) as a function of temperature and magnetic field. Under a 500 Oe applied magnetic field, the ZFC magnetization of $Pt_{17}Cu_{14}Ni_{69}$ NPs rises with increasing temperature and attains its maximum around 6.4 K. The maximum saturation magnetization of $Pt_{17}Cu_{14}Ni_{69}$ NPs was measured to be 13.21 and 0.48 emu/g at 5 K and 320 K, respectively. The coercivity value was determined as 145.5 Oe, indicating that the magnetic moments exhibit considerable stability at low temperatures. Moreover, since the hysteresis loop did not reach full saturation, it suggests that superparamagnetic behaviour is predominant and the magnetic moments are not fully aligned under the applied magnetic field. These results demonstrate that PtCuNi NPs exhibit pronounced magnetic properties at low temperatures; however, full magnetic saturation could not be achieved, further confirming the dominance of superparamagnetic behaviour in these nanostructures.

Abstract

Zinc ferrite ($ZnFe_2O_4$) is a spinel-structured mixed metal oxide known for its diverse physical and chemical properties, making it a promising material for applications in catalysis, magnetic devices, and energy storage. In this study, $ZnFe_2O_4$ nanoparticles (NPs) were synthesized mixing precursors with citric acid and annealing at 800 °C for 12 h by sol-gel method. The structural properties of the NPs were determined by X-ray diffraction analysis which confirmed the formation of a well-crystallized cubic spinel structure with space group of Fd-3m and lattice parameters of $a=b=c=$ 8.46 Å. Scanning electron microscopy images revealed that the NPs had a relatively uniform morphology with an average particle size of approximately 220 nm. The photocatalytic performance of $ZnFe_2O_4$ NPs was tested through the degradation of methylene blue (MB) under UV light irradiation. The results demonstrated that $ZnFe_2O_4$ NPs was able to degrade nearly 80% of MB within 60 min of UV exposure. This high photocatalytic efficiency is attributed to the material's stable crystal structure, suitable particle size, and effective absorption of UV light, which together enhance the generation and separation of photogenerated charge carriers. These findings suggest that $ZnFe_2O_4$ is a promising photocatalyst for environmental applications, particularly in the degradation of organic dye pollutants in wastewater treatment.

Abstract

Big-scale Sand Smelt, *Atherina boyeri*, is an estuarine resident species, which usually lives lower parts of the rivers, lagoons, and the coastal areas of the seas. The aim of the present study is to reveal the mean abundance, spatial and temporal variation of abundance and reveal some biological parameters (length-frequency distribution, length-weight relationship, otolith-fish size relationship, otolith shape analyses etc.) of the *A.boyeri*, distributed in the coastal waters of the Sea of Marmara. Individuals were obtained with beach seine sampling at 12 various stations from the coastal areas of the Marmara Sea between December 2021 and March 2022. A total of 1728 individual were obtained, and ranged in length between 3.07 and 15.30 cm TL and weighted from 0.05 to 21.15 g. The lowest and the highest mean lengths were calculated in March (6.24 cm TL) and January (7.30 cm TL), respectively. The mean CPUE (Catch per Unit Effort) and CPUA (Catch per Unit Area) were detected as 18 ind./haul and 0.48 ind./300 m^2, respectively. The lowest and the highest CPUE were found in March (11.58 ind./haul) and January (23.75 ind./haul), respectively. The highest abundance was found in Erdek station, with a 28.4% of the total catch and 61.4 ind./haul mean abundance. The lowest and the highest mean lengths were found in Erdek (6.00 cm) and Ayazma (10.89 cm), respectively. The total length-fork length relationship and the length-weight relationship were calculated as FL:0.927*TL+0.0811 (r^2: 0.992) and $W=0.005*TL^{3.054}$ (r^2=0.932), respectively. Otolith length was ranged between 1.010 and 4.198 mm (2.284±0.051 mm) in length. A strong linear relationship was detected between the total length-otolith length, with a given formula: OL=0.0377*TL-0.397 (r^2=0.92). Due to the restricted scientific information related the fish biology of the *A.boyeri* stocks distributed in the Sea of Marmara, the results of the present study may be useful for the researchers and the fisheries management authority of Türkiye.

Özet

Son yıllarda Türkiye'de meydana gelen sel ve taşkın olayları, birçok il ve devlet karayolunda menfez ve köprü yaklaşımlarında çökmelere neden olmuştur. Bu çalışma, karayollarında kullanılan menfezlerin, yağış dönemlerinde gerçekleşen taşkın ve sellerde menfez kesitlerinde karayolu göçme mekanizmalarının araştırılmasını amaçlamaktadır. Karayollarını dış kaynaklı yağış ve toprak kayması gibi doğal afetlerden korumak amacıyla inşa edilen yapılar, 'sanat yapıları' olarak adlandırılmaktadır. Bu yapıların temel amacı, karayolunun işlevselliğine katkıda bulunmak, ekonomik ömrünü uzatmak ve güvenli trafik akışını sağlamaktır. Özellikle, karayolu altyapısında en büyük hasara yol açabilecek zemin suyunun güvenli bir şekilde uzaklaştırılması için sanat yapılarına başvurulmaktadır. Drenaj yapılarının etkin bir şekilde işlevlerini yerine getirebilmesi için, işlevine uygun tipte seçilmeli, teknik açıdan uygun konumda ve yeterli boyutlarda inşa edilmeli ve düzenli aralıklarla bakım işlemleri gerçekleştirilmelidir. Menfezler, karayolu veya demiryolu altyapısında, yağışlarla birlikte oluşan su akışının karayoluna zarar vermeden tahliyesini sağlamak, yol altından kablo, boru vb. malzemelerin geçişini kolaylaştırmak gibi amaçlarla inşa edilen mühendislik yapılarıdır. Kullanım amacına veya bulunduğu yere göre farklı türleri bulunan menfezlerin temel görevi, karayolunun bir tarafından diğer tarafına enine geçişler sağlamaktır. Menfez çeşitleri arasında köprü menfezler, kutu menfezler, kemerli menfezler, tabliyeli menfezler (standart köprüler) ve boru (büz) menfezler yer almaktadır.

Abstract

The global transition toward cleaner energy systems has intensified interest in green hydrogen as a sustainable and low-emission alternative to fossil-based fuels. However, selecting the most appropriate hydrogen production method remains a complex decision-making challenge due to the interplay of technical, economic, environmental, and social factors. This study applies the Analytic Hierarchy Process (AHP), a widely recognized multi-criteria decision-making (MCDM) approach, to systematically evaluate and rank various green hydrogen production technologies. A hierarchical framework was developed incorporating critical criteria such as investment cost, operational efficiency, environmental sustainability, and technological maturity. Expert judgments were used to assign relative weights to each criterion, and competing alternatives were assessed accordingly. The AHP analysis identified RW-Biomass: Bio Photolysis as the most favourable hydrogen production method, achieving the highest overall priority score (0.102), indicating its strong performance across the selected evaluation criteria. These results highlight the method's potential in aligning sustainability goals with practical energy planning and provide valuable insights for decision-makers in shaping future hydrogen strategies. The study confirms the effectiveness of AHP in delivering structured, transparent, and evidence-based assessments in the context of sustainable energy development.

Otomotiv Şartlarına Uygun Uv Dayanımı Sağlayan PBT/PET Harmanlarının Geliştirilmesi

Dilara SÜZER (ORCID NO: 0009-0007-2687-9294)

Technology&Innovation Product Specialist, Epsan Plastik

e-mail: dilara.s@epsan.com

Özet

Polyester reçineleri, diasit ve dialkolün reaksiyonu sonucu suyun uzaklaştırılmasıyla üretilirler. Polyester reçineler, farklı takviyeler ile mekanik özellikleri iyileştirilerek sert, esnek veya dayanıklı hale getirilebilir. Polibutilen tereftalat (PBT) ve Polietilen Tereftalat (PET), polyester ailesinin en yaygın kullanılan üyeleridir. Termoplastik polyesterler, Naylon 6 ve Naylon 66'ya benzer özellikler sergilemekle birlikte, daha düşük su emme kapasitesine ve daha yüksek boyutsal kararlılığa sahiptir. Ancak, ultraviyole (UV) radyasyonun etkisiyle polimer zincirinde parçalanmalar meydana gelebilir. PBT ve PET, geniş fiziksel ve termal özellikleriyle mühendislik plastikleri arasında önemli bir yere sahiptir. Bu polimerlerin UV dayanımlarının artırılması için uygun katkılar ile takviye edilmesi gerekmektedir. Bu çalışma ile PBT/PET kompozitleri için UV dayanımı artırılmış, dış hava koşullarına ve mekanik yüklere karşı daha dirençli yeni bir malzeme geliştirilmesi hedeflenmiştir. Uluslararası standartlara uygun test edilen ve onaylanan ürünler, otomotiv sektöründe rekabet avantajı sağlayacaktır. Özellikle UV dayanımı yüksek ve mekanik özellikleri iyileştirilmiş yeni bir mühendislik plastiği sunularak sektörde önemli bir yenilik sağlaması beklenmektedir. Çalışma kapsamında, %30 cam elyaf ile güçlendirilmiş PBT/PET kompozitlerine iki farklı UV katkısı eklenerek üretilmiş ve performansları karşılaştırılmıştır. Ayrıca, Akrilonitril-Stiren-Akrilat (ASA) katkısı farklı oranlarda kullanılarak malzemenin UV dayanımı ve mekanik özellikler üzerindeki etkisi değerlendirilmiştir. Literatür taramaları tamamlandıktan sonra belirlenen, kontrol numunesi haricinde altı farklı formülasyon, tek yönlü çift vidalı ekstrüder kullanılarak üretilmiştir. Elde edilen granüller enjeksiyon kalıplama makinesinde test plakaları haline getirilerek yoğunluk, mekanik ve UV dayanım testleri için örnekler elde edilmiştir. UV testi hizmet alımı yolu ile yapılmıştır. Karakterizasyon testleri sonucunda, ASA katkısının karışımın mekanik özelliklerine olumlu katkı sağladığı tespit edilmiştir. %15 oranda ASA kullanılan ürünün mekanik değerlerinin; %10 kullanım oranına göre yaklaşık %7,5 artığı gözlemlenmiştir. Ayrıca bu ürün UV testlerinden de başarıyla geçmiştir. Hem mekanik özellikler hem de UV dayanım açısından hedeflenen kriterler sağlanmıştır.

Anahtar kelimeler: PBT, PET, ASA, UV, Otomotiv

Abstract

The watermelon (*Citrullus lanatus* (Thunb.) Matsum. & Nakai), a member of the gourd family (Cucurbitaceae), is a widely consumed fruit around the world. It is known for its high-water content and is a prominent food source and notable horticultural crop that is also associated with numerous health benefits. Watermelon cultivation presents significant challenges arising from the presence of both biotic and abiotic stressor factors. In this study, a genome-wide in silico analysis of pathogen-associated 1 (PR1) genes, an important part of the molecular response system activated by biotic stress factors, was performed in the *C. lanatus* genome. The analyses have identified 19 distinct PR1 genes/proteins in the *C. lanatus* genome. The genes in question range in length from 384 to 690 base pairs (bp) and are primarily composed of a single exon. They are located on chromosomes 3, 4, 6, 10, and primarily on chromosome 2, and they regulate the synthesis of ClPR1 proteins, which have a molecular weight ranging from 16 to 215 kilodaltons. These proteins are typically localized in the extracellular space and possess a CAP_PR-1 (IPR001283/IPR034113) domain that confers antibacterial, antifungal, and antiviral properties. ClPR1 proteins are predominantly hydrophilic and comprise a total of 10 conserved motifs, of which 4 are shared among all. The proteins contain a series of special motifs, including CAP1 to CAP4 and CBM, which have been associated with pathogen tolerance. The 3D structures of the proteins were generated based on the homology of the previously characterized *Solanum lycopersicum* 1CFE PR14A protein, and secondary structure analysis was performed. The information obtained on PR1 genes and proteins identified in the watermelon genome has been presented to scientific literature to contribute to the development of disease-resistant varieties.

Keywords: Biotic factors, plant pathogens, tolerance, molecular response.

Abstract

This study aimed to assess the UV-B protective potential of the pollenkitt in pollen grains of *Narcissus tazetta*. For this purpose, pollenkitt isolates were obtained from pollen grains using dH_2O (dH_2O group, control) and ethanol (ethanol group). Additionally, pollen grains were first exposed to UV-B radiation, followed by isolation of pollenkitt using dH_2O (UV-B+dH_2O group) and ethanol (UV-B+ethanol group). Furthermore, pollenkitt isolates obtained through dH_2O and ethanol isolation were subsequently exposed to UV-B radiation (dH_2O+UV-B group and ethanol+UV-B group). DPPH% activity, total phenolic and flavonoid content, and UV-B absorption capacity of all pollenkitt isolates were analyzed. The findings were evaluated using heat-maps, correlation analysis, and PCA biplots. According to our findings, ethanol was more effective than dH_2O in pollenkitt isolation. DPPH% activity decreased, while phenolic and flavonoid contents increased in the ethanol, UV-B+ethanol, and ethanol+UV-B groups compared to the control. However, the UV-B absorption capacity of the isolates decreased in all treatment groups compared to the control. The heat-map ranking of UV-B protective potential from highest to lowest was: UV-B+ethanol, ethanol+UV-B, ethanol, dH_2O, dH_2O+UV-B, UV-B+dH_2O. Correlation analysis showed a positive link between phenolic and flavonoid contents and a negative link with DPPH activity. According to the PCA biplot analysis, UV-B absorbance values contributed the most to the overall variance, whereas total flavonoid and phenolic contents contributed the least. The UV-B+ethanol, ethanol, and ethanol+UV-B groups were linked to phenolic and flavonoid contents, while the UV-B+dH_2O and dH_2O+UV-B groups aligned with DPPH activity, and the dH_2O group with UV-B absorbance. The findings suggest that ethanol-isolated samples exposed to UV-B may indicate a protective role of pollenkitt against UV-B radiation. This work was financially supported by the Marmara University Scientific Research Projects Commission (Project no: FYL-2025-11606).

*Corresponding author e-mail: senaacar.mu@gmail.com

Abstract

The aim of this study was to investigate the antioxidant responses of pollen grains of *Camellia sinensis* under low-temperature stress. For this purpose, pollen grains from the low-temperature stress treatment groups were germinated at 5, 10, and 15 °C, while control group pollen grains were germinated at room temperature in a germination medium containing 8% sucrose for 4 hours. According to the findings, pollen germination rates and pollen tube lengths decreased significantly in response to temperature reduction compared to the control group. The antioxidant response of pollen grains to low-temperature stress was assessed by analysing the total antioxidant activity as well as the activity or levels of enzymatic and non-enzymatic antioxidants. DPPH% activity significantly decreased only after the 5 °C treatment. Conversely, total phenolic and flavonoid contents significantly decreased at all treatment temperatures compared to the control group. Superoxide dismutase activity increased significantly only after the 5 °C treatment, while no significant changes were observed in catalase activity at any temperature. However, ascorbate peroxidase activity showed a significant increase after 5 and 10 °C treatments. Overall, the results indicate that low temperatures disrupt the oxidative stress balance in *Camellia sinensis* pollen grains, exerting a notable inhibitory effect on pollen performance. This work was financially supported by the Marmara University Scientific Research Projects Commission (Project no: FYL-2025-11603).

Keywords: antioxidant response, *Camellia sinensis*, low-temperature stress, pollen

Abstract

The CYP2D6 gene is a key member of the cytochrome P450 enzyme family involved in drug metabolism. Missense single nucleotide polymorphisms (SNPs) in this gene can alter protein function and contribute to interindividual variability in drug response. In this study, selected missense SNPs in the human CYP2D6 gene were analyzed using various in silico prediction tools, including SIFT, PolyPhen-2, PANTHER, FATHMM, and MutPred2. The functional effects of these variants were evaluated and their potential deleterious impact was classified. According to the results, the R296C variant was predicted to be deleterious by all five tools, highlighting it as the most critical variant in this study. Additionally, R245S, R296S, and R245G were identified as potentially harmful by at least three of the prediction tools. These findings indicate that these variants may significantly impair the function of the CYP2D6 protein. In future phases of this study, these variants will be further investigated through protein-protein and gene-gene interaction analyses, as well as three-dimensional structural evaluations using tools such as I-TASSER and HOPE. The results are expected to contribute to a better understanding of genetic variations in drug metabolism and to support the advancement of personalized medicine.

Abstract

The Gannon Geomagnetic Superstorm of May 2024, classified as a G5-level extreme space weather event, caused profound disturbances in Earth's magnetosphere and ionosphere, particularly over the European sector. This study investigates the ionospheric response to the storm by integrating Global Navigation Satellite System (GNSS)-based Total Electron Content (TEC) data from the Centre for Orbit Determination in Europe (CODE), ground-based geomagnetic observations from the IZN observatory in Türkiye, and key interplanetary parameters. The results reveal a clear storm-time evolution: a significant TEC enhancement during the main phase, followed by widespread and persistent TEC depletions during the early recovery phase, reaching up to –35 TECU across mid-latitudes. Geomagnetic field perturbations at IZN, including marked negative deviations in the horizontal component (ΔH), fluctuations in declination (ΔD), and enhancements in the vertical component (ΔZ), coincide temporally with TEC depressions, indicating strong magnetosphere–ionosphere coupling. The simultaneous occurrence of intense interplanetary electric field (IEFy) penetration, southward turning of the interplanetary magnetic field (IMF), and ring current intensification supports the interpretation of enhanced high-latitude energy input as a key driver of mid-latitude ionospheric disturbances. This study highlights the necessity of continuous space weather monitoring to better understand and mitigate extreme ionospheric variability during future storm scenarios.

Abstract

The seismic reflection method has been widely utilized in oil and gas exploration to detect potential hydrocarbon zones due to its capability to provide detailed insights into sedimentary layers. However, in regions where high-velocity rocks overlie low-velocity sediments such as resistive volcanic cover above more conductive zones in overthrust terrains seismic methods face challenges in distinguishing hydrocarbon-bearing areas from other sedimentary units. This difficulty arises from the decrease in seismic velocity at the base of the volcanic layers and the dispersive nature of volcanic rocks. In such cases, the magnetotelluric method can be employed to achieve sufficient investigation depths and to image subsurface structures effectively.

In this study, a synthetic dataset from a station network was used to demonstrate the significance of three-dimensional magnetotellurics in areas covered by high-resistivity rocks, aiming to identify hydrocarbon-bearing zones and typical thrust-related structures. Various representative reservoir models characterized by high-resistivity cover layers overlying lower-resistivity units and incorporating folded and overthrust geometries were constructed to compute synthetic magnetotelluric responses and assess the effectiveness of the method.

The results indicate that the subsurface models derived from inversion accurately reconstructed the initial hydrocarbon trap scenarios, emphasizing that 3D magnetotellurics should be considered prior to seismic surveys in contractional tectonic regimes, particularly in fold-and-thrust belts. However, it is important to acknowledge the limitations of the method in hydrocarbon exploration.

Özet

Diyabetin küresel prevalansının önümüzdeki yıllarda önemli ölçüde artacağı ve bu artışın özellikle ilaç erişiminin kısıtlı olduğu gelişmekte olan ülkelerde önemli bir sosyoekonomik yük oluşturacağı öngörülmektedir. Postprandiyal hiperglisemi, tip 2 diyabet gelişiminde başlıca risk faktörlerinden biridir. Bu nedenle, tip 2 diyabetin yönetiminde en etkili yaklaşımlardan biri, yemek sonrası karbonhidrat emilimini düzenlemek ve glukozun kana geçişini geciktirmektir. Nişasta, diyetle alınan başlıca karbonhidrat kaynağı olduğundan nişasta sindiriminin yavaşlatılması diyabetik bireylerde glisemik kontrolü sağlamada etkili yöntemlerden biridir. Bu bağlamda karbonhidrat sindiriminde görevli olan α-amilaz enziminin inhibisyonu, postprandiyal glukoz düzeylerini azaltarak antidiyabetik diyetlerin geliştirilmesine olanak sağlayabilir. Meyve ve sebzeler ile bunların işlenmesi sonucu oluşan yan ürünler, α-amilaz inhibitör aktivitesi gösteren flavonoidler, fenolik asitler gibi sekonder metabolitler açısından zengindir. Bu çalışmada, Türkiye meyve suyu endüstrisinde yaygın olarak işlenen elma, kayısı ve şeftali posalarının α-amilaz inhibitör aktiviteleri araştırılmıştır. Endüstriyel yan ürünü olan meyve posaları kontrollü koşullarda kurutulup öğütülerek sulu ekstraktları hazırlanmıştır. Ekstraktların a-amilaz inhibitör aktiviteleri nişasta-iyot renk esaslı spektrofotometrik yöntemle belirlenmiştir. A-amilaz inhibisyon oranları sırasıyla elma için %13.52, kayısı için %54.76 ve şeftali için %5.14 olarak tespit edilmiştir. Elde edilen sonuçlar özellikle kayısı posasının a-amilaz enzimi üzerine anlamlı bir inhibitör etkiye sahip olduğu ve antidiyabetik beslenme için iyi bir kaynak olabileceğini gösterdi.

Özet

Enerji üretiminde kullanılan yakıtlardan kaynaklanan karbon, azot ve sülfür emisyonları, çevresel sürdürülebilirlik ve insan sağlığı açısından önemli tehditler oluşturmaktadır. Artan dünya nüfusuna bağlı olarak deniz taşımacılığı da belirgin şekilde artmış; bu durum, gemi kaynaklı emisyonlarda kayda değer bir yükselişe yol açmıştır. Bu bağlamda, Uluslararası Denizcilik Örgütü (IMO) tarafından 2020 yılında yürürlüğe giren düzenlemeler ile Emisyon Kontrol Alanları'nda (ECA) deniz yakıtlarındaki sülfür içeriği %0,1; diğer bölgelerde ise %0,5 ile sınırlandırılmıştır. Ayrıca IMO, 2050 yılına kadar karbon nötr olma hedefi doğrultusunda çevre dostu yakıtların kullanımını teşvik etmektedir. Bu çalışmada, günümüzde yeni inşa edilen gemilerde öne çıkan dört farklı yakıt alternatifinin (sıvılaştırılmış doğal gaz (LNG), metanol, geleneksel yakıt ve scrubber ile donatılmış geleneksel yakıt) tercih edilirliğini etkileyen faktörler belirlenmiştir. Söz konusu alternatifler teknik, maliyet ve sosyal ana başlıkları altında sınıflandırılmış ve bu başlıklar altında yer alan alt kriterler, uzman görüşleri doğrultusunda literatür desteğiyle ortaya konmuştur. Çalışma, henüz değerlendirme aşamasına geçilmemiş bir ön araştırma niteliğindedir. Devam eden süreçte, belirlenen bu kriterler doğrultusunda çok kriterli karar verme (ÇKKV) yöntemleri olan Analitik Hiyerarşi Süreci (AHP), Ağırlıklı Toplam Ürün Değerlendirmesi (WASPAS) ve Gri İlişkisel Analiz (GRA) gibi yöntemler ile alternatiflerin karşılaştırmalı analizlerinin gerçekleştirilmesi planlanmaktadır. Bu kapsamda elde edilecek bulguların, denizcilik sektöründe sürdürülebilir ve dengeli yakıt tercihi yapmak isteyen karar vericilere yol göstermesi hedeflenmektedir.

Abstract

Kefir has been gaining increasing global attention both as a traditional food and a functional food due to its probiotic nature. In response to growing consumer demand, optimizing both the nutritional value and sensory quality of kefir has become a significant area of research. This study aimed to evaluate the effects of fat content and fermentation time on the quality of kefir. For this purpose, kefir was produced using low-fat (0.1%) and full-fat (3.1%) UHT milk, and subjected to two different incubation times: 20 and 26 hours. The resulting kefir samples were analyzed in terms of pH, water-holding capacity (WHC), viscosity, and sensory attributes. According to the results, after 20 hours of fermentation, both full-fat and low-fat kefir exhibited similar pH values. However, at 26 hours, pH levels decreased in both, with a more pronounced drop in the low-fat sample. WHC followed the descending order: full-fat (26 h), full-fat (20 h), low-fat (26 h), and low-fat (20 h) kefir, with respective values of 58%, 50%, 32%, and 28%. Viscosity was notably higher in full-fat samples, whereas the lowest viscosity was recorded in the low-fat kefir fermented for 20 hours. Sensory evaluation revealed that full-fat kefirs were perceived as less sour, and the sourest sample was identified as the low-fat kefir fermented for 26 hours. The most preferred sample in terms of taste and overall acceptability was the full-fat kefir fermented for 26 hours, while the least favored was the low-fat kefir with the same fermentation time. These findings indicated that both fat content and fermentation time are critical parameters affecting the physicochemical properties and consumer acceptance of kefir.

Abstract

Hyaluronic acid (HA) is a natural polysaccharide widely used in medicine, cosmetics, and tissue engineering due to its biocompatibility and biodegradability. However, it faces performance and industrial applicability limitations when isolated from biological sources due to impurities such as proteins, lipids, and nucleic acids. This study aims to achieve high-purity HA production from a low-cost animal waste source, rooster combs, while analyzing the process's sustainability of the process and structural properties of polymer [1,2]. Rooster comb tissues were processed using an optimized protocol that involved mechanical separation, sequential alcohol precipitation, ultracentrifugation, and dialysis, leading to the isolation of pure HA. UV-VIS spectroscopy confirmed the effective removal of impurities, as shown by a notable increase characteristic absorption peaks of HA at 200-220 nm after purification. Gel Permeation Chromatography (GPC) analysis revealed a homogeneous molecular weight distribution and a high molar mass for HA, while FTIR spectroscopy confirmed the preservation of its core functional groups (carboxylate, acetamide). This study demonstrates that rooster comb waste can be a sustainable resource for industrial-scale HA production, offering a 35% cost advantage compared to conventional methods. The obtained high-purity HA can be accepted as suitable for critical applications such as cosmetic formulations, viscosupplementation eye drops, and intra-articular injections [3-5]. These findings suggest the biotechnological valorization of animal waste, which would contribute to a circular economy for a green world and a viable economic model.

Keywords: Hyaluronic acid, rooster comb waste, sustainable production.

Abstract

Myomimus roachi, or Roach's mouse-tailed dormouse, is a small rodent in the family Gliridae, found only in Bulgaria, Greece, and Türkiye. It inhabits scrubland and semi-open environments such as orchards and riverbanks. Due to its limited range and habitat degradation, it is classified as Vulnerable (VU) by the IUCN. Genetic characterization is vital for understanding evolutionary history of the species and supporting conservation efforts. The Cytochrome c Oxidase Subunit I gene (*COI*), known as the DNA barcode, is widely used for reliable species identification in such studies. In this context, the current study analyzed the *COI* gene sequences of eight *M. roachi* samples from Edirne and Çanakkale in Türkiye to assess genetic variation and support conservation strategies for the first time. Multiple sequence alignment of the 563 bp long partial sequence of the *COI* gene revealed 508 monomorphic and 55 polymorphic sites, including 3 parsimony-informative sites. The estimated average transition/transversion ratio was 1.40. Nucleotide frequencies were as follows: A = 25.22%, T/U = 31.82%, C = 26.98%, and G = 15.99%. Analysis of partial gene sequences from the eight samples revealed a total of five haplotypes, which clustered into two distinct genetic groups: three from Edirne and two from Çanakkale. The haplotype diversity (Hd) observed in all samples of *M. roachi* was 0.857 ± 0.108, while the nucleotide diversity (π) was 0.02582 ± 0.01608. In the Edirne population of *M. roachi*, Hd was 0.700 ± 0.218 and π was 0.03837 ± 0.02177. On the other hand, in the Çanakkale population, Hd was 0.667 ± 0.314, and π was 0.00118 ± 0.00056. Both populations exhibited moderate haplotype diversity may indicate that the populations have retained genetic diversity from the past or are recovering from a historical reduction in size. The higher standard error observed in the Çanakkale population may be due to the small sample size or an uneven distribution of haplotypes. Based on nucleotide diversity, the greater genetic variation observed in the Edirne population may suggest a larger effective population size, an older evolutionary history, or a less recent bottleneck. On the other hand, the Çanakkale population, with low nucleotide diversity, may have experienced a recent founder effect, bottleneck, or lower mutation rate, and could be more genetically homogenous. The multimodal mismatch distribution observed in *M. roachi* suggested the presence of population structure or long-term demographic stability, rather than a recent population expansion. The relatively low Raggedness statistic (r = 0.1735) indicated a moderately smooth mismatch distribution, which may also reflect moderate genetic structuring or a recovery following a historical bottleneck. Based on the Kimura 2-parameter model, the genetic distance between the Edirne and Çanakkale was approximately 2.36%. The fixation index (FST: 0.11640), a measure of population differentiation due to genetic structure, revealed also moderate genetic differentiation ($0.05 < FST < 0.15$) between the Edirne and Çanakkale populations. These findings highlighted the presence of genetic structure between two populations of *M. roachi* and emphasized the importance of regional conservation strategies to preserve the species' genetic diversity and evolutionary potential. Overall, the genetic differentiation and diversity observed between the Edirne and Çanakkale populations provided valuable insights into the evolutionary dynamics of *M. roachi* and underscored the need for further studies with larger sample sizes to better inform conservation efforts. Also, this study represented a pioneering effort in evaluating the genetic structure of *M. roachi* populations in Türkiye at the molecular level for the first time.

Abstract

Bees are the most important pollinators of native and cultivated plants. An estimated one-third of the human diet consists of fruits, vegetables, and nuts that depend primarily on bee pollination. Approximately 73% of cultivated plants in the world are pollinated by bees. Bees pollinate not only cultivated plants but also wild plants in nature, enabling these plants to multiply and spread, wildlife to develop, and diversity in plants and animals to increase. There are approximately 20,000 identified species of bees in the world. While some groups, such as honey bees and bumblebees, have been well studied, studies on the remaining wild bee species, which constitute the vast majority, are insufficient. Although the number of bee species recorded in Turkiye is 1495, this number is estimated to be around 2000.
In spite of the fact that Turkiye is a country with a rich diversity of plants and pollinators, there are limited studies on wild bee diversity. The aim of this study is to determine the diversity of wild bees in the Aegean Region of Turkiye. Within the scope of the research, a total of 444 wild bee specimens were collected from Afyonkarahisar, Aydin, Balikesir, Izmir, Kutahya and Manisa provinces in 2023 and 2024, when climatic conditions were suitable. The collected specimens are kept in the Turkish Wild Bee Museum established within Aydin Adnan Menderes University. According to morphological diagnosis, wild bee samples belonging to the families Andrenidae, Apidae, Colletidae, Halictidae and Megachilidae were identified. After morphological identification, one to two legs of the pinned bee specimens were preserved in absolute ethanol for future molecular identification. Mitochondrial DNA cytochrome oxidase I (COXI) gene will be used for molecular identification of the species.

Determination of the role of fullerenol and green-synthesized iron nanoparticles in enhancing drought tolerance in safflower plants through photochemical mechanisms

Şeküre ÇULHA ERDAL

Hacettepe University, Faculty of Science, Department of Biology, 06800, Ankara, Turkey

e-mail: sekureculha85@hacettepe.edu.tr

Abstract

In recent years, nanoparticle applications in sustainable agriculture have been explored as a strategy to mitigate the impact of drought on the yield and growth of agricultural plants. This study aims to evaluate the potential of organic-based iron nanoparticles (FeNP) and/or fullerenol in mitigating the effects of drought on safflower plants by analyzing their impact on the photosynthetic pathway, a key determinant of plant productivity. Safflower cultivar (*Carthamus tinctorius* L., Olas) was grown in controlled growth room for 18 days and then plants were initially treated with fullerenol via foliar application (10 mg/L) and FeNP via soil application (60 mg/L), and were subsequently exposed to drought induced by PEG for 7 days (Application groups: Control, Drought, Fullenerol, FeNP, Fullenerol+FeNP, Fullenerol+Drought, FeNP+Drought; Fullenerol+FeNP+Drought). Analysis of the fluorescence transient (OJIP) curve (Kautsky curve) in safflower leaves revealed that, while a typical OJIP polyphasic rise was observed, there were variations compared to the control in drought and nanoparticle treatments. There was a significant reduction in the J-I-P phases, which indicates the electron transfer from Q_A to PSI, under the drought treatment, but nanoparticle applications attenuated this effect. Besides, drought caused significant decrease in the photosynthetic performance indexes (PIs—PI_{ABS} and PI_{TOT}) and their partial components [RC/ABS, $\varphi P_0/(1-\varphi P_0)$, $\psi_0/(1-\psi_0)$ and $\delta R_0/(1-\delta R_0)$] of safflower cultivar. However, the applications of FeNP and fullerenol anf their combination maintained the performance indexes at significantly higher levels in drought-stressed plants. Comparable results were also observed in quantum yields and energy flux per reaction center. The findings indicate that the adverse effects of drought on photosynthesis can be effectively mitigated through the combined application of fullerenol and Fe nanoparticles.

Abstract

Underground and surface water resources are increasingly threatened by various chemical pollutants, including salts, dyes, production wastes, pesticides, heavy metals, and pharmaceuticals originating from industrial and commercial usage. It has become inevitable to deal with water contamination at the source of the problem or before use. Accordingly, effective decontamination methods are essential to ensure the safety of consumable water. Among the available techniques, adsorption is the most preferred technique due to its cost-effectiveness, low energy requirement, high removal efficiency, and operational simplicity. In the present study, the adsorption-based removal of 2-(4-isobutylphenyl)propanoate (ibuprofen), which is an active pharmaceutical ingredient, from aqueous solution was examined by using activated carbon fiber (ACF) as the adsorbent. Excellent adsorption efficiency (95%) was achieved for ibuprofen. Adsorption kinetic was evaluated by applying experimental data to pseudo-first order and pseudo-second order kinetic models and the experimental data were fitted to pseudo-second-order kinetic model. Furthermore, adsorption isotherms were obtained at 25 °C through batch experiments and evaluated using both Langmuir and Freundlich isotherm models. The experimental data was well-fitted to Langmuir isotherm model that means homogenous and monolayer coverage was occurred. Gibbs free energy was found to be negative (–13.68 kJ mol^{-1}) that indicated a spontaneous and thermodynamically favorable adsorption process.

Thermodynamic analysis of internal heat recovery between the condenser and evaporator outlets in an air-source heat pump

Kutbay Sezen[1*] (*ORCID: https://orcid.org/0000-0003-1018-5793*)

[*1]Alanya Alaaddin Keykubat University, ALTSO Vocational School of Higher Education, Air Conditioning and Refrigeration Technology, Antalya, Türkiye.

Abstract

Enhancing the efficiency and reliability of vapor compression refrigeration systems remains a key goal in the development of sustainable HVAC technologies. One method being explored is internal heat recovery, which modifies the refrigerant's thermal conditions and may impact the system's overall performance. This study investigates the impact of internal heat recovery between the condenser outlet and evaporator outlet in an air-source heat pump system using R32 refrigerant. A numerical model was developed to evaluate the effect of varying levels of internal heat exchange on thermodynamic performance, assuming constant isentropic and adiabatic efficiencies for the compressor. Simulations were conducted in both cooling and heating modes, and variations in subcooling, superheating, compressor work, and coefficient of performance (COP) were analysed. The results indicate that as the amount of internal heat recovery increases, superheating rises more significantly than subcooling—nearly twice as much. In heating mode, subcooling increases from 5 °C to 11.4 °C and superheat from 5 °C to 17.1 °C, while COP decreases from 3.19 to 3.09 as the recovered heat increases from 0 to 300 W. In cooling mode, with 300 W of internal heat recovery, subcooling rises from 5 °C to 9.5 °C and superheat from 5 °C to 13.2 °C, while COP drops from 2.64 to 2.52. These findings show that internal heat recovery does not enhance thermodynamic performance; rather, it leads to a slight performance drop under constant-efficiency assumptions. The model does not account for potential improvements in isentropic or adiabatic efficiency that may result from increased superheat. Despite the minor decrease in calculated performance, internal heat recovery may offer practical benefits such as improving vapor quality at the compressor inlet, increasing system reliability, and potentially enhancing isentropic efficiency under real-world operating conditions. Future work may extend this analysis by incorporating experimental measurements of how isentropic and adiabatic efficiencies vary with refrigerant superheat, potentially revealing performance benefits not captured under the current assumptions.

Keywords: Internal heat recovery, air-source heat pump, thermodynamic performance, superheating, subcooling

Abstract

Ammonia is gaining attention as a renewable energy carrier due to its high hydrogen content, ease of storage, and carbon-free combustion. However, the vast majority of global ammonia production still relies on the Haber–Bosch process, an energy-intensive method that operates under high temperature and pressure and is responsible for significant carbon dioxide emissions, thereby raising environmental and sustainability concerns. Electrochemical ammonia synthesis has emerged as a sustainable alternative to the energy-intensive Haber–Bosch process, offering potential for ammonia production under ambient conditions. However, the low Faradaic efficiencies of current electrochemical methods remain a major challenge. Transition metal dichalcogenides (TMDs) are a class of layered materials known for their unique electronic, optical, and mechanical properties, which can be finely tuned by changing their composition or structure. Among TMDs, tungsten disulfide (WS_2) stands out due to its excellent chemical stability, layered crystal structure, and favorable electronic properties. Its exposed edge sites and strong adsorption capability for nitrogen-containing species make it a particularly attractive electrocatalyst for ammonia synthesis. Nanostructured materials often exhibit enhanced electrocatalytic performance compared to their bulk or microscale counterparts due to their higher surface area, increased density of active sites, and shortened ion/electron diffusion paths. In contrast, microscale structures may suffer from limited surface reactivity and slower charge transport, which can reduce their overall catalytic efficiency in electrochemical reactions. In this study, bulk (micro) and nanoscale WS_2 structures were investigated as electrocatalysts for electrochemical ammonia synthesis. The structural and morphological properties of the commercial WS_2 samples were characterized by EDX and TEM, respectively. Electrochemical tests and Indophenol blue method revealed that the nanoscale WS_2 achieved an ammonia production amount of 0.101 $\mu g\ h^{-1}\ mg^{-1}$, outperforming its microscale WS_2 (0.089 $\mu g\ h^{-1}\ mg^{-1}$), highlighting the significant impact of morphology and particle size on catalytic performance.

Keywords: Ammonia, Electrocatalyst, TMD, WS_2

Abstract

Nowadays, energy consumption is steadily increasing, and most of the demand is met through fossil fuels. However, their limited availability and high carbon emissions make them environmentally and economically unsustainable. Therefore, the use of renewable energy sources is becoming increasingly important. Ammonia (NH_3) is a key chemical with high energy density. Currently, a large portion of global NH_3 production depends on energy-intensive and costly processes such as the Haber-Bosch method. Producing NH_3 *via* electrochemical nitrogen reduction using hydrogen from water electrolysis powered by renewable electricity is considered a greener alternative. A major challenge in electrochemical nitrogen reduction (NRR) is the high dissociation energy (911 kJ mol^{-1}) of the nitrogen triple bond, along with the competing hydrogen evolution reaction (HER). Thus, the efficiency of NRR strongly depends on the selectivity, structure, composition, and surface morphology of the electrocatalyst. The reliance on Pt like expensive and noble metals in conventional catalysts limits widespread application, driving the search for cost-effective and efficient alternatives. Recently, molybdenum disulfide (MoS_2) has received attention for its catalytic activity in hydrodesulfurization, HER, and CO_2 reduction. Moreover, considering the critical roles of Mo and S elements in nitrogenase enzymes involved in biological nitrogen fixation, MoS_2 has been proposed as a potential NRR-active material. However, the limited active surface area of microscale MoS_2 restricts its practical use in energy applications. In this study, the effect of different particle sizes (micro and nano) of MoS_2, a member of the transition metal dichalcogenides, on electrochemical NRR performance was investigated. Ammonia production by the catalysts was evaluated electrochemically via linear sweep voltammetry (LSV) under nitrogen and argon atmospheres. Additionally, the amount of NH_3 formed was quantified spectroscopically using indophenol blue assays based on a standard calibration curve.

ÖZET

Karpal tünel sendromu, nervus medianus'un ligamentum transversum carpale'nin baskısıyla osteofibröz kanalda sıkışması sonucu gelişen bir tuzak nöropatidir. Bu sendrom, sinirin dağılım gösterdiği bölgelerde el ve el bileğinde uyuşma, karıncalanma ve ağrı ile karakterizedir. İlerlemiş vakalarda güçsüzlük ve elin thenar bölgesinde atrofiye yol açmaktadır. Karpal tünel sendromu olan bireyler günlük yaşam aktivitelerinde kısıtlanırken, el ve el bileğine ek olarak omuz ve boyun ağrısından da şikâyet etmektedir. Karpal tünel sendromuna sahip bireylerin birçoğunda servikal lordoz, disk hernisi gibi boyun problemleri beraber seyretmektedir. Çalışmamızda boyun eklem hareketleri ve boyun pozisyon hissi ayrı ayrı değerlendirilmiş ve sağlıklı bireylerle karşılaştırılmıştır. Değerlendirme sonucunda, sağ tarafı etkilenmiş bireylerde sağ boyun rotasyonunda, sol tarafı etkilenmiş bireylerde ise sol boyun rotasyonunda anlamlı farklılıklar gözlemlenmiştir. Boyun pozisyon hissi değerlendirilmesi sonucunda, boyun ekstansiyon hareketi sırasında anlamlı düzeyde fark tespit edilmiştir. Elde edilen bulgular, karpal tünel sendromu olan bireylerin tedavisinde boyun bölgesinin de değerlendirilmesinin yararlı olabileceğini göstermektedir.

Anahtar Kelimeler: Boyun Pozisyonu, Eklem Hareketi, Gonyometre, Karpal Tünel Sendromu.

Özet

Metallerin elektriksel özelliklerini, polimerlerin özellikleriyle birleştirerek tek bir malzemede toplayabilmek her zaman ilgi çeken bir araştırma konusu olmuştur. İletken polimerler çeşitli elektrokimyasal özelliklerinden dolayı çok değişik alanlarda kullanılabilmektedirler. Özellikle, sensörler, şarj olabilen piller, fotokimyasal hücreler, elektrokromik aletler ve iyon seçici elektrotların yapımında kullanım potansiyeline sahip oldukları bilinmektedir.
Bir polimerin iletken özellik gösterebilmesi için yapısında konjuge çift bağ içeren zincir bulundurması gerektiği Glarum et al. 1963, tarafından belirtilmiştir. Konjuge polimerlerde elektriksel iletkenliğin yapıda yer alan konjuge π bağları ile sağlandığı ise Berets et al. 1968, tarafından ileri sürülmüştür. Bu sebepten dolayı çıkış maddesi olarak kullanılacak polimer zincirinde korunabilen aromatik veya konjuge karbon-karbon çift bağları bulunduracak yapıda olması gerekmektedir. Bu çalışmada, epoksi türevlerinin nanopartiküller varlığında amin türevleri ile reaksiyonundan iletken polimerler ve bunlardan nanokompozit kaplamalar elde edilerek karakterizasyonları yapılarak çeşitli özelliklerinin incelenmiştir. Baslangıç maddesi olarak seçilen ticari epoksi silan türevleri, N(Azot) içeren çeşitli aromatik bileşiklerle (azol ve tiyazol türevleri) reaksiyona girerek iletken polimerler eldesi gerçekleştirilmiştir. Bu reaksiyonlarda iletkenliği artırmak amaçlı karbon ve Fe nanopartiküller kullanılmıştır. Glisidil epoksi silan türevleri, nanopartikül varlığında aromatik amin türevleri halka açılması reaksiyonunu gerçekleştirerek çapraz bağlı iletken polimerler ve bunlardan elde edilen nanokompozit kaplamalar elde edilmiştir. Elde edilen iletken polimerler alüminyum, yüzeylere uygulanarak bu yüzeyler için kullanılabilirliği test edilerek iletken nanokompozit kaplamalar elde edilmiştir. Elde edilen yeni iletken polimerlerin karakter analizi IR, NMR, diferansiyel taramalı kalorimetre (DSC), termogravimetrik analiz (TGA) ve jel içeriği testleri ile yapılmıştır. Ayrıca bu çalışmada elde edilen yeni iletken epoksi-nanokompozit kaplamaların mekanik özellikleri de ayrıca incelenmiştir.

Abstract

One of the ancient oilseeds with a highly valuable fatty acid profile as an omega-3 source is *Camelina sativa*, also known as camelina seed. The fatty acid composition of camelina seed oil was determined by gas chromatography with the Soxhlet oil extraction system and the presence of significant amounts of polyunsaturated fatty acids (PUFA) was detected. In the fatty acid profile of camelina seed oil, 55.18% of the total fatty acids are α-linolenic acid (C18:3 n-3), which demonstrates its strong potential as an alternative to marine-based omega-3 sources. The oil also contained moderate levels of palmitic acid (C16:0, 13.43%), stearic acid (C18:0, 6.21%), linoleic acid (C18:2, 7.27%) and oleic acid (cis-C18:1, 3.04%). Minor fatty acids included arachidic acid (C20:0, 4.11%), homo-γ-linolenic acid (C20:3, 3.22%), erucic acid (C22:1, 6.18%) and eicosadienoic acid (C20:2, 0.92%). The presence of trans-oleic acid was detected as (0.24%). The total PUFA content of this oil was 66.59%. The free fatty acid value of the oil obtained from camelina seed was found as 0.66±0.37% and peroxide value as 3.21±1.01 (meq g O2/kg).
Although the high α-linolenic acid (C18:3 n-3) content positions camelina seed oil as a valuable ingredient for functional food formulations and nutraceutical development, the high erucic acid (C22:1, 6.18%) content in its fatty acid profile constitutes a significant obstacle to human consumption. Because high erucic acid intake has been associated with potential cardiovascular risks. In conclusion, camelina seed oil exhibits a highly valuable fatty acid profile with potential applications in the development of functional food ingredients. However, to ensure compliance with food safety standards, erucic acid content requires a process similar to the historical development of canola oil.

Abstract

Liver cancer is the sixth most diagnosed cancer and the third leading cause of cancer-related deaths. Hepatocellular carcinoma comprises 75-85% of liver cancer cases in adults, 60% of which are advanced cases that are not amenable to local treatment. In advanced hepatocellular carcinoma cases, systemic drug therapy is used, which is associated with many side effects. Nowadays, drug delivery systems developed with nanotechnological approaches can be used to reduce the side effects of drugs and increase the effectiveness of treatment. The aim of this study was to load sorafenib, which is used in the treatment of hepatocellular carcinoma, and vismodegib, an inhibitor of the hedgehog pathway that has been found to be activated in hepatocellular carcinoma, into a liposomal drug carrier system, to examine their synergistic effects and to investigate their in vitro therapeutic efficacy on liver cancer. Liposomes prepared by thin lipid film hydration method and loaded with sorafenib and vismodegib drugs were characterized. In vitro drug release, stability and hemolysis assays were performed. In vitro cytotoxicity and apoptotic effect of the carrier were investigated. According to the data obtained, it was determined that the drug carrier system has appropriate properties, releases drugs in a controlled manner, does not cause hemolysis and has cytotoxic and apoptotic effects on hepatocellular carcinoma cells. In conclusion, it can be said that the obtained dual drug-loaded carrier system has the potential to reduce side effects and increase therapeutic efficacy in the treatment of hepatocellular carcinoma.

Abstract

With the rapid advancement of technology, global energy demand has increased significantly. Lithium-ion batteries—offering high energy density, safety, long cycle life, rapid charging capability, and environmental friendliness—are widely used across various sectors, including electric vehicles, consumer electronics, and photovoltaic systems. As non-renewable energy sources continue to deplete and energy storage needs grow, the use of lithium-ion batteries is expected to expand further. This trend underscores the critical importance of recovering lithium carbonate, the primary raw material in lithium-ion batteries, for both environmental sustainability and resource conservation. Hydrometallurgical processes are commonly utilized for lithium recovery from spent batteries, wherein lithium ions are precipitated as lithium carbonate via reaction with sodium carbonate. However, the presence of impurity metal ions during recovery can significantly affect the structural, morphological, and functional properties of the resulting lithium carbonate, ultimately influencing the electrochemical performance of new batteries.
This study investigates the effect of Mg^{2+} ions on the crystallization of lithium carbonate. Lithium carbonate crystals were synthesized through reactive crystallization in both the absence and presence of varying Mg^{2+} ion concentrations. The structural characterization was performed using X-ray diffraction (XRD) and Fourier-transform infrared spectroscopy (FTIR). The variations in crystal morphology and particle size were characterized using scanning electron microscopy (SEM) and particle size analysis. Zeta potential measurements confirmed a reduction in crystal agglomeration in the presence of Mg^{2+} ions. Additionally, the influence of Mg^{2+} concentration on the filtration behavior of the crystals was assessed and the changes in specific cake resistance and porosity were quantitatively determined based on Darcy's law.

Keywords: Crystallization, lithium carbonate, characterization, metal ion effect.

Abstract

The adverse effects of environmental pollution and climate change have significantly increased interest in environmentally friendly, sustainable, and renewable energy sources. In this context, extensive research has been conducted on renewable energy systems to reduce dependence on fossil fuels. Photocatalytic hydrogen production, which enables the generation of hydrogen gas through the decomposition of water under solar irradiation, is considered a promising approach for clean energy production. In this study, a boron-dipyrromethene (BODIPY)-thiophene-based covalent organic polymer (COP) structure was designed by utilizing the advantageous properties of BODIPY dyes, such as high molar absorptivity, tunable optoelectronic features, and high fluorescence quantum yields. The effect of a methyl group on the photocatalytic performance of the COP structure was systematically investigated. Integration of the BODIPY dye into the COP framework was employed to enhance light-harvesting capability, and the resulting structure was evaluated as a photocatalyst under simple experimental conditions. Surface, thermal, and structural characterizations of the synthesized polymers were carried out using scanning electron microscopy coupled with energy-dispersive X-ray spectroscopy (SEM-EDX), transmission electron microscopy (TEM), and Fourier-transform infrared spectroscopy (FT-IR). The prepared BODIPY-Th-COP-CH_3_TiO_2 photocatalyst demonstrated a hydrogen evolution rate of 0.132 mmol g^{-1} h^{-1} under 8 hours of visible light irradiation in the presence of methanol as a sacrificial electron donor, without the need for any additional co-catalyst. These results indicate that BODIPY-thiophene-based COP systems containing methyl groups hold significant potential as effective photocatalyst candidates for sustainable hydrogen production.

Abstract

Lung cancer is the leading cause of cancer death worldwide. Nanotechnology is currently used in many fields including medicine. methods such as surgery, radiotherapy, chemotherapy, immunotherapy are used in cancer treatment. however, existing methods have limited effect and it is important to identify new agents. Medicinal plants contain important anticancer agents and these agents can be organized in nanoparticle form to enter cells faster and show stronger activity. In this context, the aim of this study was to determine the anticancer activity of Moluccella laevis-silver nanoparticles from the Lamiaceae family on lung cancer cells. The cytotoxic activity of ML-AgNP on lung cancer cells was determined by MTT method. The morphological characteristics of ML-AgNP-treated A549 cells were determined by Inverted phase-contrast microscopy. Percentages of early apoptotic, late apoptotic and necrotic cells after ML-AgNP treatment were determined by flow cytometry after Annexin-V/propodium iodide staining. Chemical characterization of ML-AgNP was determined by XRD, FTIR and SEM-electron microscopy. ML-AgNP treatment of A549 cells resulted in decreased proliferation and altered cell morphology. However, 200 and 500 mg/ml ML-AgNP weakly increased the percentage of early and late apoptotic cells. However, no change was observed in the percentage of necrotic cells. In this study, ML-AgNP showed cytotoxic effect on lung cancer cells and induced apoptotic cell death.

Özet

Mobilya üretiminde kullanılan kenar bantları, mobilya tasarımında hem estetik hem de işlevsel açıdan kritik bir öneme sahiptir. Bu bantlar, mobilyaların dış kenarlarını kapatarak daha şık bir görünüm sağlar ve aynı zamanda bu yüzeyleri dış etkenlere karşı korur. Mobilya üretiminde kullanılan malzemeler genellikle darbelere, suya, kimyasallara ve aşınmaya maruz kaldığı için kenar bantlarının dayanıklılığı, ürünün genel ömrünü doğrudan etkiler. Kenar bantları, aynı zamanda montaj ve kullanım sırasında karşılaşılan mekanik zorlamalara karşı direnç göstererek ürünlerin uzun ömürlü olmasını sağlar.

Polipropilen (PP) bazlı kenar bantları, hafiflik, dayanıklılık ve düşük maliyet gibi avantajlarıyla mobilya sektöründe yaygın olarak kullanılmaktadır. Ancak, PP'nin düşük yüzey enerjisi nedeniyle yüzeylere yeterli düzeyde yapışamaması, üretim kalitesini ve ürün ömrünü olumsuz etkileyebilmektedir. Bu bağlamda, söz konusu yapışma sorununu çözmeye yönelik olarak, PP kenar bantlarının MDF ve sunta gibi yüzeylere daha güçlü bir şekilde yapışmasını sağlayacak bir Hotair tutkal formülasyonu geliştirilmesi hedeflenmiştir.

Hotair teknolojisi, yüksek sıcaklıkla PP'nin yüzey enerjisini artırarak yapışma kuvvetini artırma potansiyeline sahiptir. Bu çalışmada, farklı bağlayıcılar içeren çeşitli tutkal formülasyonları hazırlanmıştır. Her bir formülasyonun soyulma dayanımı, yapışma kuvveti ve genel mekanik özellikleri detaylı olarak incelenmiş, farklı uygulama sıcaklıkları (350°C ve 400°C) ile uygulama hızlarında (14 m/dak ve 20 m/dak) gerçekleştirilen denemelerle, sıcaklık ve hız gibi uygulama parametrelerinin etkileri karşılaştırmalı olarak değerlendirilmiştir.

Çalışmanın amacı, daha düşük maliyetli, yüksek performanslı ve uzun ömürlü kenar bantları üretimini mümkün kılacak optimize edilmiş bir tutkal çözümü sunmaktır. Mobilya sektöründe maliyet etkinliği sağlayacağı ve ürün kalitesini artıracağı öngörülmektedir. Ayrıca, geliştirilen bu yenilikçi tutkal formülasyonlarının sürdürülebilirlik açısından da avantaj sunarak sektörde rekabet gücünü yükselteceği düşünülmektedir.

Bu çalışma ile PP bazlı kenar bantlarının yapışma zayıflığını ortadan kaldıracak, yüksek sıcaklıklarda dahi güçlü tutunma sağlayan ve üretim verimliliğini artıran bir Hotair tutkal teknolojisinin geliştirilmesi amaçlanmaktadır. En iyi performansı gösteren formülasyonlar, hem ekonomik hem de teknik açıdan avantaj sağlayacak şekilde sektöre kazandırılacaktır.

Anahtar Kelimeler: Polipropilen (PP), kenar bandı, Hotair tutkal teknolojisi, yapışma performansı.

[3]Yalova Üniversitesi, Mühendislik Fakültesi, Polimer Malzeme Mühendisliği Bölümü, Yalova, Türkiye.

samet.filiz@tece.com.tr

Özet

PVC (Polivinil Klorür), dayanıklılığı, işlenebilirliği ve uygun maliyeti sayesinde mobilya sektöründe kenar bandı üretiminde yaygın olarak kullanılan bir polimerdir. Kenar bantları, mobilyaların estetik görünümünü tamamlamanın yanı sıra dış etkilere karşı koruma sağlar. Ancak PVC'nin doğal olarak sert ve kırılgan yapısı, kullanım sırasında performans düşüklüğüne yol açabilir. PVC'nin performansını artırmak amacıyla plastifiyanlar kullanılır. Bu katkı maddeleri, PVC'nin moleküler yapısını değiştirerek daha esnek, işlenebilir ve dayanıklı hale gelmesini sağlar. Ayrıca termal ve kimyasal stabiliteyi artırarak malzemenin kullanım alanını genişletir. Plastifiyan türü ve kullanım oranı, üretim sürecinde ve ürünün son özelliklerinde kritik rol oynamaktadır.

Endüstride yaygın olarak kullanılan plastifiyanlar arasında DOP, DOTP, DINP ve TOTM gibi ftalat ve tereftalat bazlı türler yer alırken, çevre dostu seçeneklerden biri olan ESBO (Epoksidize Soya Yağı) da önem kazanmaktadır. Plastifiyan oranının artması genellikle esnekliği artırırken, fazla kullanımı malzemenin mekanik dayanımını olumsuz etkileyebilir. Bu nedenle doğru plastifiyan seçimi ve dozajı büyük önem taşır.

Bu çalışma kapsamında, farklı oranlarda (%2,8, %4,3, %5,8, %7,3) plastifiyan içeren PVC kenar bantları üretilmiş ve bu bantların tokluk, esneklik ve dayanıklılık gibi fiziksel özellikleri detaylı şekilde karşılaştırılmıştır. Amaç, plastifiyan miktarının artırılmasının ürün performansına etkisini ortaya koymak ve en uygun plastifiyan oranını belirlemektir.

Elde edilen veriler, PVC kenar bandı üretiminde plastifiyan miktarının dikkatli şekilde optimize edilmesinin ürün kalitesini artırabileceğini göstermektedir. Epoksitlenmiş soya yağının (ESBO) PVC formülasyonlarında plastikleştirici ve yüzey modifiye edici olarak etkili bir rol oynadığı net bir şekilde ortaya konmuştur. Farklı ESBO oranlarının (%2,8, %4,3, %5,8 ve %7,3) ürünün mekanik ve fiziksel özelliklerini önemli ölçüde etkilediği, özellikle %7,3 oranının en yüksek parlaklık, elastik modül ve kopma dayanımı gibi değerlerle en iyi performansı sağladığı tespit edilmiştir. Bununla birlikte, daha düşük ESBO oranları da belirli uygulamalar için esneklik ve darbe dayanımı açısından avantajlar sunabilmektedir.

Anahtar Kelimeler: Plastifiyan, PVC, Kenar bandı, ESBO (Epoksidize Soya Yağı)

Abstract

Liver cancer, particularly hepatocellular carcinoma (HCC), is one of the most aggressive and difficult-to-treat cancers globally. One of the underlying drivers of this disease is abnormal DNA methylation and epigenetic change that can silence critical tumor-suppressor genes. A key enzyme involved in this process is DNMT3A which has emerged as a promising therapeutic target. In this study, we explored two distinct binding regions within the catalytic domain of DNMT3A with the goal of identifying existing FDA-approved drugs that can potentially bind and inhibit its activity.

The present study initially evaluates the potential of numerous drugs by molecular docking and molecular dynamics simulations to understand how well various compounds interact with each site. In silico approach demonstrated that second site has stronger interactions, especially with several peptide-based drugs such as Lanreotide (–10.025 kcal/mol) and Desmopressin (–9.974 kcal/mol), suggesting this site may be more structurally favorable for larger, flexible ligands. While the binding scores were encouraging, medicinal chemistry properties and ADMET were also investigated, and several violations were noted suggesting that may still be effective as injectables or targeted treatments. This comparison emphasizes the need to consider both binding performance and practical drug characteristics when identifying repositioning candidates.

In summary, our findings suggest that second site identified in DNMT3A is a particularly promising target for strong, stable binding especially by peptide-based drugs while the other site remains a valuable option for small molecules. This dual-site approach enhances our understanding of DNMT3A's structural behavior and opens the door for repositioning safe, existing drugs in the treatment of liver cancer.

Keywords: DNMT3A, hepatocellular carcinoma, drug repositioning, molecular dynamics, ADMET, medicinal chemistry rules

Özet

Küresel deniz taşımacılığının artmasıyla birlikte, limanların çevresel etkilerini azaltmak kaçınılmaz bir gereklilik hâline gelmiştir. Uluslararası Denizcilik Örgütü'nün (IMO) 2050 yılına kadar sera gazı emisyonlarını net sıfıra indirme hedefi doğrultusunda, limanların enerji verimliliği, atık yönetimi, hava ve su kalitesi yönetimi, dijitalleşme gibi alanlarda yenilikçi çözümler üretmesi kritik öneme sahiptir. Türkiye, stratejik coğrafi konumu ve artan deniz ticareti hacmi ile limanlarının sürdürülebilirliğini sağlama konusunda önemli bir potansiyele sahiptir. Limanların çevresel etkilerini en aza indirecek uygulamaların geliştirilmesi, sadece yerel düzeyde değil, aynı zamanda küresel çevre politikaları açısından da önem arz etmektedir. Bu bağlamda yeşil (ekolojik) limanlar; faaliyetlerinin çevresel, sosyal ve ekonomik boyutlarda sürdürülebilirliğini dengelemeyi amaçlayan limanlardır. Türkiye'de Ulaştırma ve Altyapı Bakanlığı tarafından geliştirilen "Yeşil Liman Sertifikası", limanların çevre dostu teknolojilere uyumunu teşvik etmekte ve uluslararası standartlara uyum sağlamaktadır. Çalışma, literatür taraması ve ulusal raporların incelenmesi yöntemi ile Türkiye'deki gönüllülük esasına dayalı yeşil limanların sürdürülebilirlik boyutlarını ele almaktadır. Bulgular, yeşil limanların sadece çevresel sürdürülebilirliğe değil, aynı zamanda ekonomik sürdürülebilirliğe ve saygınlık kazandırıcı etkilere de katkı sağladığını göstermektedir. Türkiye'nin yeşil liman dönüşümünün hızlandırılması, hem çevresel koruma hem de uluslararası rekabet gücü açısından kritik öneme sahiptir. Bu çalışma, yeşil liman uygulamalarının yaygınlaştırılmasının sürdürülebilir kalkınma hedeflerine önemli ölçüde katkı sağlayabileceğini ortaya koymaktadır.

A Comparative Analysis Of Tracking Algorithms Used On The Ground_Based Platform To Monitor Moving Targets

Kübra PAPÜR[1], Nebi GÜL[1], Ömer Faruk ELALDI[1], Murat ÜÇÜNCÜ[1]

[1]Department of Electrical-Electronics Engineering Baskent University/Ankara

Corresponding author: Murat Üçüncü (e-mail: murat.ucuncu@ yahoo.com.tr).

Abstract

The objective of this study is to compare different Kalman Filter algorithms in single and multiple target tracking (MTT). In the analysis, three different models are utilized: linear constant velocity (CV), non-linear constant velocity (NCV) and constant acceleration (CA) models. In single target tracking, Standard Kalman Filter (SKF), Extended Kalman Filter (EKF), Unscented Kalman Filter (UKF) and Interactive Multiple Model (IMM) are used. The tracking performance of SKF is examined for both CV and CA models. For the comparison of EKF and UKF tracking performance, all parameters except the process noise in the CV and CA target motion models are kept constant. The tracking performance of IMM is analyzed by changing filter transition probability coefficient. For MTT, the standard deviation of process noise is modified to compare the tracking performance of the nearest neighbour (NN) and joint probabilistic data association (JPDA). The dynamic filters and targets are implemented by our own code and inserted into MATLAB R2022B. We can confidently state that UKF provides more stable estimates for the uncertainty in both CV and CA target motion. In clutter-free environments, JPDA produces more stable results compared to NN.

Özet

Meme kanseri dünya çapında kadınlar arasında en sık görülen ve yüksek mortalite oranına sahip kanser türüdür. Meme kanseri tedavi seçeneklerine yönelik çalışmalar günümüzde artarak devam etmektedir. Doğal ürünlerin kanser karşıtı ajanlar olarak kullanılmasının, ulaşılabilir ve uygulanabilirlikleri ve sitotoksisiteyi azaltıcı etkileri sayesinde tedavi etkinliğini arttırıcı bir yaklaşım olduğu kabul edilmektedir. Doğal ürün olan bitkiler, geçmişten günümüze çeşitli hastalıkların önlenmesi ve tedavisinde kullanılmaktadır. Yüksek antosiyanin ve antioksidan içeriğine sahip olduğu bilinen *Aronia melanocarpa* meyvesinin çeşitli patolojik durumlara karşı koruyucu etkileri kanıtlanmış olup günümüzde bitkisel ilaç ve fonksiyonel bir besin olarak kullanılmaktadır. Gerçekleştirilen bu çalışmada *Aronia melanocarpa* meyve ekstresinin insan umblikal ven endotel hücreleri (HUVEC) ve insan meme kanseri hücre hatlarından MCF-7 ile MDA-MB-231 üzerine olan etkisinin in vitro yöntemlerle araştırılması amaçlanmıştır. *Aronia melanocarpa* meyvesinden elde edilen ekstre ile oluşturulan 12 farklı konsantrasyonun her üç hücre hattında hücre canlılığına olan etkisi MTT tahlili ile değerlendirildi. *A.melanocarpa* meyve ekstresinin her üç hücre hattı için IC50 değerleri GraphPad Prism 10.4.2 yazılımı kullanılarak hesaplandı. MTT tahlili sonucunda *Aronia melanocarpa* meyve ekstresinin 24 saatlik uygulama sonrası HUVEC hücre hattı için IC50 değeri 19.89 mg/mL; MCF-7 meme kanseri hücre hattı için 10,76 mg/mL; MDA-MB-231 meme kanseri hücre hattı için ise IC50 değeri 15,39 mg/mL olarak hesaplandı.

Anahtar Kelimeler: Aronia Melanocarpa, Kanser, HUVEC, MCF-7, MDA-MB-231.

Abstract

This study focuses on enhancing the performance of conventional aluminum fuel used in solid rocket propellants by incorporating a suitable catalyst into the propellant composition. In solid propellants, the combustion of metallic fuel occurs through the presence of an oxidizer, most commonly ammonium perchlorate (AP). The decomposition of AP releases oxygen, which facilitates the combustion of the metallic fuel. Therefore, accelerating the decomposition of the oxidizer is crucial for improving the overall combustion efficiency of the propellant system. To achieve this, a catalyst with an oxide structure containing oxygen vacancies, specifically samarium-doped ceria (SDC20), was selected due to its potential to promote AP decomposition. Since the preparation method of the catalyst significantly influences its catalytic activity, SDC20 was synthesized using various techniques. The synthesized catalysts were then incorporated into model propellant formulations to evaluate their effectiveness in enhancing AP decomposition. The catalytic effect was assessed via thermogravimetric and differential thermal analysis (TG-DTA), focusing on the change in the activation energy of AP decomposition. Typically, the high temperature decomposition activation energy of pure ammonium perchlorate ranges between 200–250 kJ/mole. With the incorporation of SDC20 catalysts, this value was successfully reduced to approximately 130-150 kJ/mole, indicating a notable improvement in thermal decomposition behavior. The findings of this study highlight the critical role of catalyst synthesis methods in tailoring the thermal characteristics of oxidizers in solid rocket propellants. The optimized catalyst not only improves the decomposition kinetics of AP but also contributes to the development of more efficient and responsive propulsion systems. This research offers a promising approach to advancing solid propellant technology through rational catalyst design.

Abstract

Tomato-based products are recognized for their inherent anticancer and anti-inflammatory properties, primarily attributed to their rich content of bioactive compounds, including lycopene, β-carotene, vitamin C, and polyphenols. In this study, functionalized tomato products—specifically juice and sauce—were formulated by incorporating plant proteins (pea protein and RuBisCO) and lyophilized olive powder to investigate the effects of compositional variations on their health-related potential. While all products were enriched with lyophilized olive powder, pea protein and RuBisCO were individually incorporated into the formulations to assess their distinct contributions. The engineered products were designed to systematically evaluate the influence of these ingredients on anticancer properties. Additionally, the impact of processing methods, namely conventional water bath and microwave pasteurization, was examined for both juice and sauce formulations. The MTT assay was performed to determine the survival rates of various cancer cell lines, including breast cancer, glioblastoma, colorectal cancer, and melanoma. Our findings revealed that the newly developed tomato products reduced cancer cell viability in a concentration- and cancer type-dependent manner. These results demonstrate that the engineered tomato products exhibit significant anticancer effects, though their precise mechanisms of action and broader implications for cell survival warrant further investigation.

Abstract

Vibrio cholerae, the causative agent of cholera, continues to pose a global health threat, with an estimated 1.3 to 4 million cases and up to 143,000 deaths annually. The disease is primarily transmitted through contaminated water or food. While mild cases are manageable with oral rehydration therapy, severe infections require a combination of intravenous fluids and antimicrobial treatment. Although antibiotics such as tetracycline, fluoroquinolones, and azithromycin have been successfully used to treat cholera patients, treatment failures have become increasingly common recently due to the emergence and spread of antimicrobial-resistant *V. cholerae* strains. This highlights a critical need to identify novel drug targets and develop alternative therapeutic strategies.

In this study, a systems biology approach was employed to uncover potential antimicrobial targets. Transcriptomic data of *V. cholerae* O1 El Tor N16961 exposed to eleven different stress conditions mimicking the human host environments were integrated with its genome-scale metabolic model to identify reporter metabolites, the key metabolites around which significant transcriptional changes occur. The analysis revealed significant enrichment in metabolic pathways, including amino acid biosynthesis, fatty acid metabolism, and carbohydrate metabolism. Further investigation of common reporter metabolites highlighted FabV, ArgE, and MenE as promising antimicrobial target candidates. These findings offer valuable insights into the metabolic adaptability of *V. cholerae* and potential antimicrobial targets for developing new antimicrobial therapies.

Abstract

Plastic injection molding is one of the most commonly used manufacturing methods due to its ability to produce complex geometries with high precision and cost efficiency. In injection-molded parts, various structural features are utilized to enhance mechanical strength and minimize manufacturing defects. Among these features, rib structures (also known as “feder” structures) play a critical role in reducing stress concentrations, improving shape stability, and preventing crack initiation. The purpose of this study is to review the current literature on the influence of rib structures on the material behavior of plastic injection molded parts and to provide a comprehensive overview of the research conducted in this field. This research is based on a systematic review of national and international studies focusing on rib design and its impact on the mechanical behavior of plastic components. Key parameters such as rib geometry, placement, rib-to-wall thickness ratio, and transition radii have been examined in the context of their effects on stress distribution and overall mechanical performance. Additionally, studies involving different types of thermoplastics (e.g., PP, ABS, PC, PA6) have been analyzed to understand material-specific behaviors. The literature reveals that well-designed rib structures significantly improve part strength, crack resistance, and molding quality. Specifically, rounded transitions at the rib base reduce stress concentrations, while maintaining an optimal rib-to-wall thickness ratio enhances structural integrity without causing molding defects such as sink marks. The findings underscore the importance of rib design in optimizing the performance of plastic parts and highlight the need for continued research in this area to support more efficient and reliable product development.

Abstract

Nowadays, comfort has become an increasingly important factor in individuals' clothing preferences. To meet this demand, dual-layer fabrics incorporating different yarns on the inner and outer surfaces are being utilized, and multi-layered garment designs are also being adopted. When a garment consists of multiple layers, the air trapped between these layers, especially the outermost layer, plays a crucial role. Garments that fit closely to the body contain less air compared to those that hang loosely. In multi-layered garments, the total thermal insulation is greater than the insulation provided by a single layer alone (Marmaralı, A., Kretzschmar, D. S., Özdil, N., & Oğlakcıoğlu, G. N. (2006). Parameters affecting thermal comfort in clothing. Tekstil ve Konfeksiyon, 16(4), 241-246). Based on this, the present study was designed to enhance moisture management comfort in terms of water vapour permeability and wear comfort in men's upper garments by using combinations of knitted and woven fabrics with different fiber contents. By designing and testing inner-outer fabric combinations focused on fiber and fabric types, this study aims to help designers better understand fabric and garment properties, as well as their interactions, enabling them to develop garments with improved wear and moisture comfort. As a result, fabric and design combinations that promote comfort have been proposed based on the findings and evaluations.

Abstract

Bimetallic nanoparticles are of great interest in a broad variety of applications due to their high degree of tunability of the physical and chemical properties [1]. The coalescence process of two metal nanoparticles is widely accepted as one of the growth mechanisms of nanoparticles [2]. In coalescence, independent nanoparticles collide and merge to form a larger aggregate [3]. In order to understand nanoparticle coalescence, a considerable progress has been made by using computational methods [4] and Molecular dynamics (MD) simulations are particularly well suited to this phenomenon [5]. In this study, the coalescence of two different metal nanoparticles were performed by using MD simulations. Visualizations and analysis of MD trajectories were carried out by using OVITO [6]. The coalescence process was analyzed by dependence on temperature, geometric structure, nanoparticle size and composition. It was obtained that it can be possible to tune the structural and chemical ordering properties of the resultant configurations obtained at the end of the coalescence process by changing temperature, geometric structure, nanoparticle size and composition.

Keywords: Metal nanoparticles, coalescence, molecular dynamics simulations.

Abstract

As the environmental impact of organic waste from the food and agricultural sectors grows, transforming such waste into value-added products has become critical for sustainability. In this study, low-value cabbage waste was converted into functional biochar via hydrothermal carbonization (HTC) at 200°C, 225°C, 250°C, and 275°C for 3 and 6 hours in deionized water. The goal was to produce biochar suitable for environmental applications, particularly adsorption. Yield analysis indicated a clear influence of both temperature and time. At 200°C for 3 hours, the yield was 29.18%, increasing to 31.85% after 6 hours. The highest yield (33.89%) occurred at 225°C for 6 hours, highlighting the effect of extended reaction conditions on biochar formation and process optimization. FT-IR analysis revealed temperature- and time-dependent changes in functional groups. A decrease in –OH bands (3300–3400 cm^{-1}) and C–O bands (1000–1100 cm^{-1}) indicated the breakdown of oxygenated groups, while the increased intensity of C=C bands (~1600 cm^{-1}) reflected enhanced aromaticity. SEM images confirmed morphological changes such as increased porosity and surface roughness, especially at higher temperatures. TGA results showed improved thermal stability with increased carbonization. XRD analysis revealed a reduction in crystallinity and a transition toward amorphous carbon structures, confirming advanced carbon development. TOC and COD analyses of the liquid phase demonstrated a decrease in organic content at higher temperatures and durations, suggesting more environmentally benign effluents. This study offers a promising approach to organic waste valorization by producing eco-friendly, structurally stable, and adsorptive biochars. Hydrothermal carbonization of cabbage waste supports sustainable waste management and environmental remediation goals through efficient resource recovery.

Abstract

Rubber bumpers are widely used in various industrial applications, particularly in the automotive sector, due to their ability to carry loads, absorb vibrations, and dampen impacts. Natural rubber-based materials are preferred in such applications because of their high elasticity and favorable mechanical performance. However, the performance of these materials may vary depending on parameters such as hardness, filler content, and deformation conditions. Therefore, conducting both experimental and numerical analyses is essential for reliable design and material optimization.In this study, mechanical tests were conducted at room temperature on three equivalent natural rubber bumpers. The tests included hardness measurements using the Shore A scale, ash testing to determine inorganic filler content, and load-bearing tests under 25 mm deformation. The measured hardness values were 76.7, 76.9, and 78.0 Shore A, while the corresponding load capacities were 11,920 N, 13,155 N, and 14,252 N. According to the ash test results, the filler contents were 9.7%, 7.5%, and 6.5%, indicating that a lower filler ratio correlates with increased load-bearing capacity.Based on the average experimental values, a finite element analysis was performed using ANSYS software and a hyperelastic Mooney-Rivlin material model. The numerical model was constructed using a representative rubber mount with 77.2 Shore A hardness, a load capacity of 13,109 N, and 7.9% ash content. The simulation yielded a load value of 14,058 N, resulting in a 7.2% deviation from the experimental result—well within acceptable engineering limits for such materials. The developed model offers a reliable numerical analysis approach that can be used in the design of new rubber mount applications.

Abstract

Spiral galaxies are known for their high levels of star formation activity. However, the process by which late-type galaxies evolve into early-type ones is not well understood. Lenticular galaxies are key to investigating such transitions. Giant molecular clouds (GMCs) are the birthplaces and deathbeds of stars in galaxies. High-angular-resolution observations are essential to probe the physical properties and kinematics of GMCs, and to improve our understanding of star formation processes in galaxies. In this study, we present high-resolution, high-sensitivity observations of carbon monoxide (CO) in the nearby lenticular galaxy NGC 383. Data were obtained using the Atacama Large Millimetre Array, achieving an angular resolution of 0.085 arcsec x 0.052 arcsec (approximately 22 parsecs) and a velocity resolution of 2 km/s. This excellent resolution enables us to resolve the GMCs both spatially and spectrally. Here, we present the initial results of our analysis, based on a modified GMC identification algorithm. This algorithm enables us to determine various physical parameters, such as the boundaries and dimensions of GMC structures, as well as star formation at the GMC scale. Our results suggest that the GMCs are gravitationally unbound and likely to undergo gravitational collapse. We will also discuss results based on Larson relations (i.e. relations between the size, velocity dispersion, and luminosity of GMCs) and their physical interpretation for hundreds of GMCs identified across the disc of the galaxy.

Abstract

Assessing the mechanical behaviors of composites reinforced with continuous and long fibers via additive manufacturing under different loading scenarios is essential for understanding their capabilities and limitations in real-world industrial use, as well as for enhancing 3D printing technologies and materials. A crucial factor defined by ASTM D2344/2344M-22 standard is the short beam strength (SBS), which indicates the interlaminar shear strength (ILSS) of a composite. This research conducts a comparative investigation into the short-beam strength of both flat and curved additively manufactured fiber polymer laminates. The study focuses on the performance of a laminated hybrid composite material form with the lay-up configuration 3/2 that contains three layers of short-fiber carbon-reinforced nylon (Onyx®) and two layers of unidirectional continuous carbon fiber-reinforced nylon. The short-beam specimens were subjected to three-point bending tests with a crosshead movement of 1 mm/min after they had been printed with the build configuration of on-edge orientation by a Markforged Mark Two™ 3D printer. Load and crosshead displacement were recorded throughout each test. Load-displacement and short-beam stress-displacement histories, damage modes, and mean values of maximum loads, SBSs, and specific SBSs were compared with each other and their non-hybrid configurations (three layers of Nylon White® and two layers of unidirectional continuous carbon fiber reinforced nylon). There was progress on energy storage capacity before the complete failure of the composite; however, the existence of the curve created a significant decrease of 19.6% in SBS and an increase in standard deviation, which is a sign of a decrease in foreseeability of material behavior, unlike non-hybrid design. This study aims to enhance the understanding of the mechanical behavior of 3D-printed hybrid composites manufactured using the continuous filament fabrication (CFF) technique—a method derived from fused deposition modeling (FDM)—and to support future engineering applications through deeper insights into their structural performance.

Keywords: Fused deposition modeling, continuous filament fabrication, short-beam strength, interlaminar shear strength, curved structures, hybrid composites

Abstract

Dye-sensitized solar cells (DSSC) are one of the most promising alternatives to silicon solar cells in terms of efficiency and easy production. In this study, the effect of organic alizarin ($C_{14}H_8O_4$) dye sensitizer on the efficiency of TiO_2-based DSSC under different light intensities was investigated. TiO_2 nanoparticles to be used as photoanodes in DSSC were synthesized using a low-cost and environmentally friendly hydrothermal method at 120 °C for a 12-hour deposition time. The synthesized TiO_2 nanoparticles were calcined in a muffle furnace at 450 °C. The calcined TiO_2 nanoparticles were made into paste and coated on a 0.49 cm^2 area on the fluorine-doped tin oxide (FTO) coated glass surface using the doctor-blade method. The structural and optical properties of the coated TiO_2 photoanode film were characterized by XRD and optical absorption measurements. XRD measurements revealed that the TiO_2 film was in the anatase phase, while optical analysis showed that the film had a maximum transmittance of 80% in the visible wavelength range and a direct bandgap energy of 3.28 eV. For DSSC fabrication, TiO_2 photoanode film coated on FTO was sensitized by soaking in an alizarin dye solution for 6 hours. Then, fabrication was completed by using iodide/triiodide (I^-/I_3^-) redox electrolyte solution and a Pt counter electrode. J-V measurements were performed under different light intensities (20, 60, 100 mW/cm^2) to determine the photovoltaic parameters of the fabricated DSSC. From these measurements, it was determined that the DSSC's J_{sc}, V_{oc}, and η parameters varied in the ranges of 5.70-9.59 mA/cm^2, 0.66-0.76 V, and 4.01-9.27%, respectively, depending on the light intensity. Based on these findings, it was concluded that organic alizarin dye has the potential to be used in DSSCs.

Abstract

Graphene and its derivatives, graphene oxide (GO) and reduced graphene oxide (rGO), are considered promising nanomaterials due to their exceptional mechanical, thermal, and electrical properties. This study aims to synthesize graphene nanoplatelets (GNP), graphene oxide (GO), and reduced graphene oxide (rGO) through green synthesis routes by employing the modified Hummers method. The process designed in accordance with sustainable chemistry principles, minimizing the use of toxic reagents and optimizing energy efficiency. GO will be produced through the chemical oxidation of graphite using a modified version of the classical Hummers method, which enhances safety and environmental compatibility. In the subsequent step, GO will be reduced to rGO using environmentally reducing agents such as ascorbic acid, replacing conventional hazardous chemicals like hydrazine. The synthesized nanomaterials thoroughly characterized using a range of techniques including X-ray diffraction (XRD), Raman spectroscopy, scanning electron microscopy (SEM), and transmission electron microscopy (TEM) etc. These analyses aim to investigate the structural, chemical, and morphological features of the materials and to determine the effectiveness of the modified method in producing high-quality graphene derivatives. Process parameters such as oxidant ratio, reaction time, and temperature systematically varied to optimize yield and product performance. This research intends to contribute to the development of scalable, eco-friendly production strategies for graphene-based materials. The synthesized graphene derivatives further applied as reinforcing agents in ceramic matrix composite systems.

Abstract

Food packaging is a fundamental process for preserving products, facilitating transportation, and extending shelf life. Environmental concerns and health risks associated with conventional packaging have increased interest in sustainable, biodegradable alternatives. These alternatives contribute to waste reduction and support the circular economy while promoting resource efficiency. In this context, emerging smart packaging systems offer innovative solutions capable of performing functions such as detection, monitoring, recording, and communication.
Freshness is a key indicator of product quality in seafood, which is known for its high nutritional value and sensitive sensory properties. Smart packaging technologies play a critical role in maintaining quality during the transportation and storage of these products, while also enhancing consumer safety.
Applications of smart packaging in seafood include a variety of systems such as biosensors for monitoring freshness and spoilage, color-changing indicators, time–temperature indicators, gas sensors, and RFID tags. This study aims to evaluate smart packaging techniques used for monitoring the freshness of seafood products and to discuss existing limitations as well as future development opportunities.

Abstract

Plants are considered as an important resource in new phytomedicinal product development studies due to their wide clinical benefits, high efficiency, low costs and fewer side effects. *Cotinus coggygria* Scop. (*C. coggygria*) plant stands out among these natural resources with its strong antioxidant effect due to its flavonoids and phenolic compounds. Ethanol consumption can cause serious damage to tissues and organs as a result of oxidative stress and inflammation. In this study, the protective effect of *C. coggygria* aqueous extract was investigated to prevent ethanol-induced kidney damage. In the study, 5-6 months old male Sprague Dawley rats were divided into four groups: Group I (control group), Group II (group administered 50 mg/kg *C. coggygria* aqueous extract), Group III (group administered 1 mL absolute ethanol) and Group IV (group administered *C. coggygria* aqueous extract and 1 mL absolute ethanol one hour later). *C. coggygria* aqueous extract and ethanol were administered to rats by gavage method. One hour after ethanol administration, blood and tissue samples of rats were collected under anaesthesia and various biochemical analyses were performed. When the results were evaluated, it was found that there was an increase in urea and uric acid amounts in serum samples; lactate dehydrogenase, xanthine oxidase and arginase enzyme activities, as well as reactive oxygen species, total oxidant content and oxidative stress index increased in kidney tissues of ethanol-treated rats. On the other hand, a decrease in sodium-potassium ATPase enzyme activity and total antioxidant content was observed. It can be suggested that these biochemical parameters were reversed by the application of *C. coggygria* extract and this plant extract showed a protective effect.

Abstract

We study the magnetic properties of the antiferromagnetic Blume-Capel model on a triangular lattice by means of Monte Carlo simulations. We investigate staggered magnetization, staggered susceptibility, specific heat, and Binder parameters of the model. Those quantities of the spin system are computed for different sizes and anisotropy parameters over a range of temperatures. The ground state and finite temperature results suggest different phases of the model, importantly, a Berezinskii-Kosterlitz-Thouless type phase at higher temperatures. The low-temperature phase is expected to be the antiferromagnetic long-range ordering on two sublattices, while the remaining one remains in a nonmagnetic state.

Keywords: Blume-Capel model, Monte Carlo simulation, antiferromagnetism.

Abstract

Alcohol use disorder and ethanol dependence is a common condition that causes serious health problems on a global scale. As a result of ethanol metabolism, acetaldehyde accumulates in the organism and causes oxidative stress. The free radicals, generated in this process, affect the glycosylation of proteins and lipids and cause cellular damage. *Cotinus coggygria* Scop. (*C. coggygria*) plant has been used in various treatment processes for many years due to its strong antioxidant and anti-inflammatory components. In our study, the protective effect of *C. coggygria* aqueous extract against ethanol-induced small intestinal damage in rats was investigated. In our study, 5-6 months old male Sprague Dawley rats were divided into four groups: Group I (control group), Group II (group administered 50 mg/kg *C. coggygria* aqueous extract), Group III (group administered 1 mL absolute ethanol) and Group IV (group administered *C. coggygria* aqueous extract and 1 mL absolute ethanol one hour later). *C. coggygria* aqueous extract and ethanol were administered to rats by gavage method. One hour after ethanol administration, blood and tissue samples were obtained from anaesthetised rats and various biochemical analyses were performed. The results showed that ethanol-induced small intestinal tissue damage caused an increase in hexose, hexosamine and sialic acid levels. Administration of *C. coggygria* aqueous extract may play a protective role against ethanol-induced tissue damage by reducing these negative effects.

Abstract

The integration of artificial intelligence (AI) into education brings not only technological and pedagogical advancements but also raises significant ethical and legal concerns (1). Key issues such as data privacy, algorithmic transparency, accountability, and fairness are increasingly emphasized in educational AI research (2). This study aims to examine how ethical dimensions of AI are addressed in the educational context by analyzing the relevant academic literature. The research is designed as a qualitative study based on the descriptive survey model and utilizes the systematic mapping method. Data were collected from three major academic databases: Scopus, Web of Science, and ERIC. A total of 611 articles published between 2020 and 2024 were selected for full-text analysis based on predetermined inclusion and exclusion criteria. Findings show that the most frequently addressed ethical theme is data privacy and security (30.48%), followed by transparency and explainability of algorithmic decisions (19.70%), responsibility and accountability (10.78%), and discrimination and bias (9.88%). Other prominent themes include legal insufficiencies (6.41%), ethical design principles (6.35%), digital ethics education (3.29%) and challenges in developing ethical frameworks (4.79%). The results suggest that ethical concerns in AI-supported education are multifaceted and require comprehensive policy and design approaches. Particularly, the dominance of themes such as privacy and algorithmic fairness highlights the need for transparent, accountable, and human-centered AI systems in education. The study concludes that the ethical integration of AI in education is not merely a support mechanism but a transformative process that demands ethical sensitivity and regulatory foresight.

Abstract

Molecular brushes are polymer architectures consisting of a linear backbone that is densely grafted with side chains. Molecular brushes with core-shell side chains show promising structural and responsive behavior, making them suitable for applications such as drug delivery systems and advanced functional materials. In this study, the behavior of brushes with core-shell copolymer side chains was investigated using dissipative particle dynamics (DPD) simulations performed in LAMMPS. The polymer segments and solvent molecules were modeled as coarse-grained beads that interacted via conservative, dissipative, random and harmonic bond forces. PEG, PCL, and PLLA were selected as representative polymers with distinct hydrophilic, semi-crystalline, and biodegradable properties, respectively. To investigate phase behavior, the interaction parameters were systematically varied to adjust their compatibility.
Preliminary simulation results demonstrated the sensitivity of brush morphology to variations in grafting density and backbone configuration. The responsiveness of the polymer brush system to these molecular design factors highlights the value of coarse-grained modeling in capturing mesoscale behavior that is often challenging to observe experimentally. These results confirm the practicality of DPD as a predictive tool for investigating soft matter and reveal possibilities for adjusting polymer brush configurations to achieve specific functions.

Keywords: Molecular brush, dissipative particle dynamics, core-shell, polymer modeling.

Özet

Arıtma çamurlarının artan hacmi ve bertaraf edilmesi günümüzde ciddi bir problem haline gelmiştir. Belediye tesislerinde arıtma çamurlarının işlenmesi veya bertaraf edilmesi işletme maliyetlerinin temel bölümünü oluşturmakta, bundan dolayı ekonomik ve çevresel açıdan sürdürülebilir yöntemlerin kullanılması gerekmektedir. Sürdürülebilirliğin sağlanması ve maliyetin düşürülmesi amacıyla arıtma çamurlarının tarımda arazi tabanlı uygulanması alternatif yöntemler arasında yer almıştır. Bu çalışmada; analizleri belirlenen atık çamurun (%7,5, %15, %20, %25, %50, %75) toprakla seyreltilerek farklı gübre dozlarında (%25, %50, %100) sorgum bitkisinin gelişimi üzerine etkileri incelenmiş ve kullanılabilirliği değerlendirilmiştir. Bulgular, arıtma çamurunun ilave edilen miktarının artmasının sorgum bitkisinin gelişimine engel olduğu ancak miktarı seyreltildiğinde sorgum gelişimini teşvik ettiği, özellikle arıtma çamurunun dozunun azaltılmasının ve gübre ilavesinin birlikte etkisinin bitki-kök boyu, sap çapı, bitki-kök yaş ağırlığı, bitki-kök kuru ağırlığı gibi fizyolojik parametreleri kontrol grubuna kıyasla önemli düzeyde etkilediği belirlenmiştir ($p<0,001$). En yüksek değerler bitki boyunda A7,5-G50 grubunda 76,16 cm, kök derinliğinde A7,5-G25 grubunda 35 cm, bitki ve kök yaş ağırlığı A7,5-G100 grubunda sırasıyla 66,79 g ve 41,07 g ölçülmüştür. Ayrıca uygulanan atık çamur miktarının artması kontrol grubuna kıyasla toprak pH değerlerinde azalmaya, EC ve organik madde değerlerinde artışa neden olmuştur. Bulgular değerlendirildiğinde, arıtma çamurunun yüksek oranlarda toprağa ilavesinin bitkisel üretimi olumsuz yönde etkileyebileceği; ancak uygun dozlarda uygulandığında bitki gelişimini destekleyici yönde anlamlı sonuçlar elde edilebileceği düşünülmektedir.

Anahtar Kelimeler: Arıtma çamuru, sorgum, tarımsal sürdürülebilirlik

Abstract

Entomopathogenic fungi (EPF) are known to produce a range of secondary metabolites, which have been observed to possess a variety of biological activities, including antibacterial, antifungal and insecticidal properties. This study aimed to obtain the total secondary metabolites of four *Metarhizium* sp. (Metch) (OZM-4, OZM-8, OZM-22b, OZM-14) isolated from *Dendroctonus micans* (Kugelann) (Coleoptera: Curculionidae, Scolytinae) and to elucidate the antibacterial and antifungal properties of these metabolites. Following the experimental design, two different solvents, ethyl acetate and chloroform, were employed in the synthesis of the secondary metabolites. Among the metabolites obtained using chloroform, OZM-4(K) was found to have the most effective antibacterial effect, as evidenced by the formation of an inhibition zone of 19.17 mm on *Staphylococcus aureus* ATCC 25923 and 17.62 mm on *Escherichia coli* ATCC 2471. OZM22b (E), one of the metabolites obtained by using ethyl acetate, demonstrated the most effective antibacterial effect, with an inhibition zone of 26.03 mm on *Bacillus subtilis* ATCC TCC6051U and 16.91 mm on *S. aureus*. It was established that OZM22b (K) exhibited the most pronounced antifungal activity against *Candida albicans*, manifesting as an inhibition zone of 12.33 mm. It was established that the metabolite derived from OZM14 (E) exhibited a pronounced antifungal effect on *C. albicans*, manifesting as an inhibition zone of 18.26 mm. The insecticidal effects on *D. micans* pest metabolites obtained using ethyl acetate showed mortality rates between 13% and 80% in larvae. Total metabolites obtained using chloroform showed mortality in larvae at a rate of 13% to 93%. In this context, the results obtained showed that the determination of the insecticidal effects of secondary metabolites obtained from EPFs on both human pathogenic bacteria and fungi, as well as the spruce pest *D. micans*, demonstrated that these compounds, derived from natural sources, have potential applications in agriculture and health.

Keywords: Antimicrobial, Entomopathogenic fungus, Insecticidal, *Metarhizium*, Microbiology, Secondary metabolite

Abstract

In this study, undoped ZnO and different amounts of Al doped ZnO (AZO) thin films were prepared on glass substrates by sol-gel spin-coating method. In order to see the effects on the structural properties, morphology and optical properties of the films, the initial precursor concentration was changed by adding Al at 1%, 3%, 5% and 7%. The films were characterized by UV-vis transmittance measurements, X-ray diffraction (XRD) and scanning electron microscopy (SEM-EDS). In addition, ZnO and AZO thin films produced by sol-gel spin-coating technique were analyzed with the contact angle device. XRD measurements revealed that all the obtained films were polycrystalline with hexagonal structure. Absorption and transmittance measurements were taken to determine the forbidden energy band gap of the prepared undoped and doped ZnO thin films. The absorption spectrum of ZnO and AZO thin films varies significantly with Al content, especially in the 300-400 nm UV region. All films have high transmittance in the visible range (400-800 nm) at 85-95%. The optical band gap of all films was investigated by measuring the optical absorbance depending on the wavelength and was found to be between 3.2-3.3 eV. In addition, SEM analysis was performed to obtain a detailed understanding of the surface morphology of the thin films. The elemental composition was examined by EDX. The SEM image of Al-doped ZnO reveals a more homogeneous and smoother structure compared to undoped ZnO. Surface contact measurements were determined to support the SEM analysis for surface morphology (roughness). The change in contact angle indicates the increase or decrease in the surface roughness of the film. The results are consistent with the SEM images.

Keywords: Aluminum-doped zinc oxide (AZO), Sol-gel spin coating method, Transparent conductive oxide (TCO), Contact angle.

Abstract

Let G be a simple connected and undirected graph with n vertices. The energy of a graph is defined as the sum of the absolute values of all eigenvalues of the adjacency matrix of graph. For vertices u,v in $V(G)$, the distance $d(u,v)$ is the length of the shortest path between u and v in G. A topological index is a number related to graph which is invariant under graph isomorphism. Distance based topological indices TI and to each topological index associated a general extended adjacency matrix A_{TI} can be represented in the form $TI=TI(G)=\sum_{u\sim v} f(n_u(e)n_v(e))$ where for a given edge $e=uv$, the quantity $n_u(e)$ denotes the number of vertices closer to u than v, the quantity $n_v(e)$ denotes the number of vertices closer to v than u, and $A_{TI} = (f_{uv})$, here $f_{uv} = f(n_u(e)n_v(e)$ if $u\sim v$, $f_{uv} = 0$ otherwise, respectively. Let G_1 and G_2 be two graphs. Their product (Cartesian product, corona product, strong product, lexicographic product) also is a graph. In this study, we obtain the distance based eigenvalues and energy of product of two graphs from the eigenvalues of the given graphs.

Keywords: Distance, Co-PI energy, Corona Product, Graph products, Graph Theory.

Özet

Bu çalışma, çilek (Fragaria × ananassa) yaprağı ekstresi kullanılarak çevre dostu bir altın nanoparçacık (AuNP) sentez yönteminin geliştirilmesini ve bu nanoparçacıkların potansiyel biyomedikal uygulamalar açısından karakterizasyonunu amaçlamıştır.
Yeşil sentez yöntemi, fenolik bileşikler ve flavonoidler açısından zengin olan çilek yapraklarının sıcak su ekstraktı kullanılarak gerçekleştirilmiştir. Bu fitokimyasallar, güçlü antioksidan ve metal indirgeme özellikleri sayesinde 0.1 mM'lik kloroaurik asitten ($HAuCl_4$) Au^{3+} iyonlarının indirgenmesini sağlamış ve oluşan altın nanoparçacıklarının stabilizasyonuna katkıda bulunmuştur. Nanoparçacık oluşumu, karakteristik kırmızı rengin ortaya çıkmasıyla görsel olarak doğrulanmıştır.
Sentez sonrası, altın nanoparçacıklar, santrifüjleme ve etanol ile yıkama işlemleri (örnek:etanol = 1:5 oranında) ile saflaştırılmıştır. Karakterizasyon çalışmaları, transmisyon elektron mikroskobu (TEM), UV–vis spektrofotometresi ve dinamik ışık saçılımı (DLS) teknikleri kullanılarak gerçekleştirilmiştir. TEM görüntüleri, çapları 40–80 nm arasında değişen, çoğunlukla küresel şekilli nanoparçacıklar göstermiştir. UV–vis spektrumunda, AuNP'lerin yüzey plazmon rezonansına karşılık gelen 420 nm'de bir tepe gözlemlenmiştir. DLS analizi ise parçacık boyutu dağılımını doğrulamıştır.
Sonuç olarak, çilek yaprağı ekstresinin, altın nanoparçacıklarının yeşil sentezinde etkili ve sürdürülebilir bir ajan olduğu gösterilmiştir. Elde edilen nanoparçacıkların kolloidal stabilitesi ve boyut aralığı, onları lateral akış testleri ve diğer biyosensör sistemlerinde kullanım için uygun hale getirmektedir. Tanı uygulamalarının ötesinde, farklı uygulama gereksinimlerine göre boyutları ayarlanabilen altın nanoparçacıklar; ilaç taşıma, fototermal terapi, biyo-görüntüleme ve antimikrobiyal uygulamalar gibi alanlarda da benzersiz optik ve yüzey özellikleri sayesinde umut vadeden adaylardır.

Abstract

Cisplatin is an effective chemotherapeutic agent frequently used in the treatment of various cancers. However, it has adverse effects on non-target tissues, including the salivary glands. Baicalin, a flavonoid compound derived from Scutellaria baicalensis, possesses various pharmacological properties, including antioxidant, anti-inflammatory, and cytoprotective effects The aims of this study is to investigate the effects of baicalin on cisplatin-induced parotid gland damage. In this study, twenty-eight adult female rats were divided into four groups as Control (n=6), Baicalin (n=6), Cisplatin (n=8), and Cisplatin + Baicalin (n=8) groups. In the Control group, rats were given vehicle solution (Dimethyl sulfoxide (DMSO)) intraperitoneally (i.p.) for five days. In the Baicalin group, rats were given baicalin (100 mg/kg, dissolved in DMSO) i.p. for five days. In the Cisplatin group, rats were given a single dose of 7 mg/kg cisplatin on day the first day of the experiment and the vehicle solution (DMSO) i.p. daily for five days. In the Cisplatin + Baicalin group, rats were given a single dose of cisplatin (7 mg/kg) on day first day of the experiment, followed by baicalin (100 mg/kg, dissolved in DMSO) i.p. daily for five days. On the sixth day of the experiment, all rats were sacrificed and parotid glands were taken for histological analysis. Cisplatin administration caused a damage in acinar and ductal structures, as well as vascular congestion. However, baicalin treatment notably ameliorated the morphological alterations in the parotid gland induced by cisplatin administration. According to our histological results, baicalin treatment appears to have a protective role on cisplatin-induced parotid gland damage.

Abstract

Black hollyhock (*Alcea rosea* var. *nigra*), a member of the Malvaceae (mallow) family, is native to Asia and has been extensively cultivated across Europe since medieval times. The flowers range in color from deep maroon to almost black and may appear as single or double blooms, typically measuring 3 to 4 inches in diameter. The flower, along with other parts of the plant, has been used in traditional medicine to treat pain, ulcers, wounds, diabetes, and more, largely due to its rich content of anthocyanins, mucilage, flavonoids, and tannins. In this study, fresh flowers were collected from the Tigris River shoreline in Diyarbakır during mid-June, and dried under ambient conditions, and extracted with a methanol-to-water mixture (5:1, v/v). Different concentrations of the flower extract were used to evaluate the *in vitro* cytotoxic effects on healthy lung epithelial (MeT-5A) and two malignant pleural mesothelioma, i.e, biphasic mesothelioma (NCI-H2452) and sarcomatoid mesothelioma (NCI-H2052) cell lines. Cell proliferation in healthy epithelial cells (MeT-5A) was observed at concentrations of 15.625, 31.25, and 62.5 µg/mL, with corresponding cell viability values of 112.05%, 118.01%, and 109.95%, respectively. The strongest anti-proliferative effects were observed in NCI-H2052 and NCI-H2452 cell lines at a concentration of 500 µg/mL, with cell viability reduced to 58.63% and 72.13%, respectively. Remarkably, healthy epithelial cells exhibited no significant signs of cytotoxicity at the given treatments.

Abstract

Valproic acid (VPA), also known as 2-propylpentanoic acid, is a broad-spectrum antiepileptic drug used in the treatment of generalized and focal seizures. Alpha lipoic acid (ALA), due to the functional dithiolane ring in its structure, possesses antioxidant properties. The small intestine is the part of the digestive tract and digestive processes are completed in this tissue.
In this study, we aimed to investigate the effects of ALA against VPA-induced small intestinal damage. The experimental groups were divided into four groups as follows: Control group, VPA given group, ALA given group and VPA+ALA given group. VPA and ALA were given at doses of 500 mg/kg (i.p) and 50 mg/kg (orally) for 15 days, respectively. At the end of the experiment, the tissues were taken, homogenized in cold physiological saline and centrifuged. In supernatants, GSH and TAC levels were found to be decreased whereas LPO, TOS and OSI levels were increased at VPA given group. Administration of ALA reversed these effects in VPA group. We can conclude that ALA ameliorated small intestine damage caused by VPA.

Özet

Tarım ve Orman Şûrası, Türkiye'de tarım ve kırsal kalkınma politikalarının şekillendirilmesine katkı sunmak amacıyla düzenlenen yüksek düzeyli bir istişare platformudur. İlk olarak 1997 yılında yapılan şûranın dördüncüsü 30 Ocak 2025 tarihinde, 16 farklı çalışma grubunun katılımıyla gerçekleştirilmiştir. Bu çalışma amaç, IV. Tarım Orman Şûrası sonuç bildirgesinde yer alan kararların, tarım işletmelerine yönelik sürdürülebilirlik eğilimleri açısından nasıl bir çerçeve sunduğunu değerlendirmektir. Çalışmada, şûra sonucu alınan kararlar tematik olarak gruplandırılmış, bu kararların Birleşmiş Milletler Sürdürülebilir Kalkınma Amaçları (SKA) ile olası ilişkileri incelenmiştir. Çalışma sonucunda özellikle SKA 2 (Açlığa Son) ve SKA 13 (İklim Eylemi) ile bağlantılı başlıklar ön plana çıkmaktadır. Üretim planlaması, su kullanımı, dijitalleşme, iklim uyumu ve kırsal altyapı gibi alanlara yönelik kararların, tarım işletmelerinin sürdürülebilirlik kapasitesine katkı sunabilecek potansiyeller barındırdığı görülmektedir. Bununla birlikte, bazı kararların önceki şûralarda da yer aldığı ve benzer önerilerin tekrarlandığı dikkat çekmektedir. Bu durum, politika belgelerinin uygulanabilirliğinin işletme düzeyinde nasıl yansıdığına dair daha fazla değerlendirme ihtiyacını gündeme getirmektedir. Çalışmada, şûra kararlarının tarım işletmeleriyle ilişkili yönleri öne çıkarılmış ve sürdürülebilirlik hedefleriyle kurulan bağlar üzerine genel bir değerlendirme sunulmuştur.

Anahtar Kelimeler: Üretim planlaması, şûra kararları, sürdürülebilir kalkınma amaçları

Abstract

The growing environmental concerns associated with fossil fuel consumption and the critical demand to decrease carbon emissions have intensified global efforts toward the deployment of clean and sustainable energy systems. In this context, hybrid renewable energy systems (HRES) offer a promising solution for meeting urban electricity demands without relying on conventional, carbon-intensive power generation. This study presents a comparative techno-economic analysis of six different grid-independent HRES configurations designed to meet the annual electricity demand of a city. All configurations were modelled and optimized using HOMER software and include various combinations of generators, PV panels, wind turbines, lithium-ion batteries, and converters. The estimation of key performance indicators, including Net Present Cost (NPC), Levelized Energy Cost (LCOE), Renewable Fraction (RF), and Excess Electricity (EE), was made for each configuration during a 20-year project lifespan under consistent economic and resource assumptions. The third configuration, comprising one generator, 154 wind turbines, 118 MW PV panels, and 11,923 battery arrays, achieved a renewable energy ratio of 71.6%, the lowest LCOE of $0.259/kWh, and an NPC of $2.26 billion. In fully renewable scenarios (fourth and sixth configurations), higher costs (LCOE ranging from $0.375 to $0.611/kWh) and significantly excess production (55.7-69%) were generated. The second configuration minimized excess electricity (10.7%) but relied heavily on PV and generator backup, resulting in a moderate LCOE of 0.319 $/kWh. The results stated that both technical and economic parameters must be comprehensively evaluated in off-grid energy systems. The effective integration of renewable energy resources with adequate storage and backup production units that can be enabled, when necessary, offers a more feasible and sustainable approach than fully renewable but high-cost solutions. Moreover, the findings provide important insights for researchers, investors, and decision-makers involved in the design and implementation of renewable energy systems, particularly at the urban scale or in isolated settlements.

Abstract

The increasing global production of plastics, which are frequently used today, causes plastic pollution. Traditional methods used for the disposal of plastics are inadequate in dealing with plastic pollution. The idea of biodegradation of plastics has been put forward as a new alternative to develop a sustainable approach to this problem, which continues to increase every year. Biodegradation of plastics by insects offers a different alternative to traditional plastic waste management. Insect larvae that can consume plastic materials are called “plastivores”. The ability of plastivore insects to digest plastic is mediated by gut microorganisms. Microorganisms in the insect gut initiate enzyme activity, along with metabolic processes such as oxidation and depolymerization. In this way, polymer plastic slowly degrades into smaller monomers, which are then converted into biomass, carbon dioxide, and water that are then excreted as waste by insect larvae. One of the important benefits of this approach is that insects complete the degradation of plastics in a much shorter time, whereas in natural environments they occur very slowly. In addition, environmental friendliness, minimum cost, and the absence of secondary contamination are also advantages. In addition, plastivore larvae have good utilization and financial value as a source of animal feed. In addition, small plastic particles such as microplastics can be completely degraded into water and carbon dioxide, thus minimizing the adverse effect on the environment. Various studies have investigated the ability of insects from different orders to degrade plastics. Identifying new candidate insects from different species that can degrade plastics will undoubtedly be important in helping solve this problem. In addition, the ability of microorganisms/enzymes isolated from these insects to degrade different types of plastics should be investigated in detail.

Keywords: Plastic waste, Plastivore insects, Pollution.

Abstract

The aim of the study was to investigate the effect of Glaucocalyxin A on cell migration in A549 cell line in which cell migration capacity was induced by TGF- β.
Three replicate MTT assays were performed to determine the IC50 dose of Glaucocalyxin A on A549 cell line. Increasing doses of Glaucocalyxin A were added to 85% confluent cells seeded in 96-well plate. As a result of the analysis, the IC50 dose was measured as 10 µM at 24th and 48th hours of the experiment. After determination of the doses, four experimental groups were formed in 6-well cell culture plates. Our groups were; control group without treatment, T group with 5 ng/mL TGF- β, G group with 10 µM Glaucocalyxin A, T+G group with both 5 ng/mL TGF- β and 10 µM Glaucocalyxin A. In order to evaluate the migration level of the cells, a line was drawn in the wells with a 1000 µl micropipette tip and a wound site model was created. After the cells were checked under an inverted microscope, they were incubated at 37°C and 5% CO2. The experimental groups were examined at 24 hours and 48 hours under an inverted microscope and the images were recorded. Images were evaluated with the help of Image J program.
The wound closure rate of the TGF- β group was significantly higher than that of the control group at 24 and 48 hours ($p<0.001$). The wound closure rate in the G and T+G groups was significantly lower at 24 and 48 hours of the study compared to the control and TGF- β groups ($p<0.001$). Wound site patency in the G group was significantly higher compared to all groups at 24 and 48 hours of the study.
Based on the results we obtained in our study, we concluded that Glaucocalyxin A has an inhibitory effect on cell migration at increasing concentrations and that it can also show this effect in the presence of TGF-β. We believe that further studies are needed to determine the other effects of Glaucocalyxin A on A549 cells.

Keywords: Glaucocalyxin A, Cell migration, A549

Abstract

A tuned mass damper (TMD) is a well-known passive control device widely used in structures located in regions prone to high seismic activity. Its effectiveness in enhancing the seismic energy absorption capabilities of buildings and systems is well recognized across various engineering industries, from automobiles to shipping. However, the impact of TMDs on overall building performance has not been extensively studied. In this research, a TMD device with a 5% mass ratio is integrated into a 7-story reinforced concrete (RC) building. The analysis is conducted using structural finite element software, SAP 2000. The results are compared to those of the building without a TMD. While the TMD does not significantly change the capacity curve of the building, it enhances the performance point by reducing it by 26% compared to the uncontrolled structure. This indicates that TMD systems can be a promising alternative to conventional retrofitting methods.

Keywords: Capacity curve, Pushover nonlinear analysis, Tuned mass damper.

Özet

İç Anadolu Bölgesi floristik yapısının bitki çeşitliliğini içerisinde barındıran Eskişehir, Türkiye bitki çeşitliliği için önemli bir görev üstlenmektedir. Eskişehir, İran-Turan fitocoğrafik bölgesinde yer almasına rağmen yeryüzü şekillerinin çeşitliliği ve jeomorfolojik farklılıklar sebebiyle mikroklimal iklim bölgelerine de sahiptir. Bu nedenle Eskişehir'deki bazı bölgelerde Akdeniz iklimi de gözlemlenmekte, Akdeniz fitocoğrafik bölgesinde doğal olarak yetişmekte olan bitki türleri de gözlenmektedir. Ayrıca, Eskişehir'in bitki çeşitliliği peyzaj çalışmalarına da katkı sağlamaktadır.
Bu çalışma, Eskişehir Sazova Bilim Kültür ve Sanat Parkı'nın floristik yapısı ile ilgili ön bilgileri kapsamaktadır. Araştırma, Ocak 2024 - Ekim 2024 tarihleri arasında on beş günlük periyotlar şeklinde gerçekleştirilmiş olup bitkilerin yapraklı, çiçekli ve meyve/tohum durumları fotoğraflanmış ve toplanmıştır. Daha sonra tür teşhisleri yapılarak floristik yapısı ile ilgili ön bilgilere ulaşılmıştır. İncelemeler sonucunda, Eskişehir Sazova Bilim Kültür ve Sanat Parkı'nın genel floristik yapısına ait tür sayısı bakımından zengin olan bazı familyalar şu şekilde sıralanmaktadır; *Asteraceae, Betulaceae, Brassicaceae, Cupressaceae, Fabaceae, Liliaceae, Pinaceae, Rosaceae, Sapindaceae*

Anahtar Kelimeler: Taksonomi, Park Florası, Kent Ekolojisi, Sazova

The role of microbiome research in improving gut health of farmed species for sustainable disease resistance in aquaculture.

Ulviye Karacalar (https://orcid.org/0000-0002-9093-2324)

Ege University, Fisheries Faculty, Aquaculture Department, Fish Disease Unit, Izmir, Türkiye.

e-mail: ukaracalar@yahoo.com

Abstract

More than 50% of seafood produced worldwide comes from aquaculture, the fastest growing sector in food production (FAO, 2022). However, disease outbreaks and antibiotic use pose serious challenges to sustainability, particularly given the potential for antibiotic resistance genes to spread to other pathogenic systems. According to recent research focused on identifying microbiome species found in the gastrointestinal tracts of fish and shellfish, a large number of bacterial and viral diseases that continuously affect aquaculture and cause major financial losses can be successfully controlled. Aquaculture has recently seen significant advances with the emergence of new insights into the applications of high-throughput sequencing, metagenomics, and probiotics as well as pro- and prebiotics. This research aims to focus on the current state of research on the impact of the gut microbiome in farmed fish and shellfish on nutrient metabolism, immune regulation and disease prevention, while summarizing genetic and technological innovations introduced for microbiome manipulation (probiotics, prebiotics, synbiotics and sustainable feeds) and early pathogen detection, particularly on the basis of sustainability.

Keywords: Aquaculture microbiome , gut health, disease resistance, sustainable aquaculture

Effects of sustainable diets such as insect-based, essential oil-supplemented and single-cell protein on disease resistance in aquaculture

Ulviye Karacalar (https://orcid.org/0000-0002-9093-2324)

Ege University, Fisheries Faculty, Aquaculture Department, Fish Disease Unit, Izmir, Türkiye.

e-mail: ukaracalar@yahoo.com

Abstract

Aquaculture is one of the fastest growing sectors and has the potential to contribute to sustainable food production in the future. However, with the intensification of production, the sector has been faced with disease outbreaks that cause global losses exceeding US$ 6 billion per year, and serious problems such as antimicrobial resistance (AMR) and environmental pollution due to antibiotics and chemical treatments have also faced significant limitations in sustainable production. In response to these problems, many researchers have succeeded in developing sustainable feed alternatives that not only meet nutritional demands but also provide health benefits to farmed aquatic animals. Studies have shown that the use of alternative ingredients in feed ingredients (especially insect-based proteins, essential oil (EO) supplements and single-cell proteins (SCPs)) contributes to both environmental sustainability and a significant increase in the potential to increase host disease resistance. Key findings show that insect feeds increase survival rates against bacterial infections through their immune-stimulating effect, essential oils exhibit broad antimicrobial activity and single-cell proteins significantly increase antiviral resistance. The aim of this research is to evaluate the immunomodulatory and antimicrobial effects of sustainable feeds in aquaculture species and to present current studies on promising feed ingredients that could be alternatives to fishmeal-based diets.

Keywords: Aquatic animals, insect-based feed, essential oil-supplemented, antimicrobial effects, immunomodulatory

Özet

Birincil alüminyum üretiminin yüksek enerji tüketimi ve çevresel etkileri, geri dönüştürülmüş (ikincil) alüminyum alaşımlarının kullanımını teşvik etmektedir. Ancak, bu tür alaşımların yapısal ve kimyasal safsızlıkları, malzeme özelliklerini olumsuz etkileyebilmektedir. Literatürde nadir toprak elementlerinin (Rare Earth Elements, REE) A356 tipi alüminyum alaşımı üzerindeki mikro yapı ve mekanik özelliklere etkisi araştırılmış olsa da, korozyon davranışına etkileri sınırlı sayıda çalışmayla ele alınmıştır. Üstelik mevcut çalışmalarda elde edilen bulgular arasında belirgin bir tutarsızlık bulunmakta olup, farklı REE ilavelerinin oranlarına bağlı etkilerin sistematik ve detaylı bir şekilde incelenmesine duyulan ihtiyaç devam etmektedir. Bu doğrultuda yürütülecek kapsamlı araştırmalar, hem akademik literatüre hem de alaşım geliştirme süreçlerinde uygulamaya yönelik sanayiye önemli katkılar sağlayacaktır. Bu çalışma, geri dönüştürülmüş A356 alaşımına farklı oranlarda La, Sc, Ti ve Zr eklenmesiyle elde edilen mikroyapısal değişimlerin, alaşımın korozyon performansı üzerindeki etkilerini sistematik olarak ortaya koymayı amaçlamaktadır.

Çalışmada, çeşitli mikroalaşım kombinasyonları hazırlanarak, numuneler %3,5 NaCl içeren asidik ortamda ASTM G31 standardına uygun olarak daldırma tipi korozyon testine tabi tutulmuştur. Bulgular, La ilavesinin belirli oranların üzerinde intermetalik faz oluşumunu teşvik ettiğini, bu fazların mikroyapıda heterojen dağılımı nedeniyle galvanik hücre oluşumunu artırarak korozyon direncini azalttığını göstermiştir. Öte yandan, Sc elementinin özellikle Zr ile birlikte kullanıldığında tane yapısını rafine ettiği ve korozyon hızını önemli ölçüde düşürdüğü tespit edilmiştir. %0,1 Sc + %0,2 Zr içeren numunede ölçülen 0,07177 mm/yıl korozyon hızı, tüm kombinasyonlar arasında en iyi performansa işaret etmektedir. Kıyas olması bakımından SAA-A356 alaşımı 0,76264 mm/yıl korozyon hızına sahiptir. %0,1 Sc + %0,2 Zr içeren numunede, korozyon hızında yaklaşık %90,6 oranında iyileşme sağlanmıştır.

Bu çalışma, literatürde eksikliği hissedilen bir alana katkı sunarak, geri dönüştürülmüş alüminyum alaşımlarının sürdürülebilirliğini artıracak yeni mikroalaşımlama stratejilerinin geliştirilmesine bilimsel zemin hazırlamaktadır. Ayrıca, mikroalaşımlama işleminin ilave tezgah yatırımı gerektirmemesi, özellikle ikincil alüminyum alaşımları (SAA) gibi düşük maliyetli hammadde grupları açısından bu yöntemi endüstriyel uygulamalar için tercih edilebilir ve uygulanabilir bir çözüm haline getirmektedir.

Anahtar Kelimeler: Al-Si döküm alaşımı, İkincil alüminyum alaşımı, Korozyon davranışı, Nadir toprak elementleri

Abstract

Wound dressings play a vital role in shielding wounds from external contaminants, preserving a moist environment that promotes healing, and supporting a faster recovery process. Among advanced wound dressings, hydrogel films have gained attention due to their tunable properties and ability to act as platforms for the co-delivery of various therapeutic agents. In our study, we developed chitosan (CH) and polyvinylpyrrolidone (PVP)-based hydrogel films loaded with silver nanoparticles (AgNPs) and vancomycin hydrochloride (VH) as a co-delivery platform for wound dressing applications, prepared via the solvent casting method. CH, a naturally derived biopolymer, has been extensively studied for such applications owing to its biodegradability, biocompatibility, hemostatic effect, and antimicrobial activity. AgNPs possess excellent physical and chemical stability, along with strong bactericidal properties. In this study, AgNPs were synthesized *in situ* via a green method using CH as a natural reducing and stabilizing agent, avoiding toxic-reducing reagents. To enhance mechanical strength, the synthesized AgNPs-CH nanocomposite was blended with PVP, a synthetic, water-soluble polymer widely used in wound dressings for its excellent biocompatibility and film-forming ability. VH is a glycopeptide antibiotic was incorporated to target gram-positive bacteria.

The successful synthesis of AgNPs-CH was confirmed by a visible color change from light yellow to dark yellow, and UV-Vis spectroscopy revealed a characteristic surface plasmon resonance absorption band at ~425 nm, indicative of spherical AgNPs. The chemical structure of the resulting hydrogel films was confirmed by FTIR analysis. All films demonstrated favorable swelling behavior at pH 7.4 and 37 °C. *In vitro* release studies demonstrated a sustained release profile of VH from the composite films.

In summary, our findings demonstrate that the AgNPs-CH/PVP-VH film is a suitable candidate for development as a multifunctional wound dressing platform.

Abstract

In this study, the essential oil composition of *Chenopodium botrys* L. was analyzed separately from its aerial parts and seeds using Gas Chromatography-Mass Spectrometry (GC-MS). The components of the essential oils obtained from both parts were identified based on peak area percentages, and the major constituents were determined. *C. botrys* is an aromatic plant reported to possess various biological activities such as antimicrobial, anti-inflammatory, and anticancer potential. The composition of essential oils derived from the aerial parts and seeds is significant for understanding the variation in these biological effects and the plant's potential applications. Findings revealed both similarities and notable differences between the essential oil profiles of different plant parts.

According to the GC-MS results, the seed essential oil contained 22 components, with the major ones being 2,3-Dimethylpentane (43.5%), Cyclopentane, methyl- (8.32%), Elemol (11.16%), and β-Eudesmol (4.93%). In contrast, the aerial part oil yielded 19 components, with Cyclopentane, methyl- (52.56%), Elemol (16.10%), and 4,4-Dimethyladamantan-2-ol (6.02%) identified as the main constituents. Cyclopentane, methyl- was found in both parts in significant amounts, being particularly dominant in the aerial oil. Notably, 2,3-Dimethylpentane was only detected as a major compound in the seed oil. Additionally, sesquiterpene alcohols such as Elemol and Selina-6-en-4-ol were major components in both oils, indicating their potential therapeutic relevance.

These compositional differences suggest that the biosynthetic pathways of *C. botrys* may vary between aerial and seed tissues, potentially affecting the pharmacological properties of their essential oils. Both oils exhibit rich chemical profiles with key constituents such as Cyclopentane, methyl-, Elemol, Selina-6-en-4-ol, and β-Eudesmol, which highlight the pharmaceutical and industrial potential of the plant. The data obtained provide a valuable basis for further studies on the bioactive properties and possible therapeutic uses of *Chenopodium botrys* essential oils.

Keywords: *Chenopodium botrys*, essential oils, GC-MS, aerial parts, seeds, chemical composition

Abstract

Water pollution has become an increasingly serious global challenge that threatens both human health and the environment [1]. Among pollutants, dyes released from textile industries are particularly concerning due to their complex chemical structures and resistance to degradation [2]. Remazol Red, a reactive dye extensively used for dyeing cellulose-based fibers, is characterized by its high solubility and bright color, which can cause severe environmental pollution if discharged untreated into water bodies [3]. Adsorption has been widely recognized as an effective and cost-efficient method for removing dyes from aqueous solutions, offering operational simplicity and high removal efficiency [4].
In this study, natural zeolite was utilized as an adsorbent to investigate the removal of Remazol Red dye from aqueous solutions under varying experimental conditions, including temperature (25°C, 35°C, and 45°C), pH (2, 3, and 4), and adsorbent dosage (0.1, 0.3, and 0.5 g/100 mL). The adsorption kinetics were analyzed using pseudo-first-order and pseudo-second-order models, while Langmuir and Freundlich isotherm models were applied to describe the equilibrium behavior of dye adsorption on zeolite. The results obtained in this study indicate that natural zeolite can be considered an environmentally friendly, reusable, and cost-effective adsorbent for the removal of Remazol Red dye from aqueous solutions, showing promising performance in terms of adsorption efficiency, kinetic behavior, and equilibrium modeling.

Keywords: Remazol Red, Zeolite, Adsorption Kinetics, Isotherm Models, Dye Removal.

Abstract

The consumption of organic foods has gained increasing attention due to rising concerns about health, food safety, and environmental sustainability. This study aimed to explore the relationships between organic food consumption, food choice motivations, and food neophobia among adults living in Kırklareli, Türkiye. A total of 506 individuals aged 18–64 years participated in the study. Data were collected through a structured questionnaire including sociodemographic characteristics, the Food Choice Questionnaire (FCQ), the Turkish version of the Food Neophobia Scale (T-FNS), and the Organic Food Consumption Scale (OGTÖ). Descriptive findings showed that the majority of participants had a moderate level of organic food consumption and expressed motivations related to health, natural content, and ethical concerns. Correlation analyses revealed positive associations between organic food consumption and motivations such as health, natural content, ethical concerns, weight control, and personal identity. Additionally, a positive relationship was found between organic food consumption and trust in new foods, whereas willingness to try new foods was negatively associated. These findings suggest that although individuals may view organic products as beneficial and trustworthy, unfamiliarity or food neophobia may limit their openness to novel food products. In conclusion, organic food consumption appears to be influenced by a combination of health-driven, value-based, and psychological factors. Understanding these motivations may support the development of targeted nutrition education strategies that promote sustainable and informed dietary choices.

Abstract

Plastic waste has begun to pose serious threats to aquatic environments and human health with the increasing use of plastics. Most plastic materials can persist in the environment for hundreds of years under suitable conditions, leading to long-term pollution. As plastics degrade, microplastics (particles smaller than 5 mm) and even smaller nanoplastics (less than 1 µm) are released into ecosystems, raising growing environmental concerns. This project aims to remove nanoplastics from water through adsorption using two different adsorbents: powdered activated carbon (PAC) and Sepabeads SP-207, a commercial ion exchange resin. Activated carbon was chosen for its high surface area and porous structure, which enhances its adsorption potential. Sepabeads SP-207, composed of a hydrophobic aromatic polymer structure, was selected for its strong affinity toward organic pollutants. Batch adsorption experiments were performed with 1 µm polystyrene nanoplastics under controlled laboratory conditions. The equilibrium data fitted best to the Freundlich isotherm model for both adsorbents, indicating heterogeneous multilayer adsorption. Kinetic analyses revealed that the adsorption behavior of SP-207 followed a pseudo-second-order model, suggesting chemisorption, while PAC followed a pseudo-first-order model, suggesting physical adsorption. According to equilibrium results, SP-207 exhibited a removal efficiency of 73.46%, while PAC achieved 69.07%. These results demonstrate that both materials are effective, though they operate via different adsorption mechanisms. The results of this study emphasize the effectiveness of adsorbent technologies in combating water pollution and provide forward-looking solutions in the field of environmental protection and sustainability. This important research is a significant step toward leaving a cleaner and healthier environment for future generations.

The role of swimming exercise in preserving uterine and ovarian reserves in a DSS-induced chronic ulcerative colitis mouse model

İshak Gökçek[1*] (*ORCID: https://orcid.org/0000-0002-0590-6405*)

Abstract

In this study, the effects of exercise on ovarian reserves and uterine lipid peroxidation were investigated in mice with chronic colitis. Fifty female Balb-c mice were randomly divided into five groups of ten animals each: Control (C), Colitis (CLT), Exercise (EX), Colitis+Exercise (CLT+EX), and Colitis+Sulfasalazine (CLT+SSZ). The experimental period lasted for thirty-five days. Chronic colitis was induced in the mice by adding 1.5% Dextran sulphate sodium (DSS) to their drinking water, following three cycles of 5 days of DSS administration followed by 5 days of regular drinking water. Also, in the CLT+SSZ group, sulfasalazine (10 mg/kg) was administered regularly for thirty-five days to the animals in which colitis was induced. The swimming exercise protocol was applied to the animals for thirty-five days, one hour per day, five days a week. At study completion, blood samples were collected to assess AMH levels, and uterine tissues were analyzed for malondialdehyde (MDA) concentrations. The findings revealed a statistically significant reduction in AMH levels in the CLT group ($p=0.007$). Moreover, uterine MDA concentrations were markedly elevated in the CLT group, whereas MDA levels in the CLT+EX group were comparable to those observed in the control group, with no significant difference noted ($p=0.001$). In conclusion, moderate-intensity swimming exercise has the potential to reduce ovarian lipid peroxidation and to exert protective effects on ovarian reserves. Nevertheless, further comprehensive analyses are warranted to elucidate the underlying molecular mechanisms.

Abstract

Completing projects in the most efficient way with limited resources is of great importance, especially in dynamic and time-pressured areas such as the construction sector. In this study, optimization was performed by considering time and cost criteria for a construction project within the scope of multi-objective project scheduling. In the study, instead of classical heuristic algorithms, a mathematical programming-based approach was adopted; project planning was modeled within the framework of Crashing, Deadline and Budget techniques. The developed model was solved in the GAMS (General Algebraic Modeling System) program and alternative scenarios that provide time-cost balance were evaluated. The most appropriate solution was determined, especially in terms of shortening activity periods (crashing), project delivery time (deadline) and budget limitations. The model aimed to minimize both the total project duration and cost under the specified constraints, and realistic and applicable results were obtained in this direction. When we crashed, the minimum duration was found to be 202 days, and the cost for this day is 106,293,100,000 TL. When we increase the duration to 230 days, our cost becomes 78,293,100,000 TL. When we make the duration 260 days, our minimum cost becomes 48,293,100,000 TL. The results of the study were supported by the optimization results obtained through the GAMS software and a solution proposal with sectoral applicability in terms of project management was presented. This approach provides an effective reference model for decision makers who want to evaluate time and cost constraints simultaneously in engineering projects.

*savastaerzeynep@gmail.com:

Özet

Su, yaşam ve endüstriyel süreçler için hayati önem taşıyan temel bir doğal kaynaktır; bu nedenle ulusal kalkınmada temel bir rol oynamaktadır. Önümüzdeki yıllarda, küresel nüfusun %40'ının su kıtlığı stresiyle karşı karşıya kalacağı tahmin edilmektedir. Su kıtlığı, küresel ekonomiyi ve insanlığın geçim kaynaklarını etkileyen en önemli endişe kaynağıdır. İklim değişikliği, hızlı nüfus artışı, tatlı su kirliliği ve tükenmesi durumu daha da kötüleştiren faktörler arasındadır. Henüz kapsamlı bir şekilde kullanılmamış olsa da atıksuyun ıslahı ve yeniden kullanımı, bu sorunu hafifletmek için potansiyel mekanizmalar olarak kabul edilmektedir.

Suyun güvenli bir şekilde yeniden kullanılabilmesi için, atıksuyun farklı alanlarda yeniden kullanım amaçlarına uygun, iyi kalitede atıksu elde edilmesi için yeterince arıtılması gerekir. Geri kazanılan atıksu, alternatif bir su kaynağı görevi görerek doğal su kaynakları üzerindeki baskıyı azaltmaktadır.

Tarım, ortalama su tüketiminin %80'ini oluşturan en yoğun su sektörüdür. Sonuç olarak, su kaynaklarının tarım ve diğer sektörler için etkin ve sürdürülebilir bir şekilde yönetilmesi için entegre su kaynakları yönetimi gerekmektedir. Özellikle, alternatif su kaynakları arasında yer alan arıtılmış atıksuyun yeniden kullanımı, sürdürülebilir, iklim açısından akıllı ve dayanıklı bir tarım sisteminin elde edilmesine katkıda bulunmaktadır.

Arıtılmış atıksuyun tarımsal sulamada kullanılması, su kıtlığıyla başa çıkmada etkili bir strateji olarak yaygın olarak kabul edilmekte ve dünya çapında ilgi görmektedir. Tatlı su kaynaklarını korumanın yanı sıra, bu uygulamanın kimyasal gübrelerin yerini alabilecek besinlerin sağlanması ve böylece politantların hassas su kaynaklarına deşarjını azaltmak da dahil olmak üzere çeşitli avantajları vardır. Bu iki yönlü fayda için, arıtılmış atıksuların tarımda kullanılması, yoğun tarım alanlarında yeraltı sularını korumak için iyi bir strateji olarak kabul edilebilir.

Bu çalışma kapsamında, alternatif kaynak olarak değerlendirilebilecek olan arıtılmış atıksuların uygun kaliteye getirildikten sonra yeniden kullanımı konusu çalışılmıştır. Birçok alanda kullanım imkânı olan arıtılmış atıksuların sulama ihtiyacının fazla olması nedeniyle özellikle tarım sektöründe yeniden kullanılması değerlendirilmiştir.

Anahtar kelimeler: Atıksu, geri kazanım, yeniden kullanım, tarımsal sulama.

Abstract

Amiodarone (AMD) is a class III antiarrhythmic drug and due to its iodine containing structure, AMD tends to accumulate in many organs. AMD can generate oxidative stress by forming reactive oxygen products. White cabbage (*Brassica oleracea* L. var. capitata) is one of the most consumed vegetables in the world and has important antioxidant potential due to its rich phytochemical content. The small intestine is a part of the digestive system and digestive processes are completed in this tissue.
In this study, we aimed to investigate the effects of white cabbage aqueous extract against AMD-induced small intestinal damage. The experimental groups were divided into four groups as follows: Control group, white cabbage aqueous extract given group, AMD given group and AMD+white cabbage extract given group. AMD and white cabbage aqueous extract were given at doses of 50 mg/kg (orally) and 500 mg/kg (orally) for 7 days, respectively. At the end of the experiment, the small intestine tissues were taken, homogenized in cold physiological saline and centrifuged. In supernatants, glutathione levels were found to be decreased whereas lipid peroxidation levels, catalase and xanthine oxidase activities were increased at AMD given group. Administration of white cabbage aqueous extract reversed these effects in AMD group. We can conclude that white cabbage ameliorated small intestine damage induced by AMD.

Abstract

Breast cancer is classified into multiple molecular subtypes based on the status of hormone receptors (estrogen receptor (ER) and progesterone receptor (PR)) and HER2 (ERBB2), with large differences in response to therapy and prognosis. TNBC (triple-negative breast cancer) is the subtype with the highest mortality rates. Pyroptosis is a regulated pro-inflammatory cell death mechanism resulting in the formation of membrane pores mediated by gasdermin (GSDM) proteins. Certain pro-inflammatory molecules such as IL-18 can be released from these gasdermin pores to the extracellular space. Here, I studied how the transcript levels of gasdermin family of genes (6 members present in humans: GSDMA-F) differ between TNBC and non-TNBC, using publicly available TCGA-BRCA transcriptomics dataset. I found that the expression of GSDMC and GSDME was increased; in contrast, the expression of GSDMD was decreased in TNBC compared with non-TNBC. I further investigated ER-, PR-, and HER2-dependent changes in the mRNA expression of GSDMC, GSDMD and GSMDE in breast tumors from patients. I observed decreased GSDMC mRNA expression in breast tumors with ER-positive and PR-positive status than in those with ER-negative and PR-negative status, respectively. In contrast, HER2-positive breast tumors had higher expression of GSDMC compared to HER2-negative breast tumors, at the transcript level. Unlike GSDMC, the mRNA expression of GSDMD was higher in ER-positive and PR-positive breast cancer samples than in ER-negative and PR-negative samples, respectively. I found that GSDME transcript levels were lower in ER-positive breast tumors compared to ER-negative breast tumors. Finally, I showed that breast tumors from premenopausal women had slightly higher transcript levels of GSDME than breast tumors from postmenopausal women. Combined, this study points to the possible differences in pyroptotic cell death between TNBC and non-TNBC, and also between different breast cancer subgroups defined based on hormone receptor (ER, PR) and HER2 status.

Abstract

Onobrychis species are widely recognized among medicinal and aromatic plants for their high phenolic content and significant antioxidant potential. Onobrychis oxyodonta, one of these species growing naturally in various regions of Turkey, was evaluated in this study in terms of its biological activity. This study aimed to evaluate the total phenolic and flavonoid contents, as well as the antioxidant and anticancer potential of the methanolic extract obtained from this plant. The total phenolic and flavonoid contents of the extract were determined as 70.24 ± 0.58 mg GAE/g and 26.43 ± 0.36 mg QE/g, respectively. Antioxidant capacity was calculated using the FRAP method as 98.75 ± 0.21 µg TE/g, and DPPH radical scavenging activity was IC_{50}: 27.39 ± 1.34 µg/mL. Anticancer activity was evaluated on A549, Calu1, and H1650 lung cancer cell lines and the Beas2B normal lung epithelial cell line. GI_{50} values below 10 µg/mL in all cancer lines indicate strong growth inhibitory activity. TGI values were 179.88 µg/mL (5FU: 105.40) in A549, 78.70 (5FU: 98.51) in Calu1, and 4.86 (5FU: 97.74) in H1650. Calu1 and H1650 cells showed superior inhibition compared to 5FU. LC_{50} values above 500 µg/mL in all cell lines indicate low general cytotoxicity. In Beas2B cells, the extract's TGI was 454.67 µg/mL, compared to 112.19 µg/mL for 5FU, suggesting lower toxicity in normal cells. The Tumor Selectivity Index (TSI) was >2, confirming selective toxicity toward tumor cells. Membrane integrity and cytotoxicity assays showed that the extract induced higher toxicity (10.9–29.6%) than 5FU in all lines except A549, with 5FU showing 6.7–10.9% toxicity. These results suggest that Onobrychis oxyodonta extract has strong anticancer potential and may provide selective cytotoxic effects with lower toxicity in normal cells.

Keywords: Anticancer potential, Antioxidant activity, *Onobrychis oxyodonta*, Tumor selectivity ındex (TSI).

Abstract

This study aimed to identify, patotype, serotype, and determine the antibiotic susceptibility of an *Escherichia coli* isolate recovered from a cat urine sample. For the purpose, a 16-year-old male cat presented to Erciyes University Faculty of Veterinary Medicine, Department of Internal Medicine, with the complaint of dysuria. Clinical examinations and hemogram analysis revealed elevated WBC levels, and a diagnosis of cystitis was made. Urine sample was collected via cystocentesis and subjected to bacteriological analysis at the Department of Microbiology. The sample was inoculated on 7% sheep blood agar and MacConkey agar, and the media incubated aerobically, microaerophilically, and anaerobically at 37°C for 24-72h. Following incubation, colonies were evaluated, and pure culture was obtained. In the phenotypic identification of the isolate, Gram staining, motility, oxidase, catalase, and carbohydrate-fermentation tests were performed. *E. coli* species-specific PCR was used for molecular identification. Multiplex PCR was used to detect Uropathogenic *E. coli* (UPEC) pathotypes and serogroups. The disk diffusion method was used to determine antibiotic susceptibility. As a result of phenotypic tests and molecular analyses, the isolate was identified as *E. coli*. In UPEC analysis, it was revealed that the isolate was not UPEC. As a result of UPEC analysis, it was revealed that the *E. coli* isolate was not UPEC. In serogrouping, it was determined that the isolate was not included in the 4 serogroups tested. In the antibiotic susceptibility, the isolate was determined to be resistant to 9 out of 14 antibiotics. Treatment commenced with meropenem at 12mg/kg q12h/14. Complete blood counts monitored on days 1 and 7 showed WBC levels of 23.5×10^9/L and 18.9×10^9/L, respectively, indicating clinical improvement. In conclusion, performing antimicrobial susceptibility testing for *E. coli*, an important etiological agent in urinary tract infections, determining pathotypes/serogroups, and then selecting appropriate antibiotics to start treatment are beneficial for successful therapeutic outcomes.

Abstract

The effective removal of cadmium ions from water is a growing environmental concern due to the toxic and bioaccumulative nature of Cd(II). In this study, a series of mercapto-functionalized silica xerogels were synthesized via a facile, ambient-pressure sol-gel method using tetraethyl orthosilicate (TEOS) and varying molar ratios (20–60%) of 3-mercaptopropyltrimethoxysilane (MPTMS) as a sulphur-containing organosilane. The incorporation of MPTMS into the silica matrix was confirmed by FTIR spectroscopy, and SEM imaging revealed a uniform, interconnected porous structure. Nitrogen sorption analysis showed mesoporous characteristics with surface areas exceeding 300 m^2/g and porosity greater than 85%. Batch adsorption experiments were conducted to evaluate the materials' performance in Cd(II) removal from aqueous solutions. The results indicated rapid adsorption kinetics and high removal efficiency (>95%), especially for samples with higher thiol content. The strong affinity between Cd(II) ions and thiol (-SH) groups suggests that chemisorption is the dominant mechanism. These findings demonstrate the potential of mercapto-modified silica xerogels as highly efficient and regenerable adsorbents for cadmium remediation in water treatment applications, offering a sustainable strategy for mitigating heavy metal pollution.

Abstract

The adoption of millimeter-wave (mmWave) sensors is rapidly growing in diverse sectors, driven by their low power requirements, small footprint, and effectiveness in applications like object detection and tracking. In this study, we present the development of a short-range mobility detection system based on W-band mmWave radar technology, specifically operating in the 76–81 GHz frequency range, where commercial single-chip integrated circuits are available. The proposed system is capable of detecting multiple moving targets—such as humans, animals, and vehicles—in real time and at varying distances. Designed for use in environments with high mobility, it features simultaneous multi-object tracking and reliable positional data output to a central computing unit. The system maintains low power consumption and offers a flexible, integrated architecture that can be adapted to both portable and fixed installations. To enhance the system's performance, we investigate gain optimization in a patch antenna array configuration. We analyse the S-parameters and radiation patterns of a reference antenna through both simulation and experimental measurements, ensuring design accuracy and validating the radar's effective coverage. A wide operational bandwidth underpins high-resolution detection, and an intuitive interface allows users to set detection thresholds, range limits, and speed windows. The resulting platform offers a compact, energy-efficient, and high-precision solution for mobility sensing, with clear potential in smart-city infrastructure, security, and real-time monitoring applications.

Abstract

Acinetobacter lwoffii (*A. lwoffii*) is an opportunistic pathogen that causes infections in humans and animals. In this study, it was aimed to characterize A. lwoffii isolates from necropsy materials (lungs, liver, spleen, and abscessed lymph nodes) of 4 different sheep. The necropsy materials brought to Erciyes University, Faculty of Veterinary Medicine, Department of Microbiology Laboratory were subjected to bacteriological analysis and for this purpose, 7% defibrinated sheep blood agars were inoculated from necropsy materials. The inoculated media were incubated in aerobic, microaerobic, and anaerobic environments at 37°C for 24-48 hours. After incubation, convex, gray-white, and S-type colonies were evaluated. It was obtained the pure cultures of colonies on blood agar. Phenotypic identification of isolates was performed by Gram staining, motility test, and biochemical tests. In molecular identification, 16S rRNA gene sequence analysis using 27F and 1492R primers was used. Enterobacterial Repetitive Intergenic Consensus Sequence-Based Polymerase Chain Reaction (ERIC-PCR) was performed to genotype the recovered *A. lwoffii* isolates. The Kirby-Bauer disk diffusion method determined the susceptibility to amoxicillin+clavulanic acid, ampicillin, ciprofloxacin, erythromycin, gentamicin, and tetracycline of the isolates. As a result of the cultural examination, four isolates from sheep necropsy samples were identified as *A. lwoffii* by phenotypic/molecular analysis. In the result of ERIC-PCR used for genotyping, it was determined that all 4 A. lwoffii isolates exhibited different ERIC profiles. In the antibiotic susceptibility test, 2 (50%), 2 (50%), and 1 (25%) of 4 *A. lwoffii* isolates were found to be resistant to erythromycin, gentamicin, and ampicillin, respectively. In conclusion, considering the different ERIC profiles and antibiotic resistance, *A. lwoffii* may be thought the etiological agent of various infections in sheep.

Keywords: *Acinetobacter lwoffii*, antibiotic susceptibility, ERIC-PCR, identification, sheep necropsy material.

Abstract

Cattle farming play a vital role in meeting the human demand for animal-based food products. In cattle farming, the primary objectives include maintaining an optimal herd size, applying effective culling and selection strategies, and ensuring productivity by achieving a minimum of one calf per cow per year and raising healthy offspring. The achievement of these objectives is closely associated with improvements in animal welfare, supported by evidence-based husbandry practices that promote healthy physiological development, high standards of well-being, productivity, and long-term sustainability. According to various international frameworks, animal welfare is assessed based on four core principles: appropriate housing, sufficient nutrition, good health, and the ability to express natural behaviours-each supported by specific evaluation criteria. In assessing calf welfare, key indicators include the absence of prolonged hunger and thirst; access to a comfortable and thermally appropriate resting environment; freedom of movement; absence of injury and disease; minimization of pain resulting from management procedures; the ability to express social and species-specific behaviours; the capacity to experience positive emotional states; and the presence of positive human-animal interactions. This study aims to explore the specific welfare criteria used in evaluating the well-being of calves.

Keywords: Behaviour, calf, health, nutrition, housing.

Abstract

While the advancement of technology has brought about benefits such as prolonging human lifespan and enabling the production of faster and higher-quality industrial products, it has also undeniably triggered certain problems in parallel. The nourishment of an increasing population and the contamination of natüre, particularly agricultural lands, by industrial waste serve as notable examples. Among the major pollutants, heavy metals reach agricultural soils through both anthropogenic activities and natural processes, thereby hindering the development of crop plants such as wheat, which is a primary dietary staple for humans. Polyvinyl alcohol (PVA), due to its biodegradability, high water retention capacity and negligible toxicity to living organisms, finds extensive application across various fields ranging from biomedical science to the paper industry, food packaging, and the textile sector. Literature indicates that the growth of various plants cultivated in soil mixed with PVA is promoted compared to those grown in non-PVA-containing soil. In this study, the effects of varying concentrations of PVA on two different wheat cultivars (*Triticum aestivum* L. cv. Müfitbey and *Triticum aestivum* L. cv. Nacibey) grown under lead (Pb) stress in a hydroponic system were investigated. For this purpose, groups were established as Pb (0.5 mM, 1.5 mM, 3.0 mM), PVA (5 ppm, 50 ppm, 500 ppm), and Pb+PVA (0.5 mM+5 ppm, 1.5 mM+50 ppm, 3.0 mM+500 ppm) and the plants were subjected to 10 days of germination followed by 10 days of growth in Hoagland nutrient solution. Analyses of hypocotyl and radicle lengths, chlorophyll contents, relative water contents were performed on plant seedlings that completed 20-day growth.

Abstract

With the increase in population, the resulting rise in industrial pollution and excessive use of agricultural lands negatively affect ecosystem health, leading to reductions in food production and nutritional problems. Heavy metals from various sources such as industrial waste, fertilizers, pesticides, and airborne pollutants contaminate agricultural lands, degrading soil and water quality and hindering healthy crop development. In particular, pollution caused by pesticides and heavy metals reaching farmlands through natural or anthropogenic activities restricts plant growth and reduces yield. Heavy metals like lead (Pb) are elements with high atomic numbers and densities. Due to their bioaccumulation properties, they accumulate in living organisms and cause cytotoxic effects. Their presence in the human body through the food chain leads to chronic toxicity and causes neurological and organ damage, threatening public health. Polyvinyl alcohol (PVA) is a synthetic polymer with high hydrophilicity and low toxicity to living organisms and it is biodegradable. It is widely used in medical devices, paper, textiles and food packaging. According to the literature, plant growth is supported in environments containing PVA. In this study, the effects of varying PVA concentrations on two wheat cultivars (*Triticum aestivum* L. cv. Müfitbey and *Triticum aestivum* L. cv. Nacibey) grown under Pb stress in a hydroponic system were investigated. Treatment groups included Pb (0.5 mM, 1.5 mM, 3.0 mM), PVA (5 ppm, 50 ppm, 500 ppm) and Pb+PVA combinations (0.5 mM+5 ppm, 1.5 mM+50 ppm, 3.0 mM+500 ppm). Plants underwent 10 days of germination followed by 10 days of growth in Hoagland nutrient solution. After 20 days, seedlings were analyzed for glutathione content, glutathione *S*-transferase activity and total protein content.

Abstract

Polycystic ovary syndrome (PCOS) is one of the leading causes of female infertility. In this study, the effects of PCOS and the direct in vitro kisspeptin application on the expression of genes concerning steroidogenesis, estrogen receptors and inhibin in the granulosa cells were investigated via qRT-PCR method. . This study was approved by The Clinical Studies Ethical Committee of Ondokuz Mayis University via decision numbered 2019/724 with the date of 19/01/2019. The samples were obtained from 32 patients,16 of which are PCOS and 16 are non-PCOS patients. Half of the granulosa cells collected from the patients were applied with in vitro Kisspeptin-54. The groups were formed as 16 patients in the Control and Control-Kiss groups and 16 patients in the Pcos and Pcos-Kiss groups. It was found that serum and follicular fluid KISS1 level are significantly higher in PCOS group in comparison to the Control group ($p=0,017$; $p<0,05$; $p=0,0004$; $p<0,001$). The ESR1nad ESR2 gene expressions were significantly higher in the PCOS group in comparison to the Control group ($p<0,05$). Between the Kisspeptin applied groups, the ESR1 and 2 gene expression were significantly higher in PCOS-Kiss group in comparison to Control-Kiss group ($p<0,05$). Regarding FSHR gene expression change, the PCOS group was significantly lower in comparison to the Control group ($p<0,05$). Between the Kisspeptin-54 appplied groups, in terms of FSHR gene expression, PCOS-Kiss group was significantly lower in comparison to the Control-Kiss group ($p<0,05$). In terms of LHCGR gene expression change, PCOS group and PCOS-Kiss were significantly higher in comparison to Control group and Control-Kiss group ($p<0,05$). The results of this study indicates that direct in vitro kisspeptin application affects the expression of steroidogenic and gonadotropin receptor gene expressions in non-PCOS and PCOS granulosa cells and thus its intraovarian application can alleviate the follicular atresia encountered in these patients.

Abstract

This study aimed to investigate the effects of different LED light spectra (white, red, and blue) on the total phenolic and flavonoid contents of fenugreek (Trigonella foenum-graecum L.) microgreens grown under controlled environmental conditions. By keeping variables such as temperature and substrate constant, the role of light quality on the biochemical properties of microgreens was isolated and evaluated. Seeds were first germinated in darkness, and upon sprouting, containers were exposed to white, red, or blue LED lights under a 16-hour light / 8-hour dark photoperiod. Standard light intensity was maintained across all treatments. Harvested plant samples (10 g) were pulverized using an ultra-centrifugal mill and subjected to Soxhlet extraction with acetone or water as solvents. Extracts were filtered, concentrated with a rotary evaporator, and freeze-dried to obtain high-yield crude extracts. The total phenolic content, expressed as gallic acid equivalents (GAE), varied significantly among treatments. The highest phenolic content was observed in the acetone extract of fenugreek microgreens grown under blue LED light (231.41 ± 5.69 mg GAE/100 g), followed by the acetone extract of those grown under red LED light (210.85 ± 5.00), and the acetone extract of those grown under white LED light (204.71 ± 1.90). Water extracts showed lower phenolic levels, with the water extract of microgreens grown under blue LED light (147.71 ± 4.18) being the highest among them. Regarding total flavonoid content (quercetin equivalents), the acetone extract of microgreens grown under red LED light (631.80 ± 11.60) demonstrated the highest concentration, followed by the acetone extract of those grown under white LED light (509.35 ± 8.52) and the acetone extract of those grown under blue LED light (398.42 ± 5.14), indicating that red light in combination with acetone extraction was most effective in accumulating flavonoids. Again, water extracts contained markedly lower flavonoid content, with the water extract of microgreens grown under red LED light (73.84 ± 2.56) showing the lowest. These findings suggest that LED light quality significantly influences the accumulation of phenolic and flavonoid compounds in fenugreek microgreens. Red and white LED lights, particularly when paired with acetone extraction, enhanced the phytochemical richness of the microgreens, indicating potential strategies for improving their functional food value.

Abstract

This study aimed to evaluate the antioxidant activities of leaf and fruit extracts of *Cotoneaster coriaceus* Franch. using the DPPH (2,2-diphenyl-1-picrylhydrazyl) radical scavenging assay. Plant materials were collected, dried, and powdered. Extraction was performed using Soxhlet apparatus with three solvents of differing polarities: acetone, ethyl acetate, and water. The antioxidant activities of the obtained extracts were analyzed spectrophotometrically based on their ability to scavenge DPPH free radicals at various concentrations. The results demonstrated that the antioxidant capacities of the extracts varied significantly depending on both the plant part and the solvent used. Among all samples, the acetone extract of the leaves exhibited the strongest activity, with the lowest IC_{50} value of 10.55 µg/mL. This extract showed a rapid increase in activity between 12.5 µg/mL and 50 µg/mL, reaching over 92% inhibition and maintaining this level at higher concentrations, indicating an early saturation point. The acetone extract of the fruit also exhibited strong activity (IC_{50} = 31.15 µg/mL), with inhibition values sharply rising from 22.99% at 12.5 µg/mL to 91.70% at 100 µg/mL, followed by a plateau. In contrast, ethyl acetate extracts from both parts demonstrated weaker antioxidant activity at low concentrations but improved significantly at higher doses, reaching around 89% inhibition at 400 µg/mL. Water extracts showed moderate activity. Leaf water extract rose from 26.10% inhibition at 12.5 µg/mL to 89.85% at 400 µg/mL, showing a marked increase after 100 µg/mL. Similarly, fruit water extract exhibited a gradual rise, peaking at 89.61% at the highest tested concentration. In conclusion, *C. coriaceus*, particularly its leaf acetone extract, possesses significant antioxidant potential. These findings suggest that this species could serve as a promising natural source of antioxidants for pharmaceutical or nutraceutical applications.

Measuring Perceived Accessibility: The Role of Subjective Experiences in Transportation Planning

Zehra Özçelik (*ORCID: https://orcid.org/0009-0009-0108-1635)*

Yıldız Technical University, Faculty of Architecture, Department of City and Regional Planning, İstanbul, Türkiye.

zehra.ozcelik@yildiz.edu.tr

Abstract

Objective accessibility criteria based solely on spatial data are insufficient for understanding the impact of transportation systems on the daily life experiences of city dwellers. This study focuses on the concept of perceptual accessibility, which goes beyond the limitations of traditional measurements to examine individuals' perceptions of their ability to lead a satisfying life using transportation systems. Perceived accessibility encompasses individual assessments such as access to desired activities via a specific mode of transportation, the ease of performing these activities, and the ability to maintain overall quality of life (Lättman et al., 2016; Pot et al., 2024).

Within the scope of the research, survey data collected from 183 participants was used to evaluate individuals' patterns of transportation system use, their access to daily life activities, and the impact of this access on their quality of life. The study aimed to measure individuals' perceptions of their experiences in scenarios they imagined using different modes of transportation, based on personal statements.

The collected data were analyzed in SPSS. Descriptive statistics, Pearson correlation analysis, reliability testing (Cronbach's Alpha = 0.70), and exploratory factor analysis (EFA) were performed, demonstrating that perceived accessibility represents a multi-layered user experience.

The results demonstrate how dimensions that cannot be measured objectively can emerge from the user perspective, highlighting the need for transportation policies to be shaped with a more holistic approach aimed at reducing social exclusion, enhancing subjective well-being, and promoting the adoption of sustainable transportation modes. The usability of perceptual accessibility criteria in policy monitoring and evaluation processes is particularly high when assessing goals aimed at reducing car dependency and visions such as “the ease of living without a car.”

This study aims to contribute to the development of user-centered and more equitable urban transportation solutions by providing insights into how individuals perceive their environment, rather than focusing solely on physical accessibility, within the field of urban planning.

Keywords: Perceived accessibility, transportation modes, daily life activities, survey, SPSS

Abstract

Bemisia tabaci, belonging to the Aleyrodidae family, is commonly known as the tobacco whitefly or sweet potato whitefly. First described by Gennadius (1889) in Greece, this species is one of the leading agricultural pests worldwide. Currently, at least 24 distinct biotypes are recognized. MEAM 1 and MED biotypes are the most notable due to the significant agricultural damage they cause globally. This study aimed to identify the biotypes of *B. tabaci* populations distributed in the southwestern provinces of Türkiye. To this end, a total of 360 individuals were collected, with 60 individuals sampled from each of six different provinces. DNA samples extracted from these individuals were subjected to partial amplification of the mitochondrial cytochrome oxidase I gene, followed by sequencing of the amplified region. The obtained sequences were analysed using the NCBI Nucleotide BLAST tool for biotype identification. Three biotypes (MEAM 1, MED Q1, and MED Q2) were identified across the six studied provinces. According to the results, the population in İzmir consisted entirely of MED Q1 (100%). In Aydın, 88% were MEAM 1 and 12% were MED Q1. In Muğla, 75% were MED Q2 and 25% were MEAM 1. Based on these findings, among the 180 individuals from the Aegean region, 38% were MEAM 1, 37% MED Q1, and 25% MED Q2. In the Mediterranean region, the population in Antalya was composed of 50% MED Q2 and 50% MEAM 1; in Mersin, all individuals were MEAM 1; and in Adana, 80% were MEAM 1, 12% MED Q1, and 8% MED Q2. Accordingly, among the 180 individuals from the Mediterranean region, 77% were MEAM 1, 19% MED Q2, and 4% MED Q1. Based on all results, it was determined that the MEAM 1 biotype is the dominant biotype in both the Aegean and Mediterranean regions of southwestern Türkiye.

Özet

Fotosentetik bir mikroorganizma olan mikroalgler, kök, gövde ve yapraktan yoksun olan en ilkel bitki türleridir.Sucul sistemlerde birincil besin zincirinin büyük bir bölümünü oluşturan mikroalgler hem tatlı sularda hem de deniz sistemlerinde yaygın olarak bulunurlar. Chlorella, Spirulina ve Scenedesmus genellikle tatlı su mikroalgleri, Dunaliella, Nannochloropsis ve Isochrysis ise bazı deniz mikroalg türleridir. Bu derlemede, sürdürülebilir bir üretim için mikroalglerin biyolojik rolleri ve biyoteknolojik potansiyelleri hakkında güncel bir genel bakış sağlanması amaçlanmıştır. Mikroalgler tarafından sentezlenen çoklu doymamış yağ asitleri, karotenoidler, fikobiliproteinler, peptitler, steroller, polisakkaritler, fenolik bileşikler, vitaminler, mikosporin benzeri amino asitler ve alkaloidlerin sağlık, kozmetik ve fonksiyonel gıdalardaki uygulamaları, biyoyakıt üretimi ve depolama kararlılığını artırmayı amaçlayan gelişmiş teknolojiler, endüstriyel atıklar, boyalar, pestisitler ve ilaçlar gibi kalıcı dirençli kirleticilerin yeni teknolojik ilerlemeler (örneğin, nanoteknoloji) ile biyoremediasyon sürecinin sürdürülebilirliği ve uygulanabilirliği, oksijen eksikliğiyle artan hastalıkların tedavisinde mikroalg bazlı biyomalzemelerin geliştirilmesi, fosil yakıtlara bağımlılığın azaltılmasında temiz enerji üretimi için sürdürülebilir bir kaynak olarak mikroalglerin kullanılmasının uygulanabilirliği, küresel karbon azaltma stratejilerinin temel bir bileşeni olarak mikroalg temelli tekniklerin potansiyeli ve mikroalglerin antioksidan aktiviteleri konularına odaklanılmıştır.

Abstract

Insect haemocytes are multifunctional cellular components that play essential roles not only in classical immune responses – such as phagocytosis, encapsulation, nodule formation, and melanisation- but also in non-immune physiological processes including tissue repair, hypoxia adaptation, vitellogenin and ferritin transport, apoptotic cell clearance, and haematopoietic niche formation. The number and types of haemocytes vary depending on insect species, developmental stage, and physiological conditions. Major haemocyte types are prohemocytes, plasmatocytes, granulocytes, spherule cells, and oenocytoids. These haemocytes collectively regulate both humoral and cellular immune pathways through the coordination of antimicrobial peptide synthesis, coagulation, reactive oxygen species production, and immune signalling. Among these, granulocytes have received increasing attention for their versatile roles in immunity. As spherical, granule-rich cells, granulocytes are typically the first to encounter pathogens and initiate immune responses by exocytosing granules that activate other haemocytes, particularly plasmatocytes, and facilitate capsule or nodule formation via opsonin-like factors. Resembling vertebrate macrophages, granulocytes exhibit high phagocytic capacity, elevated lysosomal activity, and strong expression of immune-related genes. Recent findings also suggest that granulocytes may contribute to long-term immune protection in insects, mimicking adaptive-like memory responses. The aim of this review is to give an in-depth primer on insect haemocyte functions, with a special focus on the emerging immunological significance of granulocytes. Taken together, this review highlights the immunological versatility of insect haemocytes and proposes new perspectives for investigating innate immune memory in invertebrates.

Keywords: Insects, haemocyte, granulocytes, immune responses

Özet

Ekosistemde bulunan canlı türlerinin çeşitliliği ne kadar fazla ise o ekosistemin direnci de dolaylı olarak o kadar fazladır ancak son yıllarda Türkiye'de de biyoçeşitlilik ve endemizm ciddi tehlike altındadır. Biyosferdeki antropojenik bozulmalar, sanayileşme hızı, tarım, artan nüfus, hızlı ve çarpık kentleşme ve madencilik stres ve tahribat faktörleri oluşturarak ekolojik ve çevresel sorunlara sebep olmaktadır. İklim, tahribatın sıklığının ve yoğunluğunun artması ve yerli türlerin rekabet özellikleri sonucunda, birçok farklı yollarla ortama yerleşen yabancı türler yerli türlerle rekabete girip alana yerleşerek, zamanla biyolojik istilalara sebep olmakta, İstilacı türlerin rekabette üstün gelmesi ve yayılmacı yapısıyla zamanla biyoçeşitlilik ve endemizm yok olmaktadır. Çalışmamızın amacı Samsun ili sınırları içinde yayılım gösteren istilacı yabancı tür *Cirsium arvense* L. in Grime'in CSR (Rekabetçi, strese- dirençli, ruderal) metodu kullanılarak ana ve ara stratejiler halinde sınıflandırılmasıdır. Grime (1977), bitkileri ekolojik faktörleri dikkate alarak sınıflandırmaya çalışmıştır. Bunu yaparken de başlıca stres ve tahribat faktörlerine karşı bitkilerin geliştirdikleri cevapları, dikkate almıştır. Buna göre bitkileri Rekabetçi (C), Strese- toleranslı (S) ve Ruderal (R) olmak üzere üç gruba ayırmıştır. Ancak bitki türleri sadece bu üç grup halinde sınıflandırılmamakta, çok sayıda ara stratejiler de göstermektedirler. Bu sınıflandırmaya dayanarak türlerin Grime stratejilerinin hangilerini benimsedikleri belirlenmiştir. Bu çalışma kapsamında öncelikle Samsun ilinde bulunan yedi adet farklı habitat Nebiyan Dağı, Kocadağ, Balaç köyü, Deniz kenarı, OMÜ Gölet, OMÜ Prof. Dr.Tahsin Tuncalı Parkı ve Bafra Kuş Cenneti'ne gidilmiştir. Bu bölgelerde bitki bireylerinin ayrı ayrı kanopi boyu, lateral yayılma durumu, çiçeklenme başlangıcı, çiçeklenme periyodu, kuru yaprak ağırlığı, yaş yaprak ağırlığı, spesifik yaprak alanı, yapraktaki kuru madde içeriği belirlenmiştir. Çalışma sonucunda; Deniz kenarı,,OMÜ Gölet, Kocadağ, Nebiyan Dağı ve OMÜ Prof. Dr. Tahsin Tuncalı Parkı'nda Rekabetçi (R)strateji ve Strese- toleranslı/ Rekabetçi Strateji (SC), Bafra Kuş Cenneti ve Balaç Köyü'nde ise Rekabetçi Strateji (R) ve Rekabetçi/ Ruderal Strateji göstermektedir. StrateFy yöntemine göre ise Strese- toleranslı strateji göstermiştir. İstilacı yabancı bitkilerle mücadelede, bitkinin stratejisini bilmek mücadelenin birinci adımıdır.

Anahtar Kelimeler: CSR stratejileri, Stres, Tahribat, *cirsium arvense*

Özet

Yara iyileşmesi sürecinin karmaşıklığı ve yüksek enfeksiyon riski nedeniyle enfeksiyonu önleyebilecek, hücre canlılığını destekleyebilecek ve iyileşme sürecini hızlandırabilecek özellikte yara örtülerine duyulan ihtiyaç giderek artmaktadır. Bu açıdan bakıldığında doğadan elde edilen biyopolimerler ve bitkisel ekstreler, sahip oldukları antimikrobiyal ve biyolojik özellikler sayesinde yara iyileştirme uygulamalarında dikkat çekmektedir. Bu çalışmada, doğadan elde edilen *Cinchona* (Kınakına) ekstresi ve Arap zamkının biyolojik ve antimikrobiyal potansiyelleri, yeni nesil bir yara örtüsü tasarımında değerlendirilmiştir. Bu kapsamda ilk olarak PVA/kitosan/Arap zamkı içeren çözeltilerin 3B biyoyazıcı ile basılabilirlikleri değerlendirilmiştir. Optimum formülasyon belirlendikten sonra basılan yara örtülerinin üzerine ikinci katman olarak PCL/*Cinchona* ekstresi elektrosprey yöntemiyle püskürtülmüş ve elde edilen çift katmanlı yapının karakterizasyonları gerçekleştirilmiştir. Bitki ekstraksiyonu maserasyon yöntemi ile gerçekleştirilmiş ve ekstrenin antioksidan kapasitesi DPPH analizi ile maksimum %94.04 radikal giderme oranı olarak tespit edilmiştir. Karakterizasyon çalışmaları kapsamında FTIR analizi, her iki tabakada da karakteristik fonksiyonel grupların başarılı bir şekilde entegre edildiğini; SEM analizi ise yara örtüsü yüzeylerinin düzgün bir yapıya sahip olduğunu göstermiştir. Yara örtüsünün antimikrobiyal etkinliği *Staphylococcus aureus* ve *Escherichia coli* suşlarına karşı disk difüzyon yöntemi ile değerlendirilmiş; inhibitör zon çapları sırasıyla 14.2 mm ve 12.8 mm olarak ölçülmüştür. Elde edilen bulgular, doğadan elde edilen malzemelerle geliştirilen bu çift katmanlı yapının, fonksiyonel ve antimikrobiyal özellikleri sayesinde yara örtüsü uygulamalarında etkin bir alternatif olabileceğini göstermektedir.

Abstract

In this study, a machine learning-based approximate model was developed to accurately predict the electrical performance of dual optical element concentrated photovoltaic (CPV) systems. The model was built based on a total of 25 different CPV configurations composed of various combinations of primary and secondary Fresnel lenses. For each configuration, the inter-lens distance (L_d) was systematically varied, and approximately 220 experimental data points were collected under two different solar irradiance levels (G = 500 and 1000 W/m²). Key optical and geometrical parameters, including concentration ratios (C_1, C_2), f-numbers (f_1, f_2), and inter-lens distance, were used as input features for the model. The extensive dataset was processed using the XGBoost regression algorithm combined with the MultiOutputRegressor approach to simultaneously predict short-circuit current (I_{sc}) and open-circuit voltage (V_{oc}). Additionally, Optuna was employed for hyperparameter optimization to enhance model accuracy.The developed model successfully captured the complex nonlinear relationships between optical design parameters and the electrical outputs of the CPV system, achieving high prediction accuracy. This capability enables rapid and reliable evaluation of system performance without the need for extensive physical prototyping and long-duration experiments. Through virtual experiments and parametric studies, the proposed approach facilitates design optimization and provides valuable insights for the development of high-performance dual optical element CPV systems.

Keywords: CPV System, Fresnel Lens, Optical Parameter, XGBoost, Machine Learning.

Özet

Endüstriyel seramik üretimde hammadde maliyetlerinde hedeflenen iyileşme ve artan çevre bilinciyle uyumlu üretim süreçlerin geliştirilmesi amacıyla bu çalışma planlanmıştır. Seramik endüstrisi gibi kaynak tüketimi yoğun olan sektörlerde, üretim sırasında ortaya çıkan atıkların yeniden değerlendirilmesi hem doğal kaynakların korunması hem de işletme maliyetlerinin düşürülmesi açısından büyük önem taşımaktadır. Seramik karolar, sahip oldukları üstün mekanik dayanım, kimyasal etkilere karşı gösterdikleri direnç ve düşük su emme oranları gibi özellikleri sayesinde inşaat sektöründe vazgeçilmez yapı malzemeleri arasında yer almaktadır. Ancak bu ürünlerin üretim süreçlerinde ortaya çıkan atıkların değerlendirilmemesi, hem çevresel anlamda kirliliğe yol açmakta hem de işletmeler için önemli bir ekonomik yük oluşturmaktadır. Bu nedenle, seramik endüstrisinde atık yönetimi ve geri dönüşüm uygulamaları giderek daha fazla önem kazanmaktadır. Bu çalışmada, seramik karo üretiminde kullanılan ve zamanla atık haline gelen fırın rulolarının yeniden değerlendirmesi için karolarda kullanımı denenmiş ve standart karolar ile karşılaştırılmıştır. Fırın rulo atıklarının, yüksek sıcaklığa dayanıklı yapıları sayesinde seramik karolarda alternatif hammadde olarak kullanılabilme potansiyeli incelenmiştir. Elde edilen verimli bulgular sonucunda karo yüzeylerinde kaplama uygulamaları ile bazı özelliklerin geliştirilebileceği tespit edilmiştir. Çalışma kapsamında, standart seramik karo reçetesine belirli oranlarda fırın rulo atığı eklenerek örnekler hazırlanmıştır. Üretilen karolar üzerinde temas açısı ölçümleri, renk analizleri, su emme testleri, mekanik dayanım testleri ve taramalı elektron mikroskobu (SEM) analizleri gerçekleştirilmiştir. Sonuçlar, uygun miktarda fırın rulo atığı ilavesinin karoların mekanik özelliklerini iyileştirdiğini göstermiştir. Bu bulgular, atık malzemelerin geri kazanımının hem ekonomik hem de çevresel açıdan avantaj sağladığını ortaya koymaktadır. Sonuç olarak, bu araştırma, seramik endüstrisinde sürdürülebilir üretim için yenilikçi ve uygulanabilir bir yaklaşım sunmaktadır.

Anahtar Kelimeler: Seramik hammaddeleri, Karo, Sürdürülebilir üretim, Karakterizasyon.

Linking Forest Management to Water Treatability: Improved Coagulation Performance Following Silvicultural Activities in Forested Watershed

Habibullah Uzun (*https://orcid.org/0000-0001-7675-0885)*

Department of Environmental Engineering, Istanbul Technical University, Istanbul, Türkiye

uzunh@itu.edu.tr

Abstract

This study examines the impact of silvicultural forest treatments, including thinning, regeneration, and controlled burns (Prescribed [Rx] burnings), on the treatability (i.e., enhanced alum coagulation) of dissolved organic carbon (DOC) and related water quality parameters within a 155-hectare experimental forest (WS 77) located in the Santee Experimental Forest, South Carolina (SC). Watershed 80 (WS 80), which remained untreated by fire or other interventions, served as a control. Raw water samples were collected from two distinct periods: before treatment in 2016, when only prescribed burning was conducted, and post-treatment in 2024, following four different treatment methods. The study examined various parameters related to water quality (WQ) and treatability, including DOC, dissolved organic nitrogen (DON), specific ultraviolet absorbance (SUVA), turbidity, and ultraviolet absorbance at 254 nm (UV_{254}). Following the implementation of silvicultural treatment (2019-2022), the efficiency of removal in WS 77 exhibited a marked improvement, rising from an average of 45% in 2016 to 65% in 2024. However, an increase in $SUVA_{254}$ in the raw water was observed, indicating a shift towards more aromatic DOC species, which are more effectively removed through alum-coagulation. Raw water turbidity decreased by over 50%, likely due to reduced surface erosion and organic matter mobilization in WS 77. Overall, WS 80 exhibited only modest changes during the same period, highlighting the role of Forest management in modifying DOC characteristics conducive to alum-coagulation. These findings align with recent literature indicating that low-intensity fire regimes promote the formation of aromatic, humic-like dissolved organic matter (DOM) and decrease hydrophilic DOC fractions that resist coagulation. This study offers field-based evidence that silvicultural activities, including prescribed burning (Rx), can effectively source water protection strategies, enhancing coagulation performance and reducing the demand for treatment chemicals. Continued molecular characterization of dissolved organic matter is recommended to elucidate further fire-induced shifts in natural organic matter (NOM) composition and optimize treatment processes.

Keywords: Forest Management, Water Treatment, Enhanced Coagulation, DOC

Aspergillus fumigatus ERG6 Protein Modelinin Antifungal Ajanlarla Moleküler Etkileşim Analizi

Sinem Koçer*[1] (ORCID:https://orcid.org/0000-0003-0517-7422)

*[1] İstanbul Yeni Yüzyıl Üniversitesi, Eczacılık Fakültesi, Eczacılık Teknolojisi Ana Bilim Dalı, İstanbul

*Corresponding author e-mail: sinem.kocer@yeniyuzyil.edu.tr

Özet

Aspergillus fumigatus, bağışıklık sistemi baskılanmış bireylerde alerjik ve kronik akciğer patolojilerine neden olan en yaygın ve fırsatçı hava mantarı patojenidir. Mantar zarında bulunan ergosterol, zar akışkanlığı düzenlemesi, integral proteinlerin aktivitesi, hücre döngüsünün kontrolü gibi çok sayıda biyolojik işlevde görev alır. Bu nedenle, ergosterol biyosentezi, bu organizmanın hayatta kalması için kritik olduğundan bu yolaktaki enzimler antifungal tedavilerde önemli hedeflerdendir. Bu çalışmada, ergosterol biyosentezinde görev alan sterol 24-C-metiltransferaz (AfERG6, UniProt ID: Q4W9V1, NCBI Protein ID: XP_746550) proteini hedeflenmiştir. ERG6'nın üç boyutlu yapısı AlphaFold üzerinden modellenmiştir. Chimera 1.13.1 programı ile 1000 adımda (steepest descent) minimizasyonu yapılmış ve yapısal doğrulama analizleri (ERRAT, Verify3D, Ramachandran plot grafiği ve ProSA-web) ile modelin güvenilirliği değerlendirilmiştir. ERRAT genel kalite faktörü 94,5652 olup yüksek yapısal güvenilirlik göstermiştir. Verify3D analizine göre rezidülerin %88,06'sı kabul edilebilir 3D-1D skoru sağlamıştır. Ramachandran plot sonuçları, rezidülerin %92,3'ünün en uygun bölgede yer aldığını göstermiştir. ProSA-web analizi ise −8,18 Z-skoru ile modelin deneysel protein yapılarıyla uyumlu olduğunu ortaya koymuştur. Tüm validasyon sonuçları değerlendirildiğinde oluşturulan AfERG6 modelinin moleküler yanaştırma analizleri için uygun olduğu tespit edilmiştir. Potansiyel bağlanma cepleri DogSiteScorer ile belirlenmiş ve en yüksek ilaçlanabilirlik skoruna sahip bölge (Drug Score: 0,81) seçilmiştir. Bu hedef bölgeye yönelik olarak, üç antifungal ajan— Posakonazol, Terbinafin, Flusitozin — ile moleküler yanaştırma çalışmaları SwissDock üzerinden AutoDock Vina metodu kullanılarak gerçekleştirilmiştir. Moleküler yanaştırma analizleri, en güçlü bağlanmanın −8.152 kcal/mol ile Terbinafin tarafından gerçekleştirildiğini ortaya koymuştur. Flusitozin, −5,258 kcal/mol bağlanma enerjisi ile göreceli olarak daha zayıf bir etkileşim sergilemiştir. Öte yandan, Posakonazol için hesaplanan pozitif bağlanma enerjisi (3,746 kcal/mol), hedef proteinle düşük affiniteli veya uygun olmayan bir etkileşimi işaret etmektedir. Elde edilen bu veriler, özellikle Terbinafin'in AfERG6 proteini ile etkileşim potansiyeli açısından umut verici bir aday olabileceğini göstermektedir. Ancak, bu sonuçlar ön tahmin niteliğinde olup, farklı bağlanma ceplerinde yapılacak ileri düzey moleküler yanaştırma analizleriyle desteklenmesi gerekmektedir.

Abstract

Hypericum perforatum is a widely recognized medicinal plant known for its antimicrobial, anti-inflammatory, and antioxidant properties. Recently, its potential immunomodulatory effects have garnered attention, particularly in experimental models such as *Galleria mellonella*, an invertebrate increasingly used to investigate innate immune responses. The choice of *G. mellonella* in such research is especially valuable, as its immune system shares notable similarities with that of vertebrates and supports the 3R principles by offering an ethical, cost-effective alternative to vertebrate models. The study using this model have shown that *H. perforatum* extract can influence phenoloxidase activity and the expression of antimicrobial peptides like hemolin and gallerimycin, suggesting its ability to modulate immune signaling and effector mechanisms. Larvae reared under controlled conditions were injected with four doses of *H. perforatum* extract, and immune responses were evaluated 24 hours post-injection. Hemolymph samples were collected to assess total hemocyte counts, phenoloxidase and antioxidant enzyme activities, as well as encapsulation and melanization responses using standard light microscopy-based and spectroscopic techniques. *Hypericum perforatum* administration modulated immune responses in *G. mellonella* in a dose-dependent manner, with higher doses significantly enhancing strong encapsulation and lower doses promoting strong melanization responses. The results indicate that *H. perforatum* modulates hemocyte count in a dose-dependent manner, with moderate concentrations significantly increasing total hemocyte numbers, while the highest concentration showed no immunostimulatory effect, suggesting a potential shift toward immunosuppression or tolerance at elevated levels. However, despite these cellular immune modulations, *Hypericum* extract did not exhibit a measurable effect on DPPH radical scavenging activity in *G. mellonella* hemolymph, indicating limited systemic antioxidant impact under the tested conditions. These findings suggest that *H. perforatum* may act as a dose-dependent immunomodulator in *G. mellonella*, enhancing cellular immune responses at moderate concentrations while showing potential immunosuppressive effects at higher doses.

Keywords: *Hypericum perforatum*, *Galleria mellonella*, DPPH, immune responses

Abstract

This study investigates the cytotoxic and antimicrobial activities of methanolic extracts derived from *Cystoseira foeniculacea* and *Sargassum vulgare*, two edible brown algae collected from the Mediterranean Sea. Cytotoxic effects were assessed on HepG2, MCF-7, and MDA-MB-231 cell lines, while antimicrobial activity was evaluated against clinically relevant bacteria and yeast strains. *Cystoseira foeniculacea* exhibited potent antiproliferative effects, particularly on HepG2 (IC_{50}: 35.25 µg/mL) and MCF-7 (IC_{50}: 105.5 µg/mL) cells. In contrast, *Sargassum vulgare* displayed limited cytotoxicity but demonstrated selective antimicrobial activity against *Enterococcus faecalis* and *Candida albicans*, with MIC values of 128 µg/mL and 512 µg/mL, respectively. Both extracts were ineffective against Gram-negative bacteria. The findings highlight species-specific therapeutic potential and support further investigation of these macroalgae as sources of multi-target natural products. Future work should focus on bioactivity-guided fractionation and *in vivo* validation.

Keywords: *Cystoseira foeniculacea, Sargassum vulgare*, cytotoxicity, antimicrobial activity, methanolic extract, macroalgae

Abstract

The sexual development is an important mechanism in life which, is subject to the spatial and temporal expression of numerous genes. One of these genes, designated as DMRT1 (Doublesex and Mab-3 Related Transcription factor 1), is homologous to the DSX gene of *Drosophila melanogaster* and the MAB-3 gene of Caenorhabditis elegans. The DMRT1 gene encodes a transcription factor containing a conserved zinc finger domain, which is involved in sex determination and differentiation. Despite its vital function, the studies related to the evolution of this gene are limited. In this study we investigated evolution of the dmrt1 gene across various lineages of the Anatolian water frogs complex (*Pelophylax*). This group consists of recently diverged lineages (*Caralitanus, Cerigensis*, Cf. *bedriagae* and *Euphrates*) and olderly diverged lineages (*Cilician* and *Ridibundus*). This high genetic and phylogenetic diversity make them a valuable model for studying molecular evolution of genes. In the present study, we amplified and sequenced the coding sequence of the Dmrt1 sex gene. This analysis involved the analysis of five exons, with a total length of 1005 base pairs, from six lineages of the Anatolian water frog complex, including both male and female individuals. The analysis of the DNA sequences of the Dmrt1 was performed at both nucleotide and amino acid levels. Sequencing results revealed that the coding sequences of the Dmrt1 gene obtained from both female and male individuals from each lineage were found to be identical. Furthermore, the position of conserved motifs, including the DM domain, the male-specific motif and the P/S-rich element, was identified throughout the coding sequence of the gene. The resulting phylogenetic trees demonstrated that the Dmrt1 gene is highly conserved between closely and distantly related *Pelophylax* lineages, including one or two SNPs. These findings contribute to a deeper understanding of the evolution of sex-determination genes in amphibians and lay the groundwork for future research on other sex-determining genes.

Keywords: Dmrt1 gene, sex gene, *Pelophylax*, water frog, Anatolia

Abstract

Clean and renewable alternative energy sources are needed because fossil-based energy sources have limited reserves and cause environmental problems. The growing demand for energy with the rise of renewable sources, requires more efficient energy storage devices. Lithium-ion batteries (LIBs) have become essential due to their high energy density and long cycle life. The choice of electrode materials is crucial, as it directly affects LIB performance. While graphite is widely used, its relatively low theoretical capacity limits battery performance. Metal oxides offer higher capacities but suffer from volume expansion and poor cycling stability. Two-dimensional materials like graphene oxide (GO) can enhance the electrical performance of metal oxides in composites. In this study, graphite was first converted to GO using a modified Hummers method and then nitrogen-doped by hydrothermal treatment with urea. Binary and ternary N-doped GO (N-GO) based metal oxide composites (MnO_2, NiO, V_2O_5) were synthesized with hydrothermal method, ensuring homogeneous distribution of metal oxides in the N-GO matrix. The composites were characterized by SEM, Raman spectroscopy, XRD, and XPS, confirming uniform nanometer-scale distribution, crystalline phases, and successful nitrogen doping. Electrochemical performance was evaluated by cyclic voltammetry and galvanostatic charge-discharge tests in button cells.The N-GO/NiO binary hybrid anode showed a high initial discharge capacity of 520 mAh/g at 100 mA/g, retaining 480 mAh/g after 50 cycles, reflecting NiO's high theoretical capacity. In contrast, the N-GO/V_2O_5 binary hybrid anode exhibited a lower initial capacity of 250 mAh/g and 220 mAh/g after 50 cycles, consistent with V_2O_5's lower theoretical capacity. The N-GO/NiO/V_2O_5 hybrid composite anode (20 wt% N-GO, 40 wt% NiO, 40 wt% V_2O_5) achieved 410 mAh/g initially and 370 mAh/g after 50 cycles, surpassing graphite. These results demonstrate the promise of N-GO-based hybrid metal oxide composites as robust anodes for next-generation LIBs, especially where stability and high-rate performance are required.

Abstract

In this study, lignite-derived carbons coated on ceramic tiles by spin coating. Their structural, morphological, surface wettability and antibacterial activity properties were investigated by XRD, SEM, surface contact angle measurement system and acredite ISO 22196 measurement, respectively. Graphitic carbon structure with typical (002) and (100) peaks were observed with relative homogenous carbon coating on ceramic tiles. Enhanced *E.coli* antibacterial activity is integrated into the hydrophilic surface. According to these results, this coating can be preferred in areas with high pollution levels such as toilets, bathrooms.

Keywords: antibacterial coating, ceramic surface, *E.coli*

[2]Dicle University, Faculty of Medicine, Department of Medical Pathology, Diyarbakır, Turkey

[1]dr.bilaltuncturk@gmail.com

Abstract

Mucormycosis is a rare but fatal fungal infection caused by fungi belonging to the order Mucorales. It poses a serious threat especially in immunosuppressed individuals. Conditions such as diabetes mellitus, hematologic malignancies, organ transplantation, long-term corticosteroid use are among the main risk factors for mucormycosis. With the COVID-19 pandemic, the diagnosis of COVID-19 Associated Mucormycosis (CAM) entered the literature. Histopathologically, the presence of thick hyphae branching 90 degrees is important in the diagnosis. In this single center study, we aimed to retrospectively evaluate the epidemiological data and clinical features of the patients.

Thirty-nine cases diagnosed with mucormycosis between 2006 and 2025 in the Department of Pathology, Dicle University Faculty of Medicine were retrospectively reviewed and included in our study. Demographic and clinical findings obtained from the hospital information management system were included in the evaluation.

Twenty (51%) of our patients were male and 19 (49%) were female. The age range varies between 6 and 80 years, with an average age at diagnosis of 53.5 years. We have 13 patients (33%) in 13 years before 2019 and 26 patients (66%) in 7 years after 2019. Among our patients, 15 (38%) had hematologic malignancy, 11 (28%) had diabetes mellitus, 2 (5%) had non-hematologic malignancy, 2 (5%) had chronic steroid use, and 1 (2.5%) had coexistence of diabetes and malignancy. Seventeen (43%) cases were localized in the nasal passage, 14 (35%) in the paranasal sinus, 6 (15%) in the hard or soft palate of the mouth, and 2 (5%) in the nasal wing.

There was no significant difference in the number of cases between men and women. Rhinocerebral mucormycosis typically starts in the paranasal sinuses by inhalation of spores and rapidly spreads to the orbit and brain. In our study, 31 of our cases (80%) were sampled from the nasal cavity and sinuses. When the number of cases between 2019 and 2025 is compared with the number of cases between 2006 and 2019, it is noteworthy that twice as many cases were seen in half the time. The emergence of this significant difference highlights the impact of the Covid-19 pandemic. Mucormycosis is an opportunistic infection and 31 of our cases (80%) had underlying diabetes, malignancy or steroid use.

Mucormycosis has a remarkable clinical significance due to its high mortality rates and aggressive nature. Untreated, the mortality rate approaches 100%, while with treatment the rate drops significantly but is still high. Current data suggest that overall mortality rates range from 32% to 71%, depending on clinical form, underlying conditions and treatment efficacy. The high mortality rate of the disease reaffirms the importance of early diagnosis and aggressive treatment strategies. Diabetes control, avoidance of unnecessary steroid use and evaluation of immunosuppression status are important to reduce the prevalence. In patients in the risk group, mucormycosis should be considered in the differential diagnosis in case of antibiotic resistance.

Abstract

In considering the carbon emissions and environmental impacts of the cement industry, the utilization of cement with decreased clinker content has been established and executed both academically and commercially in numerous countries with regulatory frameworks. The temperature throughout the cement production process is the stage with the greatest environmental impact across the whole production cycle. Given its status as one of the most utilized materials, the environmental impact of sustainability research in this domain will be significant. Upon the reaction of the primary constituents of cement, C_3S (tricalcium silicate) and C_2S (dicalcium silicate), with water, calcium silicate hydrate (C-S-H) and calcium hydroxide (CH) are produced. C-S-H is the primary product of cement hydration. C-S-H gel constitutes the fundamental binding phase that imparts mechanical strength and durability to concrete. C-S-H, the substance formed during the hydration reaction of cement, can also be synthesized artificially. The maximal manufacturing temperature of C-S-H is 220°C. It can be utilized directly as an additive for cement or for surface coating/composite products. In the study, 1%, 2%, 3%, 4%, and 5% synthetic C-S-H was incorporated into the cement paste. Strength tests were performed based on EN 196-1 "Methods of testing cement — Part 1: Determination of strength" standard. Bending and compression tests were conducted after 2, 7, and 28 days of curing to assess performance. Material was taken from cement pastes and cured in compliance with the standards. Upon completion of the curing period for the samples, the reaction was stopped by a solvent exchange method, followed by XRD and FTIR studies to monitor the reaction process. The results were assessed by analyzing the microstructure and performance, revealing that the optimal C-S-H content is 2%.

Keywords: Synthetic C-S-H, environmental impact, reaction monitoring, microstructure.

Abstract

Brain tumors pose significant diagnostic challenges due to their variability in size, location, and morphology. Accurate detection and segmentation are critical for treatment, yet manual annotation is time-consuming and prone to variability. This study investigates the application and comparative performance of various You Only Look Once (YOLOv8) models and integrates the Segment Anything Model (SAM) algorithm to build a deep learning-based, automated pipeline for zero-shot segmentation of brain MRI scans. The dataset comprises annotated MRI images, well balanced among four classes: pituitary tumor, meningioma, glioma, and no tumor. Five YOLOv8 architectures (x-large, large, medium, small, nano) were evaluated under identical conditions on unseen test data using mAP50-95, mAP50 and F1-score metrics. Cost-efficiency was assessed based on performance, training time, inference time and memory consumption. Among the tested models, smaller architectures demonstrated superior cost-effectiveness, with the small variant achieving the highest mAP50-95 score of 0.549 and offering the best trade-off between performance and practicality. In contrast, the x-large model offered no marginal performance gain with a mAP50-95 score of 0.535 at over double the training time and memory cost. None of the models performed notably well in detecting gliomas with the highest score AP50-95 of 0.353 attained by the small model. The 'no tumor' class was consistently the easiest to detect with the highest score of 0.712 AP50-95 attained by the x-large model. Finally, the model with the best raw detection performance was used to generate bounding-box prompts for SAM, facilitating the construction of the emerging YOLOv8-SAM pipeline for zero-shot segmentation on brain MRI scans for a visual presentation of the tumor boundaries. This study highlights the ease of integrating SAM into the YOLOv8 pipeline, particularly for medical imaging tasks requiring precise tumor boundary detection.

Abstract

Polystyrene waste poses a significant environmental concern due to its non-biodegradable nature and widespread accumulation in natural ecosystems. As such, developing effective recycling and upcycling strategies is critical for mitigating its ecological impact and promoting sustainable material use. *Aloe vera* is a natural bioactive compound with well-documented antimicrobial, anti-inflammatory, and healing properties, making it an ideal additive for biomedical applications such as wound dressings and tissue engineering. Its inherent biocompatibility and hydrophilicity also enhance filtration performance and environmental remediation potential when incorporated into polymeric nanofibers. This study investigates the fabrication of nanofibers from recycled polystyrene and *Aloe vera*, highlighting their potential applications in various areas.

Post-consumer polystyrene from food containers and coffee cups was dissolved in a natural solvent (DL-limonene), blended with different concentrations of *Aloe vera*, and processed via electrospinning to fabricate nanofibers. Before blending, *Aloe vera* leaves were washed with distilled water, sliced, freeze-dried, ground, and sieved to obtain particles smaller than 100 µm. The morphology and structure of the resulting fibers were characterized using scanning electron microscopy (SEM), Fourier-transform infrared spectroscopy (FTIR), and contact angle (CA) measurements. The fabricated nanofibers exhibit strong potential for applications in biomedical, filtration, wound healing, and environmental fields. Future research should focus on functional evaluations such as antibacterial activity, biodegradability, and mechanical performance to further assess their practical applicability.

Keywords: *Aloe vera*, electrospinning, recycled polystyrene, sustainable nanofibers

Abstract

Contamination of aquatic habitats by heavy metals is regarded as one of the most critical environmental concerns, posing severe risks to both aquatic life and human health. Owing to their persistence, heavy metals tend to accumulate in aquatic environments, leading to long-term ecological and toxicological consequences. In recent years, biological methods for heavy metal removal, have gained increasing attention due to their affordability, reduced energy demand, and environmentally friendly nature. As a branch of bioremediation, phytoremediation, utilizes plants with high biomass productivity and pollutant uptake capacity to absorb, accumulate, transform, or stabilize heavy metals in water and sediments, offering an effective and eco-friendly remediation strategy. However, current research often overlooks the synergistic or antagonistic effects of multiple plant species and the crucial influence of biological, and physicochemical properties of water on phytoremediation efficacy.

This study aimed to investigate the Cd removal performance of *Limnobium laevigatum* (Humb. & Bonpl. ex Willd.) Heine and *Egeria densa* Planch. by exposing them to 1, 2.5, and 5 ppm concentrations of cadmium for 1, 4, and 7 days in two different mediums (25% Hoagland and pond water) individually and together. Cadmium concentrations were determined by ICP-OES, and the percentage removal, Cd concentration accumulated in plants, and bioconcentration factors (BCF) were calculated to investigate the removal performance of the macrophytes.

The results showed that the macrophytes exhibited a higher percentage removal when exposed to Cd individually in both mediums. Additionally, the Cd concentration accumulated in the macrophytes was higher when the macrophytes were exposed to Cd individually than in the co-cultured groups. Similar findings were seen in the BCF values. Overall, the data obtained from the study showed that both plants exhibited a more successful removal when individually exposed to Cd in both mediums.

Abstract

The aim of the present study is to prepare copper oxide nanoparticle by green synthesis method at temperature T=60°C using *Rubus Idaeus*. The aqueous extract of *Rubus Idaeus* was found to act as both a natural reducing agent and a capping agent, contributing to the eco-friendly synthesis of nanoparticles. The synthesized copper oxide nanoparticle was allowed to dry at 50 °C in a vacuum oven. Fourier transform infrared spectroscopy (FT-IR), X-ray diffraction (XRD) and scanning electron microscope (SEM) techniques were used for the characterization of the synthesized copper oxide nanoparticle. XRD and FT-IR analyses confirmed the successful synthesis of a copper oxide nanoparticle through characteristic structural and spectral features. SEM analysis demonstrated that the copper oxide nanoparticle had a size below 100 nm, highlighting its nanoscale nature.

Keywords: Copper oxide, Nanoparticle, Green synthesis, Nanotechnology.

Abstract

Due to the adaptation of microorganisms to the antibiotics, their excessive use and/or abuse and mutations, the bacteria causing the infections are becoming more resistant, known also as antimicrobial resistance (AMR) [1]. Therefore, improving or developing new antimicrobial drugs with good inhibitory properties against the resistant pathogens remains still a substantial demand. Owing to the biological and pharmacological features of quinone compounds, they are of great importance in drug development researches as lead and key molecules. Since quinone molecules exhibit biological activity, for many years they have been investigated for their different activities such as antiviral, antioxidant, antifungal, antibacterial, anticancer, etc. [2-3]. The introduction of amine molecules into the *p*-quinone structures gives aminoquinone derivatives and improves biological activity substantially [4]. Aminoquinones have received remarkable attention because of their various applications and increasing efficacy in medicinal chemistry [5]. Accordingly, in the search of new potential lead molecule, cyclic amine bonded novel amino-*p*-benzoquinone compounds designed, synthesized and characterized in the present work. Their antimicrobial activity was evaluated against a panel of the Gram-positive and Gram-negative pathogenic bacterial strains in addition to three different fungal strains. In order to understand deeply the chemical properties enhancing the antimicrobial activity, substitued cyclic secondary amine moieties were introduced bearing various group(s) and/or atom(s) in different positions and their influences on the biological activity were analyzed.

Keywords: Quinone, *p*-Benzoquinone, Cyclic amine, Antibacterial activity, Antifungal activity.

Abstract

The skin antiseptic rivanol, also known as ethacridine lactate, is 6,9-diamino-2-ethoxyacridine lactate [1]. Different analytical methods have been reported to determine rivanol concentration in different samples, such as HPLC–UV, SPE–HPLC and Laser Induced Fluorescence [2]. However, these methods lack certain advantages provided by potentiometric techniques. Potentiometric devices offer versatile advantages over their alternatives, including wide concentration range, ease of preparation and use, low cost, fast response time, low detection limit, long lifetime, high selectivity and good reproducibility [3, 4]. In this study, polymer membrane potentiometric sensor was developed for the determination of rivanol. Potentiometric performance properties of the prepared sensors were tested under laboratory conditions using rivanol solutions. Polymer membrane rivanol sensors had a low detection limit and good reproducibility in a wide linear concentration range. At the same time, greenness evaluation of the prepared sensor was performed using complex–GAPI and AGREE tools. Finally, the fabricated sensor was applied to bovine serum albumin (BSA) protein solutions containing different amounts of rivanol and the obtained results were compared with the spectrophotometric method. As a result, the prepared sensors can determine rivanol with high recoveries and can be considered as green sensors.

Keywords: Rivanol, sensor, potentiometry, skin antiseptic

Abstract

Tobacco is recognized as one of the most commonly consumed and highly addictive substances both worldwide and within Türkiye. The leaves of the tobacco plant are particularly significant, as nicotine is predominantly synthesized in the roots and subsequently accumulates in the leaf tissues. Before reaching a consumable state, tobacco undergoes several technological processing steps.
In this study, a total of 35 rolled tobacco samples originating from the Southeastern and Aegean regions of Türkiye were analyzed. The nicotine and reducing sugar contents were quantified using an Autoanalyzer system, and the moisture content of the samples was also measured. To investigate the thermal behavior of the tobaccos, Thermogravimetric Analysis (TGA) and Differential Thermogravimetric Analysis (DTG) were performed on three representative samples from each region. The experiments were conducted in a temperature range of 105°C to 800°C, with a constant heating rate of 10°C per minute. The decomposition stages corresponding to hemicellulose and cellulose breakdown were identified, and reaction kinetics were evaluated based on the thermal degradation profiles.
Kinetic modeling was carried out using the Coats-Redfern method, focusing on the 200°C to 350°C temperature interval. The most suitable reaction models for different stages of pyrolysis were identified based on correlation coefficients, and activation energies were calculated accordingly. According to the kinetic analysis of the pyrolysis process, different reaction mechanisms were observed for the Southeastern and Aegean tobacco samples across specific temperature ranges. In the first temperature interval (473 K – 553 K), the one-dimensional diffusion model was found to be appropriate for all samples. In the second temperature interval (553 K – 623 K), one sample followed a unique reaction model, while the other two samples were best described by the bi-directional diffusion model for the Southeastern region, and for the Aegean region, all three samples conformed to a second-order reaction model.

Abstract

In recent years, the use of pesticides has increased significantly due to population growth and the rising demand for food. This increase has raised concerns about soil health and biodiversity, as pesticides affect not only pests but also non-target organisms. Studies have demonstrated that pesticides have various toxic effects on non-target organisms, including oxidative stress, genetic damage, endocrine disruption and histopathological alterations. Furthermore, pesticide residues can circulate through ecosystems, impacting organisms in distant habitats. Therefore, understanding the damage caused by pesticides is essential for developing sustainable agricultural strategies to mitigate their adverse effects. In this study, the effects of Phosmet, an organophosphate pesticide widely used in fruit and vegetable cultivation against harmful insects, were investigated on *Eisenia fetida.* The earthworms were assigned to five groups, including a negative control (0 mg/kg), a solvent control (0 mg/kg) and three groups exposed to different concentrations of Phosmet (5 mg/kg, 10 mg/kg, 20 mg/kg). Samples were collected on days 7, 14, 21, and 28 of the exposure periods. The study evaluated changes in the activities of antioxidant enzymes (superoxide dismutase, catalase, and glutathione S-transferase), total energy reserves (carbohydrates, proteins, lipids) and histopathological alterations in relation to concentration and exposure duration. As earthworms play a crucial role in maintaining soil health, their responses to pesticide exposure provide critical insights into ecological risk. Accordingly, comprehensive pesticide risk assessment is essential, and this study provides valuable data relevant to environmental toxicology.

Keywords: Phosmet, histopathology, earthworm, oxidative stress, ecotoxicology.

Abstract

Histopathology is still the gold standard for diagnosis of many cancers, including Prostate Adenocarcinoma (PRAD). While tumor cell morphology is primarily focused, the tumor microenvironment, particularly the presence and distribution of tumor-infiltrating lymphocytes (TILs), have gained importance as a biomarker in cancer research for predicting clinical outcomes and guiding treatment since they play a crucial role in cancer prognosis and response to immunotherapy. Machine learning (ML), especially deep learning (DL), models are being developed and used more and more every day in histopathological image classification problems. Kolmogorov-Arnold Network (KAN) is a new promising ML method that is based on Kolmogorov-Arnold representation theorem and Convolutional KAN (CKAN) is a recently differentiated model which came along by integrating KANs into convolution layers that leads to changing the classic linear transformation of the convolution to learnable nonlinear activations in each pixel. The purpose of this study is to test CKAN models, which have not been previously applied or evaluated on histopathological images, and to compare them with standard methods for classification tasks. For this aim, TCGA-TIL-PRAD dataset, which has 4865 TIL-negative and 730 TIL-positive patches obtained from Whole Slide Images taken from The Cancer Genome Atlas (TCGA), is used. Data preprocessing, augmentation and weighted random sampling were employed to handle class imbalance. CKAN and CNN models were built with the same number of layers and trained with the same parameters to classify these patches. Model performance was evaluated using accuracy, precision, recall, F1-score, and Area Under the Curve (AUC). CNN performed 71% accuracy, AUC of 0.5778, with an F1-score of 0.26 for TIL-positives. However, CKAN model had 79% accuracy, AUC to 0.6495, with an F1-score of 0.32 for TIL-positives. According to metrics, CKAN outperforms CNN and shows a promising preliminary result for effectively identifying TILs while offering valuable insights for personalized immunotherapy.

Abstract

This study evaluates the suitability of various cities in Turkey for the establishment of biogas plants, with a specific focus on the use of small cattle manure as the sole feedstock. To identify the most appropriate locations, a multi-criteria decision-making approach was applied. Three criteria were taken into account in the evaluation process. The comparative analysis of cities based on these factors resulted in a prioritized ranking of potential sites. According to the analysis, Van, Diyarbakır, and Mersin emerged as the most favorable cities for biogas plant siting. The findings of this study are expected to guide policymakers and investors in strategic planning and resource allocation for sustainable energy projects in Turkey.

Abstract

The supply of energy resources is one of the cornerstones of economic growth and social development. In this context, the exploration and development of alternative energy sources beyond fossil fuels is of great importance. As the demand for sustainable energy and raw materials in industrial sectors increases, interest in biomass continues to grow, intensifying competition over biogenic carbon sources. Among renewable energy sources, cellulose—and especially hemicellulose—are considered high-potential raw materials. Cellulose-based ethanol production stands out as an effective alternative to the adverse impacts of fossil-derived fuels. Agricultural and industrial residues such as grass clippings, bamboo, rice straw, empty palm fruit bunches, and sugarcane bagasse are commonly utilized in bioethanol production from cellulosic sources. This study investigates the optimization of bioethanol production using waste from tobacco and tobacco products. Bioethanol production consists of four main stages: pretreatment, hydrolysis, fermentation, and distillation. For the processing of complex raw materials like lignocellulosic biomass, it is necessary to optimize various parameters in each of these stages. Acidic, basic, and enzymatic methods were compared for the hydrolysis of lignocellulosic waste, and enzymatic hydrolysis was found to yield the highest sugar content. Specifically, an enzyme combination of 60% cellulase and 40% hemicellulase produced the most effective results in terms of both total and reducing sugar yields. During the fermentation phase, parameters such as duration, initial sugar concentration, and inoculum amount were optimized using the Response Surface Methodology (RSM). Theoretical and experimental data were compared for product yield calculations, and the highest yield obtained at the end of fermentation was approximately 13.73%.
The results of this study emphasize the importance of converting waste into value-added products in terms of sustainability and suggest that this research may serve as a scientific basis for future large-scale bioethanol production projects.

Abstract

Nowadays, it is necessary to prevent the increasing water pollution caused by dye residues in industrial and agricultural waste, which poses a potential threat to both the environment and human health. As it is known, the separation of dyes is quite tricky due to their complex and stable chemical structures. Removal of these dyes from wastewater is carried out using various physical and chemical methods, including membrane separation, ion exchange, chemical precipitation, and adsorption. Among these, adsorption is widely accepted as a globally appreciated water treatment process due to its versatility, economic feasibility, and broad applicability. In the study, the copolymer of widely found Polymethyl methacrylate (PMMA) with NH_2 functional groups was synthesized. Synthesized PMMA-NH_2 was reacted with $FeCl_3$ by Fridel Krafts to produce Fe-PPMA-NH_2 with increased crosslink formation. Fe-PPMA-NH_2 anionic Congo red (CR) and Methyl orange (MO) dye adsorption and kinetic studies were carried out. The CR and MO adsorption capacities of Fe-PPMA-NH_2 were calculated to be 3984 and 1046 mg/g, respectively. The obtained results showed that Fe-PPMA-NH_2 is a highly effective and promising adsorbent for the adsorption of Congo red (CR) and Methyl orange (MO) from aqueous solutions, thanks to its NH_2 functional groups.

Abstract

The main components of the extract obtained from Olive Leaf are oleuropein and hydroxytyrosol. In particular, oleuropein has been found to possess hypotensive, coronary vasodilatory, and antiarrhythmic activity in animal experiments. Actinobacteria have a wide range of applications in fields such as medicine, agriculture, industry, food, and the detergent industry. In this study, the production capacities of industrially important cellulase, protease and amylase enzymes synthesized by Actinobacteria isolates were determined and the effects of olive leaf extract on these enzyme activities were investigated.
It was found that the addition of olive leaf extract increased cellulase enzyme activity in isolate GBT32, and protease enzyme activity was also increased in the same isolate. Additionally, amylase activity was enhanced in isolates VYN25, and GBT17.
Based on 16S rRNA sequencing studies, isolate GBT17 was found to be related to *Micromonospora cremea*, while isolate VYN25 was related to *Micromonospora hortensis*. Isolates GBTUV4 and GBT32 were found to be related to the genus *Streptomyces*. Isolate GBTUV4 showed close relation to *Streptomyces durocortorensis*, and isolate GBT32 to *Streptomyces badius*.
In conclusion, the results indicate that the studied Actinobacteria isolates possess high biological activity and have potential applications in medicine, agriculture, and various industries such as food, detergent, and paper.

Abstract

Urtica dioica, commonly known as stinging nettle, is a plant that has been used in traditional medicine for centuries. Its medicinal importance arises from its content of biologically active compounds exhibiting various pharmacological properties. This plant contains a wide range of phytochemicals such as flavonoids, phenolic compounds, terpenoids, and sterols, which are known for their antioxidant, anti-inflammatory, and antimicrobial activities. These properties suggest that *Urtica dioica* could serve as a potential natural source for the prevention and treatment of various diseases. The type and concentration of the solvent used are critical for the efficient extraction of bioactive compounds from plant material. These factors directly influence both the extraction yield and the bioavailability of the extracted compounds. This study aimed to evaluate the effects of different solvent types (water, ethanol, methanol, dichloromethane) and their concentrations (20%, 50%, 70%, and 100%) on the total phenolic content extracted from *Urtica dioica*. Following the extraction process performed using the ultrasonication method, total phenolic contents were quantitatively determined using the Folin–Ciocalteu reagent, and absorbance values were measured with a UV-Visible spectrophotometer. According to the findings, among all tested solvents and concentrations, water (132.97 mg GAE/g) and 20% dichloromethane (136.98 mg GAE/g) extracts yielded the highest total phenolic contents. It was observed that both the solvent type and its concentration significantly affected the total phenolic content. Although optimal extraction yield varied depending on the solvent, in general, solvents with higher polarity were more effective. Moreover, an inverse relationship was noted between solvent concentration and phenolic content; the lowest total phenolic content values were obtained from pure (100%) solvents. These results indicate that water, due to its high polarity and non-toxic nature, is an effective and safe solvent for the extraction of phenolic compounds from *Urtica dioica*, and may be considered suitable for future pharmaceutical applications.

Keywords: *Urtica dioica*, nettle, total phenolic compound, ultrasonic extraction

[*]e-mail: zorcu18@itu.edu.tr

Özet

Bu çalışmada, defne yapraklarından hidrotermal yöntemle sentezlenen karbon kuantum noktalarının (CQD), 1 M HCl çözeltisinde karbon çeliğinin korozyon davranışı üzerindeki etkisi incelenmiştir. CQD'ler, defne yapraklarının 225 °C'de 24 saat hidrotermal işleme tabi tutulmasıyla elde edilmiştir. Korozyon hızı ve inhibisyon verimliliği, 24 saatlik ağırlık kaybı testleriyle değerlendirilmiştir. CQD içermeyen çözeltide çeliğin ağırlık kaybı 0,4717 g ve korozyon hızı 49,14 $g \cdot m^{-2} \cdot h^{-1}$ olarak ölçülmüştür. CQD konsantrasyonu arttıkça, bu değerlerde belirgin bir azalma gözlemlenmiştir. 1000 mg/L CQD konsantrasyonunda ağırlık kaybı 0,0175 g'a, korozyon hızı ise 1,82 $g \cdot m^{-2} \cdot h^{-1}$'e düşmüş ve %96,29 inhibisyon verimliliği elde edilmiştir. Elektrokimyasal analizler, bu sonuçları desteklemiştir. 500 mg/L CQD içeren, 1 M HCl ortamında açık devre potansiyeli −423,5 mV'den −404,2 mV'ye kaymış, polarizasyon direnci ise 3,11'den 4,68 $\Omega \cdot cm^2$'ye yükselmiştir. Bu durum, CQD'lerin metal yüzeyini daha pasif hâle getirerek korozyon hızını azalttığını göstermektedir. Elde edilen bulgular, defne yaprağı kaynaklı karbon kuantum noktalarının asidik ortamlarda karbon çeliği için etkili bir korozyon inhibitörü olduğunu ortaya koymuştur. Bu çevre dostu yaklaşım, metal yüzeylerin korunmasında sürdürülebilir bir alternatif olarak değerlendirilebilir.

Anahtar Kelimeler: Korozyon, karbon kuantum noktaları, defne yaprağı, hidrotermal sentez, karbon çeliği

Abstract

Hawthorn (*Crataegus*) species, which are of high importance in terms of medicinal and aromatic properties, are widely used as food, dietary supplements, and phytopharmaceutical products, and also hold significant economic value. Particularly in Europe and China, the leaves, flowers, and fruits of *Crataegus* species are offered for over-the-counter sale in the form of herbal drugs, tinctures, tablets, teas, and extracts. Species with large fruits, such as *C. azarolus* subsp. *pontica,* are especially important in the Caucasus and Mediterranean countries for both traditional local consumption and small-scale commercial production. In Türkiye, the genus is represented by approximately 29 species. The presence of rich ecosystems in the province of Artvin provides a favorable environment for the natural distribution of hawthorn species. The natural occurrence of these species in the region constitutes an important local genetic resource in terms of species diversity and ecosystem sustainability. The DNA barcoding technique, one of the modern molecular biology methods, has proven successful not only in identifying living species and discovering unknown ones, but also in verifying the authenticity of processed or unprocessed food products of commercial importance, and in detecting food fraud in already produced and marketed items. In this study, the goal is to genetically identify four different hawthorn species (*Crataegus* spp.) naturally distributed in and around Artvin by generating sequence data from three different gene regions (ITS, matK, rbcL), and to create a reference dataset for these species. The DNA sequences obtained from these gene regions have been uploaded to reference databases such as NCBI and BOLD Systems. Additionally, the study aims to contribute to the establishment of a National DNA Barcode Database by completing the DNA barcoding processes for four plant species prioritized for the project that naturally occur in Artvin, and registering them on behalf of Türkiye.

Abstract

The genus *Valeriana* (Caprifoliaceae) represents a significant group of plants, comprising 441 species worldwide. The genus name is believed to derive from the medieval term rooted in the Latin word valere, meaning "to be healthy," likely referring to the plant's traditional medicinal uses for conditions such as nervousness and hysteria. Among them, species like *Valeriana officinalis* (commonly known as medicinal valerian) are frequently investigated in pharmacological studies due to their sedative, anxiolytic, and antispasmodic effects. Clinical studies have demonstrated that root extracts of *V. officinalis* reduce anxiety and sleep disorders. In aromatherapy, valerian essential oil is used in diffusers and massage oils for its calming effects. From an economic standpoint, *Valeriana* products represent a market valued at over $100 million annually in the global herbal medicine sector. Türkiye is an important center of diversity for the genus *Valeriana,* hosting 15 species. Of these, 12 are endemic and are primarily distributed across the microhabitats of Anatolia. Common species in Türkiye, such as *V. dioscoridis* (in the Mediterranean region) and *V. alliariifolia* (in rocky habitats), have been frequently studied in ecological, medicinal and taxonomic research. These are perennial herbaceous plants characterized by their fragrant leaves, stems, flowers, and roots. According to inventory studies on medicinal and aromatic plants in Türkiye, valerian species are predominantly used as sedatives, and in the treatment of digestive disorders, nausea, and menstrual cramps. *Valeriana officinalis*, in particular, is commonly used as a sleep aid. In the context of medicinal plant trade in Türkiye, species such as *Valeriana dioscoridis* and *V. officinalis* are utilized in the natural products and dietary supplements industries. However, due to overharvesting and habitat loss, wild populations of some species are under threat, highlighting the growing importance of sustainable agricultural practices.

Abstract

Brushless DC (BLDC) motors are widely preferred in industrial applications due to their high efficiency, long service life, and low maintenance requirements [1]. Proportional–Integral–Derivative (PID) controllers are frequently employed for precise speed control in such systems. However, manual tuning of PID parameters often results in time-consuming and suboptimal outcomes, particularly in nonlinear systems [2]. In this study, four different metaheuristic algorithms were investigated for the optimal tuning of PID controller parameters: Genetic Algorithm (GA) [3], Particle Swarm Optimization (PSO) [4], Grey Wolf Optimizer (GWO) [5], and Red Panda Optimization (RPA) [6].
The simulations were carried out in MATLAB/Simulink, and performance was evaluated based on settling time, overshoot, and mean squared error (MSE) criteria [7]. A comparative analysis was conducted by assessing the convergence speed and accuracy of each algorithm. The results indicate that GWO and RPA demonstrated superior performance in terms of faster convergence and lower MSE values. Notably, the application of RPA in this domain remains limited in the literature, making the findings of this study a novel contribution [6].
This work highlights the effectiveness of metaheuristic algorithms in PID controller design for BLDC motor applications. Moreover, it provides a comparative framework that aids in selecting appropriate optimization strategies by balancing classical and next-generation approaches.

Abstract

A variety of traditional medicinal plants has been widely used by different indigenous people in Türkiye. This study, which was conducted between 2021 and 2023 to record the traditional medicinal plant usage culture of the inhabitants of South Villages of Ardanuç (Aydınköy, Ballı, Bereket, Ekşinar, Ferhatlı, Gümüşhane, Meşeköy, Ovacık, Örtülü, Peynirli, Sakarya, Tepedüzü, Torbalı, Tosunlu, Zekeriyaköy) was the first to be conducted in the district. face-to-face interviews with individuals with advanced ethnobotanical knowledge were conducted in the villages (15) of the district, and the medicinal plants which were used were gathered and identified. Besides descriptive statistics, the data were analyzed using some ethnobotanical analysis tools like preference ranking, paired comparison, direct matrix ranking, informant consensus factor, and fidelity level index. The information gathered as a result of the interviews with participants was recorded for this purpose. A total of 105 species of medicinal plants were identified and collected with 90 genera and 46 families were used to treat 44 different diseases. The most used medicinal plants were from the family Rosaceae followed by Urticaceae, and Asteraceae. The usage value (UV) was calculated for each species. Out of these, 70 species (66.67%) were used against human ailments. The most frequently used plant part was fruit (26.69%), followed by leaves (20.61%), and herba (15,71%). The most widely used method of preparation was uncooked (30.51%) followed by decoction (17.63%). The most common route of administration was oral (71,64%) followed by dermal (28.36%). The disease category with FIC value (0.76) was the skin diseases. *Berberis vulgaris* was the most preferred species. Anthropogenic factors are the major threats to medicinal plants. In general, the study area is rich in medicinal plants that have a significant role in the management of various human and livestock diseases.

Abstract

Magnetic iron oxide nanoparticles are one of the most preferred materials for nanotechnology-based applications due to their excellent magnetic properties along with extremely adequate biocompatibility. The efficient incorporation of magnetic nanoparticles to relevant applications relies on utilization of specific surface functionalization. The surface modification allows both the binding of niche molecules to the surface and enhance the colloidal stability. β-Cyclodextrin (β-CD) is a cyclic oligosaccharide consisting of both a hydrophilic outer surface and a hydrophobic cavity. The structural characteristics of this system facilitate the formation of complexes with a range of hydrophobic guest molecules, including drugs. These guest molecules can be encapsulated within the non-polar cavity of β-CD, thereby rendering β-CD a highly versatile platform for applications in the controlled release of drugs. Although, magnetic nanoparticles are shown to be modified with several molecules for biomedical applications, the surface functionalization of relatively larger and unconventional partial oxidation based magnetic nanoparticles with β-CD has not been studied extensively. Consequently, the objective of this study was to synthesize magnetic nanoparticles in the presence of β-CD possessing adequate colloidal stability in aqueous medium and subsequently analyze its potential in hyperthermia applications via studying the local temperature enhancements at varying concentrations, magnetic field strengths and frequencies. The results demonstrated that the magnetic nanoparticles synthesized using the partial oxidation method exhibited an average size of 27 nm and a saturation magnetization of 48.4 emu/g. Furthermore, the obtained nanoparticles exhibited sufficient colloidal stability and morphological changes after modification with β-CD. In addition, hyperthermia analyses conducted in the presence of an alternating magnetic field have indicated that local temperatures increased in conjunction with concentration, magnetic field strength, and frequency. The findings demonstrate the preliminary possibility of magnetic nanoparticles modified with β-CD and synthesized using the partial oxidation method for utilization in both drug delivery and hyperthermia applications.

Abstract

The graft copolymers can be designed by grafting another polymer chain or monomer to the active center of the polymer chain and are a important class of the macromolecular structure [1,2]. Reversible addition/fragmentation chain transfer (RAFT) polymerization is one of the CRP techniques which introduced by the Rizzardo and co-worker [3]. This polymerization technique based on the radical closing mechanism and the molecular control of the copolymers which prepared via RAFT is achieved by chain transfer agent (RAFT-agent). In this study, three arm block-brush copolymer was prepared by a combination of ring- opening polymerization (ROP) and RAFT bulk polymerization in two-step procedure. For this purpose, macropolymeric ester based RAFT agent (multifunctional macro-RAFT agent) was obtained from reaction of the brominated/chlorine-terminated poly(ε-caprolactone) (PCL-Br/Cl) which synthesized by ROP of the ε-caprolactone and ethylxanthic acid potassium salt. Then, the poly(ε-caprolactone-*g*-styrene) [(PCL-*g*-PSt)] three arm block-brush copolymer was synthesized via RAFT bulk polymerization using multifunctional macro-RAFT agent based on PCL. This polymerization was carried out at 80 °C by changing the polymerization time and investigation of the polymerization time and polymerization temperature on the molecular weight, monomer conversion and dispersity. As a result of this polymerization, very high molecular weight polymers with low dispersity were obtained. The products were characterized by using multi-instruments such as proton nuclear magnetic resonance spectroscopy, Infrared spectroscopy, gel permeation chromatography, thermo gravimetric analysis, differential scanning calorimetry.

Özet

Uçak Bakım, Onarım ve Yenileme (Maintenance, Repair, and Overhaul- MRO), sektörü havacılık açısından operasyonel süreklilik ve maliyet etkinliği açısından kritik öneme sahiptir. Uçak komponentlerinin alış fiyatlarının doğru bir şekilde öngörülmesi, pazar dinamikleri, parça özellikleri, tedarikçi çeşitliliği ve talep değişkenliği gibi çok sayıda faktörden etkilenmesi nedeniyle karmaşık bir problem teşkil etmektedir. Geleneksel fiyat tahmin yöntemleri bu faktörler arasındaki doğrusal olmayan ve dinamik ilişkileri yakalamada sıklıkla yetersiz kalmaktadır.

Çalışmanın temel amacı MRO sektöründe uçak komponentlerinin alış fiyatlarını yüksek doğrulukla tahmin etmek üzere bir derin öğrenme modeli geliştirmek ve performansını değerlendirmektir. Bu amaç doğrultusunda geçmiş satınalma kayıtları komponent teknik detayları tedarikçi verileri ve ilgili pazar göstergelerini içeren kapsamlı bir veri seti derlenmiştir. Çalışmada farklı derin öğrenme mimarileri incelenmiş ve en uygun yapı belirlenmiştir.

Derin öğrenme yaklaşımının çok boyutlu ve karmaşık veri setlerindeki gizli örüntüleri ve faktörler arası etkileşimleri etkin bir şekilde modelleyebilme kabiliyeti sayesinde geleneksel yöntemlere kıyasla fiyat tahmin doğruluğunu önemli ölçüde artırması beklenmektedir. Bu araştırma MRO şirketlerine komponent tedarik ve tamir süreçlerinde daha bilinçli kararlar alma, bütçeleme süreçlerini iyileştirme ve maliyet optimizasyonu sağlama potansiyeli taşıyan veri odaklı bir yaklaşım sunmaktadır. Çalışma derin öğrenme tekniklerinin MRO tedarik zinciri yönetimindeki pratik uygulamalarına ve potansiyel faydalarına ışık tutmayı hedeflemektedir.

Anahtar Kelimeler: Uçak Bakım Onarım ve Yenileme, havacılık, derin öğrenme, fiyat tahmini

Abstract

Most indigenous people in the world, as well as in Türkiye have used medicinal and aromatic plants to treat many diseases. Plant diversity is very rich in Şavşat district of Artvin Province and it is understood from the reports that Şavşat people used and rely on them different purposes, including health issues. In this study, we investigated the traditional uses of medicinal and aromatic plants, including their uses herbal mixtures¸ modes of preparation, commonly used plant parts and disease categories treated with documented plant species. In this investigation, we aimed to examine the traditional uses of medicinal-aromatic plants in the villages surroundings of Karagöl-Sahara National Park of Şavşat District. This study carried out to record the traditional medicinal plant usage culture of the inhabitants with face-to-face interviews local inhabitants from 10 villages of the district having advanced ethnobotanical knowledge. The information gathered as a result of the interviews with 63 participants was recorded. Disease categories treated with documented plant species, using ethnobotanical indices such as Fledity Level (FL), relative frequency citation (RFC), and informant consensus factor (ICF). In total, 106 medicinal-aromatic plant taxa belonging to 83 genera and 43 families using in different ethnobotanical purposes were identified and collected. Out of these, 73 species (68.87%) were used against human ailments. The most frequently used plant part was fruit (52) (49.06%), followed by leaves (50) (47,16%), and the whole plant material was (28) (24.42%). The human ailment category with the highest Informant Consensus Factor (ICF) value was the skine disorders (0.85) and Musculoskeletal disease (0,79) respectively. Most cited medicinal and aromatic plants were determined as *Urtica dioica* L. The highest ICF value was detected for skin disorders (0.85), We determined that *Urtica dioica* L., *Plantago major* L. and *Malus sylvestris* L. have widely traditional uses, with high using reports.

Özet

EIA [1], IRENA [2], TotalEnergies [3], McKinsey [4] ve ExxonMobil [5] tarafından yayınlanan raporlar, enerji tüketiminin önümüzdeki yıllarda önemli ölçüde artacağını ve bu artışın sürdürülebilirlik için ciddi riskler oluşturabileceğini ortaya koymaktadır. Artan küresel enerji talebi, sürdürülebilirlik hedefleri ve uzaktan erişilebilir izleme çözümlerine duyulan ihtiyaç, enerji yönetim sistemlerinde yeni nesil yaklaşımları gerekli kılmaktadır. Bu gereksinimlere yanıt olarak, bu çalışma düşük maliyetli, modüler, yerel ve bulut tabanlı bir enerji izleme sistemi önermektedir. Kenar hesaplama sistemi, Raspberry Pi üzerinde çalışan Raspbian OS Lite (bookworm) ve Docker konteyner mimarisi üzerine inşa edilmiştir. DHT11 ortam sıcaklığı ve nem verilerini toplarken, PZEM-004T (v3.0) [6] modülü akım, voltaj ve enerji tüketimi verilerini toplamaktadır. Toplanan veriler, MQTT [7] protokolü aracılığıyla güvenli bir şekilde (TLS/SSL ile şifrelenmiş biçimde) Amazon Web Services (AWS) bulut altyapısına iletilmekte; kenar hesaplama (edge computing) ise Docker konteynerleri içerisinde çalışan InfluxDB veri tabanında zaman serisi formatında depolanmaktadır. Bu veriler, yine Docker üzerinde barındırılan Grafana arayüzü kullanılarak gerçek zamanlı analiz edilmekte ve görselleştirilmektedir. Olağandışı durumlar, AWS Simple Email Service (SES) tabanlı e-posta bildirim sistemi aracılığıyla ilgililere anlık olarak iletilmekte; bu sayede hızlı müdahale süreçlerini başlatan yanıt mekanizmaları etkin bir şekilde devreye alınmaktadır. Telegram Bot API ile bildirim mekanizması yedeklenmektedir. Çalışmanın genel mimari yapısı Şekil 1'de sunulmuştur. Çalışma, bireysel kullanıcılar ve KOBİ'ler için uygulanabilir bir çözüm sunarak enerji verimliliği, çevresel sürdürülebilirlik ve siber güvenlik risklerine katkıda bulunmaktadır. Ayrıca çalışmanın modüler yapısı ve genişletilebilir mimarisi; akıllı ev otomasyonu, elektrikli araçlar, OCPP destekli şarj istasyonları, yenilenebilir enerji sistemleri, endüstriyel IoT uygulamaları, mikro şebeke entegrasyonları gibi çeşitli enerji yönetimi senaryolarında kullanılma potansiyeli sunmakta olup, bu alanlarda geliştirilecek yeni nesil enerji yönetim sistemlerine rehberlik edebilir yapıdadır.

Abstract

Artvin is rich in terms of medicinal-aromatic plant biodiversity. Uncontrolled collection of medicinal plants from nature may pose a danger of extinction for these species. The need to cultivate these plants comes to the fore as a way to meet the demand for medicinal plants. The study aims to determine their ecological requirements, create suitable cultivation areas, collect live plant materials and seeds of the target species, conduct soil analyses, establish a production greenhouse, distribute seedlings to the local community free of charge, provide training on cultivation, and set up Model Gardens in suitable areas identified in eight different districts of Artvin for the cultivation of these species. In the project aimed at developing medicinal-aromatic plant cultivation, cultivation continues using seeds, cuttings, and live plant specimens collected during field studies. Of the 54 species, 43 herbaceous species have been planted in the raised beds, while the remaining 11 woody species have been planted in suitable areas within the TAB plots. Soil texture, soil reaction (pH) and salinity (EC), organic matter content, analyses were conducted on 162 samples from 11 different areas. Model garden projects have been created for trees, shrubs, climbers, and herbaceous medicinal-aromatic species. Detailed photographs of the collected seeds have been taken with the imaging system set up in the Artvin Çoruh University Herbarium (ARTH) and uploaded into the system. Studies on creating a virtual seed bank are ongoing. For the germination of the seeds, direct sowing and soaking in distyle water for 24 hours in 500 and 1000 ppm Gibberellic acid solutions were applied. Peat, Peat + Perlite was used as seed growth media. While the emergence rate varied between 5-10% in control and distyle water soaking treatment, over 90% was obtained in *Helichrysum orientale* and *Inula orientalis* seeds with 1000 ppm GA_3 treatment and peat media.

Abstract

Immobilization of enzymes is an effective method for improving the properties and applications of enzymes. Various support materials are used for enzyme immobilization, and cellulose nanocrystals (CNC), with their eco-friendly structure and biocompatible nature, are among the notable cellulose nanomaterials for this purpose. Urease (urea amidohydrolase, EC 3.5.1.5) is an enzyme that catalyzes the hydrolysis of urea into ammonia and carbon dioxide. In this study, Jack bean urease was immobilized onto CNC by different immobilization methods. CNC was activated with 3-aminopropyltriethoxysilane (3-APTES) then modified with glutaraldehyde (GA). Urease was immobilized onto this modified support by covalent immobilization ($IU_{CNC\text{-}GA}$). CNC modified with GA was further functionalized separately with polyethyleneimine (PEI) and 1,2-bis(3-aminopropylamino)ethane (1,2BIS). These modified supports were used for ionic adsorption of urease ($IU_{CNC\text{-}PEI}$ and $IU_{CNC\text{-}1,2BIS}$). The urease immobilization was carried out in 50 mM phosphate buffer at pH 7.0 and 25 °C for 2 hours. The amount of immobilized urease was determined as 1.5 mg/g support, 1.9 mg/g support and 2.5 mg/g support for $IU_{CNC\text{-}GA}$, $IU_{CNC\text{-}PEI}$, and $IU_{CNC\text{-}1,2BIS}$, respectively. The amount of immobilized urease affected the modification methods of CNC. The characterization of immobilized urease will be carried out.

Abstract

This study summarizes the work carried out between 2021 and 2025 under the project titled *"Establishment of a Facility for Processing and Storing Aromatic Plants in Artvin"* (Project No: 2021-TAB-02), supported by the Presidency of Strategy and Budget of the Republic of Turkey and coordinated by Artvin Çoruh University. The main goal was to convert local plant resources into high-value-added products using modern extraction and drying technologies. A Plant Processing and Product Development Center is established with units for distillation, extraction, evaporation, and spray drying. The facility includes support systems such as a purified water treatment unit and environmental control equipment. Each main vessel has a capacity of 500 liters, allowing efficient processing of plant materials into essential oils, extracts, and powders. Field studies targeted species such as *Malus sylvestris, Pyrus communis, Cornus mas, Diospyros lotus, Rubus idaeus, Rosa canina, Cydonia oblonga, Ficus carica, Vitis vinifera*, and *Vaccinium arctostaphyllos*. Collected plant materials were propagated and conserved in the university's botanical garden. Extraction and spray drying trials were conducted on species including *Olea europaea, Valeriana erotica, Amaranthus retroflexus, Xanthium strumarium, Erigeron canadensis, Teucrium hyrcanum, Origanum rotundifolium, Salvia sclarea, Ferula orientalis, Epimedium pinnatum*, and *Tribulus terrestris*. These species, among nearly 60 plant types processed during the project, were successfully extracted and spray-dried. The resulting extracts were formulated into value-added products intended for commercial sale. Stable powder products with long shelf life were obtained through optimized procedures. Freeze-drying trials were successfully performed on *Malus domestica* (apple), *Pyrus communis* (pear), *Cydonia oblonga* (quince), *Aronia melanocarpa* (aronia), and *Vaccinium* sp. (blueberry). From fresh weight to dried product, the approximate yields were as follows: *Malus domestica* ~12%, *Pyrus communis* ~11%, *Cydonia oblonga* ~9.3%, *Aronia melanocarpa* ~7.2%, and *Vaccinium* sp. ~6.8%. The drying efficiency ranked from highest to lowest was: apple, pear, quince, aronia, and vaccinium. Additional demand for freeze drying of various fruits has also been received from local producers. Future freeze-drying operations will be planned in line with incoming demands.
In the next phase, a new 1,000 m² facility will be built with expanded lines for fruit processing, jam production, pasteurization, and packaging, supporting sustainable botanical product development in the region.

The role of hormesis in nutrition and health

Merve Başak Sarraç[1*], Gamze Toydemir[1] (*ORCID: https://orcid.org/0000-0003-3738-0986)*

*basaksarrac01@gmail.com

Abstract

Hormesis is a two-phase phenomenon characterized by inverted U, U, or J-shaped dose-response curves that cannot be explained by classical threshold or linear-no-threshold toxicology models. At low doses, hormetic agents are well-reported to generate mild stress conditions that trigger cellular adaptive responses, such as enhanced antioxidant defense, improved levels of heat shock proteins, etc.; whereas these agents cause toxic effects at high doses. The molecular basis of hormetic response is supported by receptor theory, which explains that a small number of high-affinity receptors are activated at low doses; while a large number of low-affinity receptors are activated at high doses. Components of food, especially the ones that are not abundant in the diet (e.g., plant bioactives, micronutrients) are gaining an increasing interest as promising nutritional agents that exert their potential health benefits by hormesis. Several phytochemicals and micronutrients, including polyphenols, organosulfur compounds, vitamins, etc., have been related with reduced inflammation and lower risk of degenerative diseases when consumed at low doses; however, in contrast, their excessive intake have been documented to produce detrimental effects. Distinctively, some food contaminants (e.g., heavy metals, mycotoxins) have also been reported to induce hormetic responses through exhibiting dose-dependent biphasic effects which is characterized by low-dose stimulation and high-dose inhibition depending on the level and duration of exposure. Depending on this background, it is essential to gain a deep knowledge on nutritional hormesis and its mechanisms in order to provide a critical framework for precise regulation of the optimal intake of diet-derived hormetic agents. Therefore, this presentation aimed to discuss how nutrition and hormetins within the diet could reduce the risk of disease and promote health through modifying the key biochemical targets and their importance in developing promising therapeutic strategies.

BIX-induced Somatic Embryogenesis through Epigenetic Reprogramming in *Arabidopsis thaliana*

Burcu Gündüz [1*] *(ORCID: https://orcid.org/0009-0005-9683-9971)*, Sinan Meriç [1] *(ORCID: https://orcid.org/0000-0003-0336-0004)*

[*] Istanbul Kültür University, Faculty of Science and Letters, Department of Molecular Biology and Genetics, 34156 Ataköy, Istanbul, Turkey

[*] Corresponding Author e-mail: s.meric@iku.edu.tr

Abstract

Somatic embryogenesis (SE) can be induced in vitro through various approaches, including stress treatments, tissue culture techniques, and genetic engineering. The most commonly used method involves incorporating high levels of plant hormones into the culture medium. Other methods utileze wounding, extreme pH, osmotic or heat shock, and exposure to certain chemicals. The growth regulator 2,4-dichlorophenoxyacetic (2,4-D) is widely used in both direct and indirect SE, playing critical role in cell dedifferentiation and SE recovery. BIX-01294 is a diazepine-quinazoline-amine derivative histone lysine methyltransferase inhibitor (HKMT) that was identified as a specific G9a HKMT and reduced global H3K9me2 levels in several mammalian cell lines. Short-term application of the HKMT inhibitor BIX-01294 increase cell reprogramming, totipotency and embryogenesis initiation efficiency by decreasing H3K9 methylation. In this study, the effects of BIX-01294 on SE in Arabidopsis thaliana Col-0 ecotype were investigated with different concentrations. It was determined that the HKMT inhibitor in the medium at different concentrations was sufficient to induced embryogenesis with 0.1 µM. The SE number formed from immature zygotic embryos (IZEs) in the presence of 2.5 µM BIX-01294 and 2,4-D at the end of the 21st day was determined to be 35.41% and 31.25%, respectively. BIX-01294 increased SE formation by 1.13-fold in bent cotyledon stage immature zygotic embryos compared to 2,4-D. Moreover, the average number of somatic embryos produced per explant was also determined to be dramatically higher in 2.5 µM BIX-01294 than in the presence of 2,4-D.

Özet

Nüfus artışıyla birlikte dünya genelinde nitelikli gıdaya ulaşmanın zorlaştığı, özellikle proteince zengin gıda arzını karşılamanın zorlaştığı bir durum ile dünya karşı karşıyadır. Sucul canlı kaynakları hem proteince zengin hem de diğer hayvansal proteinlere göre daha ucuz ve daha kolay sindirilebilir ürünlerdir. Bu yüzden her geçen gün sucul canlı kaynakların tüketimine olan ilgi artmakta ve su ürünleri üretim miktarları da hem Dünya'da hem de Türkiye'de buna paralel olarak yükselmektedir. Dünya balıkçılık ve tarım organizasyonuna göre 2022 yılı itibarıyla Dünya'da toplam su ürünleri üretim miktarı 186 milyon ton, kişi başına düşen ortalama su ürünleri tüketimi 22 kg iken, ülkemizde üretim miktarı 1 milyon ton ve su ürünleri tüketimi yıllık 7.2 kg'dır. Bu durum ülkemizde halen su ürünlerinin öncelikli protein kaynağı olarak tercih edilmediğinin bir göstergesidir. Besin olarak insanlar tarafından tüketilen su ürünleri kaynaklarının başlıca deniz ve tatlı su balıkları, kabuklu su ürünleri (Karides, istiridye, midye vb.) ve kafadanbacaklılar (ahtapot, kalamar, sübye vb.) gibi sucul canlılardan oluşmakta ve bu canlı kaynaklar bir çok kültürde önemli yere sahip olmaktadır. Sucul canlı kaynaklar hiç işlem görmeden çiğ olarak, farklı pişirme teknikleri ile (tuza gömme, kurutma, kızartma, marinasyon, konserve vb.) ve ileri işleme teknikleri ile (kroket, surumi, köfte, pastırma, cips vb.) dünya su ürünleri mutfağında sokak lezzetlerinden en lüks restorantlara kadar yer bulmaktadır. Dünya üzerinde en fazla gelişmiş su ürünleri mutfağı ve su ürünleri yemek çeşitliliği uzakdoğu ülkelerinde görülmekte ve en öne çıkan yemekler suşi, kamaboko, katsuobushi, shrimp paste (karides ezmesi) olduğu bilinmektedir. Avrupa ülkelerinde havyar ve botarga, Avustralya'da gravlax, Güney Amerika'da Ceviche, Kuzey Amerika'da ise Tuna Tartar yemekleri öne çıkmaktadır. Ülkemizde çoğunlukla su ürünleri kızartma ve ızgara olarak işlem görmeksizin pişirilmekte ve su ürünleri mutfağının Dünya geneline göre gelişmemiş olduğu görülmektedir. Dünya su ürünleri mutfağının gelişiminde yaşanılan coğrafya ve kültürün en etkili faktörler olduğu anlaşılmaktadır.

Abstract

In Turkey's dynamic and inflation-sensitive economic landscape, accurately forecasting the Domestic Producer Price Index (PPI (YI-UFE)) and the Consumer Price Index (CPI (TUFE)) is paramount. These indices are critical for guiding monetary policy, informing investment choices, and ensuring economic stability. PPI offers an early indication of future consumer price movements, while CPI directly reflects household cost changes. Both indices in Turkey exhibit a consistent upward trend, necessitating robust prediction models. This study explores various individual forecasting techniques, including Holt's Exponential Smoothing, Auto ARIMA, Theta Method, Piecewise Linear Trend, Prophet Method, LOESS, and Support Vector Regression, acknowledging their inconsistent performance across different conditions. To address this limitation, an innovative ensemble methodology is introduced. This approach utilizes the Fuzzy C-Means clustering algorithm to strategically group and combine the forecasts from these diverse individual models. By leveraging the collective intelligence of clustered predictions, the ensemble method aims to deliver more reliable and stable forecasts. Rigorous evaluation of this ensemble approach demonstrated its superior performance. The proposed method consistently achieved lower Mean Absolute Percentage Error (MAPE) and Root Mean Squared Error (RMSE) compared to individual models when predicting PPI and CPI. This highlights the significant potential of the ensemble strategy in enhancing the accuracy and stability of key economic indicator forecasts within complex and volatile economic environments.

Radiation Shielding Properties of Gd_2O_3 Reinforcement Paraffin Materials: MCNP6.2 Simulation Analysis

Seyit Çağlar* (*ORCID: https://orcid.org/0000-0002-0701-3029*)

*Department of Metallurgical and Materials Engineering, Zonguldak Bülent Ecevit University, Zonguldak 67100, Türkiye

*Corresponding author e-mail: s.caglar@beun.edu.tr

Abstract

This study investigates the effects of Gd_2O_3 (gadolium oxide) doping on the radiation shielding performance of paraffin-based polymer matrix materials. The study analyzed the radiation interaction properties of paraffin materials doped with 3%, 6%, 9%, 12%, and 15% Gd_2O_3 using a Monte Carlo-based MCNP6.2 simulation program. According to the simulation results, a significant increase was observed in the attenuation capacity of the material against both thermal and fast neutrons with increasing Gd_2O_3 doping ratio. In addition, it has been determined that the radiation absorption ability has improved regarding photon interactions. In this context, a significant improvement in the linear attenuation coefficient (LAC) was achieved; the LAC value of 6.582 in the undoped material increased to 7.554 with 15% Gd_2O_3 doping, which corresponds to an increase of approximately 14.77%. The obtained findings reveal that Gd_2O_3-doped paraffin-based composites improve not only neutron but overall radiation shielding properties and therefore have the potential for use in a wide variety of fields such as radioactive material transportation and storage, nuclear medicine applications, nuclear power plants, and space technologies.

Abstract

Alzheimer's disease (AD) is a progressive neurodegenerative disorder that increasingly affects the aging global population, leading to gradual loss of memory, cognition, and behavioral functions. The clinical manifestations of the disease are associated with the accumulation of amyloid beta (Aβ) plaques and tau protein-related neurofibrillary tangles in the brain. One of the key pathological mechanisms of AD involves the proteolytic cleavage of amyloid precursor protein (APP) by secretase enzymes, resulting in the generation of Aβ peptides. Therefore, secretase inhibitors, which aim to reduce Aβ production, have emerged as important pharmacological agents in the therapeutic landscape of AD.

This study focuses on the biological functions of α-, β-, and γ-secretase enzymes and evaluates the pharmacological properties of their inhibitors. The efficacy, safety, and therapeutic potential of secretase inhibitors under clinical and preclinical investigation has been conducted. Although β-secretase (BACE1) inhibitors significantly reduce Aβ levels, they have failed to provide cognitive benefits in clinical trials. On the other hand, γ-secretase inhibitors have been associated with severe adverse effects due to their interaction with multiple physiological substrates, indicating the limitations of single-target treatment strategies. Meanwhile, new-generation agents such as γ-secretase modulators (GSMs), which offer higher selectivity and fewer side effects, represent a promising direction for future AD therapies.

The findings of this study highlight the significance of secretase-targeted therapies in the development of AD drugs, while also emphasizing the need for multi-targeted and combinational therapeutic strategies.

Abstract

Allergic rhinitis is recognized as a common inflammatory disease of the upper respiratory tract, with its prevalence increasing, particularly among children. This increase has been attributed to environmental risk factors, particularly air pollution. In this study, short-term seasonal exposure to $PM_{2.5}$, SO_2 and NO_2, and its impact on allergic rhinitis prevalence among children in Edirne, Türkiye, were analyzed using Generalized Additive Model based on data collected between 2013 and 2018. Edirne was selected as study area due to its high vehicle emissions resulting from transportation and border trade, as well as intensive agricultural activities. A significant association was identified between $PM_{2.5}$ exposure and allergic rhinitis cases in adolescents aged 13-17 years, particularly at lag2 (RR: 1.0101; 95% CI: 1.0010-1.0192) and lag3 (RR: 1.0082; 95% CI: 1.0013-1.0151). Similarly, NO_2 exposure was found to be significantly associated with allergic rhinitis cases in the same age group between lag0-lag5, with the highest risk observed at lag0 (RR: 1.0516; 95% CI: 1.0177-1.0867). However, no statistically significant association was observed between SO_2 exposure and allergic rhinitis in any age group (0-5, 6-12, 13-17). When seasonal variations in air pollution exposure were examined, significant associations were found in 13-17 years age group during autumn, with $PM_{2.5}$ between lag0-lag3, with SO_2 between lag0-lag3, and with NO_2 between lag0-lag2. In the 6-12 years age group, NO_2 exposure was significantly associated with allergic rhinitis between lag3-lag7. In particular, increased NO_2 concentrations were recorded during morning and evening hours, likely due to traffic emissions near school routes. The findings of this study indicate that fossil fuel consumption, increased traffic density, atmospheric inversion events, and seasonal allergen exposure have contributed to the increase in allergic rhinitis cases, particularly in autumn. These results highlight the necessity of implementing targeted interventions to minimize air pollution exposure and its adverse health effects on children.

Abstract

Air pollution, exacerbated by increasing industrialization and urbanization, poses a significant threat to public health, particularly in relation to respiratory diseases such as asthma. Epidemiological studies have shown a positive association between air pollutant exposure and higher asthma incidence. This study examined the impact of air pollution on asthma diagnoses in Edirne, a city in northwestern Türkiye, using machine learning models. The dataset includes air quality and meteorological parameters obtained between 2013 and 2018, specifically focusing on four criteria air pollutants: $PM_{2.5}$, SO_2, NO_2, and O_3. Prior to modelling, all variables were standardized using Z-score normalization to ensure a mean of 0 and a standard deviation of 1. The data were divided into training (80%) and testing (20%) subsets, and model validation was conducted using 10-fold cross-validation. The Spearman correlation analysis indicated that $PM_{2.5}$ had the strongest association with asthma diagnoses. Three classification algorithms- Support Vector Machine (SVM), K-Nearest Neighbors (KNN), and Kernel Naive Bayes (KNB) were employed to model the predictive relationship between air pollution exposure and asthma incidence. Model performance was assessed using receiver operating characteristic (ROC) curves and the area under the curve (AUC) metric. The highest AUC value was achieved with SVM (0.802), followed by KNN (0.789), and KNB (0.777), indicating moderate to strong predictive performance. These findings highlight the significant role of air pollutants and meteorological factors in asthma prevalence and emphasize the potential of machine learning approaches in environmental health research.

Abstract

Pesticide pollution poses an increasing threat to aquatic ecosystems. Fish are among the organisms that are constantly exposed to these chemical agents, and pesticides can trigger various physiological stress responses. In particular, activation of the hypothalamic-pituitary-interrenal (HPI) axis increases the release of stress hormones in fish. In this context, changes in the levels of hormones such as adrenocorticotropic hormone (ACTH) and cortisol are considered important indicators of the endocrine disrupting effects of pesticides.

Studies in the literature show that different types of pesticides (insecticides, herbicides, fungicides) can significantly affect ACTH and cortisol levels in fish. Pesticide exposure generally results in excessive activation of the HPI axis, which leads to a significant increase in plasma cortisol levels. Some studies have shown that even low-dose exposure increases ACTH release and triggers cortisol secretion. However, depending on the type, dose, duration of exposure and fish species, differences in the severity of stress responses are observed. It has also been reported that long-term or high-dose pesticide exposure can cause chronic effects such as depletion in the HPI axis and a decrease in cortisol response.

The effects of pesticides on ACTH and cortisol levels in fish are critical for the health status and ecosystem balance of aquatic organisms. Changes in these hormones can be used as a biomarker of physiological stress caused by pesticides. Controlling pesticide use and reducing pesticide contamination in aquatic environments are of great importance for the sustainability of fish populations

Abstract

Oxidative stress is an important biochemical condition that occurs when the balance in the detoxification of reactive oxygen species (ROS) formed as a result of cellular metabolism is disrupted and plays a role in the pathogenesis of many chronic diseases. Antioxidants are molecules that protect cells from oxidative damage by neutralizing these harmful free radicals. In recent years, interest in natural antioxidant sources has increased and especially medicinal mushrooms have attracted attention with their rich phenolic compounds, polysaccharides and compounds such as ergothioneine. In this study, the antioxidant capacities of various medicinal mushroom species were examined and the potential therapeutic uses of these effects were evaluated. It has been documented in many studies that extracts of mushrooms such as Ganoderma lucidum, Pleurotus ostreatus, Lentinula edodes and Hericium erinaceus exhibit high activity in in vitro antioxidant tests such as DPPH, FRAP, ABTS and CUPRAC. These activities show that mushroom extracts can be used not only as preventive health components but also as natural antioxidant additives in the pharmaceutical and food industries. In addition, it has been shown that the antioxidant effects of some mushroom species are not limited to free radical scavenging activity but also activate endogenous antioxidant defense systems (SOD, CAT, GPx). In this respect, medicinal mushrooms are promising natural agents in the prevention and supportive treatment of diseases associated with oxidative stress. In this presentation, the antioxidant properties of selected mushroom species, the mechanisms of these effects and potential avenues for future clinical applications will be discussed in detail.

Phytoremediation potential of some aquatic medicinal plants for heavy metals

Beyza Yıldırım*, Muhittin Doğan

University of Gaziantep, Faculty of Arts and Sciences, Department of Biology, Gaziantep, Türkiye

*Corresponding author e-mail: yildirimbeyza2002@gmail.com

Abstract

Accumulation of heavy metals in the environment poses serious threats to both ecosystem health and human health. Therefore, phytoremediation, an environmentally friendly and sustainable method, stands out as an important solution in the remediation of contaminated areas. In this study, the heavy metal removal potential of some aquatic macrophytes with medical importance was evaluated. The capacity of plants to absorb and accumulate heavy metals and phytoremediation mechanisms were examined. Additionally, medical aspects of the macrohytes, such as their use in the public or pharmaceutical field, were also discussed.

Key words: Phytoremediation, medicinal aquatic plants, heavy metal

Abstract

Global warming causes climate change by releasing greenhouse gases into the atmosphere and increasing the temperature of the world. It is a known fact that this warming will accelerate hydrological disasters, cause extreme weather events such as droughts and floods, and increase climate change. Global climate change poses a threat to the global climate due to increasing carbon emissions and the effects of other greenhouse gases. Global climate variability causes increases in evaporation, temperature, and precipitation, which are very important factors for the life of living things. This situation causes a continuous decrease in water resources, endangers natural life, and has negative effects on agricultural production. Plants are significantly affected by climate variability, which causes a decrease in agricultural production. Food production is a serious component that can be affected by changes in climate. Climate change also threatens global food systems, which feed all living things on the planet. Climate change and variability can be effective in the emergence of dangers at various stages of the food chain, from primary production to consumption. There are multiple ways in which climate-related factors can affect food security. In this study, the risks of global warming and climate change on food security and food safety in agricultural production were examined.

Key words: Global warming, climate change, food security, sustainability

Abstract

Nanotechnology is considered the most important technological development of recent years and is used in many areas due to its potential applications. Today, their use in agricultural production to maintain an environmentally friendly agriculture offers a great opportunity. Globally, food safety and security are currently receiving great attention with the aim of ensuring the sustainable supply of nutrient-rich and safe foods. Nanotechnology has become a promising solution to many problems faced by some applications used globally, and has also made great contributions to applications in the agricultural, environmental and food sectors. Nanotechnology in agriculture has significant effects at every stage of agricultural production, including seed germination, growth, harvesting, processing, storage and transportation of agricultural products. Nanofertilizers, nanoherbicides, nanofungicides, nanobiosensors, nanoscale genetic carriers, nanobioremediation agents and nanocomposites for packaging are new applications of nanotechnology in the field of product development. Nanotechnology minimizes loss and increases efficiency by ensuring the delivery of nutrients to the target area of the plant. Nanoscale materials are used to increase agricultural yields, improve food quality and safety, improve water and nutrient efficiency, and reduce environmental pollution. Nanotechnology has emerged as a promising avenue that offers significant opportunities to revolutionize food safety practices and increase agricultural productivity in a sustainable manner. This study aims to provide information on nanotechnological applications used in agricultural production, taking into account current developments.

Abstract

The exponential growth in mobile data traffic and the emergence of ultra-reliable low-latency applications are driving the need for revolutionary wireless architectures that go beyond conventional cellular systems. Cellular massive MIMO networks, in which numerous access points (APs) equipped with multiple antennas cooperatively serve users, offer the potential for enhanced coverage, increased throughput, and improved spectral efficiency. However, despite their promise, optimal deployment strategies for such networks remain insufficiently explored—particularly regarding the trade-offs between AP density, antenna configurations, and overall system efficiency in densely populated user environments. This study presents a comprehensive analysis of these trade-offs using high-resolution simulation data, examining the joint impact of antenna diversity, AP scaling, and user load on system performance. Results show over 160% improvement in user throughput when increasing AP density under moderate antenna configurations, while antenna diversity contributes additional throughput gains ranging from 20% to over 70%, depending on AP density. Conversely, a tenfold increase in user count leads to more than 98% degradation in per-user throughput, underlining the limits of scalability. Efficiency analysis further reveals that maximum throughput per AP is reached at moderate AP densities, beyond which performance per AP declines due to resource contention and coordination overhead. These findings highlight deployment sweet spots where system throughput and spectral efficiency are balanced, offering practical guidelines for scalable wireless infrastructure design in next-generation networks.

Effects of The Diatomaceous Earth and Entomopathogenic Fungi Against The Tomato Leafminer Moth, Tuta absoluta (Meyrick) [Lepidoptera: Gelechiidae] in Field Condition.

Zainelabdin Adam Mohmmed Ali, Orkun Barış KOVANCI

Bursa Uludağ University, Faculty of Agriculture, Department of Plant Protection
Campus of Görükle, 16059 Bursa/TÜRKİYE

Email: baris@uludag.edu.tr

Abstract

Field tests were done by the Department of Plant Protection at the Faculty of Agriculture, Bursa Uludağ University. The tomato varieties Albeni and UG 12406 740 are provided by United Genetics Turkey Seedling Company. This study sought to evaluate the impact of diatomaceous earth and entomopathogenic fungi on the mortality of the tomato leafminer moth, *Tuta absoluta*, as an alternative to insecticides. Diatomaceous Earth (DE) was combined with *Paecilomyces fumosoroseus* strain PFs-1 (Priority) and *Verticillium lecanii* strain Bb-1 (Nibortem) to manage *T. absoluta* larvae, alongside a positive control of Azadirachtin (Nimbecidine) and an untreated control group. In field studies with the Albeni variety, optimal toxic effects (elevated mortality, minimal infestation) were seen with Nibortem + DE: mortality increased steadily over time (40% to 93.3% on day 7). Infested fruit: 44.6%. Mortality demonstrated a gradual escalation (46.1% → 92.3%). Infested fruit: 52.4%, demonstrating a considerable protective effect. Nembecidine, utilized as a positive control, demonstrated the highest death rate by day 7 (100%). Infested fruit: 37.9% – the lowest infestation rate, signifying strong field efficacy. In the UG 12406 740 variety optimal Toxic Effects (Elevated Mortality, Minimal Infestation) Nibortem + DE: Mortality progressively escalated over time (55.5% → 88.8% by day 7). Infested fruit: 37.4% — significantly lower than individual treatments. Proposes a synergistic interaction between Nibortem and Diatomaceous Earth. Priority + DE: Mortality exhibited a progressive increase (44.4 → 77.7). Infested fruit: 47.6%, indicating a significant protective effect. Demonstrates that the combination of Priority and DE yields superior performance compared to each independently. Nembecidine, utilized as a positive control, exhibited the highest death rate by day 7 (92.3%). Infested fruit: 29.6% — the minimal infestation, indicating robust field performance. Thus, Nibortem+ DE and Priority+ DE can be considered a viable alternative to chemical control for the management of *T. absoluta* larvae.

Abstract

Energy is one of the most pressing global issues of the 21st century, with energy independence being essential to national sovereignty. In line with global carbon neutrality goals and Türkiye's 2035 and 2050 energy targets, this project proposes an optimized hybrid renewable energy system combining solar tracking-enabled photovoltaic panels and wind turbines.

The study focuses on enhancing system performance through multiple optimization strategies, including wind farm orientation, wind turbine blade design, and anti-soiling coatings for solar panels. Using Python-based computational modeling and simulation tools, the project evaluates annual solar irradiance and wind speed data to identify the most suitable geographic locations across Türkiye. It also includes optimal PV panel sizing and tilt angle selection, dynamic solar tracking integration, and region-specific turbine selection based on wind profiles.

A key component involves the positional optimization of wind farms to increase capacity factor and reduce wake effects. In parallel, innovative blade design improvements are considered to enhance aerodynamic efficiency. For the solar component, the implementation of dust-repellent coatings is investigated to reduce performance loss due to soiling. The integration of these elements aims to improve operational efficiency and extend system lifespan.

By synthesizing solar and wind technologies into a unified energy solution, this project not only targets higher energy yield and CO_2 emission reduction but also reduces Türkiye's dependency on imported fossil fuels. Furthermore, the model developed will be evaluated for its scalability and adaptability to other regions and renewable infrastructure projects.

Abstract

The genus *Galium* L., a member of the Rubiaceae family comprising nearly 600 species, is known as "yoğurt otu" (yoghurt herb) in traditional Anatolian medicine. Various *Galium* species have long been utilized for their diuretic, antidiarrheal, antispasmodic, and sedative properties, and in certain regions of Türkiye, notably Elazığ and Tunceli, they are also used to help regulate blood glucose levels. Phytochemical investigations have identified the presence of a wide range of bioactive constituents in *Galium* species, including flavonoids, tannins, iridoids, and saponins.

In the present study, methanol extract was prepared from the aerial parts of *Galium divaricatum*. Enzyme inhibition assays demonstrated that while the extract showed no inhibitory effect on α-amylase, it effectively inhibited the α-glucosidase enzyme, with an IC_{50} value of 20.66 ± 2.43 µg/mL, and the reference drug acarbose inhibited the α-glucosidase enzyme, with an IC_{50} value of IC_{50} 62.37 ± 3.58 µg/mL. LC-MS/MS analysis of the methanol extract confirmed the presence of several phenolic and flavonoid constituents, including quinic acid (36.467 µg/g), chlorogenic acid (35.624 µg/g), cynaroside (25.963 µg/g), and isoquercitrin (11.313 µg/g). Each of these compounds is known for specific biological activities: cynaroside exhibits anti-inflammatory effects, chlorogenic acid is a potent antioxidant, quinic acid functions as an α-glucosidase inhibitor, and isoquercitrin contributes to blood glucose regulation.

Collectively, these findings suggest that *Galium divaricatum* is not only rich in compounds with strong antioxidant, antiinflammatory, and antidiabetic properties, but may also hold therapeutic potential in the management of diabetes mellitus—a chronic and progressively prevalent disease with systemic consequences. This study adds to the growing body of evidence supporting the medicinal value of traditionally used plants in modern therapeutic contexts.

This work was supported by Office of Scientific Research Projects of Karadeniz Technical University under Grant [number TLÖ-2024-16264].

Abstract

Fossil fuels are known to constitute approximately half of the world's energy production, yet international organizations like the European Union have begun investing in renewables for carbon neutrality. In line with COP28 decisions, Türkiye aims to increase its renewable energy usage between 2035 and 2050. Meanwhile, the International Air Transport Association (IATA) targets carbon neutrality in air transportation by 2050. Given the high energy consumption and carbon emissions in the aviation industry, progress in reducing environmental impacts is accelerating faster than in other sectors. This study seeks to generate tangible results for reducing Türkiye's energy dependence and carbon emissions. Its primary objective is to develop a simulation-based Python system to enhance energy efficiency and reduce carbon emissions within the sector.

The project will employ data analysis to identify optimal locations based on solar radiation, annual average wind speeds, and energy production potential. Performance of photovoltaic panels and wind turbines in selected regions will be assessed. Parameters such as solar panel size, tilt angles, and suitable turbine choices for wind speeds will be optimized. Python-based optimization techniques will evaluate the hybrid system's performance and analyse ways to increase the efficiency of energy production processes for electric motors in airports and ports.

Solar-wind hybrid systems hold significant promise for countries like Türkiye, potentially meeting 70-100% of an airport's daily energy needs. Integrating these systems could reduce fossil fuel-based carbon emissions by 50-80%. To achieve zero-carbon targets, specialized software will simulate and compare various propulsion systems, bolstering environmental sustainability. Ultimately, this approach simplifies incorporating renewable energy solutions into design, empowering companies to optimize long-term energy and cost planning effectively.

Abstract
Breast cancer is a heterogeneous, hormone-dependent malignancy that represents the primary cause of cancer among women and is one of the most prevalent contributors to cancer-related mortality nowadays. Our research aims to assess the expression of ER and PR status in women diagnosed with breast cancer, as well as to assess the correlations between these receptors and prognostic parameters of the disease. A retrospective study of 252 women with breast cancer was conducted at the oncology department of Mother Teresa University Hospital in Albania between 2021 and 2024. Statistical analysis was performed utilizing SPSS. The over-45 age group has the highest diagnostic rate (92.5%) compared to the under-45 age group (7.5%). The most common morphological type observed was ductal carcinoma, accounting for 81.3% of the cases. A significant association was observed between the disease stage and the receptors assessed in the study ($p<0.001$). Our analysis of the association between receptor status and age group revealed a statistically significant association between the two variables ($p=0.02$). A strong association was observed between ER and PR expression receptors ($p=0.00$)
Keywords: breast cancer, Albanian population, ER receptor, PR receptor.

INTRODUCTION

Globally, breast cancer is the most common type of cancer and the leading cause of cancer-related deaths among those under 70 (Esmat E, 2024).
Receptor status has been consistently demonstrated to be one of the most significant predictive factors that affect five-year survival rates, mortality, and disease-free survival rates. (Davey MG, 2021), (Falck AK, 2013). Estrogen receptors (ER) and progesterone receptors (PR) are highly expressed in breast cancer cells and are regarded as diagnostic and prognostic biomarkers for the disease. The overall survival and time to recurrence are positively correlated with increased ER/PR expression, whereas a more aggressive course of the disease, as well as a worse prognosis and recurrence, are typically associated with low ER and PR levels (Łukasiewicz S, 2021).

MATERIALS AND METHODS

The research comprised 252 Albanian women. The data of our study were acquired from patients diagnosed with breast cancer at the oncology service of Mother Teresa University Hospital throughout the years 2021-2024. In the medical records of each patient, all the data directly associated with breast cancer were evaluated.
Statistical analysis was conducted utilizing SPSS. Descriptive and analytic data were evaluated. A p-value of less than or equal to 0.05 was deemed statistically significant. Tables and graphs illustrate the results.

DRAFT

RESULTS

The study included 252 female participants. The over-45 age group had the highest diagnostic rate (92.5%) compared to the under-45 age group (7.5%). The subjects' average age was 62.2 years, with a standard deviation of 11.73. Ductal carcinoma was the most prevalent form at 81.3%. The left breast had the highest prevalence of the disease (57.1%). According to the receptor measurements in the study, ER+ had the highest percentage of positive receptors (85.3%), followed by PR+ (80.6%). Of the subjects, 88.9% were non-TN, and 11.1% were TN. The mean age of subjects with ER and PR overexpression was 63, 63 compared with those lacking ER and PR expression (59; 60).

The analysis of the association between receptor status (TN and non-TN) and age group using the non-parametric Chi-square test revealed a statistically significant association between the two variables ($p=0.02$). A statistically significant correlation ($p<0.001$) existed between the receptors' status and the disease's stage. ER had a strong, positive, and significant association with PR ($r = .589$, $p < 0.01$).

Table 1: Distribution of receptors according to disease grade.

<<		Stage				r, p
		Stage I	Stage II	Stage III	Stage IV	
		Count	Count	Count	Count	
ER	0%/ negative	0	20	13	2	
	1-9%/ low positive	1	2	3	0	r=-0.228;
	10-100%/ positive	15	154	39	0	p=<0.001
	Total	16	176	55	2

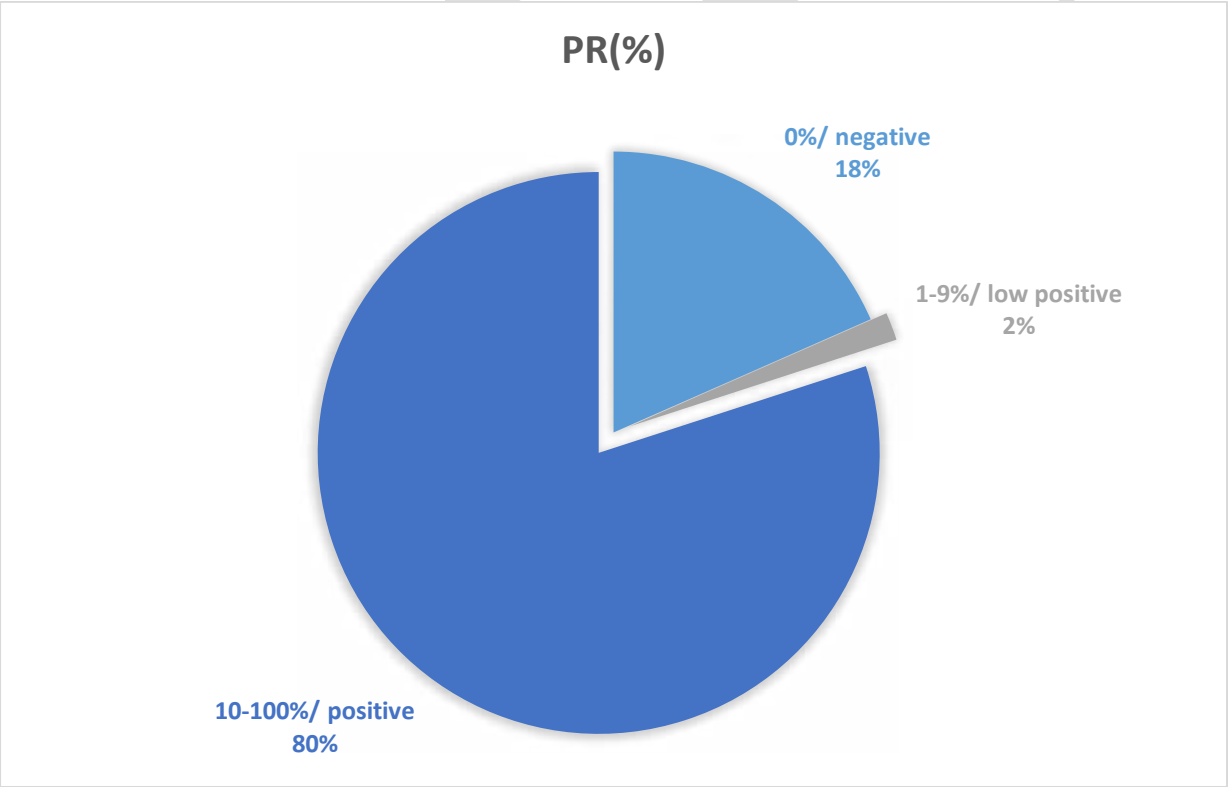

Chart 2: PR receptor distribution

DISCUSSIONS

Approximately 80% of individuals diagnosed with breast cancer are over the age of 50, and over 40% are aged above 65 (McGuire A, 2015) (Łukasiewicz S, 2021). In our study, the mean age of the subjects was 62.6 years. The over-45 age group has the highest diagnostic rate (92.5%) compared to the under-45 age group (7.5%).

Ductal carcinoma was the most common histological type (81.3%) of breast cancer, comparable to other studies. (Azizun-Nisa, 2008), (Sharif MA, 2009), (Anupama Dayal, 2016), (Pathak TB, 2011), (Ellis IO, 1992), (Hiral Samir Shah, 2020).

Measurable amounts of ER and PR receptors were found in about 50–85% and 60-70% of patients with breast cancer (Senel, 2021). In our study, the ER receptor was positive in 85.3% of the subjects and the PR receptor in 80.6%. Other studies have found varying expressions of estrogen and progesterone receptors in breast cancer (Yip CH, 2014) (Łukasiewicz S, 2021) (MN., 2014).
The HER2 gene is 15-25% positive in breast cancer (Senel, 2021) (Kohler BA, 2015). In our study, HER2/neu was 14.277%.

Clinical observations and biomarker studies indicate that late-onset breast cancers grow more slowly. They are biologically less aggressive than early-onset breast cancers, even when controlled for hormone receptor (for example, estrogen receptor, ER) and growth factor receptor (for example, HER2) expression, supporting the conclusion that the biology of breast cancer is age-dependent (CC., 2008).

In our study, a significant association was observed between the disease stage and the receptors assessed in the study ($p<0.001$). Advanced stages were likelier to exhibit low positivity for ER and PR ($p\leq0.001$; $p = 0.04$). ER and PR expression increased with rising age. Our results are consistent with the literature (Azizun-Nisa, 2008) (Tero A. H. Jarvinen, 2000).

Given our current findings on breast cancer and the role of hormonal status in this disease, as well as the role of BRCA genes in the development of inherited breast cancer in our most recent article (Xhetani, 2024) (Hasa, 2024), we intend to conduct additional research on BRCA genes in women with a family history of breast cancer.

CONCLUSION

ER and PR receptor expression is higher in differentiated low-grade tumors compared to high-grade tumors. Their expression rises with age. ER and PR receptors are essential for prognostic evaluation, risk assessment of disease recurrence, and therapeutic decision-making.

ACKNOWLEDGEMENTS

I wish to express deep regards to the oncology department of Mother Teresa University Hospital in Albania for their cooperation in this study.

Active Control of Air Suspension Systems in Commercial Vehicles

İ. Sina Kuseyri
Marmara University Department of Mechanical Engineering, Maltepe-İstanbul, Turkey

sina.kuseyri@marmara.edu.tr

Abstract

Commercial vehicles such as public transportation busses can benefit from the height control of the chassis that an air suspension provides. Main benefits of height control are retaining a pitch angle parallel to the road for passenger comfort regardless of the load and road disturbance, and easy accessibility to vehicle for especially old or disabled people. Electronically controlled air suspension systems are commonly used in commercial vehicles to enhance ride comfort and improve handling stability. This paper focuses on the vehicle height adjustment process in actively controlled air suspension systems. A non-linear mathematical model for adjusting vehicle height is developed by integrating vehicle dynamics, suspension pneumatics, and the thermodynamic effects of compressible flow. A PID controller is proposed for accurate control of vehicle height. Effectiveness and performance of the proposed controller are verified by simulations.

Keywords: Modeling and simulation, air suspension, active control

1 Introduction

The background of ECAS is closely linked to advancements in both air suspension and electronic control technologies, bringing together the best of both worlds to create a highly adaptable and customizable suspension system. Initially adopted in high-end luxury vehicles, ECAS systems have gradually expanded their presence to other automotive segments, including commercial trucks and buses, further emphasizing their effectiveness and versatility in addressing the challenges of diverse driving scenarios. The advantages of ECAS in public transportation buses are notable for their contribution to both passenger comfort and overall vehicle performance. ECAS allows public buses to adjust their ride height based on the number of passengers, cargo load, or road conditions. Customizable ride height contributes to improved accessibility, making boarding and disembarking easier for passengers. The precise control over air pressure in ECAS results in a smoother and more comfortable ride for passengers.

In conventional passive air suspension systems vehicle height is continuously regulated by the direct connection between the air reservoir and air suspensions [1]. To keep the vehicle height constant in rough terrain, high pressure air is continuously supplied to the air springs. In ECAS, on the other hand, control is taken over by an electronic control device (ECU). Hence, air supply to the suspensions can be provided only if the vehicle height exceeds the predefined tolerance [2]. Therefore, actively controlled air suspension systems consume less pressurized air leading to energy savings during the ride.

In [3] the evolution of vehicle pneumatic suspension systems is reviewed. An adaptive LQR controller is designed in [4], and its performance is validated by experiments. Robust controllers for air suspension systems are designed in [5] using finite-time approach and in [6] considering unmodeled dynamics and parametric uncertainties. In [7] and [8] authors design model predictive controllers with a cooperative control method and with multi-mode switching damping respectively. In [9] authors proposed a fuzzy PID controller with nonlinear delay factors to control an ER damper. In [10] authors designed a fuzzy PID controller for damping control of the shock absorber by combining a PID control algorithm with the fuzzy control concept that involves a genetic algorithm-optimized fuzzy PID air suspension control approach.

In this paper we propose a basic PID controller for hight adjustment and road disturbance rejection of ECAS. It is shown that this basic controller is effective with acceptable performance. Modeling of electrical and mechanical parts of the drive system is presented in Section 2. Model based numerical simulation

results are in Section 3. Finally we summarize the conclusions of our study in Section 4, and provide suggestions for further research.

2. System Dynamics

The height adjustment function of the ECAS system is achieved by inflating and deflating the air springs. The circuit diagram for this process is shown in Figure 1. It includes four air springs, one at each corner of the vehicle, a solenoid valve that regulates the airflow into the air springs, a compressor that provides compressed air when the gas pressure in the reservoir falls below a certain threshold, a reservoir that stores the compressed air, an air filter that removes impurities from the system, and an air dryer that removes moisture from the intake air to prevent damage caused by excess moisture.

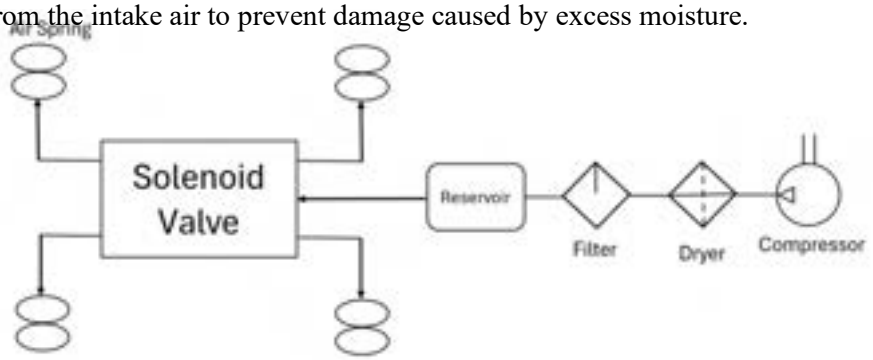

Figure 1: Pneumatics of the ECAS system

The displacement of the sprung mass (vehicle) is adjusted by inflating and deflating the air springs, which modifies the vehicle's height to achieve the desired driving performance.

During inflation, compressed air from the reservoir is directed into the air springs through the pipeline, raising the vehicle's height. In the deflation process, air is released from the air springs into the atmosphere via the pipeline, lowering the vehicle's height.

Based on the described height adjustment processes, a mathematical model for vehicle height adjustment can be derived by integrating vehicle dynamics, the compressible flow equations through the solenoid valve, and the thermodynamic behavior of the air in the air springs. The following assumptions/simplifications are made during this derivation:
i) Air is treated as an ideal gas, and its kinetic energy is considered negligible in all air springs.
ii) The pressure within the air reservoir remains constant, and there is no gas leakage from the system.
iii) The solenoid valve is modeled as a throttle (orifice).
iv) The pressure and temperature of the gas in the air springs are assumed to be uniformly distributed.
v) Rate of change of the volume and the effective area of air springs are constant.

2.1 Thermofluid models for the valve and air springs

As the solenoid valve in the gas circuit is simplified as an orifice, when the solenoid valve is open, area-normalized mass flow rate through the valve is

$$q_m = S_e P_u \phi \tag{1}$$

where the definition of parameter ϕ changes upon the choked and unchoked flow conditions.

$$\phi = \begin{cases} \sqrt{\frac{k}{RT}\left(\frac{2}{k+1}\right)^{\frac{k+1}{k-1}}} & \frac{P_d}{P_u} \le C_r \\ \sqrt{\frac{2k}{(k-1)RT}\left[\left(\frac{P_d}{P_u}\right)^{\frac{2}{k}} - \left(\frac{P_d}{P_u}\right)^{\frac{k+1}{k}}\right]} & \frac{P_d}{P_u} > C_r \end{cases} \quad (2)$$

In Equations (1) & (2) q_m is area-normalized mass flow rate, S_e is effective area of the valve, P_u is the upstream pressure, P_d is downstream pressure, R is the gas constant, k is polytropic index, T is the temperature, and C_r is the critical pressure ratio. The upper and lower parts in Equation (2) are for the choked and unchoked flow conditions respectively.
During the elevation of the vehicle, the upstream pressure is the pressure of the air in the reservoir, i.e., $P_u = P_r$, and the downstream pressure is the pressure of the air in the air spring, i.e., $P_d = P_s$. While lowering the vehicle, the upstream pressure is the pressure of the air in the air spring, i.e., $P_u = P_s$, and the downstream pressure is the atmospheric pressure, i.e., $P_d = P_{atm}$.

The variable mass thermodynamic model of air spring is derived to obtain a relationship of air pressure and the area-normalized mass flow rate of the pipeline. The charging and discharging process of the air spring is independent of each other and they are relatively fast, so they can be regarded as adiabatic processes. Assuming ideal gas conditions, the nonlinear dynamic model of the simplified air spring is

$$\dot{P_s} = \frac{kRT}{V} q_m - \frac{kP_s}{V}\dot{V}, \quad (3)$$

where rate of change of the volume of the air spring is

$$V = \frac{dV}{dx}\dot{x} = V_x\dot{h}. \quad (4)$$

2.2 Mechanical model of the air suspension

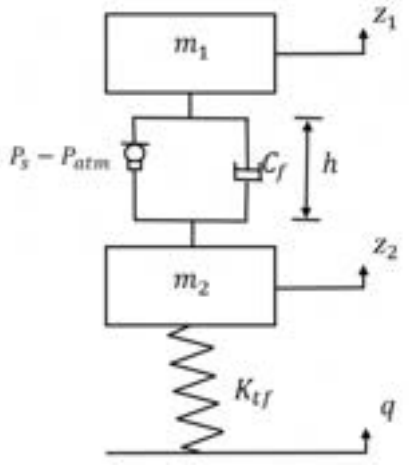

Figure 2: Quarter-vehicle mechanical model of the air suspension

Equations of motion for the quarter-vehicle mechanical model of the suspension system shown in Figure 2 are

$$m_1\ddot{z}_1 = (P_s - P_{atm})A_e + C_f\dot{h} - m_1 g \quad (5a)$$

$$m_2\ddot{z}_2 = K_{tf}(q - z_2) - (P_s - P_{atm})A_e - C_f\dot{h} \quad (5b)$$

$$\dot{h} = \dot{z}_2 - \dot{z}_1 \quad (5c)$$

In this model mass of the quarter-vehicle, m_1, can vary depending on the load on the vehicle.

3Numerical Simulations and Results

Numerical simulations reflecting the active air suspension system performance during the cruise on a relatively rough road, and during the passage through a bump in this section. We also verify the performance of active control during the ascent and descent of the vehicle. Mathematical model of the air suspension system combined with the PID controller is composed in MATLAB/Simulink.

Rough road condition is modeled by a first order filter that takes white noise as its input [11]

$$q = n - \frac{1}{\omega_c v}\dot{q}, \quad (6)$$

where q is the vertical displacement of the road, n is the white noise signal, ω_c= 0.8 rad/s is the cut-off frequency, v= 7.5 m/s is the vehicle's speed. Bump on the road is modeled by

$$q = 0.15 \sin(9\pi t). \quad (7)$$

Hence bump has a height of 15cm, and a width of 83cm during the cruise with a speed of 7.5 m/s. We take only the half period of the sine signal to represent the bump.

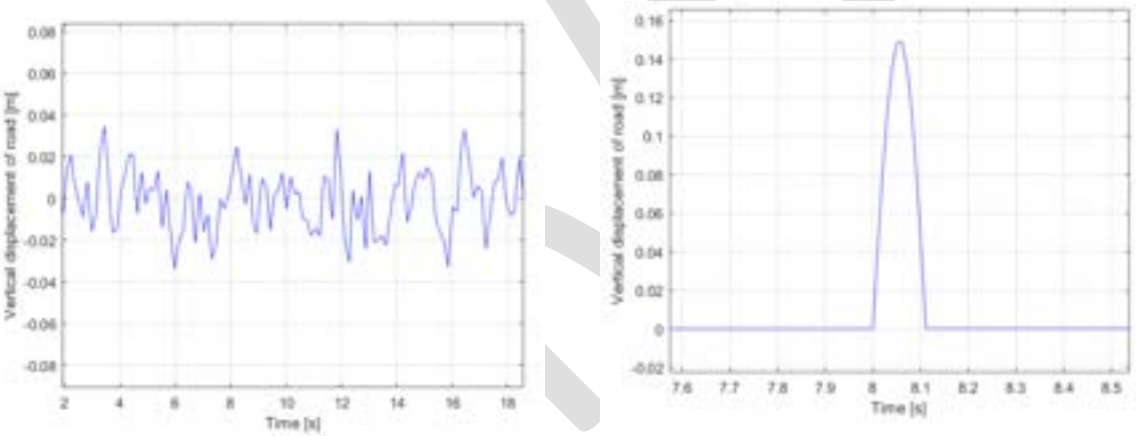

Figure 3: Rough road and bump models

Parameters of the suspension system used in the simulations is given in Table 1 [2]. PID controller gains, optimized by trial and error, are 3,5, 0.06, and 1.5 respectively with the filter coefficient 100.

Table 1: Air suspension parameters

Parameter	Symbol	Value
Sprung mass (kg)	m_1	1550
Unsprung mass (kg)	m_2	200
Nominal bus height (m)	h	0.5
Damping coefficient (kN.s/m)	C_f	8.3
Tire vertical stiffness (kN/m)	K_{tf}	750
Effective air spring area (m^2)	A_e	0.042
Unit change in volume (m^3/m)	dV/dx	0.045
Reservoir pressure (MPa)	P_r	0.8
Effective valve area (m^2)	S_e	$7.34x10^{-6}$
Polytropic index	k	1.38
Critical pressure ratio (kg)	C_r	0.528
Temperatue (K)	T	300

Response of the active air suspension system to a bump and to rough road disturbance is shown in Figure 4. When the vehicle passes over an 15 cm height bump, its height rises 5 cm during the transient response. Hence ECAS system bump suppression performance is 67%. Bus reaches the steady-state in 3 seconds.

The road disturbance model is a pseudorandom signal taking values in the range of $\pm$ 0.03 m The ECAS system is so adjusted that it does not take any action if the disturbance is within $\pm$ 0.02 m margin. If the road disturbance exceeds this margin controller activates air valves and bus height is adjusted. This mode is the main benefit of the active air suspension over the passive air suspension systems in disturbance rejection. Frequent switching of the air valve can cause premature wear of the components. Moreover, high energy consumption of the vehicle to generate compressed air is mitigated.

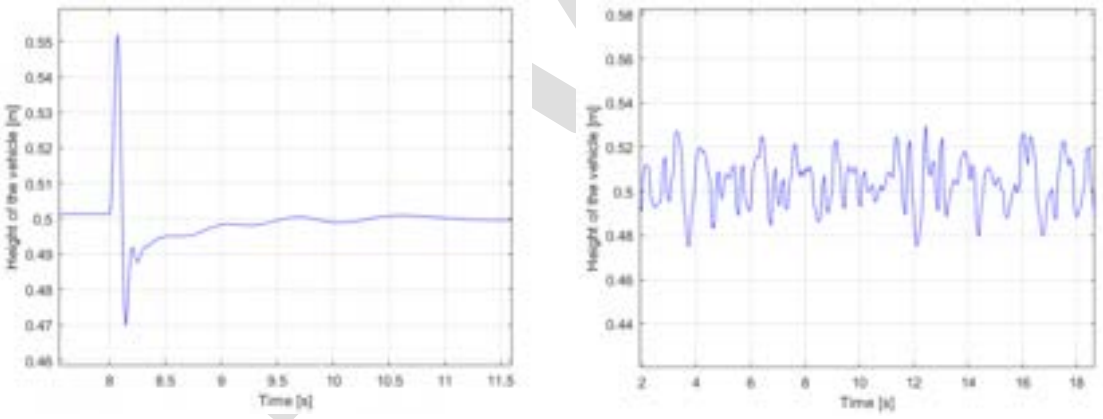

Figure 4: Bump and rough road responses

The ECAS system also enables the driver to adjust the height of the bus. In Figure 5 height adjustment processes are simulated.

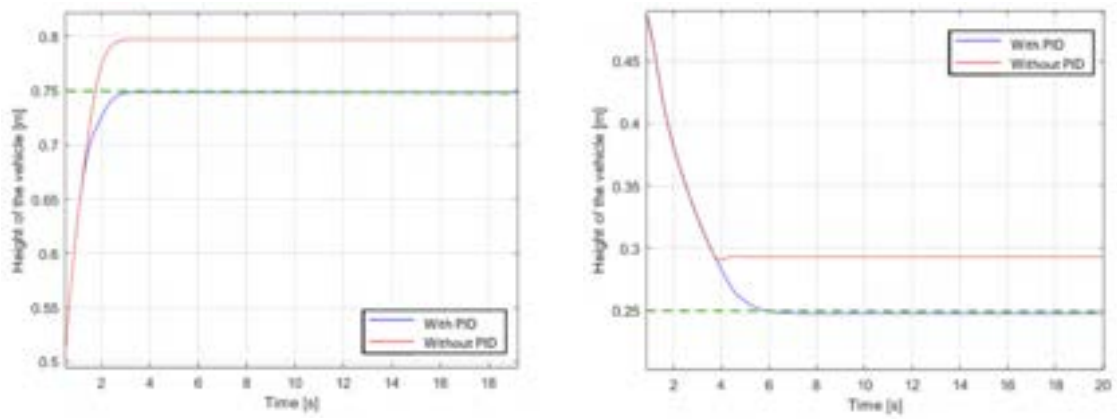

Figure 5: Height adjustment processes

Dashed green line is the target height in the simulations which is 0.75 m during the ascent of the vehicle body, and 0.25 m during the descent. Without feedback control system height is elevated to 0.8 m during descent which is 5 cm above the reference command. Feedback PID control achieves almost zero steady-state error. Similarly, during the descent of the vehicle feedback PID control achieves zero steady-state error as opposed to 4 cm error in the case without feedback. Moreover, it is clear from the figures that settling time during the vehicle ascent process (3 seconds) is approximately half of the settling time of vehicle descent process (6 seconds) hence, ascending the bus is faster than descending it. The difference stems from the fact that, during the ascent process, upstream pressure is reservoir pressure which is 0.8 MPa, whereas during the descent upstream pressure is the internal pressure of the air spring which is around 0.58 MPa.

Conclusion and Recommendations for Future Work

In this paper we have studied electronically controlled air suspension systems which represent a significant advancement in the field of public transportation, offering enhanced ride quality, improved safety, and enabling height adjustment. The implementation of ECAS in public buses addresses the critical need for adaptive suspension solutions that can respond dynamically to varying load conditions and road surfaces, thereby optimizing passenger comfort and vehicle stability and passengers' accessibility by height adjustment. The ECAS system used with the system specified in our work had a suppression performance for the bump on the road up to 67%. We have shown that Feedback PID control leads to zero steady state error during the height adjustment processes. Moreover, it is possible to deactivate the air valves if the road disturbance is less than a margin that can easily be tolerated by the passengers. Frequent switching of the air valve can cause premature wear of the mechanical components. Moreover, high energy consumption of the vehicle to generate compressed air can be mitigated. We recommend further studies to be made on the quantification of possible energy savings of active air suspension systems over their passive counterparts.

Abstract
The objective of this study is to propose a methodology for the decision-making process concerning the patenting of innovations within an R&D company. The patenting process is to be integrated into the company's workflow at an opportune stage, in order to avoid loss of time and disruption to the process. Multi-criteria decision-making techniques are to be used to this end. Literature research was conducted to identify possible selection criteria, and these criteria were finalized through a survey. The AHP method was used to weight the criteria, and the TOPSIS method was used to evaluate and rank the existing projects that met the company's objectives and strategies. The development of a decision support system was undertaken to prioritize the patenting of projects and to allow it to be used by different companies.
Keywords: Multi Criteria Decision Making, AHP, TOPSIS, Patent, R&D Project, Decision Support System.

INTRODUCTION

Companies do not only create value but also compete with each other. To benefit from the advantages arising from the innovation process, companies must protect their innovations from being imitated by others. One of the mechanisms that enables companies to safeguard themselves in this regard is the patent system. A patent is a legal document that grants its holder exclusive rights to prevent others from making, using, or selling the invention without their consent for a specific time and place (Turkish Patent Institute, 2017). Patents play a crucial role in promoting innovation and economic growth. In addition to protecting an invention, patents also serve as a motivational factor for future ideas that have yet to be developed (Bennett, 2020). Obtaining a patent can provide a significant advantage for a company, especially for a research and development (R&D) company. However, the process of obtaining a patent is lengthy and challenging. Companies may find it daunting to determine which product or project to patent from the developed ones.

In their studies, Mehrez and Sinuany-Stern (1983) used Multi-Criteria Decision Making (MCDM) methods to address the project selection problem. MCDM methods, such as Analytic Hierarchy Process (AHP), Technique for Order of Preference by Similarity to Ideal Solution (TOPSIS), and Elimination and Choice Expressing the Reality (ELECTRE), are commonly used for solving decision-making problems. AHP, a MCDM method, is useful for solving complex problems with a small number of alternatives (Mahmoodzadeh et al., 2007). Developed by Saaty (1977), this mathematical theory is based on pairwise comparisons. AHP is structurally simple and popular for weighting criteria in decision-making.

In addition, the TOPSIS method was developed by Hwang and Yoon (1981) and has been applied in various fields by ranking a large number of alternatives and quickly identify the best option. The combination of AHP and TOPSIS has been frequently used in research due to the superiority of AHP in determining criteria weights compared to other methods and the ability of TOPSIS to identify the best alternative (Tavana and Hatami-Marbini, 2011). This combination has yielded positive results when used together.

The objective of this study is to create a systematic decision-making process for prioritising finished products or ongoing R&D projects of an R&D company in Eskişehir for patenting. The projects are ranked based on their importance, and a systematic decision-making process is used to identify the most suitable project for patenting. During the study, criteria for evaluating the projects were identified through a literature review. The specific criteria to be included in the project were then decided through an internal

DRAFT

survey within the company and surveys conducted with other companies. A decision support system for the Analytic Hierarchy Process (AHP) was created in Excel VBA to calculate the weights of the criteria based on the evaluations. The projects were ranked in order of importance using the Technique for Order of Preference by Similarity to Ideal Solution (TOPSIS) method, based on the assigned weights.

This study is unique in its focus on prioritising which product's patent process the company should initiate, among existing products and projects. This prioritisation is achieved through the use of multi-criteria decision-making techniques. The project's innovation lies in using multi-criteria decision-making techniques to determine which product or project the company should prioritize for initiating the patent process. This is done by considering the crucial criteria for the company before starting the patenting process. Moreover, the project's innovative and technological aspects are emphasised by the decision support system developed in the study. This system is intended for use not only by the company but also by other R&D firms in the future.

When reviewing the literature, it is evident that research tends to focus more on post-patenting processes, such as patent valuation, rather than determining which product should be patented. There is a noticeable gap in the literature regarding sufficient studies on the specific question of which product/project should be prioritised for patenting. Consequently, efforts have been made to explore studies that might be relevant to this topic.

Literature Review

In a study on the patenting process, patent-holding academics were surveyed to identify the difficulties they encountered. Qualitative research methods, specifically phenomenology and the trial model of content analysis, were employed to analyze the data (Tacgın, 2020). The study gathered information from academics and conducted literature reviews to identify codes within the scope of these studies. The identified difficulties include time constraints, financial limitations, the patronage system, and bureaucratic obstacles. To address these issues, it was concluded that administrations should engage in incentivizing activities and pursue process improvements in patenting.

Deger (2011) examined patent valuation and discussed four commonly used approaches: the market-based, income-based, cost-based, and option-based approaches. The study evaluated these methods and others to determine the most appropriate approach for patent valuation. The conclusion was that the option-based approach is the most suitable method.

A study on patent valuation was conducted, evaluating a company's ten patents using multi-criteria decision-making techniques, namely TOPSIS and VIKOR, with twelve criteria. The patents were then ranked using MOORA and ARAS. The criterion weights were determined using the entropy method. Although the obtained results had the same criterion weights, differences in rankings were observed due to the use of different methods. To address this issue, it is recommended that future studies conduct a sensitivity analysis to examine the impact of different weights on the results (Deniz, 2020).

A study (Yildirim and Yildirim, 2022)on R&D project selection using an Integrated Fuzzy Intuitive Group Decision-Making approach aimed to choose the most suitable R&D project among four alternatives for the year 2021. Linguistic evaluation expressions were used for this selection, and they were evaluated using fuzzy intuitive numbers. A decision matrix was used to identify the most ideal project, applying the Intuitive Fuzzy Grey Relational Analysis method. The study is based on Grey System Theory, which involves the mathematical modeling and analysis of grey systems to address uncertainties. Grey System Theory aims to enhance data analysis, predictions, and decision-making in situations involving a lack of information or uncertainty. The study determined the ideal project based on analysis scores.

Binici and Aksakal (2020) addressed the selection of R&D projects in their study. An expert group determined five criteria, including four benefit criteria and one budget criterion, for project evaluation. The Utilitee Additive (UTA) method was applied based on the identified criteria, and a mathematical model was formulated. The UTA method is used to evaluate various criteria and rank alternatives. It employs a mathematical model based on a specific decision matrix and criterion weights. The decision-maker's preferences are expressed through this matrix, which includes the performance of each alternative for each criterion. Criterion weights are factors that determine the importance and impact of each criterion. The mathematical model was solved using the General Algebraic Modeling System (GAMS), which resulted in the ranking of projects.

Bal and Taşçı (2021) conducted a study on patent evaluation, focusing on measuring patent value and identifying the key factors that determine it. They then scored the patent values of a climate control company. Ten patents were selected through literature reviews and scored using a rating table for indirect indicators, while direct indicators were evaluated using a Likert scale ranging from 1 to 5. The results showed that the 8 direct and indirect indicators used in the patent evaluation process significantly influenced the patent score.

The study by Demir and Soydoğan (2017) analysed the impact of patents on company performance in Turkey. The study aimed to determine whether patents had an effect on the economic performance of the firms. The study analysed the impact of patents on company performance using various methods, including Return on Assets (ROA), Return on Equity (ROE), number of employees, and export values. Statistical and trend analysis approaches were employed. The results showed a strong positive correlation between the number of patents and the number of employees, as well as between the number of patents and export values. However, no significant correlation was found between the number of patents and ROA or ROE values.

Göktaş and Gömleksiz (2011) conducted an analysis of the relationships between R&D expenditures, patents granted as an innovation indicator, researchers, and entrepreneurs. The study tested the relationships between innovation and entrepreneurship rates, R&D expenditures in sectoral classification, and the number of researchers for 25 countries, using the number of patent grants as an innovation indicator. The analysis was carried out through panel data analysis. The study indicates a significant correlation between innovation and R&D based on the coefficients linking patent grants, R&D activities, and the number of researchers.

Arıbaş and Özcan (2016) introduced a new methodology for evaluating academic research projects by combining AHP and TOPSIS methods. The study began by establishing criteria for comparing academic research projects. These criteria were then weighted using the AHP method and applied to TOPSIS to determine the importance of each project and rank them based on a sample. These criteria were then weighted using the AHP method and applied to TOPSIS to determine the importance of each project and rank them based on a sample. The results were then compared for a comprehensive evaluation.

Ömürbek et al. (2015) conducted a study on project selection in which they employed the AHP and TOPSIS methods to select a program for Enterprise Project Management Software from among alternative programs. The criteria identified in the literature were initially weighted using the AHP method through Excel. The study employed the TOPSIS approach to analyse various EPM algorithms and select the most suitable tool for the organization from the available options.

Durgun and Turan (2016) discuss the importance, advantages, eligibility conditions, and process workflows of obtaining patents in relation to protecting intellectual property rights arising from R&D activities and innovative ideas in companies. The study focuses on the management of the patent process within companies and includes a schematic of the patent application decision process. Assessments are conducted to evaluate the commercial potential of patents based on specific parameters. It is concluded that protecting innovative ideas is possible through obtaining patents, which is a result of innovation.

Yavuz and Baki (2019) conducted a study in which they ranked patents owned by an automotive company based on their values. They used multi-criteria decision-making methods due to the limited number of studies on this subject. The entropy method was chosen to determine criteria weights because of its realistic and objective weighting capabilities. The TOPSIS and VIKOR methods were used to rank the alternatives due to the benefit and cost-oriented nature of the criteria. A Spearman correlation analysis was applied to determine if there was a correlation between the results generated by the two methodologies. The comparison of the results demonstrated the applicability of the model.

Güryeli (2016) conducted a literature review on the selection of R&D projects and then used the AHP to model this subject and determine the relative weights of project evaluation criteria. Expert opinions were used to explore the prioritization levels of project evaluation criteria and the factors that referees gave more value to when evaluating projects in the AHP model. Furthermore, future research could expand the evaluation criteria within the scope of this study or develop a new network by modifying the existing structure. A new model could be created by examining the interactions between primary and sub-criteria in this new network.

Ceylan and Gürsev (2020) identified the general characteristics of software development projects and analysed the success criteria of these projects. The projects operate using different project management methodologies, such as Scrum, Kanban, and Waterfall. To determine the solution method for making selections based on importance ranking within certain criteria, the authors conducted a literature review. The research determined that the most appropriate methods for solving the MCDM problem are the AHP and the TOPSIS. Then AHP was chosen for its simplicity, ease of use, and effectiveness, while TOPSIS was selected for its ability to evaluate criteria based on their weights. The methods were explained in detail, and their applications were demonstrated. The study concluded that the Waterfall model did not improve company efficiency. Instead, project management techniques such as Scrum and Kanban were found to be more beneficial.

In a study on personnel selection in hospitality establishments, the AHP and TOPSIS methods were used to select personnel. To achieve the goal of personnel selection in human resource management, this text first details the definition and scope of the process and identifies the criteria. The identified criteria are then weighted using the AHP method, and the TOPSIS method is employed to select from 10 applicants. A resource has emerged that could be beneficial for other hospitality establishments. It provides a detailed analysis of different criteria and serves as a reference for developing applications related to personnel selection (Icigen and Cetin, 2017).

As indicated by the literature, MCDM methods are used to select projects prior to initiating them as R&D projects. However, this study employed MCDM methods for the completed R&D projects. R&D companies may focus on developing new projects and may not have time to patent them. They may have several completed projects that require patents. Due to time constraints, they may not be able to patent all of them simultaneously. Therefore, it is important to prioritize which projects to patent first. This study aims to assist R&D companies in prioritising their finished projects for patenting by using MSDM methods.

MATERIALS AND METHODS

The literature review has led to the conclusion that the most suitable multicriteria decision-making method for the project is TOPSIS. This decision is based on TOPSIS's ability to provide simple outputs, yield easily understandable results, measure distances to both positive and negative ideal solutions, and efficiently rank numerous alternatives. The TOPSIS method was applied, and the AHP was chosen to weight the criteria due to its ability to address both abstract and concrete criteria simultaneously in the decision-making process. AHP also allows for consistency checking, has broad application potential, and facilitates group decision-making by assigning weights to the criteria.

AHP Method

AHP, which was developed by Thomas L. Saaty in the 1970s, is a decision-making technique used to solve complex situations involving a large number of criteria. It allows for modelling in a hierarchical structure that shows the connections between criteria, sub-criteria, and alternatives. The most significant aspect of AHP is its ability to incorporate both objective and subjective evaluations of the decision-maker into the decision process. In essence, AHP is a method that combines an individual's knowledge, experience, thoughts, and intuitions in a logical manner. It has a broad range of applications and can be effectively used to solve various decision-making problems.

1. Determination of Selection Criteria
2. Weighting Using the AHP Method (Durak et al., 2021)

Step 1: In this stage, the decision-making problem is decomposed into fundamental building blocks, forming a hierarchical structure.

Step 2: After creating the hierarchical model, pairwise comparison matrices are established to determine the relative importance of all elements over each other.

Step 3:

The equation below is used to calculate the eigenvector value of the criteria in pairwise comparisons.

$$W_i = \frac{1}{n} \sum_{j=1}^{n} \frac{a_{ij}}{\sum_{j=1}^{n} a_{ij}}$$

- The maximum eigenvalue (λmax) is determined using the following equation to calculate the consistency indicator value.

$$\lambda_{max} = \frac{1}{n} \sum_{i=1}^{n} \frac{(a_w)_i}{w}$$

- The consistency index (CI) is calculated using the following equation.

$$CI = \frac{\lambda_{max} - n}{n - 1}$$

- The consistency ratio (CR) indicates whether the values given during pairwise comparisons are consistent with each other. The consistency ratio should be less than 0.10. In cases where it is high, the decision matrix needs to be revised and corrected.

$$CR = \frac{CI}{RI}$$

TOPSIS Method

The TOPSIS is a multiple criteria decision-making technique developed by Hwang and Yoon in 1981. It assumes that the alternative solution point is closest to the positive-ideal solution and farthest from the negative-ideal solution. The TOPSIS approach can be applied directly to the data without qualitative transformation (Omurberk et al., 2015).

1. Creation of the Decision Matrix

2. Normalization of the Decision Matrix

$$y_{ij} = x_{ij} \div \sqrt{\sum_{i=1}^{I} x_{ij}^2}$$

3. Weighting of the Normalized Decision Matrix

$$v_{ij} = W_j * y_{ij}; (i = 1,2, \dots, I; j = 1,2, \dots, J)$$

$$V = \begin{bmatrix} v_{11} & v_{12} & \cdots & v_{1J} \\ v_{21} & v_{22} & \cdots & v_{2J} \\ \cdots & \cdots & \cdots & \cdots \\ v_{I1} & v_{I2} & \cdots & v_{IJ} \end{bmatrix}$$

4. Determination of Ideal and Negative-Ideal Solutions

$$A^* = [\, v_1^*, v_2^*, \dots, v_J^*]$$

$$A^- = [\, v_1^-, v_2^-, \dots, v_J^-$$

DRAFT

$$v_j^* = \begin{cases} \max v_{ij}, if\ criteria\ j\ are\ beneficial \\ \min v_{ij}, if\ criteria\ j\ are\ cost \end{cases}$$

$$v_j^- = \begin{cases} \min v_{ij}, if\ criteria\ j\ are\ beneficial \\ \max v_{ij},\ if\ criteria\ j\ are\ cost \end{cases}$$

5. Calculation of Separation Measure

$$S_i^* = \sqrt{\sum_{j=1}^{J}(v_{ij} - v_j^*)^2} \qquad S_i^- = \sqrt{\sum_{j=1}^{J}(v_{ij} - v_j^-)^2}$$

6. Calculation of Proximity to the Ideal Solution

$$V_i = \frac{S_i^-}{S_i^- + S_i^*}$$

7. Ranking of Alternatives

Application of AHP and TOPSIS Methods for Product Selection

Priliminary Search for Products to be Patented:

The company has identified 20 products for patenting purposes. Literature reviews were conducted using Turkish Patent Institute (Türkpatent) (2023) for patents obtained only in Turkey, and Espacenet (2023), Google Patents (2023), and Patentscope (2023) for patents obtained both in Turkey and worldwide. After researching these 20 products and consulting with the company, it was decided to proceed with patent applications for six of them. These six products were chosen because they are less commonly discussed in the literature and have a higher priority for the company.

Determination of Criteria:

After conducting a literature review and consulting with the company, we identified potential criteria that are crucial for obtaining a patent. We then conducted an open-ended questionnaire survey among the company employees based on these criteria to determine if there are any other important factors. It is important to note that these criteria should be capable of obtaining numerical values. Accordingly, the survey employs the most suitable method for criteria that can take numerical values. Table 1 lists the potential criteria included in the survey.

Table 1. Possible Criteria

Criteria Code	Possible Criterias Criteria
PC1	The Annual Sales Amount of Product
PC2	The Variety of Sectoral Use of Product
PC3	Product Time to Market
PC4	Return of Profit of Product
PC5	Adaptability of the Product to Technology
PC6	The Cost of Product

The survey was participated in by seven employees. The following are additional criteria suggested by the employees, along with a percentage graph of the criteria that are considered a priority based on the survey results (See Figure 1 below).

Criterion Suggestions:

- Innovation, sustainability
- Feasibility of the product
- Number of personnel working on the Project

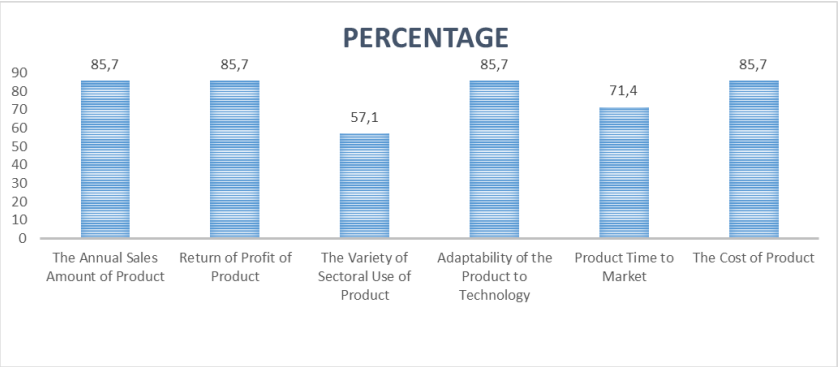

Figure 1. Percentages of Criteria

After reviewing the survey results and discussing with the company, we concluded that the criterion 'Adaptability of the Product to Technology' was not applicable since all of the company's products already have up-to-date technological features. During discussions with the company management regarding employee suggestions, it was emphasized that these criteria do not hold significant importance in the context of patent acquisition. Thus, we reached an agreement on the remaining five criteria to be used in our study. The finalised criteria are listed in Table 2.

Table 2. Finalised Criteria

Criteria Code	Criteria
C1	The Annual Sales Amount of Product
C2	The Variety of Sectoral Use of Product
C3	Return of Profit of Product
C4	The Cost of Product
C5	Product Time to Market

Application of AHP Method :

A study was conducted to determine the criteria and assess their importance among employees of the company through a company-wide survey. The employees ranked the criteria by assigning numbers from 1 to 9, including even numbers, to each criterion. To improve the study and obtain better results, it was decided to conduct a broader survey involving individuals with expertise in the field. The survey had 39 participants, 33 of whom provided rankings and the remaining 6 provided a single numerical score without ranking. The priority rankings of the 33 individuals and 4 company employees are presented in Figure 2 ant the meaning of rankings are listed in Table 3.

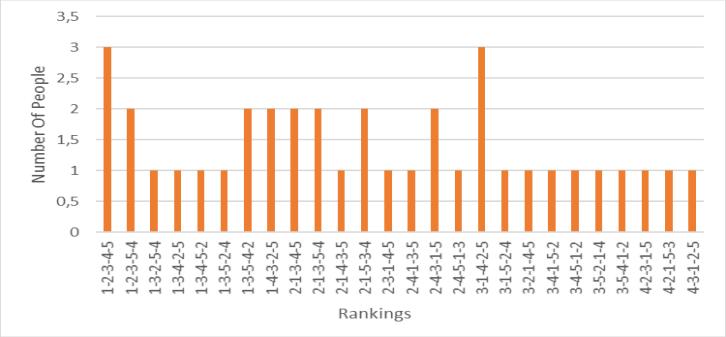

Figure 2. The Rankings Obtained as a Result of the Survey

Table 3. 1-9 Scale Used in Pairwise Comparison Method

DEGREES		DEFINITION
1	[redacted]	Equally important
3	[redacted]	A little more important
5	[redacted]	Strongly important
7	[redacted]	Very strongly important
9	[redacted]	Extremely important
2-4-6-8		Intermediate (Average) Values

The Analytic Hierarchy Process (AHP) steps were analysed to develop a decision support system using Excel VBA (See Figure 3). The system comprises of five buttons, namely: Pairwise Comparison Button, Criteria Weight Button, Normalisation Button, Consistency Ratio Button, and Result Button.

The Pairwise Comparison Button is used to establish the importance degrees of each criterion relative to other criteria on a scale of 1-9 in the first step of the pairwise comparison matrix. The matrix used for pairwise comparison is constructed by filling the upper triangular matrix with user-inputted superiority values (x_{ij}), while the values in the lower triangular matrix are determined by taking the reciprocal of the corresponding upper triangular values ($x_{ji} = \frac{1}{x_{ij}}$). The sum of values in each column is then calculated to construct the pairwise comparison matrix. A copy of this matrix is stored in a separate table. To normalize the values in the pairwise comparison matrix, use *the normalization button*. Normalization is accomplished by dividing each value in a column by the sum of that column. *The criterion weighting button* calculates the arithmetic mean of each row for the normalized values, which form the criterion weights. At *Consistency Test Button- 2* , to perform the consistency test, divide the values in each column of the pairwise comparison matrix by the criterion weights calculated for each row and then sum the resulting values row-wise.

At *Consistency Test Button- 2* , the values for each row are summed and then divided by the criterion weights. The resulting values are then averaged to obtain the maximum lambda (lambda max) value. Depending on the number of criteria (n), the Random Index (RI) is determined (1.115 for n=5). The table below shows the Random Consistency Index values. The Consistency Index (CI) can then be calculated. To determine consistency, divide the Consistency Index by the Random Consistency Index to obtain the

DRAFT

Consistency Ratio (CR). If the CR is less than 0.1, the criterion weights are consistent. If the CR is greater than 0.1, the user is prompted to re-enter the superiority values.

The geometric mean of the criterion weights obtained from 37 people is taken, and the final criterion weights for each criterion are shown in Table 4.

Figure 3. AHP Excel Interface

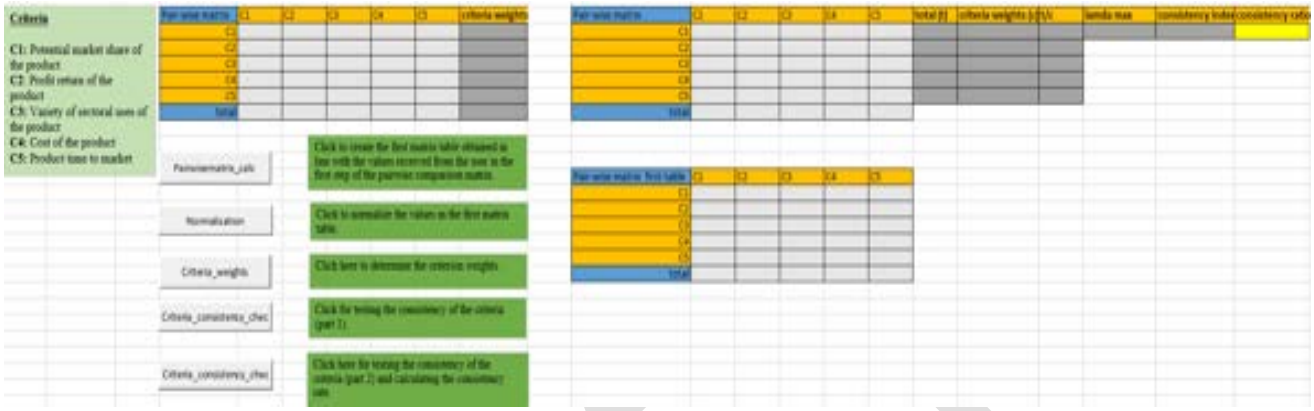

Table 1. Final Criteria Weights

Criteria	Weights
C1	0.138606
C2	0.246019
C3	0.101705
C4	0.232352
C5	0.281319

Application of TOPSIS :

The TOPSIS method has been applied with the final criterion weights obtained from the AHP method. The steps of the TOPSIS method have been coded in Excel VBA, and a user interface has been created. The Excel interface is shown in Figure 4.

Figure 4. TOPSIS Excel Interface

The values corresponding to each criterion for the product/system to be patented were obtained from the company, and the relevant data is provided in Table 5.

Table 2. Criteria Values

Product	The Annual Sales Amount of Product	The Variety of Sectoral Use of Product	Return of Profit of Product	The Cost of Product	Product Time to Market
1st. Product	480 Product	17	20 %	17508.03 €	18 months
2nd. Product	5 Product	17	40 %	23938.56 €	36 months
3rd. Product	40 Product	17	30 %	32829.29 €	24 months
4th. Product	5 Product	17	50 %	34216.07 €	18 months
5th. Product	100 Product	17	50 %	30493.11 €	24 months
6th. Product	30 Product	17	30 %	23582.97 €	18 months

The interface of the method includes a "TOPSIS" button. All steps are executed by clicking the "TOPSIS" button. The ranging values are given in Table 6.

Table 3. Vi Values

Product	Vi
1st. Product	0.83870933
2nd. Product	0.20410967
3rd. Product	0.300395057
4th. Product	0.388993977
5th. Product	0.378280572
6th. Product	0.421604855

RESULTS AND DISCUSSION

According to the results of the TOPSIS method based on the values obtained from the company for the products and their criterion values, the maximum value of Vi is 0.83870933. As a result, it is observed that the first product should be patented, which aligns with the goal of our study. Additionally, the prioritization of products to be patented is clarified. The recommended ranking for patent acquisition based on the identified criteria and their values for six products in our study is provided in Table 7.

DRAFT

Table 4. Prioritisation of Products to be Patented

Ranking	Product No
1.	1st. Product
2.	6th. Product
3.	4th. Product
4.	5th. Product
5.	3rd. Product
6.	2th. Product

Electre Method:

The Electre method was used in our study as an alternative to the TOPSIS method for comparison and control. The products obtained equal scores and were ranked 1-6-4-5-2-3 (Ranking-1), 1-6-4-5-3-2 (Ranking-2), 1-6-5-4-2-3 (Ranking-3), and 1-6-5-4-3-2 (Ranking-4) respectively in terms of priority for patent acquisition among the six products. Based on the results, it is recommended to prioritize patent acquisition for the first product, similar to the TOPSIS method.

Spearman Correlation :

The consistency of MCDM methods are compared with Spearman Correlation coefficient values whic is computed as $r_s = 1 - \frac{6\sum_i d_i^2}{I(I^2-1)}$ where r_s and d_i are the Spearman Correlation coeffient and difference between rankings, respectively. The Spearman Correlation coeffient values of rankings from both TOPSIS and Electre are given in Table 8 and as shown from Table 8, the rankings are consistency.

Table 8. Spearman Correlation coefficient values between rankings

Methods	TOPSIS	Electre (Ranking-1)	Electre (Ranking-2)	Electre (Ranking-3)	Electre (Ranking-4)
TOPSIS	1	0.9428	1	0.8857	0.9428
Electre (Ranking-1)	0.9428	1	0.9428	0.9428	0.8857
Electre (Ranking-2)	1	0.9428	1	0.8857	0.9428
Electre (Ranking-3)	0.8857	0.9428	0.8857	1	0.9428
Electre (Ranking-4)	0.9428	0.8857	0.9428	0.9428	1

CONCLUSION

Companies aim to distinguish their products and projects from others by obtaining patents. However, some companies tend to overlook this process due to its time-consuming nature. Therefore, it is important for companies to effectively use the patent acquisition process and ensure that the right product/project receives a patent.

The study analysed the relationships between projects at an R&D company in Eskisehir, Türkiye and the importance levels of identified criteria using the AHP and TOPSIS methods. Each project was evaluated based on five criteria: Annual Sales Volume of the Product, Sectoral Usage Diversity of the Product, Profitability of the Product, Cost of the Product, and Time to Market for the Product.

An assessment was conducted to determine the consistency of the identified criteria. The assessment was

carried out using a decision support system created in Excel VBA. A total of 39 participants took part in the assessment, including 4 employees from the company and 35 individuals working on R&D from different companies. Upon examining the results of the assessment, the consistency of the criteria weights was confirmed for 37 responses. To ensure consistency ratios were uniform, we calculated the geometric averages of each individual's consistency ratios to determine the final criteria weights. Prior to applying the TOPSIS method, we conducted a literature review on patent acquisition for 20 R&D projects identified and communicated by the company. After screening, we narrowed the scope of the study to 6 projects. Using the TOPSIS method, a priority order was established among the six projects for patent acquisition. Based on the results, it was recommended that the company pursue a patent acquisition study for the first product. This recommendation was validated using the alternative method, Electre.

ACKNOWLEDGEMENTS

This study was conducted within the scope of Project No. 22LÖP395 by the Scientific Research Projects Coordination Unit of Eskişehir Technical University and supported by TÜBİTAK (The Scientific and Technological Research Council of Turkey) within the framework of the 2209B University Students Research Projects Support Program.

Abstract
Globally, breast cancer is the most common type of cancer and the second leading cause of cancer mortality. Our research aims to evaluate the expression of the HER-2/neu receptor in women diagnosed with breast cancer and to examine its correlation with other prognostic indicators of the disease. A retrospective study of 252 women with breast cancer was conducted at the oncology department of Mother Teresa University Hospital in Albania between 2021 and 2024. Statistical analysis was performed utilizing SPSS. The age group over 45 years old has the highest rate (92.5%), compared to the age group under 45 years old (7.5%). A significant association between HER-2/neu and the variables, disease stage, and age was observed (p=0.033; p=0.035). An inverse association was observed between Her-2/neu expression and receptor status.
Keywords: Breast cancer, Albanian population, HER-2/neu receptor.

INTRODUCTION

Globally, breast cancer is the most common type of cancer and the second leading cause of cancer mortality (Pathak TB B. R., 2011).
Her-2/neu, known as c-erbB-2, is a protooncogene located on chromosome 17. It is amplified and/or overexpressed in 15% to 25% of invasive breast carcinomas, leading to a worse clinical outcome (Kaptain, 2001). HER2-positive Breast cancer is defined as breast cancer that tests positive for the protein human epidermal growth factor receptor 2 (HER2). This protein promotes the proliferation of cancer cells.
The interaction of ER, PR, and Her-2/neu has become crucial in the treatment of breast cancer (Allred, 2010).

MATERIALS AND METHODS

The research comprised 252 Albanian women. The data of our study were acquired from patients diagnosed with breast cancer in the oncology service of the Mother Teresa University Hospital throughout the years 2021-2024. We have analysed all the data related to breast cancer in the medical records of all the subjects included in the study (personal data, clinical manifestation, histopathological classification, stage, and receptor status.
Statistical analysis was conducted utilizing SPSS. Descriptive and analytic data were evaluated. A p-value of less than or equal to 0.05 was deemed statistically significant. Tables and graphs illustrate the results.

RESULTS

7% of participants were under 45, while 93% were above 45, with an average age of 62.2 years. The majority of breast cancer patients were grade II (69.8%), and ductal carcinoma was the most prevalent form at 81.3%. The left breast was mostly affected (57.1%). According to the receptor measurements in the study, 14.27% of the subjects were HER-2/neu positive. The mean age of subjects with Her-2/neu overexpression was 58, compared with those lacking Her-2/neu, ER, and PR expression, 63. Of the subjects, 88.9% were

non-TN, and 11.1% were TN. The analysis of the association between receptor status (TN and non-TN) and age group revealed a statistically significant association (p = 0.02). There was also a significant association between HER-2/neu and the age variable (p = 0.035).

A statistically significant correlation (p =0.035) existed between HER-2/neu and age. There was a significant association between the HER-2/neu receptor and disease stage (p = 0.033). HER-2/neu had a weak, negative, but significant correlation with ER (r = -0.174, p = 0.006) and PR (r = -0.171, p = 0.008).

Table 1: Distribution of receptors according to each other.

			Er	Pr	Her2	Receptor Status
Spearman's rho	Er	Correlation Coefficient	1.000	.589**	-.174**	.678**
		Sig. (2-tailed)	.	.000	.006	.000

3+ / positive	8	3	12	11	0	11

DISCUSSIONS

The HER2 gene is 15-25% positive in breast cancer (Senel, 2021) (Kohler BA, 2015). HER2/neu in our study was 14.277%.

Measurable amounts of ER and PR receptors are found in about 50–85% and 60-70% of patients with breast cancer (Senel, 2021). In our study, the ER receptor was positive in 85.3% of the subjects & the PR receptor was 80.6%. Other studies have found varying expressions of estrogen and progesterone receptors in breast cancer, (Yip CH, 2014) (Łukasiewicz S, 2021), (Ambroise M, 2011), (MN., 2014).

A significant inverse relation between Her-2/neu overexpression and ER and PR expression was found in different studies. (Anupama Dayal, 2016), (Azizun-Nisa, 2008), (M., 2012), (MS., 2006), (Bhagat, 2012).

Our study resulted in an inverse association between Her-2/neu and ER, PR receptor status. Her2/neu has a weak, negative, but significant correlation with ER (r=-.174, p=0.006) and PR (r=-.171, p=0.008). ER has a strong, positive, and significant association with PR (r=.589, p<0.01).

In a study, HER-2/neu positivity decreased with rising age. ER and PR expression were significantly lower in HER-2/neu positive as compared with HER-2/neu negative tumors (ER 83.8% vs 69.8%; PR 91.9% vs 77.8%). In the HER-2/neu positive tumors, ER and PR expression in high-grade tumors was significantly decreased compared with intermediate-grade tumors (ER 5.6% vs. 10.5%; PR 0% vs. 5.3%) (Azizun-Nisa, 2008). In another study, there is a strong association between ER receptor and histological grade(p=0.0003) (Tero A. H. Jarvinen, 2000).

In our study, a significant association was observed between the disease stage and HER-2/neu assessed in the study (p=0.003). Advanced stages were more likely to exhibit increased positivity for HER2/neu.

Ductal carcinoma is the most common histological type (81.3%) of breast cancer, comparable to other studies. (Azizun-Nisa, 2008), (Sharif MA, 2009), (Anupama Dayal, 2016), (Pathak TB B. R., 2011), (Ellis IO, 1992), (Hiral Samir Shah, 2020).

13.9% (35/252) of the subjects were identified with a family history of cancer. In our most recent article, which is a review of the significance of the BRCA1 and BRCA2 genes, we underscore the significance of these genes in the diagnosis of hereditary breast cancer (Xhetani, 2024) (Hasa, 2024).
Based on our current findings on breast cancer, we intend to conduct additional research on BRCA genes in women with a family history of breast cancer.

CONCLUSION

A significant association was found between different histological grades and HER-2/neu immunoreactivity. The overexpression of HER-2/neu leads to a worse prognosis. There is an inverse association between HER-2/neu and ER/PR receptors. ER/PR receptors show an inverse association with histological grades of tumor; the higher the overexpression of ER/PR receptors, the better the diagnosis. The combined assessment of HER-2/neu and ER/PR may provide significant prognostic insights for the clinical management of breast cancer patients.

ACKNOWLEDGEMENTS

I wish to express deep regards to the oncology department of Mother Teresa University Hospital in Albania for their cooperation in this study.

Özet

Sürdürülebilir olması sebebiyle toplu taşıma sistemlerinde elektrikli otobüslerin kullanılması büyük önem kazanmaktadır. Avantajlarının olmasının yanında kesintisiz hizmet veren elektrikli otobüslerin nasıl şarj edileceği ve şarj istasyonlarının konumlandırılması büyük bir sorun olarak görülmektedir. Günümüzde sürdürülebilir ulaşım sistemlerine yönelik artan talep, şehirlerde toplu taşıma araçlarının elektrifikasyonu çalışmalarını hızlandırmaktadır. Bu yönde artan talep sebebiyle, Eskişehir gibi büyük şehirlerde, otobüs filosunun elektrikli otobüslere dönüştürülmesi aşamasında, etkili bir şarj altyapısı planlaması yapılması sürecin hızlanması için oldukça önemlidir. Elektrikli araçlara olan ilgi arttıkça, şarj altyapısının kullanılabilirliğini ve verimliliğini bulma konusu, incelenmesi gereken karmaşık bir soru haline gelmektedir. Bu çalışmanın amacı, kentlerdeki elektrikli otobüsler için şarj altyapısının dağıtımını optimize etmek için geliştirilen bir matematiksel model önerisi ve uygulamasını sunmaktadır. Model Eskişehir otobüs ağı için test edilmiştir. Geliştirilecek model, sürdürülebilirlik ve emisyonun azaltılmasında katkı sağlayan yakıt alternatiflerini dikkate alarak şehirdeki elektrikli otobüsler için şarj altyapısının dağıtımını optimizasyonunu da içermektedir. Kullanılan modellemede, endeks olarak şehirdeki otobüs rotaları, durakları ve tercih edilen yakıt türü belirlenmiştir. Modelleme, duraklarının stratejik konumlandırılması, şarj istasyonlarının kapasitesi ve yerleşimi gibi faktörleri içermektedir. Modelde amaç fonksiyonları sistemdeki toplam yıllık maliyetler ve toplam emisyon olarak planlanmıştır. Modellemenin sonunda elektrikli otobüsler için şarj altyapısının uygulanabilirliği ve verimliliğiyle ilgili sonuçlar elde edilmiş ve yorumlanmıştır.

Anahtar Kelimeler: Elektrikli otobüs, optimizasyon, çok amaçlı optimizasyon, şarj istasyonu, şarj altyapısı, sürdürülebilirlik

Distribution Optimisation of Charging Infrastructure for Electric Buses

Abstract

The utilisation of electric buses within public transport systems is gaining significant importance due to their sustainability. In addition to their inherent advantages, the challenges of charging these vehicles in a manner that ensures uninterrupted service, as well as the strategic positioning of charging stations, are of paramount importance.The increasing demand for sustainable transport systems is a key factor in the accelerated electrification of public transport vehicles in urban areas. In this context, it is imperative to plan an effective charging infrastructure during the conversion of the bus fleet to electric buses in order to accelerate the process, as interest in electric vehicles continues to grow. The availability and efficiency of charging infrastructure is a complex question that needs to be examined.The aim of this paper is to propose and implement a mathematical model to optimise the deployment of charging infrastructure for electric buses in cities. The model has been tested on the Eskisehir bus network, and the results obtained have been interpreted.The model being developed includes the optimisation of the deployment of charging infrastructure for electric buses in the city, taking into account fuel alternatives that contribute to sustainability and emission reduction.In the modelling used, bus routes, stops and preferred fuel type in the city are determined as an index.The modelling includes factors such as strategic positioning of bus stops, capacity and placement of charging stations. The model's objective functions are defined as total annual costs and total emissions in the system. The results of the modelling process yield insights into the feasibility and efficiency of charging infrastructure for electric buses.

GİRİŞ

Bu çalışmanın motivasyonu "Bir ilde elektrikli otobüslerin kentsel bağlamda elektrikli otobüsler için şarj altyapısının dağıtımını optimize etmek için matematiksel model geliştirilebilir mi?" sorusunu temel almaktadır. Enerji sektöründeki yaşanan hızlı değişimler ve sıfır emisyon hedefi sürdürülebilir ulaşım sistemlerine olan ilgiyi arttırmıştır. Sıfır emisyon hedefinin gerçekleşmesi ve sürdürülebilirliğin artması için ulaşım sektöründeki değişimler önem arz etmektedir. Dünya genelinde ve Eskişehir gibi büyük şehirlerde elektrikli otobüs filolarının kullanılması, çevre dostu ulaşım sistemlerinin oluşturulması hedeflemektedir. Bu bağlamda, Eskişehir'de elektrikli otobüslerin şarj altyapısının optimize edilmesi, enerji verimliliğini artırabilir ve çevresel etkileri minimize edebilir. Eskişehir için daha önce böyle bir çalışmanın yapılmaması sebebiyle gelecekte elektrikli otobüslerin yaygınlaşması durumunda yapılacak modelleme bir örnek teşkil edecektir. Bu araştırma, Eskişehir'de elektrikli otobüslerin şarj altyapısının etkin bir şekilde dağıtılmasını amaçlayan kapsamlı bir optimizasyon modelini içerir. Model, otobüs hatları, duraklar, enerji talepleri, mevcut altyapı ve otobüs rotaları gibi çeşitli unsurları dikkate alarak geniş bir çerçeve sunar. Bu konuda yapılan çalışmalarla ilgili literatür araştırması yapıldığında başta Avrupa ülkeleri olmak üzere Amerika gibi ülkelerde bu alanda önemli araştırmalar yapılmıştır.

Wirges vd. (2012), Almanya'nın Stuttgart şehri için elektrikli araçların yaygınlaşmasına yönelik mekansal-zamansal modeli şarj altyapısı yatırımlarının finansmanına yönelik ekonomik modelle birleştirmiştir. Usman vd. (2016), Belçika'nın Flanders kentindeki bir çalışma bölgesinde faaliyet tabanlı FEATHERS modelini kullanarak elektrikli araçlara yönelik şarj optimizasyon süreci için bir çerçeve sunmuştur. Bu çalışmada kullanılan metodolojiye daha çok benzeyen Baouche vd. (2014) ve Cavadas vd (2015), Fransa'nın Lyon ve Portekiz'in Coimbra şehirlerindeki yolcu elektrikli araçları için şarj istasyonlarının konumunu belirlemek amacıyla tamsayılı optimizasyon tekniklerini kullanmıştır. Ancak bu çalışmalar, otobüs gibi Ağır Hizmet Araçlarını değil, elektrikli Hafif Hizmet Araçlarını ele aldıkları için mevcut çalışmadan farklılık göstermektedir. Ribau vd. (2014) tarafından yapılan çalışmada, Portekiz'in Lizbon ve Porto şehirlerinde temsili sürüş çevrimlerini kullanarak, hidrojenle çalışan yakıt hücreli hibrit bir otobüs için enerji yönetimi stratejisi olarak gerçek kodlu bir genetik algoritma (GA) kullanılmıştır. Kunith vd. (2017) tarafından yapılan çalışma, Berlin, Almanya'daki 17 otobüs güzergahı için şarj istasyonu konumunu ve pil kapasitesini belirlemek amacıyla karma tamsayılı doğrusal maliyet optimizasyon modeli geliştirmiştir. Her bir rota için enerji tüketim profilleri oluşturularak, farklı şarj gücü ve çalışma koşulları senaryoları analiz edilmiştir.

Literatürde dizel otobüslerin kademeli olarak elektrikli otobüslere değiştirilmesini ve kademeli olarak şarj altyapısının sağlanmasını ele alan çalışmalar da bulunmaktadır. Örneğin Lin vd. (2019) elektrikli otobüslerin hızlı şarj istasyonları için çok aşamalı bir planlama stratejisi önermişlerdir. Sebastiani vd. (2016), tam elektrikli bir otobüs ağı için şarj cihazlarını en iyi şekilde tahsis etmek amacıyla hem şarj istasyonlarının sayısını hem de şarj olayları sırasında istasyonlarda harcanan ekstra süreyi en aza indirmeyi amaçlayan ayrık bir olay simülasyon yöntemi geliştirmişlerdir. An (2020) tarafından yapılan çalışma, talep belirsizliği altında elektrikli otobüs şarj tesisi konum optimizasyon problemini ele almış ve stokastik bir tamsayı programı önermiştir. Lotfi vd. (2020) farklı elektrikli otobüs tipleri, şarj altyapıları ve otobüs güzergahları için en uygun şarj altyapılarını ve pil kapasitelerini belirlemiştir. Bagherinezhad vd. (2020) elektrikli otobüslerin mekansal-zamansal şarj olaylarını, otobüsün operasyonel kısıtlamalarını ve şarj istasyonu güç dağıtım kısıtlamalarını karşılarken elektrik şebekesinin işletme maliyetini en aza indirme perspektifinden planlamıştır. Brezilya'da yapılan bir araştırmada (Zaneti vd., 2022) Campinas Üniversitesi'nde bir sürdürülebilir şarj istasyonundaki elektrikli otobüsün farklı şarj tipleri altındaki operasyonel maliyetlerini minimize etmeyi amaçlayan bir optimizasyon modeli incelenmiştir. Optimizasyon modeli, gerçek verilerle desteklenmiş olup, fotovoltaik panellerden elde edilen ve Unicamp tesislerinde dolaşan bir elektrikli otobüsün işletmesine dair verilerle çözümlenmiştir. Başka bir çalışma (Sang vd., 2022) Nanjing şehrindeki bir örnek üzerinden gösterilmiştir. Bu çalışma elektrikli otobüslerin (EO'lar) hava kirliliği ve sera gazı emisyonlarını azaltmada etkili bir ulaşım modu olduğunu vurgulayarak, EO şarj istasyonu (EO Şİ) yer seçiminin kritik öneme sahip olduğunu belirtmiştir. Ele alınan belirsizlik ve karmaşık ilişkiler için bulanık karar verme ve DEMATEL yöntemi, tercih sıralama organizasyon yöntemi (PROMETHEE) ve gelecek teorisi (PT) yöntemlerini birleştirerek farklı sonuçlar alınmıştır. Dinç Yalçın vd. (2023) Türkiye için de bu konuda araştırmalar yapılmıştır, bu çalışmalardan birinde Türkiye'deki bir şehirlerarası otobüs şirketinin verileriyle gerçekleştirilen bir vaka çalışması üzerinden, elektrikli otobüs şarj istasyonlarının konumlandırılması konusunda bir çok amaçlı matematiksel model önerilmiştir. Bu model bütçe kısıtlamalarını dikkate alarak, tüm şehirlerarası otobüslerin elektrikli olamayabileceği gerçeğini

içermektedir. Bu, literatürde genellikle göz ardı edilen bir faktördür. Elektrikli otobüs sayısını maksimize etmeyi ve şarj istasyonu sayısını minimize etmeyi amaçlayan çok amaçlı bir matematiksel model önermiş ve bu model, ağırlıklı toplam yöntemi kullanılarak çözülmüştür. Sıfır emisyonlu bir toplu taşıma çözümü sunma potansiyeline sahip olan yakıt hücreli hibrit otobüsleri içeren çalışmalar da incelendi (Wu ve Bucknall, 2013). Bu otobüsler bataryalar, yakıt hücreleri veya her ikisini kullanarak elektrikle çalışan otobüsleri içerir. İncelenen bir makalede bahsedilen yakıt hücreli hibrit otobüsler, bir dizi polimer elektrolit zarlı (PEM) yakıt hücresi ve bir nano-fosfat lityum-iyon bataryadan güç alırlar. Bu tasarım, otobüsün elektrikle çalışan bir motoru tahrik etmesini sağlar. Bu nedenle, yakıt hücreli hibrit otobüsler, elektrikli otobüs kategorisine dahil edilebilir. Elektrikli ve hibrit araçlar, karayolu taşıma ağlarında giderek artan bir rol oynamaktadır (Gagarin ve Corcoran, 2018). Avantajlarına rağmen, geleneksel dizel/benzinli araçlara kıyasla sınırlı bir menzile sahiptirler ve önemli bir pil şarj süresine ihtiyaç duyarlar

MATERYAL VE METOD

Veriler:

Projede kullanılacak parametre ve küme değerleri için araştırmalar yapılmıştır. Araştırma için ana veri kaynağı olarak Eskişehir Belediyesi internet sitesi alınmıştır (Eskişehir Belediyesi, 2024). Buna ek olarak çeşitli kaynaklarda diğer verilere ulaşılmıştır. Eskişehir için toplamda merkezi ve ilçeleri kapsayacak şekilde 115 otobüs hattı bulunmaktadır. Yapılan analizler sonucunda güncel olarak kullanılan toplam hat sayısı 111 olarak belirlenmiştir. Elektrikli araçlar için elde edilen veriler aşağıdaki Tablo 1'de gösterilmiştir. Değerlere ulaşılan siteler kaynakça kısmında belirtilmiştir.

Tablo 1. Elektrikli Araçlar için Parametreler

Teknoloji 1 (Elektrikli)	Değerler	Birimler	Kaynaklar
Bakım maliyeti	3.000,00	₺	(Hedef Filo, 2024)
Altyapı maliyeti	1.023.870,00	₺	(T.C. Sanayi ve Teknoloji Bakanlığı,2021)
Araçlar için maliyetler	1.456.666,00	₺	(T.C. Sanayi ve Teknoloji Bakanlığı,2021)
Km başına yakıt maliyeti	3,30	₺	(Sigortam.net, 2024)
Enerji Tüketimi	1,50	kWh / km	(Dolu Batarya, 2024; Karsan, 2024a)
Maksimum pil kapasitesi	599	kWh	(Karsan, 2024b)
Yakıt başına emisyon faktörü	0	gr/CO2	(Karsan, 2024c)

Dizel araçlar için elde edilen veriler aşağıdaki Tablo 2'de gösterilmiştir. Dizel araçlarda yeni bir şarj istasyonu kurulumu ve araç satın alması yapılmayacağı için bu değerle 0 olarak alınmıştır.

Tablo 2. Dizel Araçlar için Parametreler

Teknoloji 2 (Dizel)	Değerler	Birimler	Kaynaklar
Bakım maliyeti	₺9.000,00	Tl	(TRT Haber, 2023)
Altyapı maliyeti	0	Tl	-
Araçlar için maliyetler	0	Tl	-
Km başına yakıt maliyeti	₺13,20	Tl	(Buskirala, 2024)
Enerji Tüketimi	0,3	kWh / km	(Graurs ve Bērziņš, 2015)
Maksimum pil kapasitesi	480	L	(Buskirala, 2024)
Yakıt başına emisyon faktörü	63	gr/CO2	(International Energy Agency, 2024)

Güzergâh uzunluğu hesaplanırken belediyedeki konumlar girilerek Google Maps yardımı ile hesaplanmıştır. Yıllık toplam yolculuk sayıları ise Eskişehir Büyükşehir Belediyesi sitesinden her hat için günlük yolculuk sayılarının tek tek elde edilip yıllık bazda hesaplanmasıyla oluşturulmuştur. Araç için yıllık maliyetler (araç bedeli) / (araç ömrü) ne oranlanarak hesaplanmıştır. Bir araç ömrü için kesin bir bilgi bulunmadığı için ortalama bir değer alınarak hesaplamalar yapılmıştır. Otobüsün çalıştırılması durumundaki ilk güç maksimum kapasite ile aynı olarak kabul edilecek ve bu şekilde modelde kullanılacaktır.

Matematiksel Model:

Bu kısımda Xylia vd. (2017) çalışmasından ele alınarak hazırlanan matematiksel model açıklanacaktır.

$\tilde{S}$	Tüm otobüs duraklarının seti
$S^{başlangıç}$	Başlatma duraklarının sayısı
$\widetilde{S^{başlangıç}}$	Rotaların başlangıcındaki durakların alt kümesi
$S^{bitiş}$	Son durak sayısı
$\widetilde{S^{bitiş}}$	Rotaların sonundaki durakların alt kümesi
S^{orta}	Orta durak sayısı
$\widetilde{S^{orta}}$	Rotaların ortasındaki durakların alt kümesi
$\widetilde{TECH}$	Tüm veri yolu teknolojilerinden oluşan set

İkili değişkenler	
$US_{l,s,tech}$	Otobüs durağında şarj istasyonunun kurulu olup olmadığını gösteren ikili değişken {0,1}
$TUS_{l,tech}$	Otobüs güzergahlarını belirli teknolojiyle ilişkilendiren ikili değişken {0,1}

Pozitif değişkenler	
C_{total}	Toplam maliyetler
E_{total}	Toplam enerji tüketimi
U_{total}	Toplam emisyonlar
$P^{in}_{l,s,tech}$	Otobüsün istasyona geldiğinde kalan gücü
$P^{out}_{l,s,tech}$	Otobüsün istasyondan ayrılırken olan gücü
$P^{şarj}_{l,s,tech}$	Otobüsün istasyonda şarjı için gereken güç

Parametreler	
$C_{l,tech}^{bakım}$	İşletme ve bakım maliyetleri
$C_{l,tech}^{yakıt}$	Yıllık yakıt maliyetleri
$C_{l,tech}^{altyapı}$	Altyapının yıllık maliyetleri
$C_{l,tech}^{araç}$	Araçlar için yıllık maliyetler
Cap_{tech}	Otobüste depolanan maksimum güç
$Cons_{tech}$	Her otobüs yakıt türü için enerji tüketimi
$D_{l,s-s,l}$	Durak s−1 ile s arasındaki mesafe
EF_{tech}	Her teknoloji için yakıt başına emisyon faktörü
$P_{tech}^{İlk}$	Çalıştırma durdurmadaki güç
SOC^{min}	Pilin minimum şarj durumu
TC_l	Otobüs güzergahı gezileri (yıllık toplam yolculuk sayısı)
L_l	Tüm otobüs güzergahlarının sayısı

$$C_{total} = \begin{cases} \sum_{l=1}^{L}\sum_{s=1}^{S}\sum_{tech=1}^{Tech} C_{l,tech}^{altyapı} * US_{l,s,tech} \\ + \sum_{l=1}^{L}\sum_{tech=1}^{TECH} [(C_{l,tech}^{bakım} + C_{l,tech}^{yakıt}) * L_l * TC_l + C_{l,tech}^{araç} * TUS_{l,tech} \end{cases} \quad (1)$$

$$U_{total} = \sum_{l=1}^{L}\sum_{tech=1}^{TECH} (EF_{tech} * L_l * TC_l * TUS_{l,tech}) \quad (2)$$

C_{total} içerisinde iki ayrı toplam içermektedir. Birincisi altyapı maliyetleri ($C_{l,tech}^{altyapı}$) ile durakta şarj istasyonu olup olmamasının ($US_{l,s,tech}$) ikili değişkeninin çarpılması ve indeksler ile toplanması ile elde edilir. Bu şarj istasyonu açılması durumunda oluşacak alt yapı maliyetini verecektir. U_{total} tercih edilen teknolojinin emisyon faktörü (EF_{tech}), otobüs güzergâh sayısı (L_l), yıllık toplam yolculuk sayısı (TC_l), Otobüs güzergahlarını belirli teknolojiyle ilişkilendiren ikili değişken ($TUS_{l,tech}$) çarpılması ile elde edilir.

$$P_{l,s,tech}^{in} = P_{ltech}^{ilk} * TUS_{l,tech}, \quad l \in \tilde{L}, \quad tech \in \widetilde{TECH}, \quad s \in \tilde{S} \quad (3)$$

Kısıt 3, güzergahların başlangıç duraklarında tam şarj olduğu durumlar için geçerlidir. P_{tech}^{ilk} Otobüsün maksimum şarjını vermektedir.

$$P_{l,s,tech}^{in} = P_{l,s,tech}^{out}, l \in \tilde{L}, s \in \widetilde{S^{end}}, tech \in \widetilde{TECH} \quad (4)$$

Kısıt 4 rotaların son durak için şarja gerek olmadığını ve gidilecek mesafenin olmadığını varsaymaktadır.

$$P_{l,s,tech}^{out} \geq \begin{cases} Cons_{tech} * L_l * (1 + SOC^{min}) * TUS_{l,tech}, \\ l \in \tilde{L}, s \in \widetilde{S^{start}} \text{ or } s \in S, \ tech \in \widetilde{TECH} \end{cases} \quad (5)$$

DRAFT

Kısıt 5 bir sonraki durağa gidilmesi için yeterli enerjinin olmasını garanti altına almak için kullanılmıştır. Otobüsün yakıt türü için harcanan enerji miktarı, iki durak arası mesafe, (1+ Pilin minimum şarj durumu (SOC^{min})) ve $TUS_{l,tech}$ çarpılır ve sonucunun otobüs duraktan ayrılırken enerji miktarından küçük olması kısıtı oluşturulur.

$$\sum_{tech=1}^{TECH} TUS_{l,tech} = 1 \quad l \in L \tag{6}$$

Kısıt 6 her hattın bir teknolojiye kesinlikle atanmasını sağlamak için eklenmiştir.

$$US_{l,s,t} = TUS_{l,t} \quad \forall t = 1, l \in L, s \in S \tag{7}$$

Kısıt 7 eğer bir hat elektrikli oluyorsa başlangıç ve bitiş noktasına şarj istasyonu kurulması için eklenmiştir. (5)

BULGULAR VE TARTIŞMA

Model çözdürüldükten sonra elde edilen sonuçlar Tablo 3'te gösterilmiştir.

Tablo 3. Matematiksel Model Amaç fonksiyonu Değerleri

Amaç Fonksiyonu	**Değeri**
Toplam Maliyet (C_{total})	₺684.968.395,60
Toplam Emisyon (U_{total})	183.513.657,60 gr/ CO2

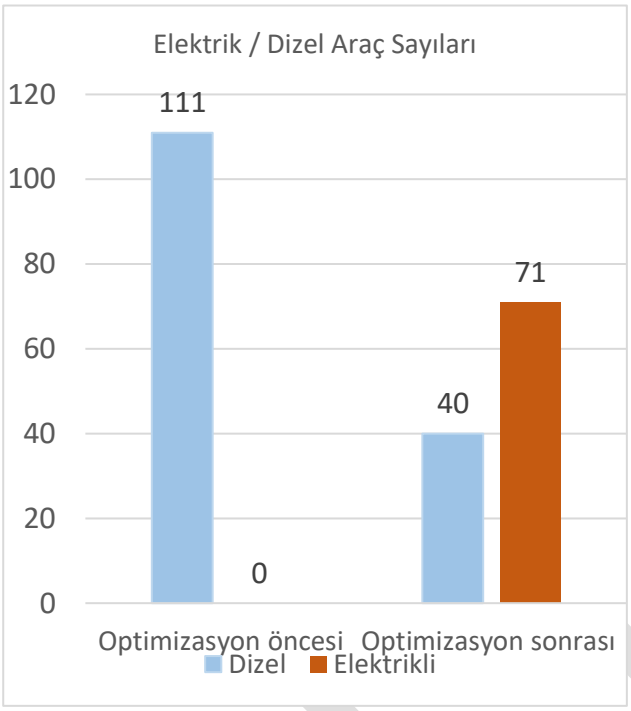
Optimizasyon öncesi ve sonrası emisyon değerleri hesaplatılmıştır. Sonucunda %92.63 emisyonda azalma olacağı sonucuna varılmıştır. Emisyon değerleri aşağıdaki Tablo 4' te gösterilmiştir.

Tablo 4. Emisyon Değerleri Karşılaştırılması

Toplam Emisyon	**Değeri**
Optimizasyon Öncesi Toplam Emisyon	2,477,558,538 gr/ CO2
Optimizasyon Sonrası Toplam Emisyon	183.513.657,60 gr/ CO2

Modeli çalıştırmadan önce 111 hat dizelken optimizasyon sonrası 71 hat elektrikli 40 hat dizel olacak şekilde sonuç elde edilmiştir. Şekil 1'de sonuçlar gösterilmiştir.

DRAFT

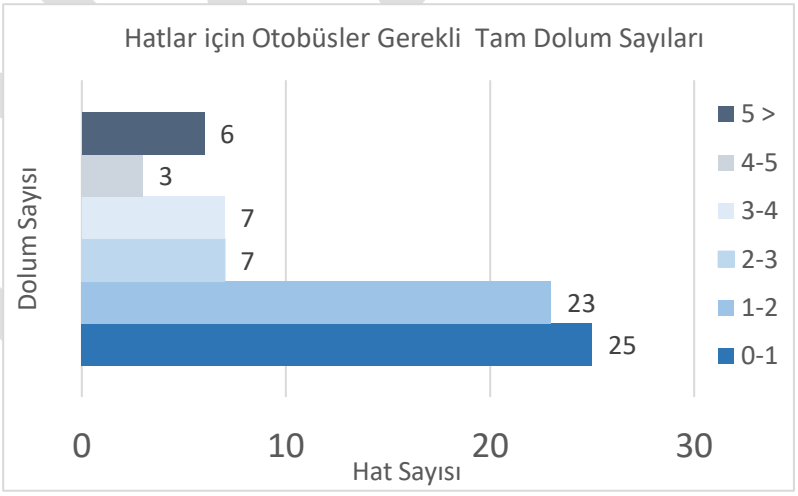


Şekil 1. Elektrik / Dizel Araç Sayıları

ANALİZLER

Analiz 1

Elde edilen sonuçlarında hatlar tek tek incelenmiştir Elektrikli hatlar için günlük gidilen toplam yol(km) tam dolum kapasitesine bölünerek hesaplamalar gerçekleşmiştir ve hatlar için gerekli tam dolum sayıları Şekil 2'de verilmiştir.



Şekil 2. Hatlar için Otobüsler Gerekli Tam Dolum Sayıları

Yapılan hesaplamalar sonucunda günde 0-1 ve 1-2 dolum arasında tam dolum gerektiren hatların tek bir noktaya şarj istasyonu konumlandırılmasının yeterli olduğu kararına varıldı. Bunla ilgili hat durakların konumları da önemsenerek şarj istasyonu sayısında ve şarj istasyonu konumunda azalma sağlanmaktadır. Model sonucu oluşan konum 76 iken analiz 1 sonucu 34 konuma düşmüştür. 152 şarj istasyon sayısı 94 şarj istasyonuna düşürülmüştür.

Analiz 2

Analiz iki ortak lokasyonlar üzerine bir inceleme gerçekleştirmek adına yapılmıştır. Modeldeki şarj istasyonları konumları incelendiğinde pek çok otobüsün aynı konumlarda başlangıç veya bitiş noktası olduğu fark edilmiştir. Ortak duraklar için incelemeler yapılmış ve sonucunda kurulum yapılacak istasyonlar aşağıda Tablo 5'te gösterilmiştir.

SONUÇ

Bu çalışmada Eskişehir şehir içi otobüs hatlarının hangilerinin elektrikli olabileceği ve Optimizasyon çalışmasının başlangıcında, Eskişehir'deki toplu taşıma sisteminin toplam emisyon değeri 2,477,558,538 gram (iki milyar dört yüz yetmiş yedi milyon beş yüz elli sekiz bin beş yüz otuz sekiz) olarak hesaplanmıştı. Optimizasyon sonrasında ise bu değer 31,084,326.00 gram (otuz bir milyon seksen dört bin üç yüz yirmi altı) seviyesine düşürülmüştür. Bu, %92.63 gibi çok büyük bir azalmaya işaret ediyor. Bu, sürdürülebilirlik adına atılan büyük bir adım olacaktır.

TEŞEKKÜR

Bu çalışma Eskişehir Teknik Üniversitesi Bilimsel Araştırma Projeleri Koordinasyon Birimi tarafından 24LÖP017 nolu proje kapsamında desteklenmiştir.

How classroom participation and course projects affect final grades in biology courses in online teaching?

Sara Pupe[1] https://orcid.org/0009-0009-6698-283X

[1]Department of Biology, Aldent University, Albania

sarapupe99@gmail.com:

Abstract
The development of technology has had a great development and impact on teaching methods. Along with the evolution of technology, the variety of teaching methods have also evolved, influencing an increase in student learning outcomes. In the framework of the variety of teaching, online teaching has an important place. The research was carried out in UT (University of Tirana) mainly in the faculty of natural sciences, in the biology department mainly in the bachelor cycle (I-III) and in the master cycle (I, II) where the aim is to focus on participation during the lesson, course projects, and the calculation of the final grade in the context of teaching.A correlational research design was used in this study. Random samples of respondent groups (N=150) and master groups (N=60) were used in the research. In order to reach the most accurate conclusion, a defined list of student participation in lectures and the degree of academic progress was used, leaving secondary data. From the research study results a high and positive correlation between the participation in the auditorium and that of online teaching and the variables of the final grade of the course. The studies show that the amount of variance of the final grade levels explained by the participation in the auditorium is 54.2% while with the points of the subject project is 67.5%, other variance can be described by other variables, the points help a lot in the final grade of the student's academic performance.
Keywords: Online learning, design, correlation, final grades, course projects, classroom participation

INTRODUCTION

The teaching of natural sciences must necessarily include a variety of teaching methodologies in order to increase the level of student learning. In the multitude of teaching varieties, an important place is voice and online teaching. Scientific competences and methodology are two main teaching competences. Teachers and lecturers who demonstrate a high level of scientific competences also show a high level of methodological competence. The use of digital tools in the teaching process plays an important role in the transformation of traditional teaching practices, leading to an increase in the level of students and studies and an increase in the level of acquisition of biological knowledge.This study aims to find out the relationship between participation in lectures, course projects and the final grade in the online learning environment. Studies and research have shown that the academic performance of students and learning is affected by many variables including age, gender, education, social background, access to school instructions, schooling trends, etc. Students should develop a variety of biological activities before and after learning. in the auditorium with the sole purpose of making the most of a blended teaching and learning. The study was conducted at the university in the Department of Biology of the bachelor and master cycle using a research design as well as being supported by two research questions that were used during the study as :

1. Is there variance in final grade explained by lecture attendance in an online learning context?
2. Is there a variance in the final grade described by the course projects in the online learning environment?

The research study is based on a review of existing works about online learning through ERIC and EBSCO using the terms "lecture participation", "course project", and "final grade". The conclusion of the study should result in a relationship between the three variables of leadership, participation in lectures, course projects, and the final grade in the student profile. Project work performance of students is positively related to their involvement in online teaching activities (Brechler,Teah&Robe,2011:Graff,2006) which links curriculum modules where they are more accessible in the ompjuter-based approach than in conventional lecture teaching. Mathneës&Pulcim(2017) found that performance-based rewards helped boost students Ward,Jacobs&Thompson(2016) show that in a traditionally at-risk population suffered from lower university results as well as lower retention and lower completion rates.Online students had lower academic results while being more likely to attend a formal setting. rather than just in the auditorium. Meanwhile, the

DRAFT

leadership style through isolation and the lack of aspiration for the future significantly affect the teacher-student interaction and the academic performance of students in a complex way (Xhomara, 2018: Bek, 2017).Academic progress is directly related in a positive and significant way to students' prior course content, course record, previous academic achievements and application of learned material in practice. Academic and social engagement of students in universities is important for study engagement, progress and dropout prevention {(Dama, Gadis & Marodze (2020)}. Academic self-efficacy, the level of student participation, internal and external motivation variables as well as individual study work and the support of lecturers predict students' performance in the exam (Sezer, Inel, Seckin, Ulucinar, 2017).There is a significant relationship between academic progress and the time students participate in online as well as prior knowledge, problem-based instruction, comprehensive learning, and work assessments (Nieuwoudt, 2020: Fematt, et, al, 2021).

MATERIALS AND METHODS

For the realization of this study, research methods were applied, where contemporary literature was browsed and reviewed. At the same time, quantitative and qualitative methods were used, and a correlative research design was chosen. Two groups of students were selected in the bachelor's and master's cycle and they were subjected to a survey for the final grade in online learning. These two groups of students were subjected to a systematic study of their participation in lectures as well as the degree of their academic reinforcement to collect secondary data. Also in the research, random samples of the groups of respondents (N=150) were used for the bachelor's cycle and (N=60) for the master cycle. The composition of the two groups is 110 women and 40 men for the bachelor group, while for the master group 45 women and 15 men.

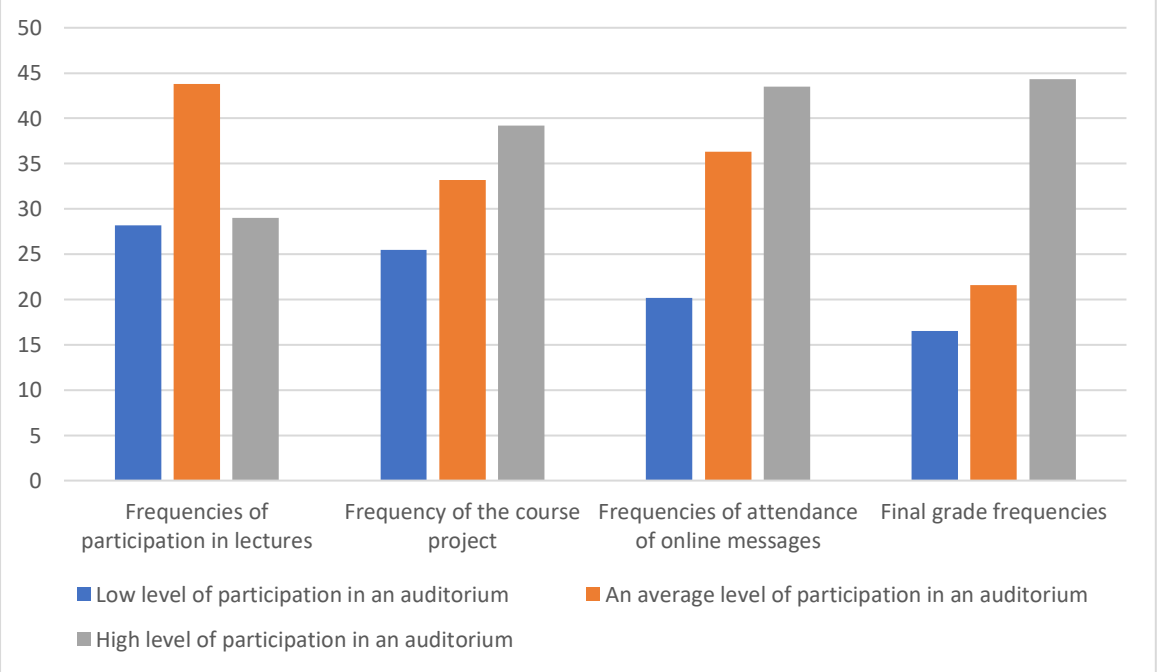

Figure 1. Percentage of participation in lectures, course project, online teaching, final grade

RESULTS and DISCUSSION

The statistical results of the correlation were used to understand the relationship between the participation in lectures and the final grade as well as between the course projects and the final grade. The results are based on descriptive analyzes based on the frequencies of participation in the auditorium, online learning and course projects, final grades. the final results were based on surveys conducted for each frequency.

- **Frequencies of participation in lectures**

From the survey of respondents, it results that 28.2% state that they have a low level of participation in an auditorium, 43.8% often have an average level of participation in an auditorium, and 29% of respondents

have a high level of participation in an auditorium. So the result is that the majority of students (72.8%) have an average and high participation in an auditorium.

● Frequency of the course project

The survey results show that 25.5% of the respondents have a low level of the results of their project, 33.2% have an average level and 39.2% have a high level of the results of their project. Thus, the majority of students (72.5%) have an average and high level of the results of their projects

● Frequencies of attendance of online messages

The survey results show that 20.2% of students have a low participation in online education, 36.3% have an average level, 43.5% have a high level of participation in online education. The results show that the majority of students (79.8%) have an average and high level of participation. attendance in online education

●Final grade frequencies

The survey results show that 16.5% of the respondents say they have failed, where 21.6% say they have a low level of the final grade, 44.3% say they have an average level of the final grade, 17.6% say they have a high level of the final grade. The majority of students (61.9%) have a medium or high final grade.

CONCLUSION

The research carried out clearly shows the relationship between participation in lectures, course projects, and the final grade in the context of online teaching. In the beginning, before starting the research, it was assumed that participation in lectures and course projects affect the final grade of students. The research study shows that the majority of students (72.8%) have an average and high level of attendance of students in online teaching, 61.9% of students have a medium or high final grade. Studies reveal a high positive correlation between lecture participation and the final grade as the increase in the results of participation in the classrooms was accompanied by an increase in the final grade. Also the study shows that the increase in course project points accompanied with an increase in the final grades. The results of this study have practical importance because it creates an opportunity to reason and support students by letting you know that participation in auditor and in course projects help in the final grade.

Antibiotics use in pediatric age groups

Klodiola Dhamo* (ORCID: *https://orcid.org/0009-0004-6422-7471)*

[*1] Alden University, Faculty of Medical Sciences, Department of Pharmacy, Tirana, Albania.

Abstract

The pediatric use of antibiotics is essential for managing infections in children. However, inappropriate prescribing can lead to negative effects and antibiotic resistance. This study aims to analyze antibiotic prescription patterns, dosages, and potential drug interactions in pediatric patients in Tirana. The objective of this study is to evaluate prescription patterns, dosage forms, and possible drug interactions of antibiotics used in pediatric patients in Tirana during the period of January-February 2024. This study analyzed 115 antibiotic prescriptions collected from pharmaceutical institutions in Tirana. The collected data included gender, age group, the name of the prescribed antibiotic, pharmacological class, dose, dosing regimen, route of administration, and the specialty of the prescribing doctor. The data were statistically analyzed using SPSS 21 to identify patterns and correlations. The results revealed a balanced gender distribution among pediatric patients, with the highest number of prescriptions in the 1-5 years old age group. Second- and third-generation cephalosporins were the most prescribed antibiotics, followed by amoxicillin and amoxicillin-clavulanate. Suspensions were the most prescribed form. It is recommended to implement guidelines for the prescription of pediatric antibiotics to prevent overuse and resistance. Careful monitoring of possible drug interactions is essential.
Keywords: *Antibiotics, prescription, pediatric patients, prescriptions*

INTRODUCTION

Antibiotic prescribing guidelines set care standards, focus efforts on improving quality, and enhance patient outcomes. There are many factors that influence antibiotic prescribing in pediatric populations, ranging from clinical decision-making by physicians, parents' expectations, to social or cultural factors. Specific diagnoses, maternal education levels, and parents' perceptions of antibiotic use also play a crucial role in shaping prescription patterns. Furthermore, the qualifications of doctors, experience, knowledge sources, and the hospital practice environment contribute to variations in antibiotic prescribing practices. Approximately 60% of hospitalized children receive antibiotics, with one-quarter of antibiotic use considered inappropriate. Although antibiotics are critical for improving clinical outcomes in children with infections, their use in pediatric populations, although widespread, has raised concerns due to potential long-term health consequences, extending beyond antibiotic resistance. Bacterial antimicrobial resistance is a phenomenon caused by changes occurring in bacteria that make the drugs used to treat infections less effective. Infectious pathogens are capable of evolving, and over time, many have developed resistance to previously known or newly developed antibiotics.

MATERIALS AND METHODS

This study used a cross-sectional methodology to analyze antibiotic prescription patterns in pediatric patients in Tirana. Data collection was carried out through a review of 115 pediatric antibiotic prescriptions obtained from pharmaceutical institutions in Tirana during January and February 2024. The collected data included patient demographics (age and gender), details of the prescribed antibiotic (name, pharmacological class, dose, form, and dosing regimen), method of administration, and the specialty of the prescribing doctor. Information on any concurrent medications and potential drug interactions was also analyzed. The data were systematically organized and analyzed to identify trends and adherence to pediatric prescription guidelines.

Statistical analysis through basic frequencies and percentages, as well as advanced SPSS analysis, was used to assess correlations and patterns in the data.

RESULTS

Table 1. 1 Distribution of patients by age and gender

Age	Gender	Frequency	Percentage (%)
0-6 months	Male	7	5,6
	Female	5	4,4
6 months – 1 year	Male	9	7,8
	Female	8	7
1 – 5 years	Male	22	19,1
	Female	18	15,9
5 – 10 years	Male 1	16	13,9
	Female	13	11,1
10 – 17 years	Male	9	7,8
	Female	8	7

55% of the patients (n=63) considered in the study are male, 35% of the patients (n=40) belong to the 1-5 years age group, followed by 25% of the patients (n=29) who belong to the 5-10 years age group.

Table 2. Type of prescribed antibiotic

Antibiotics name	Pharmacological class	Frequency	Percentage (%)
Amoxicillin	Penicillin	12	10,4
Amoxicillin-Clavulanate	Penicillin, Beta-lactamase inhibitors	12	10,4
Cefalexine	Cephalosporins I generation	6	5,2
Cefuroxime	Cephalosporins II generation	6	5,2
Cefaclor		14	12,2
Cefixime	Cephalosporins III generation	17	14,8
Ceftazidime		6	5,2
Ceftriaxone		17	14,8
Azythromycin	Macrolides	12	10,4
Metronidazole	Nitroimidazoles	6	5,2
Sulfamethoxazole-trimethoprim	Sulfphonamides	9	7,8

Regarding the type of antibiotic, cefixime and ceftriaxone are the most commonly used antibiotics, accounting for 14.8% of cases (n=17) each, followed by cefaclor with 12.2% of cases (n=14).
Regarding the pharmacological class, third-generation cephalosporins make up the most prescribed pharmacological class, accounting for 34.8% of cases.

Table.3 Description of the antibiotics by dosage form

Antibiotic	Dosage Form	Description	Frequency	Percentage (%)
Amoxicillin	125 mg/5 ml, 250 mg/5 ml	Suspension	9	7,8
	250 mg, 500 mg	Tablet	3	2,6
Amoxicil lin-clavulana te	200 mg/28.5 mg/5 mL, 400 mg/57mg/5 mL	Suspension	9	7,8
	250 mg/125 mg, 500 mg/125 mg	Tablet	3	2,6
Cephalexine	125 mg/5 mL, 250 mg/5 mL	Suspension	5	4,3
	250 mg, 500 mg	Capsule	1	0,9
Cephuroxime	125 mg/5 mL, 250 mg/5 mL	Suspension	5	4,3
	250 mg, 500 mg	Tablet	2	1,7
Cephaclor	125 mg/5 mL, 250 mg/5 mL	Suspension	12	10,4
	250 mg, 500 mg	Capsule	2	1,7
Cephixime	100 mg/5 mL	Suspension	14	12,2
Cephtazidime	50 mg/kg, 100mg/kg	Injection	6	5,2
Cephtriaxone	50 mg/kg, 75mg/kg	Injection	17	14,8
Azythromycin	200 mg/5 mL	Suspension	12	10,4
Metronidazole	200 mg/5 mL	Suspension	6	5,2
Sulfamethoxazole-trimethoprim	200 mg/40 mg/5 mL	Suspension	9	7,8

65.2% of the dosage forms (n=75) are suspensions. 22.6% of the dosage forms (n=26) are injection suspensions**.**

Tabela.4 Distribution of patients by method of administration

Method of administration	Frequency	Percentage (%)
Oral	89	77,4
Intramuscular	16	13,9
Intravenous	10	8,7

In 77.4% of cases (n=89), the method of antibiotic administration is oral

Tabela.5: Distribution of patients by antibiotic administration regimen

Therapy regimen	Frequency	Percentage (%)
Once a day for 5 days	29	25,2
Twice a day for 7 days	43	37,4
Twice a day for 10 days	6	5,2
Three times a day for 7 days	18	15,7
Three times a day for 10 days	19	16,5

DRAFT

Tabela.6 Distribution by doctor's specialty

Doctor's specialty	Frequency	Percentage (%)
General practitioner	29	25,2
Pediatrician	45	39,1
Emergency physician	41	35,7

35.7% of antibiotic prescriptions were given by a pediatrician, followed by 35.7% given by an emergency physician.

CONCLUSION

The study on pediatric antibiotic prescriptions in Tirana revealed a balanced gender distribution among pediatric patients. The youngest age groups, particularly those aged 1-5 years, accounted for the largest number of prescriptions. Second- and third-generation cephalosporins were the most commonly prescribed antibiotics. Amoxicillin and amoxicillin-clavulanate were also frequently prescribed, reflecting their role in treating common pediatric infections. Suspensions were the most recommended form, especially for younger children.

RECOMMENDATIONS

It is recommended to implement guidelines for pediatric antibiotic prescribing to prevent overuse and resistance. Healthcare providers should be educated on the importance of proper antibiotic use and potential side effects. It is recommended to ensure that liquid formulations are available and used for younger children for ease of administration. Regular training sessions on pediatric antibiotic prescribing practices should be developed for healthcare professionals. The use of probiotics alongside antibiotics should be encouraged to maintain intestinal health.

Özet

Bu çalışma kapsamında imalat endüstrisinde özellikle savunma ve havacılık başta olmak üzere birçok üretim alanında önemli ve etkin bir yere sahip olan AISI 4140 çeliklere daha iyi mekanik, fiziksel ve kimyasal yetenekler kazandırmak için çeşitli ısıl işlemler yapılmıştır. Isıl işlem prosesi tamamlanan numuneler çeşitli metalografik işlemleri ve yüzey pürüzlülük ölçümlerinden sonra numunelerin yüzeylerine son yıllarda endüstride yaygın bir kaplama yöntemi olarak kullanılan PVD (Physical Vapor Deposition) kaplama yöntemi ile Argon ve Nitrojen atmosferi altında kaplanma uygulanmıştır. PVD kaplama yöntemi, özellikle alt tabakadaki yüzeyi aşınma ve korozyon gibi etkenlerden koruması ile bilinmektedir. Bununla birlikte PVD kaplama çeşidi olarak iyi mekanik ve fiziksel özellikler ile yüksek kimyasal kararlılıkta olan sert ve yüksek darbe tokluğuna sahip bir kaplama olan TiCN (Titanyum Karbon Nitrür) kaplama çeşidi uygulanmıştır. Oluşturulan PVD kaplamalı 4140 çeliklerdeki kaplama tabakasındaki ıslanabilirlik özellikleri incelenmiş olup üç farklı kontak açısı tespit edilmesi ve elde edilen verilerin PVD kaplamalı 4140 çeliklerin ıslanabilirlik özellikleri hakkındaki bazı bilimsel değerleri ortaya çıkarmıştır.
Anahtar Kelimeler: AISI 4140, Isıl işlem, PVD kaplama, Isnalabilirlik

Investigation of the Wetting Properties of Heat Treated AISI 4140 Steels Coated with PVD Method

Abstract

Within the scope of this study, various heat treatments were carried out to give better mechanical, physical and chemical properties to AISI 4140 steels, which have an important and effective place in many production areas, especially in defence and aerospace in the manufacturing industry. After various metallographic processes and surface roughness measurements, PVD (Physical Vapour Deposition) coating method, which has been widely used as a coating method in the industry in recent years, was applied to the surfaces of the samples under Argon and Nitrogen atmosphere. PVD coating method is especially known for protecting the surface of the substrate from factors such as wear and corrosion. In addition, TiCN (Titanium Carbon Nitride), a hard and high-impact toughness coating with good mechanical and physical properties and high chemical stability, was applied as PVD coating type. The wettability properties of the coating layer on the PVD-coated 4140 steels were investigated and three different contact angles were determined and the data obtained revealed some scientific values about the wettability properties of PVD-coated 4140 steels.

Keywords: AISI 4140, Heat treatment, PVD coating, Wettability

GİRİŞ

Gelişen teknolojiler dengesinde çelik endüstrisinde her geçen gün yeni yöntemler ve gelişmeler kaydedilmektedir. Stratejik bir değere sahip olan AISI 4140 çelikler demir-çelik endüstrisinde çok fazla rağbet gören ve sürekli innovasyon içeren çalışmalara tabi tutulan bir çelik türüdür. Başlıca kullanım alanları olarak; savunma ve havacılık sanayi, otomotiv, makine imalat ve inşaat olmak üzere pek çok alanda 4140 çeliklere ihtiyaç duyulmaktadır. Bunda 4140 çeliklerin mukavemet dayanımı, aşınma ve korozyona karşı gösterdiği karşı direnç önemli bir rol oynamaktadır (Meysami ve ark 2010). 4140 çeliklerin mekanik, fiziksel ve kimyasal özelliklerini geliştirmek için çeşitli ısıl işlemler ve kaplama yöntemleri geliştirilmektedir. Bunlar ısıl işlem olarak, su verme sertleşmesi, yağda soğutma, havada soğutma ve fırında tavlama gibi sıralanabilir. Kaplama yöntemi olarak da kısaca PVD olarak bilinen fiziksel buhar biriktirme

yöntemi ve CVD olarak bilinen kimyasal buhar biriktirme yöntemleri gelmektedir (Knapp ve ark. 2017). Özellikle çelik malzemelerin aşırı stres altında çalıştıkları durumlarda mekanik özelliklerini geliştirmek amacı ile PVD kaplama yöntemleri son yıllarda yaygın olarak kullanılmaktadır (Şimşir ve ark 2021). Yapışma, iyi bir ara yüzey oluşturma, istenilen kalınlık ve esneklik PVD kaplamalarda istenilen temel özellikler arasında yer almaktadır (Warcholinski ve Gilewicz 2011).

Islanabilirlik tanım olarak katı bir ortam ile sıvı ortamın birleştiğinde moleküler etkileşim ile temas sürdürme kabiliyeti olarak ifade edilir. Katı yüzeyler için ıslanabilirlik, yüzeyin sıvı ile ıslanabileceği ıslatma derecesi olarak tanımlanır (Samanta ve ark.2020). Katı yüzeylerin hidrofobikliğini veya hidrofilikliğini değerlendirmek için CA denilen statik temas açısı parametresi kullanılmaktadır. $0° < \theta < 90°$ ise yüzey hidrofiliktir, $90° < \theta < 180°$ ise yüzey hidrofobik, $\theta > 150°$ ise yüzey süperhidrofobik, $\theta = 180°$ ise yüzey bütünüyle hidrofobiktir ve sıvı damlacık katı yüzeyde küresel bir yapıdadır (Ma ve ark. 2019). Gelişen teknolojilerle birlikte yakın zaman içinde çelik, alüminyum ve titanyum gibi bazı mühendislik alaşımlarının yüzey ıslanabilirlik (wettability) özellikleri iyileştirilerek biyomedikal, havacılık ve çeşitli stratejik malzemelerin üretilmesi tasarımcı mühendisler ve dizaynırlar tarafından ilgi görmüştür.

Bu çalışma kapsamında özellikle savunma ve havacılık sanayinde önemli bir yere sahip olan 4140 çeliklerin ısıl işlemleri yapılarak yüzeylerine PVD yöntemi ile TiCN kaplaması uygulanarak oluşan kaplama tabakasındaki ıslanabilirlik özellikleri incelenmiş ve ortaya koyulan veriler irdelenmiştir.

MATERYAL VE METOD

Has çelik firmasından temin edilen AISI 4140 çelik malzeme, 30 mm çapında ve 5 mm kalınlıkta silindirik şekilde hazırlanmış olup ısıl işlem fırınında 700-820-840° C de ısıtıldıktan sonra sırasıyla havada, suda ve yağ ortamında soğutularak ısıl işleme tabi tutulmuştur. Kaplama öncesinde numunelere gerekli metalografik yüzey işlemleri (zımparalama ve parlatma) yapılarak kaplamaya hazır hale getirilmiştir. TiCN PVD kaplamalar- Ar (%99,99), N2 (%99,99) ve C2H2 (%99,99) karışım atmosferinde InterAtom PVD-32 model kaplayıcı kullanılarak üretilmiştir. Kaplama işlemi tamamlanan numuneler ıslanabilirlik deneyleri için uygun hale getirilmiştir. Numunelerin yüzey pürüzlülük ölçümleri MarSurf PS1 marka cihaz ile gerçekleştirilmiştir. TiCN ile kaplanmış 4140 çelik numunelerin yüzeylerinde meydana gelen ıslanma davranışlarının değişimini araştırmak için kontak açısı değerleri incelenmiştir. Deneylerde temas açısı ölçümleri, 3 µL damıtılmış su damlacıkları kullanılarak elektrot yüzeylerinde beş kez farklı farklı pozisyonda uygulanarak gerçekleştirilmiştir. Ölçüm süreci, Leica optik lens sistemi aracılığıyla görüntülerin yakalanmasını, mobil bir cihaza aktarılmasını ve temas açılarını nicel olarak belirlemek için ImageJ yazılımı ile analiz edilmiştir.

BULGULAR ve TARTIŞMA

Isıl işlemli TiCN kaplamalı numunelerin ısıl işlem türüne göre kodlandırılması Tablo 1 de verilmiştir. Bununla birlikte Tablo 2'de ve Şekil 1'de gösterilen değerler numunelerin yüzey pürüzlülük değerlerini belirtmektedir. Ra değeri (ortalama pürüzlük) ve Rz değeri(ortalama derinlik) olarak en iyi değer P3 numunesinde görülmektedir. Düşük ve yüksek Ra ve Rz seviyelerinin olmaması ve bu seviyelerin birbirine çok yakın olması sıcaklık, basınç, ısıl işlem ve kaplama parametrelerinin optimal düzeyde belirlendiği anlamına gelmektedir.

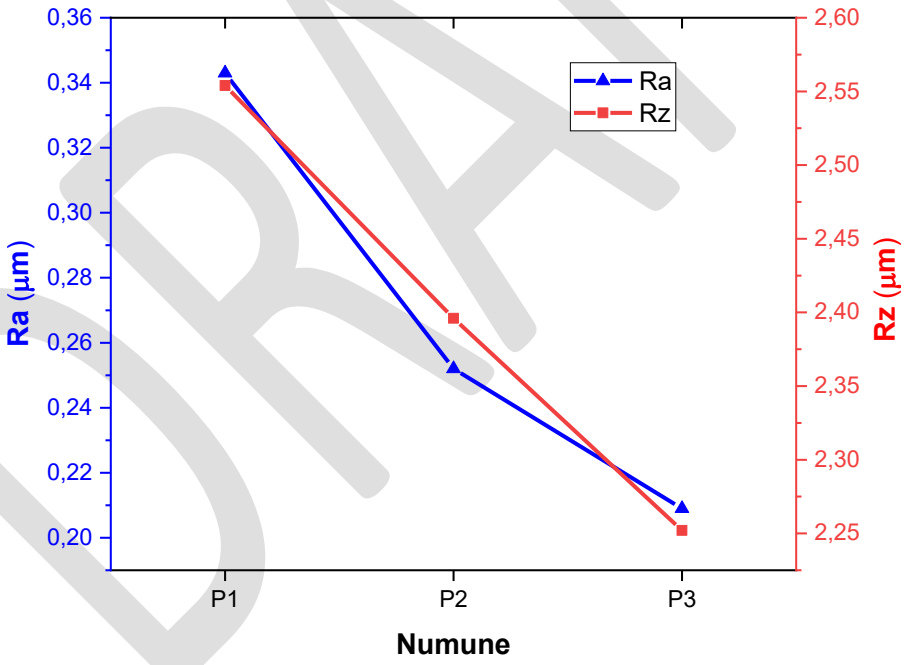
Tablo 1. Numunelerin kodları

Isıl İşlem Türü	Kod
700° Fırında soğutma	P1
820° havada Soğutma	P2
840° Yağda Soğutma	P3

Tablo 2. Numunelerin yüzey pürüzlülük değerleri

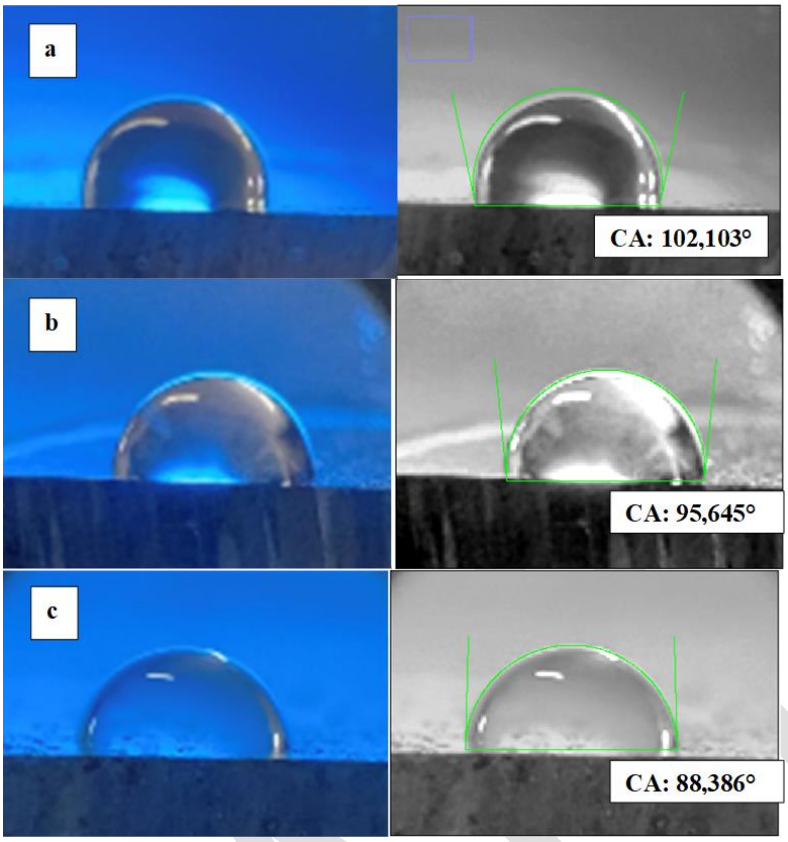
Kod	Ra (µm)	Rz (µm)
P1	0,343	2,554
P2	0,252	2,396
P3	0,209	2,252

Şekil 2' de numunelerin kontak açısı değerleri numunelerin damlacık görüntüleri verilmiştir. Kontak açısı en yüksek P1 numunesinde 102° olarak, P2 numunesinde ise 95° olarak ölçülmüştür. Burada P1 numunesinin ve P2 numunesinin yüzeyleri hidrofobik olarak nitelendirilmiştir. P1 numunesinin kontak açı değeri daha büyük olduğu için P1 numunesi, P2 numunesine göre daha hidrofobiktir. P2 numunesi yüzeyindeki ıslanabilirlik P1 numunesine göre daha fazladır. En düşük kontak açısı 88° ile P3 numunesinde ölçülmüş ve P3 numunesi yüzeyi hidrofilik olarak belirlenmiştir. Şekil 2'de bulunan damlacık görüntülerinde P3 numunesinde damlacığın yüzeye yayılması daha belirgin bir şekilde görülmektedir. Bir malzemede yüzey pürüzlülük değerinin artması, katı-sıvı temas bölgesinde büyümeye neden olacağı için kontak açısı da artış göstermesi Cassie Baxter modeli ile açıklanmaktadır. Deney numunelerinin yüzeyindeki mikro yükseklikler ve bu yüksekliklerin aralıkları büyük olduğunda damlacığın temas ettiği yüzeyin alt kısmında oluşan hava boşlukları damlacığın yüzeyi ıslatmasını önlemektedir. Şekil 3 incelendiğinde, numunelerde Ra değeri azaldıkça temas açısının da azaldığı görülmüştür. Bu durum yüzey morfolojisi ve yüzey enerjisi ile açıklanabilir.

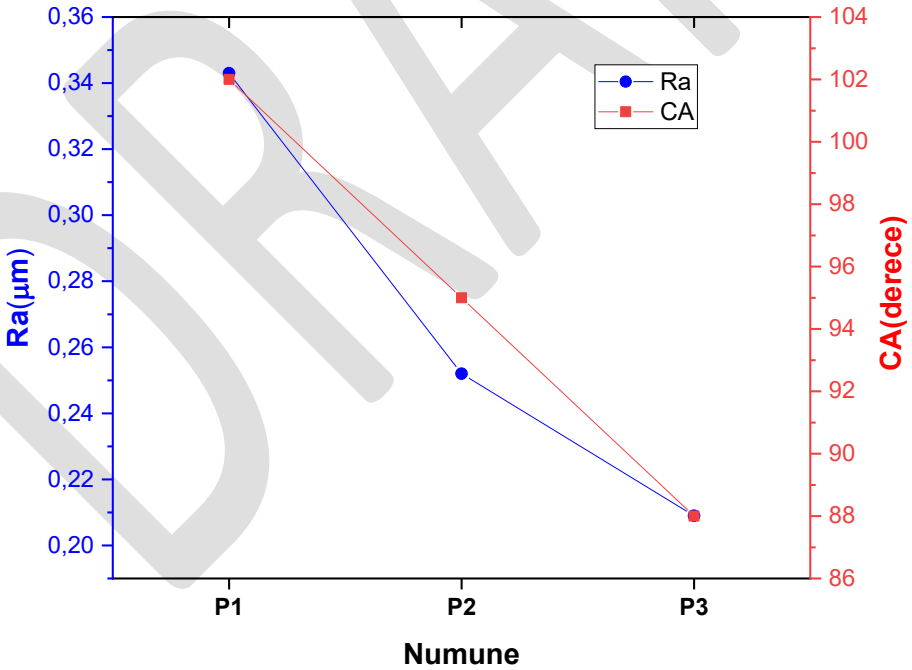


Şekil 1. Numunelerin yüzey pürüzlülük Ra ve Rz değerleri grafiği

DRAFT



Şekil 2. Numunelerin damlacık görüntüleri, a) P1, b) P2, c) P3



Şekil 3. Numunelerin kontak açısı ve yüzey pürüzlülük grafiği

SONUÇ

TiCN kaplamalı numunelerin fiziksel ve Islanabilirlik özellikleri incelenmiştir. Kaplama işlemi yapılmadan önce uygulanan ısıl işlemler numunelerin ıslanabilirlik özelliklerini etkilemiştir. Bununla birlikte her bir numune farklı kontak açısı ile damlacıkların numene yüzeyinde yayılmasında farklılıklar göstermiştir. P3 numunesine uygulanan yağda soğutma işlemi ve sonrasında TiCN kaplaması yüzey kimyasını etkilemesi ve ayrıyeten yüzeyi daha hidrofilik hale getirmiştir. Özellikle yağda soğutma işleme diğer havada ve fırın

içerisinde yapılan soğutma işlemine göre daha hızlı bir soğutma yöntemi olduğu için numune yüzeyinde mikro boyutta çatlaklar ve nano gözenekler malzeme yüzeyindeki tane sınırlarını değiştirmiş olduğu kanısına varılmıştır. Bu yapısal değişim suyun yayılmasını hidrofilik bir yapıya doğru yönlendirmiştir. Bu durum Wenzel ıslatma modeli ile açıklanabilir. P1 numunesindeki en yüksek temas açısı ile ıslanabilirliğin en az olduğu görülmüştür. Bununla birlikte ıslanabilirliğin az olması ile korozyona maruz kalma ve korozyondan etkilenen yüzey alanlarında azalmalar meydana gelecektir.

Abstract
Kaffir lime (*Citrus hystrix*) is an herbal plant from the *Rutaceae* family, grown and widely distributed in many countries, especially in Southeast Asia. It is frequently used as aromatic oil and spice due to its strong odor. As a result of the studies carried out in this study, the phenolic and organic acid content concentrations of ethyl acetate, methanol, ethanol and water extracts obtained from the shells of *C. hystrix*, which is a value of our country, were calculated qualitatively and quantitatively with the help of HPLC-DAD device. Anticholinesterase activity, tyrosinase enzyme inhibition activity and bioactivities were determined spectroscopically and in vitro. CH1 extract obtained from *Citrus hystrix* peels was found to be the extract with the highest phenolic content. It was also determined that CH1 extract showed the best enzyme inhibition activity. As a result of this, the expectation of finding natural and new enzyme inhibitors because of the isolation of the active substance by chromatographic methods from the extracts of different polarities of Kaffir lime collected from Köyceğiz district of Muğla has increased.
Keywords: *Citrus hystrix*, Enzyme inhibitory activity, HPLC-DAD, Phenolic composition

INTRODUCTION

Citrus hystrix or Kaffir lime, commonly known as "magrood", is a plant belonging to the family *Rutaceae*. The leaves and fruits of *C. hystrix* have a pleasant lemon scent and are called medicinal lime. Kaffir lime is one of the indispensable ingredients especially in Far Eastern cuisine. Kaffir lime has a bitter-sour taste, and its aroma is quite intense compared to other lemon varieties.

C. hystrix leaves are used as a flavoring in dishes in Thailand at that time. The fruit is not eaten fresh, but canned or used as a spice in meals. It is also used as a hair shampoo or medicine (Allen, 1967). Various parts of *C. hystrix*, such as its leaves, branches, fruit peels and juice, are rich in essential oils. (Akiyoshi et al., 1990). Since it is rich in essential oils, it has also been used as an insect repellent and for the treatment of insect bites.

Kaffir lime peel and leaves are known to be a source of phenolic compounds and antioxidant compounds (Tachakittirungrod et al., 2007; Jantarach and Thanaboripat, 2010; Anuchapreeda et al., 2020). It is known that many bioactive compounds obtained from various citrus fruits inhibit cancer cell proliferation (Patil et al., 2009). In addition to the positive effect of citrus fruits on cancer treatment, it can also be described as the plague of the age, irreversible nerve cell loss, the cause of which is not yet fully known; difficulties in cholinergic neurotransmission, memory and mental functions, thinking and interpretation; It has become a matter of curiosity to investigate the effect of neurodegenerative Alzheimer's disease (Tayeb et al., 2012), which is known for its personality and behavioral disorders.

In the physiology of this disease, which is quite complex to understand, neuron and axon loss occurs. As a result, there is a decrease in the acetylcholine level. Therefore, increasing acetylcholine levels is an important way to treat Alzheimer's disease. Another method to increase acetylcholine levels is to suppress cholinesterase enzymes that break down acetylcholine. Acetylcholinesterase (AChE; acetylcholinesterase) and butyrylcholinesterase (BChE, butyrylcholinesterase) are enzymes that are encoded by different genes but differ from each other due to their differences in their substrate selectivity and some catalytic mechanisms. As a result of the data obtained in the research, it is necessary to increase the concentration of melanin pigment in the body, which, unlike Alzheimer's disease, provides defense against skin photocarcinoma (Liesener et al., 2007).

DRAFT

Tyrosinase enzyme increases the concentration of melanin pigment by specifically acting on the tyrosine substrate. Melanin is one of the factors that affect skin and hair color in humans. Melanin is necessary to protect human skin against radiation (Parvez et al., 2007).

Melanin plays a protective role against skin photocarcinoma and protects the skin against UV damage and reactive oxygen species (ROS) by absorbing ultraviolet (UV) rays. It purifies toxic substances and drug residues from the organism. In recent years, it has been known that a large number of potent tyrosinase inhibitors have become available from natural and synthetic sources (Khan, 2012). Tyrosinase inhibitors such as arbutin, kojic acid and hydroquinones are used as whitening and antihyperpigment agents because they prevent melanin production in the skin.

Since *Citrus* species have many medicinal activities, the expectation of finding natural and new enzyme inhibitors from *C. hystrix* is increasing. The phenolic contents of 4 different extracts, namely ethyl acetate, ethanol, methanol and water, from the shells of *C. hystrix* collected from Muğla, which was the subject of the study, were determined by HPLC-DAD and their concentrations were determined spectroscopically and in vitro. In addition, acetylcholinesterase, butyrylcholinesterase and tyrosinase enzyme inhibition activity experiments were performed on the extracts of different qualities. Bioactivity results of ethanol, ethyl acetate, methanol and water extracts with qualitatively different polarities were calculated with the results obtained from chemical content and enzyme activity tests with 3 different methods.

MATERIALS AND METHODS

Preparation and extraction procedures of *C. hystrix*

Kaffir lime (*C. hystrix*) was collected from Köyceğiz district of Muğla, the peels were separated from the fruit, dried in the shade and at room temperature. It was cut into small pieces and ready for extraction. After removing the oily parts with hexane, the peels of *C. hystrix* were extracted with ethyl acetate (CH1), methanol (CH2), ethanol (CH3), and water (CH4) extracts by applying the sequential extraction method until their colors lightened (x3 times). Thus, extracts were obtained.

Preparation of samples for HPLC-DAD analysis

Ethyl acetate, ethanol, methanol and water extracts of *C. hystrix* peels were weighed as 8 mg, then dissolved in 1 mL of methanol, homogenized and filtered through 0.45 µm PTFE filters, and then made ready for HPLC-DAD injection.

HPLC-DAD analysis parameters

Phenolic component analysis of ethyl acetate, ethanol, methanol and water extracts of *C. hystrix* peels, Tokul-Ölmez et al. The 2020 method gradient solvent system was applied. In this study, comparison was made with 42 phenolic standard substances (fumaric acid, gallic acid, protocatechin acid, thiobromine, thiophylline, catechin, 4-hydroxybenzoic acid, 6,7-dihydroxycoumarin, methyl-1,4-benzoquinone, vanillic acid, caffeic acid, vanillin, chlorogenic acid, *p*-coumaric acid, ferrulic acid, cynarin, coumarin, propylgallate, routine, *trans*-2-hydroxy cinnamic acid, ellagic acid, myricetin, fisetin, quercetin, *trans* cinnamic acid, luteolin, rosmarinic acid, campferol, apigenin, chrysin, 4-hydroxyresorquinol, 1,4-dichlorobenzene, pyrocatechol, 4-hydroxy benzaldehyde, epicatechin, 2,4-dihydroxybenzaldehyde, hesperedin, oleuropein, naringenin, hesperetin, genistein, curcumin). The column temperature was set at 35ºC. The solvent system was methanol and 0.1% acidified water. Chromatographic separation will be performed on a C_{18} (5 µm, 4.6 mm x 250 mm) reverse phase column and Inertsil C_{18} guard column. A diode array detector (DAD) was used with absorbance using a wavelength of 254 nm. The solvent system was applied as stated in the literature (Tokul-Ölmez et al., 2020).

Anticholinesterase enzyme inhibition activity

Acetylcholinesterase and butyrylcholinesterase inhibition activities of ethyl acetate, ethanol, methanol and water extracts of *C. hystrix* peels were measured by a spectrophotometric method known as the Ellman method (Ellman et al., 1961), and acetylcholinesterase obtained from electric fish and butyrylcholinesterase obtained from horse serum were used as enzymes. Substrates were used as acetylcholine iodide and butyrylcholinen iodide, yellow colored 5,5'-dithiobis-(2-nitrobenzoic acid) (DTNB) was used to measure the activity. 160 µL of 0.1M pH=8 phosphate buffer, 10 µL of extracts containing 2 mL sample solution at

2000 ppm concentration, and 10 µL of AChE and/or BChE solution were added to each well of the 96-well microplates. 10 µL of methanol was used as a control. It was incubated for 15 minutes at 25 °C. Then, 10 µL of DTNB solution and 10 µL of AcI or BuI were added and the kinetic absorbances were measured for 10 minutes at a wavelength of 412 nm. The results are given in Table 5.

Tyrosinase enzyme inhibition activity

Tyrosinase inhibition activity of *C. hystrix* peel extracts was determined using the spectrophotometric method (Hearing, 1987). Tyrosinase fungus was used as an enzyme and L-DOPA was used as the substrate. After adding 150 µL of 0.005 M pH=6.8 phosphate buffer to the microplates and 20 µL of tyrosinase enzyme prepared from tyrosinase fungus onto 10 µL stock solutions of *C. hystrix* peel extracts at different concentrations, the samples were mixed for 3 minutes and incubated for 10 minutes at 37°C. At the end of the incubation, as soon as 20 µL L-DOPA solution was added to the microplate, the kinetic absorbance of the samples was measured at 475 nm wavelength for 10 min at 37°C. The results are given as IC_{50} concentrations in Table 5. With this study, Kaffir lime peels collected from Muğla Köyceğiz were evaluated in this context for the first time.

RESULTS and DISCUSSION

HPLC-DAD analysis

Ethyl acetate, methanol, ethanol and water extracts obtained from *C. hystrix* were prepared at concentrations in accordance with the specified procedure and HPLC-DAD analysis were performed. According to HPLC-DAD results of ethyl acetate extract (CH1) obtained from *C. hystrix*; pyrocatechol (2.18 mg/g), catechin (0.11 mg/g), vanilic acid (0.45 mg/g), *trans*-2-hydroxycinnamic acid (1.08 mg/g), ellagic acid (5.74 mg/g), kaempferol (4.89 mg/g), and curcumin (11.98 mg/g) phenolic acids were detected. Chlorogenic acid, ferulic acid, cynarin, hesperedin, myricetin, quercetin, naringenin, hesperetin, oleuropein, chrysin, and 4-hydroxyresorcinol were detected in trace amounts.

Table 1. Phenolic component contents of CH1 extract (mg/g)

No	Compounds name	Retention time	Calibration Equation	Area	Concentration
1	Pyrocatechol	23.844	y = 3772.8x + 23692	68144	2.18

The results in Table 3; 4-hydroxyresorcinol (18.73 mg/g) were detected as the major factor in *C. hystrix*; CH3 extract. It was calculated as cynarin (5.90 mg/g), hesperedin (2.38 mg/g), protocatechuic acid (1.71 mg/g), rosmarinic acid (0.54 mg/g), chlorogenic acid (0.42 mg/g), fisetin (0.40 mg/g) and genistein (0.13 mg/g), respectively. Catechin, vanilic acid, epicatechin, *trans*-2-hydroxycinnamic acid, and chyrsin were detected in trace amounts.

Table 3. Phenolic component contents of CH3 extract (mg/g)

No	Compounds name	Retention time	Calibration Equation	Area	Concentration
1	Protocatechuic acid	25.499	y = 65753x - 6932.1	44633	1.71
2	Catechin	30.628	y = 2611.2x + 74392	7541	*tr**
3	Vanilic acid	34.960	y = 66764x + 46508	30201	*tr**

The HPLC-DAD chromatogram of the CH4 extract at 254 nm wavelength is given in Figure 4.

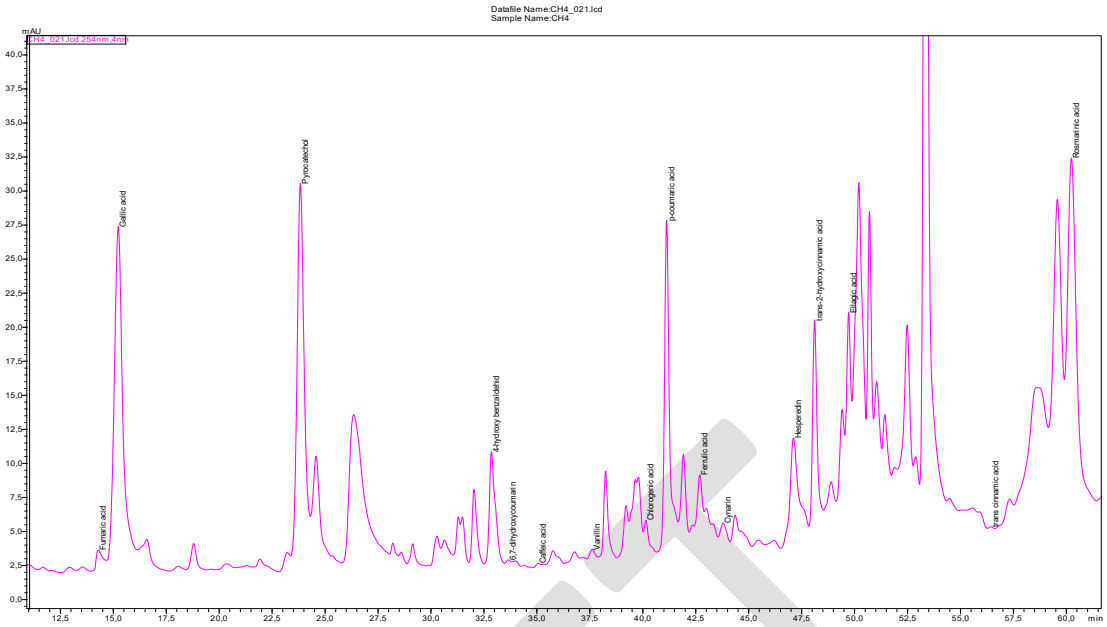

Figure 4. HPLC-DAD chromatogram of CH4 extract at 254 nm wavelength

Enzyme inhibition activity

According to the enzyme activity results given in Table 5; It was found that CH3 (ethanol) (IC_{50}: 117.68±0.60 µg/mL) extract showed better acetylcholinesterase enzyme activity than other extracts.

In the results of butyrylcholinesterase enzyme inhibition activity, it was determined that CH1 (ethyl acetate) (IC_{50}: 11.08±2.89 µg/mL) extract showed better enzyme activity compared to the standard reference substance studied, galantamine (IC_{50}: 34.58±0.60 µg/mL). CH1 extract was followed by CH2, and activity was observed in the CH4 extract at a concentration of IC_{50}: > 200 µg/mL.

Kojic acid was used as the standard reference substance in tyrosinase enzyme inhibition. According to the results of the 4 extracts obtained; CH2 (methanol) and CH3 (ethanol) tyrosinase enzyme inhibitions were calculated as IC_{50}: > 200 µg/mL. CH1 (IC_{50}: 111.96±1.45 µg/mL) extract, which showed the best activity, was followed by CH3 (IC_{50}: 141.51±2.65 µg/mL) extract.

Table 5. Anticholinesterase and tyrosinase enzyme inhibition results of *Citrus hystrix* extracts (25-200 µg/mL)

Codes	Acetylcholinesterase enzyme inhibition (AcHE)	Butyrylcholinesterase enzyme inhibition (BcHE)	Tyrosinase inhibition
CH1 (*ethyl acetate*)	*NA**	11.08±2.89	111.96±1.45
CH2 (*methanol*)	*NA**	56.15±0.27	> 200
CH3 (*ethanol*)	117.68±0.60	*NA**	141.51±2.65
CH4 (*water*)	> 200	> 200	> 200
Galantamine	16.39±0.81	34.58±0.60	*NT***
Kojic acid	*NT***	*NT***	24.99±0.13

**NA:* not active.
***NT:* not tested.

CONCLUSION

In our study, four extracts with different properties (ethyl acetate, ethanol, methanol, water) of *Citrus hystrix* were obtained fruit peels which collected from Muğla in 2022. After the extracts were prepared, their phenolic contents were determined with the help of HPLC-DAD. The HPLC-DAD analysis gave insight into the phenolic and organic acid composition of *C. hystrix* four extracts. In this way, phenolic content was determined both qualitatively and quantitatively. The results were presented in Table 1-4. As a result of our comparisons with the 42 phenolic compounds included in the phenolic method we applied, the highest number of phenolic compounds were detected in the CH1 extract. In addition, vanillic acid, chlorogenic acid and hesperidin compounds were found in common in the scanned extracts.

A certain substance is known to help treat skin conditions like hyperpigmentation and melanoma. It works by inhibiting the tyrosinase enzyme, which is crucial in the process of producing melanin, the pigment responsible for skin color (Parvez et al., 2007). Additionally, the substance contains compounds that inhibit acetylcholinesterase and butyrylcholinesterase enzymes, which are believed to help prevent nerve damage in Alzheimer's disease. So, for this reason, considering the studies in the literature on *Citrus* species with biological activity, we investigated the anticholinesterase and tyrosinase inhibition activities of 4 different extracts obtained from kaffir lime peels. IC_{50} values were calculated by screening the anticholinesterase and tyrosinase enzyme inhibition activities of the 4 extracts we obtained.

According to these results, it is seen that the ethyl acetate extract, which we code as CH1, gives more interesting results compared to other extracts, both in terms of its phenolic content and the anticholinesterase and tyrosinase enzyme inhibition results. We see in many literature studies that phenolic content and antioxidant properties support each other (Jantarach and Thanaboripat, 2010; Anuchapreeda et al., 2020). While CH1 (11.08±2.89 µg/mL) showed better butyrylcholinesterase activity than galantamine (34.58±0.60 µg/mL), which was used as the standard reference compound, CH2 (56.15±0.27 µg/mL) extract was closer to galantamine (34.58±0.60 µg/mL). It was found to show butyrylcholinesterase activity. As a result of tyrosinase enzyme inhibition activity; It was found that CH1 extract showed the best activity. On the other hand, it was determined that CH4 extract (>200 µg/mL) showed low activity against all enzyme types.

In the light of all the data obtained as a result of this study, it is recommended to conduct in vivo and in vitro studies of the rich contents of *C. hystrix* fruits with different extract types, based on our aim, phenolic content determinations. With future studies, beneficial compounds originating from natural products will be introduced to the food and health sector.

ACKNOWLEDGEMENTS

This study was financially supported by TUBITAK with the number 2209-A with the project numbered 1919B012220664 within the scope of the University Students Research Projects Support Program in the 2022/2. I would like to thank Prof. Dr. Mehmet ÖZTÜRK from Muğla Sıtkı Koçman University for support in the completion of my experimental studies. The editor and referees should be thanked for their contributions during the review and evaluation of the manuscript.

Abstract

This study explores the optimization of renewable energy integration within the microgrid (MG) framework of Kurdistan province, Iran, through a comparative analysis of Feed-in Tariff (FiT) and Net Metering (NM) policies. Building upon existing research on MG operation, renewable energy technologies, and energy policy frameworks, our investigation aims to assess the effectiveness of FiT and NM in promoting renewable energy adoption, enhancing grid stability, and optimizing economic outcomes within the Kurdistan MG context. Methodologically, we extend a previously developed optimization model to incorporate the simulation of FiT and NM policies, considering their respective regulatory frameworks, incentive structures, and operational implications. The study evaluates the impacts of these policies on key performance metrics such as energy generation, grid stability, and economic costs. Our findings highlight the nuanced effects of FiT and NM on MG operation, reducing the total cost and more exporting power to the main grid. Ultimately, this research contributes valuable insights to the discourse on renewable energy policy and MG management, offering guidance for policymakers, utilities, and stakeholders involved in energy transition efforts.

Keywords: Renewable energy integration; Feed-in Tariff (FiT); Net Metering (NM); Energy policy; Grid stability; Economic analysis

INTRODUCTION

Utilizing renewable energy sources (RES) holds paramount importance in the pursuit of sustainable energy systems globally. By harnessing RES such as solar, wind, hydro, and biomass, societies can mitigate greenhouse gas emissions, reduce dependence on fossil fuels, and enhance energy security (Alam et al., 2020). Moreover, RES offer immense potential for decentralized energy generation, enabling communities to achieve greater energy independence and resilience against external disruptions. Embracing RES not only contributes to mitigating climate change but also fosters economic development through job creation, technological innovation, and the establishment of green industries (Impram et al., 2020). In the context of Kurdistan province in Iran, where abundant renewable resources exist, leveraging RES presents a strategic opportunity to meet growing energy demands while minimizing environmental impacts and promoting regional development.

Microgrids (MG) represent a transformative paradigm in the modern energy landscape, offering localized, resilient, and sustainable solutions to energy distribution and management challenges. These self-contained energy systems integrate various distributed energy resources (DERs), including renewable energy sources (RES), energy storage systems (ESS), and demand response technologies, to efficiently supply electricity to local communities or specific facilities (D'Silva et al., 2020). MGs can operate either autonomously or in conjunction with the main grid, providing flexibility, reliability, and stability to energy networks. They empower end-users with greater control over their energy consumption, enhance grid resilience against disruptions, and facilitate the integration of intermittent renewable generation (Sharmila et al., 2019). Additionally, MGs hold significant promise for electrifying remote or underserved areas, improving energy access, and fostering economic development.

DRAFT

While RES offer tremendous potential for sustainable electricity generation, they also pose several challenges, including intermittency, variability, and limited predictability. The inherent fluctuations in RES output can lead to grid instability and mismatches between supply and demand, particularly during periods of low generation or high demand. Energy storage systems (ESS), such as battery energy storage, emerge as a viable solution to mitigate these challenges by enabling the capture and storage of excess renewable energy during periods of surplus generation for later use when demand exceeds supply (Bahramirad et al., 2012; Buchana and Ustun, 2015; IRENA, 2015). By smoothing out fluctuations, enhancing grid reliability, and providing ancillary services like frequency regulation, ESS complement RES integration efforts, unlocking their full potential while facilitating the transition towards a more sustainable and resilient energy future (Das et al., 2018; Nazaripouya et al., 2019).

Despite the promising benefits of RES and BESS, their widespread adoption faces significant economic barriers, with high upfront costs being a primary concern. The initial investment required for deploying RES infrastructure, such as solar panels, wind turbines, and associated grid integration equipment, can be substantial, deterring some stakeholders from pursuing renewable energy projects. Similarly, BESS technologies involve considerable capital expenditure for procurement, installation, and maintenance, further exacerbating the financial burden of transitioning to renewable energy-based systems. Additionally, the economic viability of RES and BESS solutions is contingent upon various factors, including local resource availability, regulatory frameworks, and market conditions, which can introduce uncertainty and risk for investors and project developers (Chen et al., 2012; Bahramirad and Camm, 2012; Gupta et al., 2017).

The necessity of robust energy policies to address the economic challenges associated with renewable energy adoption, particularly in regions like Kurdistan province in Iran, cannot be overstated. Well-designed energy policies play a pivotal role in creating a conducive environment for investment, innovation, and market development in the renewable energy sector. By providing financial incentives, energy policies can help offset the high upfront costs of renewable energy infrastructure and incentivize private sector participation. Moreover, clear and consistent regulatory frameworks, including renewable energy targets, grid access regulations, and permitting procedures, can reduce uncertainty and perceived risk for investors, facilitating greater capital flows into renewable energy projects.

Net Metering (NM) and Feed-in Tariffs (FiT) stand out as two well-known policies that have been widely implemented to incentivize renewable energy adoption and address economic barriers. Net Metering allows energy consumers who generate electricity from renewable sources, such as solar panels or wind turbines, to offset their electricity bills by exporting excess energy back to the grid. Under NM, the electricity meter runs backward when the renewable energy system generates more electricity than the consumer's immediate needs, effectively allowing them to "bank" excess energy credits for future use. This policy not only encourages the deployment of distributed renewable energy systems but also promotes self-consumption and grid stability by aligning generation with demand patterns (Marcelino et al., 2023; Poullikkas and Kourtis, 2013; Zhao, 2018). On the other hand, Feed-in Tariffs (FiT) offer renewable energy producers a guaranteed price for the electricity they generate and feed into the grid. FiT schemes typically involve long-term contracts between renewable energy producers and utilities or government entities, wherein producers receive a fixed tariff for each unit of electricity generated, often above market rates. FiTs provide revenue certainty and financial incentives for renewable energy investments, thereby stimulating market growth, attracting private sector investments, and accelerating the deployment of renewable energy technologies (Pyrgou et al., 2016; Bayod-Rújula et al., 2017; Meena et al., 2019).

Our contribution to the field lies in the formulation and application of NM and FiT policies within the context of Kurdistan province in Iran. Through a detailed case study, we have implemented these two policies and conducted a comprehensive comparison of their economic impacts relative to a scenario without any policy intervention. By integrating economic analysis with real-world data and simulation results, we have quantified the economic benefits and trade-offs associated with NM, FiT, and the absence of policy support. By elucidating the comparative economics of NM, FiT, and no policy scenarios, our research offers valuable guidance to policymakers, utilities, and stakeholders seeking to design and implement effective renewable energy policies tailored to local conditions and objectives.

The study is structured into several key sections. In Section 2, the methodology employed in the investigation is elaborated, outlining the approach taken to model and simulate the implementation of energy policies. Section 3 delves into the mathematical formulation of the model used to assess the economic implications of NM, FiT, and no policy scenarios. This section elucidates the key variables, constraints, and objective functions incorporated into the model to facilitate a rigorous analysis of the economic impacts of different policy regimes. In Section 4, the findings of the study are presented and discussed. Section 5 encapsulates the conclusions drawn from the analysis, synthesizing the key insights gleaned from the research and offering recommendations for policymakers and stakeholders.

METHODOLOGY

This section outlines the methodology employed to assess the economic implications of implementing NM and FiT policies within the MG framework of Kurdistan province. The methodology comprises several steps, including data collection, model formulation, and economic analysis.

- Step 1: Data Collection: The first step involves gathering relevant data to characterize the MG system and its operational parameters. This includes 24-hourly load demand profiles, solar and wind turbine output data, BESS size, and electricity prices based on time of use.
- Step 2: Model Formulation: Once the data is collected, an optimization model is formulated to simulate the operation of the MG under different policy scenarios. The model incorporates variables representing energy generation, storage, and consumption, as well as constraints related to grid stability, energy balance, and policy compliance.
- Step 3: Economic Analysis: The economic analysis begins by calculating the total cost of MG operation without any energy policy in place. This baseline cost serves as a reference point for comparing the economic impacts of NM and FiT policies. Subsequently, the selected policy (NM or FiT) is integrated into the optimization model, and the total cost of MG operation is recalculated. This process is repeated iteratively until the economic implications of both NM and FiT policies are fully considered.
- Step 4: Analysis of Results: Finally, the results of the economic analysis are analyzed to evaluate the comparative economic performance of NM and FiT policies relative to the baseline scenario without any policy intervention. Key metrics such as energy costs, revenue generation, and return on investment are examined to assess the effectiveness of each policy in promoting renewable energy adoption, enhancing grid stability, and optimizing economic outcomes within the Kurdistan province MG context.

6 the calculation of the total cost of MG operation and the modeling of regulatory frameworks governing NM and FiT policies.

Total cost of MG

The total cost of the MG, which is the objective of our problem, is defined by Eq. 1.

$$\min TC = CR + C_{BESS} + C_{exchanged} + CRI - CRE \quad (1)$$

In this context, TC symbolizes the overall expenditure of the MG, determined by the expenses linked with RES (CR), the BESS (C_{BESS}), and the energy transactions with the primary grid. Moreover, CRE and CRI denote the income obtained from selling surplus energy to the grid and procuring energy from the main grid, respectively. The determination of C_{BESS} and $C_{exchanged}$ is delineated in Equation 2 and Equation 3, correspondingly.

$$C_{BESS} = PC_{BESS} \times P_rated_{BESS} + EC_{BESS} \times E_rated_{BESS} \quad (2)$$

$$C_{exchanged} = \sum_{t=1}^{NT} \rho_{i,t} \times EP_t \quad (3)$$

Here,

The power and energy expenditures related to the BESS are symbolized by PC_{BESS} and EC_{BESS}, respectively. Furthermore, P_rated_{BESS} and E_rated_{BESS} denote the rated power and energy capacity of the BESS. Within Equation 3, EP_t represents the power transacted with the primary grid at time t, while $\rho_{i,t}$ signifies the cost per kilowatt-hour (KWh) of energy exchanged with the primary grid during time t of the day. We designate the energy exported and imported during time period t as $E_{\exp ort,t}$ and $E_{import,t}$ respectively.

$$CRE = \sum_{t=1}^{NT} E_{\exp ort,t} \times R_{\exp ort} \quad (4)$$

$$CRI = \sum_{t=1}^{NT} E_{import,t} \times R_{import} \quad (5)$$

The modeling of the BESS relies on its inherent constraints. The quantity of energy stored in the BESS at time t is determined by Equation 6, where the charging and discharging power of the BESS are denoted by P^c_{BESS} and P^d_{BESS}, respectively.

$$E_{BESS,T} = E_{BESS,T-1} + (P^c_{BESS} \times \eta_c - \frac{P^d_{BESS}}{\eta_d}) \times \Delta t \quad \forall t \in NT \quad (6)$$

Here, the efficiency of charging and discharging of the BESS is represented by η_c and η_d, respectively. The upper and lower bounds of the BESS's rated values are outlined as constraints in Equation 7 and Equation 8, respectively.

$$-P^R_{BESS} \le P_{BESS,t} \le P^R_{BESS} \quad \forall t \in NT \quad (7)$$

$$0 \le E_{BESS,t} \le E^R_{BESS} \quad \forall t \in NT \quad (8)$$

Additionally, Equation 9 illustrates the constraint imposed on the power interchange between the main grid and the microgrid, which is restricted by the maximum capacity of the transmission lines linking them ($P^{\max}_{exchanged}$)

$$0 \le P_t \le P^{\max}_{exchanged} \quad \forall t \in NT \quad (9)$$

Energy Policies Formulation

The regulatory frameworks are integrated into the problem formulation through their respective constraints. In the case of the NM policy, the revenue generated from exporting energy is calculated based on the net energy exported to the grid (as depicted in Equation 10). Similarly, the revenue derived from importing energy is determined by the net energy imported from the grid (as illustrated in Equation 11). The net energy exported or imported is computed as the disparity between the total energy exported to the grid and the total energy imported from the grid (as outlined in Equations 12 and 13).

The constraints associated with the regulatory frameworks are embedded within the problem formulation. Specifically, for the NM policy, the revenue generated from exporting and importing energy is determined by Equation 19 and Equation 20, respectively. Furthermore, the net energy exported ($N_E_{\exp ort,t}$) or imported ($N_E_{import,t}$) is calculated as the difference between the total energy exported to the grid and the total energy imported from the grid, as outlined in Equation 21 and Equation 22, respectively (Gholami et al., 2024).

$$CRE_{Net-metering} = \sum_{t=1}^{NT} N_E_{export,t} \times R_{export} \quad (10)$$

$$CRI_{Net-metering} = \sum_{t=1}^{NT} N_E_{import,t} \times R_{import} \quad (11)$$

$$N_E_{import} = \sum_{t=1}^{NT} E_{import,t} - E_{export,t} \quad (12)$$

$$N_E_{export,t} = \sum_{t=1}^{NT} E_{export,t} - E_{import,t} \quad (13)$$

Finally, under the FiT framework, the main grid procures the electricity generated by the MG at a pre-established fixed rate, typically exceeding the retail rate of electricity. The revenue generated from exporting energy within the FiT framework is computed by modifying the parameter FiT_{rate} in Equation 14 to reflect this fixed rate.

$$CRE_{FiT} = \sum_{t=1}^{NT} E_{export,t} \times R_{export} \times FiT_{rate} \quad (14)$$

RESULTS

The MG under investigation represents a real rural village situated at coordinates 35°59'N, 47°30'E in Kurdistan province, Iran [20]. This rural village consists of approximately 200 houses, with an average of 5 occupants per house, along with facilities such as a boarding clinic, mosque, double-shifted school, and agricultural electricity consumption, primarily for electric water pumps. The hourly electrical load profile for the month of July, depicted in Figure 1, exhibits the highest energy consumption and peak demand among all months, with highest peak demand reaching 580 kW. Figures 1 illustrate the 24-hour variations in wind turbine (WT) and photovoltaic (PV) array output powers as well, obtained from (Ataee et al., 2016). The MG infrastructure comprises wind turbines, PV arrays, A 100 KW battery system, and local loads, all interconnected with the external grid.

Also, this section outlines the input data related to RES and electricity prices based on time of use (ToU) tarrif from the main grid for the MG. The data includes the following costs: The cost of energy generated by PV and WT arrays are considered $0.048 and $0.033 per kilowatt-hour (kWh). Also, the cost of energy exchanged with the main grid varies based on the demand period: During peak demand periods, the cost is 0.024 ($/ kWh). During intermediate demand periods, the cost is 0.012 ($/ kWh), and during off-peak demand periods, the cost is 0.006($/ kWh). These cost parameters are crucial for assessing the economic viability of different energy generation and consumption scenarios within the MG framework.

The Fig.2 show the imported power from the grid with and without battery in case of using no energy policy. The analysis of imported power from the main grid for the MG reveals differences when comparing scenarios with and without the BESS. In the scenario without BESS, the imported power values fluctuate, with notable peaks at 450 kW and 480 kW. The overall trend shows considerable reliance on the main grid during high demand periods. In contrast, the scenario with BESS demonstrates a reduction in the imported power during certain peak times, particularly in the afternoon and evening hours. For example, the imported power is reduced to 400 kW. Additionally, the presence of BESS seems to smooth out some of the fluctuations observed in the no-BESS scenario, indicating better load balancing and energy management.

Figures 3 and 4 illustrate the power imported, exported, and battery usage under the NM and FiT policies (with a rate of 1.5), respectively. As shown in the FiT scenario, there are more opportunities for exporting energy to the grid compared to the NM policy. This is due to the fixed rate provided by FiT, which incentivizes higher energy exports by ensuring a guaranteed return for the electricity generated. Additionally, the FiT policy supports a larger BESS size, which can be installed to maximize energy storage and export potential. The increased BESS capacity under FiT allows for greater energy management flexibility, enabling the MG to store excess renewable energy and export it when grid prices are favorable, further enhancing economic benefits.

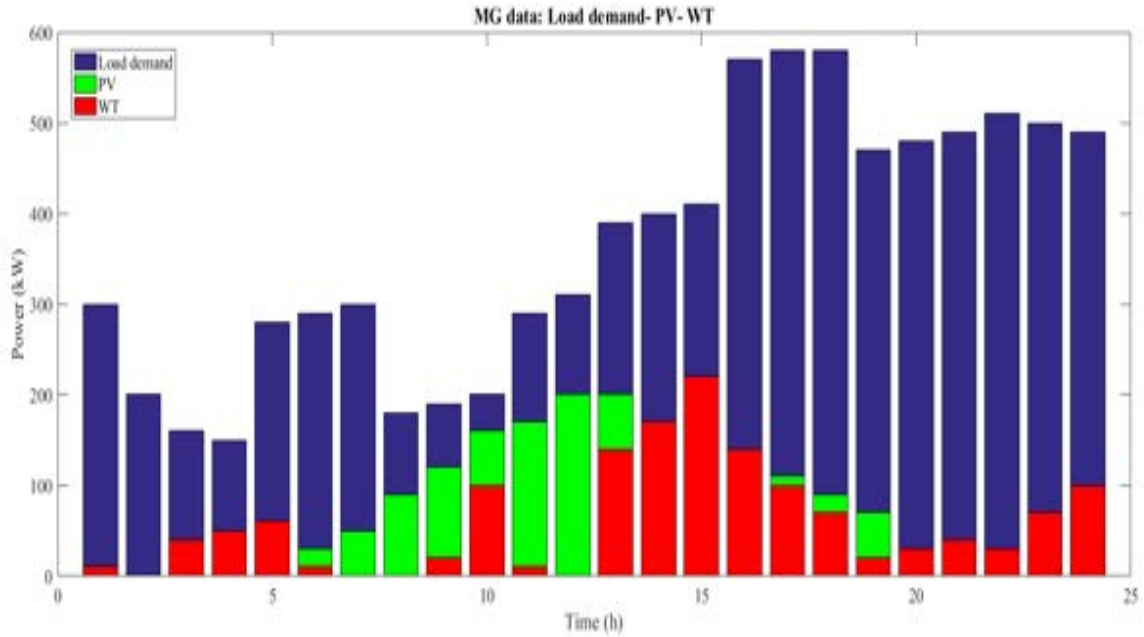

Figure 1. Data for MG under study: a rural village in Kurdistan province, Iran [Main]

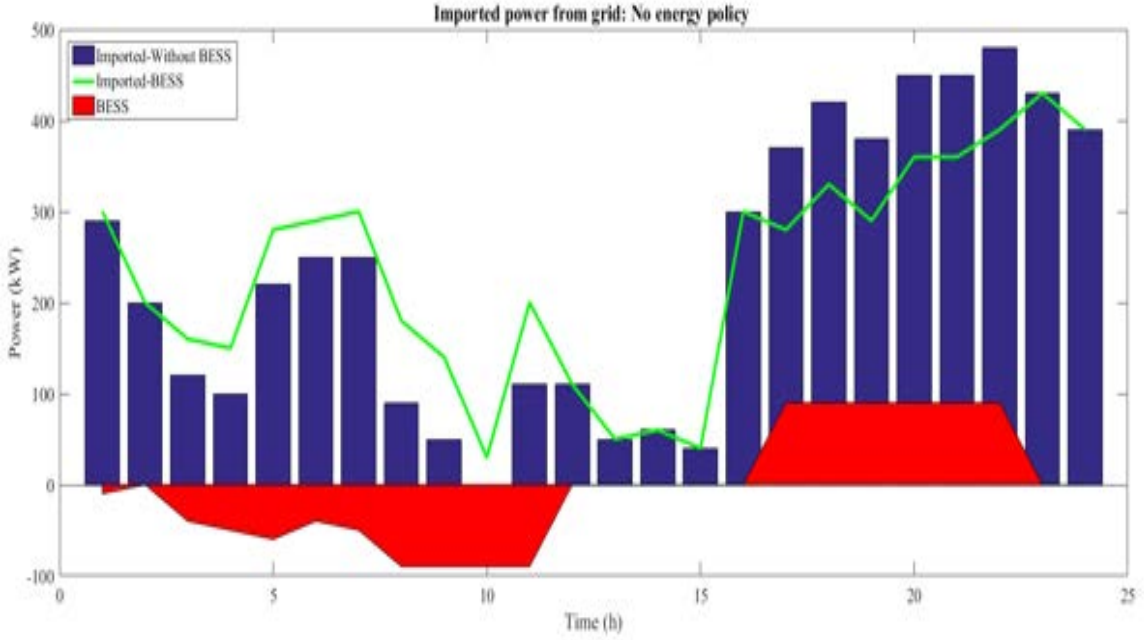

Figure 2. Imported power from the main grid: No policy is applied

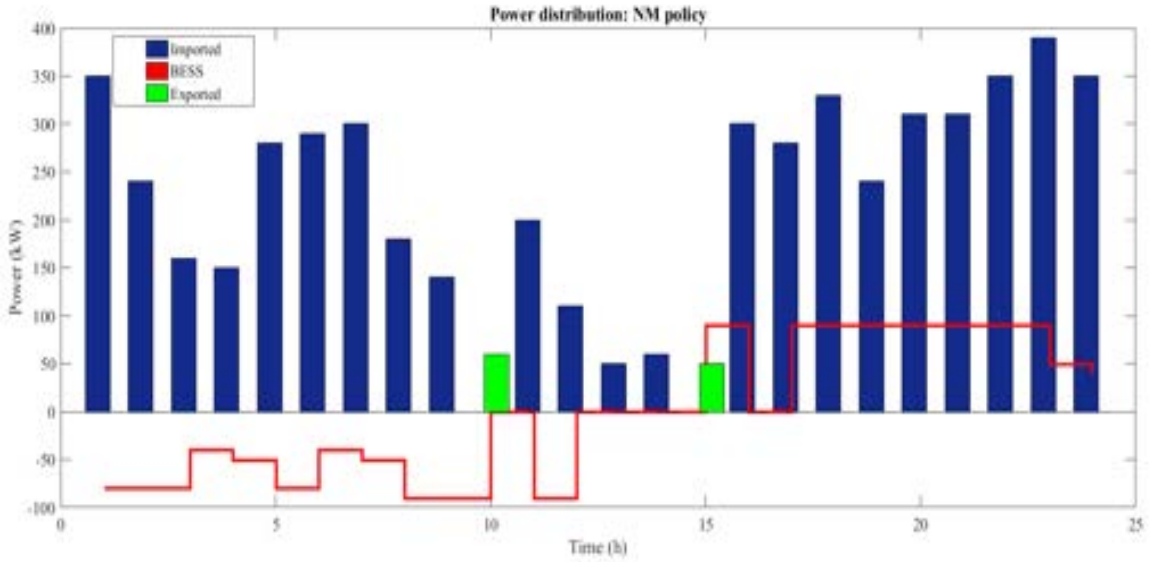

Figure 3. Imported and exported power: NM framework is applied

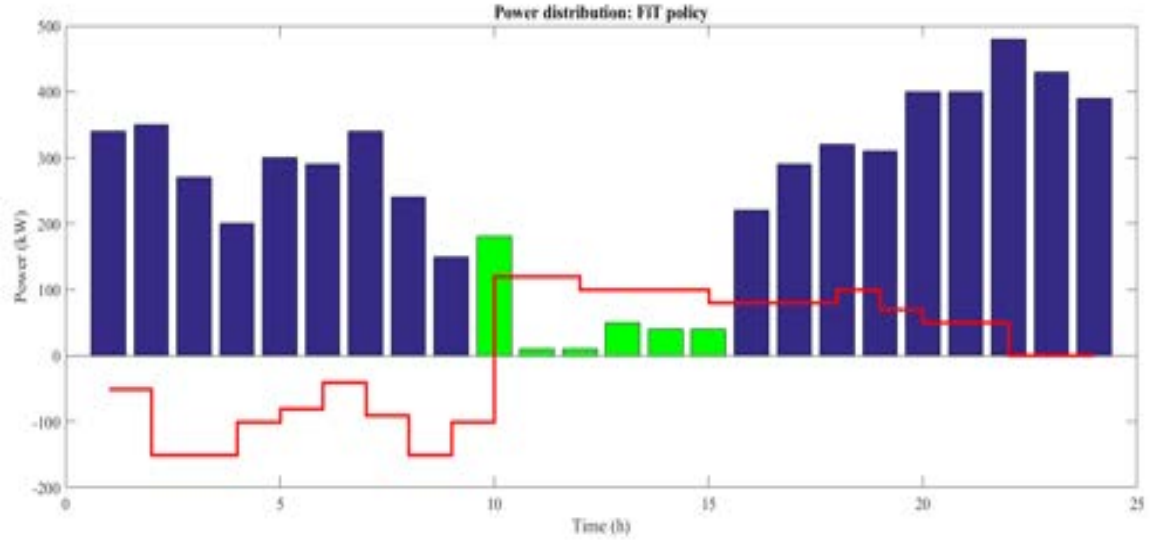

Figure 4. Imported and exported power: FiT framework is applied

Furthermore, Table 1 provides a comparative analysis of different case studies, focusing on total cost, total imported energy, and total exported energy. The scenarios include a MG without BESS and no policy, with BESS and no policy, under the NM policy, and under the FiT policy.

Table 1. Comparative Analysis of Different Case Studies

Case study	Total Cost ($)	Total Imported (kWh)	Total Exported (kWh)
MG –NO BESS- No Policy	307.59	5550	0
MG–BESS- No Policy	290.95	5620	0
MG –NO BESS- NM Policy	285.39	5370	110
MG –NO BESS- FiT Policy	273.51	5730	330

The analysis reveals that the total cost is highest for the scenario without BESS and no policy ($307.59), while the FiT policy scenario without BESS results in the lowest total cost ($273.51). The total imported energy is relatively consistent across scenarios, ranging from 5370 kWh to 5730 kWh. However, significant

differences are observed in exported energy. Under the NM policy, 110 kWh is exported, whereas the FiT policy facilitates a much higher export of 330 kWh. This indicates that the FiT policy provides better economic incentives for exporting surplus energy, thereby reducing overall costs and increasing energy export opportunities.

CONCLUSION

The integration of RES and BESS in MGs represents a critical step towards sustainable and reliable energy systems. This study focuses on evaluating the economic implications of different energy policies—NM and FiT—applied to a real-world MG in a rural village in Kurdistan province. The MG in question includes a combination of WT, PV arrays, batteries, and local loads. In this research, we developed a comprehensive methodology that involves collecting detailed hourly data on load demand, solar output, wind turbine output, and BESS size, as well as electricity prices based on time of use. Using this data, we formulated an model to calculate the total cost of MG operation under different policy scenarios. We then integrated the regulatory frameworks for NM and FiT into the model to evaluate their economic impacts. The analysis revealed significant findings. The FiT policy, with a higher fixed rate, provided greater incentives for energy export, resulting in a higher total exported energy and the lowest total operational cost among the scenarios studied. The NM policy also facilitated energy export but to a lesser extent. The inclusion of BESS in the microgrid demonstrated potential for cost savings and enhanced energy management, albeit with limited impact during off-peak periods. Highlighting the achievements, we demonstrated that the FiT policy leads to substantial economic benefits by maximizing energy export opportunities and reducing overall costs. Future work will focus on further refining the optimization model by incorporating more detailed data and exploring additional policy scenarios.

Abstract

A promising idea to segment fetal skull images is to first localize the sought structures and then refine the regions to arrive at more precise outcomes. In this work, we propose a methodology to achieve satisfactory localization of transcerebellar fetal skulls visible in gray-scale ultrasound (US) images. The approach depends on scale reduction of images to decrease the search space, extract feature points and do model fitting. Knowing that the structures resemble ellipses to a manageable extent, the selected model for fitting is an ellipse. Measuring how good a certain fit is, usually depends on meta information describing how a skull is likely to look like, such as intensities of border pixels, shape descriptors, etc. The method actually selects the best among many fits. The experiments on sample images provide good results.

Keywords: localization, scale, feature, fitting, transcerebellar.

INTRODUCTION

Segmentation of fetal skulls is required to provide input to computerized diagnosis systems (Konur et al., 2015; Konur, 2018). The process must be automated to minimize human intervention and effort. It can be argued that a segmenter could be built benefiting a training set of images whose desired segmentations are available, however, the rarity of medical data sets usually prevents the possibility of training sound models. For example, a deep learning method (Minaee et al., 2022) would need a very large training set of images to produce successful outputs and generalize well enough for all possible inputs. Lack of training data arises the need for other approaches where no training is required except the availability of some meta information (or expert knowledge) defining how a transcerebellar fetal skull looks like.

In the scope of this work, each input US image contains one and only one fetal skull structure in transcerebellar view mode excluding the possibilities of partial existence (i.e. the entire skull is located within image borders) and occlusion (this is rarely the case such as in twin pregnancies). Clearly, successful segmentation would depend on a good initial guess of skull position. This guess is definitely not all that must be done to arrive at satisfactory segmentation, however, it is probably the most important stage since starting wrong cannot lead to the right. Assuming that a skull is well-localized, the region can hopefully be refined for detailed and precise structure. In fact, this work deals with localizing fetal skulls in underscaled (Burt and Adelson, 1983) versions of images and identify skull regions. Thus, refinements for ultimate segmentation must be done at the lowest scale and, if desired, carried on to higher scales.

Model fitting (Forsyth and Ponce, 2012) is the main approach for localizing skulls. It is known that boundaries of fetal skulls (in transcerebellar view) have considerably large intensities and resemble ellipses. Hence, the natural choice is to fit an ellipse to any input image and report the result as the skull position (i.e. localize the fetal skull). Geometric models are fit using points, so feature points extracted from images are used to obtain ellipses. There exist many feature points and thus many ellipses can be fit. Selecting the best ellipse is yet another issue. The methodology in this work is to fit an ellipse using a set of 3 feature points, do this many times similar to the RANSAC (Fischler and Bolles, 1981; Forsyth and Ponce, 2012)

DRAFT

procedure with randomly selected sets of 3 points and identify the best ellipse. Obviously, a score of goodness of any fit is necessary to compare and select among fits.

The following sections describe how undersampling and feature points extraction are performed, the 3-point ellipse fitting procedure, goodness of fit measures usually derived from meta information and their utilization. Visual results on sample images are presented along with a discussion and conclusion. The algorithmic details, assumptions, design decisions and followed paths of the methodology are mentioned in the flow to some extent as the need arises to ensure complete comprehension.

METHODOLOGY

Undersampling

Input images (I) are of size 400 x 520. Since speckle noise is a characteristic of US imaging, each image is first filtered to eliminate speckle noise (Yu and Acton, 2002). Although this step does not crucially affect the performance of the overall scheme, it should not be skipped regardless of its minor gains. Next, a Gaussian image pyramid (Burt and Adelson, 1983) of 4 levels is generated out of the noise-free image (NF). The output is an underscaled (reduced) version (R) of NF and of size 50 x 65. R is to serve as the input to the next step where feature points are extracted to fit an appropriate ellipse. Figure 1 shows an example of an input and its underscaled version.

Figure 1. Sample input I (left) and its underscaled version R (right)

Feature Points Extraction

Retrieving feature points is primarily based on edge detection from R. The Sobel mask (Sobel and Feldman, 1968) is first run on R to determine the threshold value (thr) used in detection. In order not to overlook and exclude potentially important feature points, the same mask is run again on R with a new threshold value of $0.8\ x\ thr$. These parameter adjustments are arbitrary and values are selected empirically. In fact, retrieving few edge points could lead to degrading the ellipse fitting process whereas having too many of them could lead to an explosion in the number of detectable ellipses and complicate the search to select the best among them, many of which are unrelated at all in the context of the problem. The output of edge detection is the binary feature points image (F). R is also treated with Harris corner detection (Harris and Stephens, 1988) to retrieve a binary corner points image (H). H is later to be used for breaking connections between segments potentially belonging to different structures in R. This action is important because one of the goodness of fit measures used in this work depends on broken curves out of which ellipses are fit. A Harris corner detector may use different threshold values to detect each corner point and probably many are detected. In order to get rid of some detected corner points which are insignificant and thus must not be

removed, the average of minimum and maximum threshold values is considered and only those corner points exceeding that value are included in H. F and H are then used to obtain the binary broken curves image (B) just mentioned. This stage of the procedure benefits from basic image processing operations (Gonzalez and Woods, 2018). The holes in F are filled to get G whose binary skeleton image is found to get B further to be refined. First, those points both marked in B and H are turned to unmarked (i.e. corner points are removed) in B. Next, the points where branches may have formed during skeletonization and their immediate neighbors are also turned to unmarked in B. The final B goes through a process of connected components labeling. It may be the case that some connected components arose from tiny skeletons or spurs in B and thus contain only a single point. Such points (components including a single point) are also removed. At the end; B, where labels of all included points is also available as a label image L and indicate to which connected component points in B belong, is the desired disconnected curves image to be used in one specific goodness of fit measurement grading how well a particular ellipse is fit. It is worth to mention here that measuring the quality of a fit does not depend entirely on this single measure and many measures are employed, all to be detailed in the flow. As the outputs of the feature points extraction stage, Figure 2 shows the feature points image and the disconnected curves image, both derived from the input of Figure 1.

Figure 2. Feature points image F (left) and disconnected curves image B (right)

3-Points Ellipse Fitting

The usual way to fit an ellipse requires 5 points known to be on it. The current work cannot a priori assume that a correct selection of 5 points from the set of feature points can be performed and a correct (i.e. perfect) ellipse determined. Indeed, what is being done is to determine the location of a fetal skull with an ellipse fit as correctly as possible. Therefore, a more traceable approach using only 3 feature points in the fitting procedure is used to determine the "best" ellipse that localizes the fetal skull in the image. Doing this with a sufficiently large number of randomly selected sets of 3 points, similar to the RANSAC procedure (Fischler and Bolles, 1981), where the points are assured to be non-collinear and selecting the best fit is expected to give a satisfactory result. The 3-points fitting method, outlined in (Song and Wang, 2007), assumes that these points P_0, P_1, P_2 are on the ellipse and estimates the tangent lines to the ellipse at these points. The 3 points and their tangents determine the center C of the ellipse at coordinates (c_x, c_y) as shown in Figure 3.

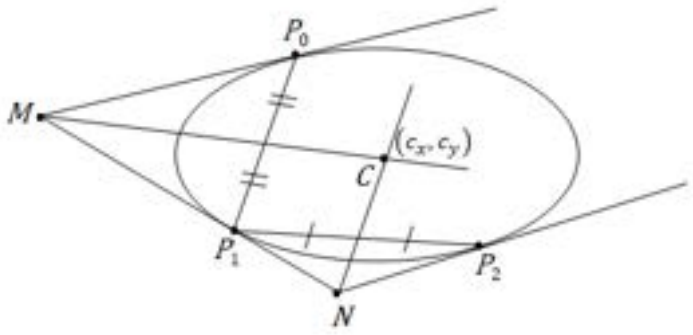

Figure 3. Determining ellipse çenter with 3 points and tangent lines

Knowing the center coordinates allows to move the center to the origin of the XY-plane and work in a new reference frame. The transformed coordinates x' and y' are as shown in Eq. (1):

$$x' = x - c_x\,,\quad y' = y - c_y \qquad (1)$$

The ellipse can then be written with three parameters as Eq. (2) shows:

$$a_0 x'^2 + 2a_1 x' y' + a_2 y'^2 = 1 \qquad (2)$$

Transforming the 3 points with coordinates $(x_0,y_0),(x_1,y_1),(x_2,y_2)$ to the new frame and naming them $(x_0',y_0'),(x_1',y_1'),(x_2',y_2')$; the three parameters $A = [a_0 \quad a_1 \quad a_2]^T$ can be written as in Eq. (3)

$$A = Q^{-1}K \qquad (3)$$

where K and Q are stated in Eqs. (4) - (5):

$$K = [1 \quad 1 \quad 1]^T \qquad (4)$$

$$Q = \begin{bmatrix} x_0'^2 & 2x_0'y_0' & y_0'^2 \\ x_1'^2 & 2x_1'y_1' & y_1'^2 \\ x_2'^2 & 2x_2'y_2' & y_2'^2 \end{bmatrix} \qquad (5)$$

Estimating the tangent lines at the 3 ellipse points is with the least squares method. At a particular point, a 5 x 5 window around the point such that it is located at the center of the window is used and line parameters are computed with the feature points inside the window. Figure 4 shows such an example with feature pixels in white color and others in gray. The result of fitting is both the ellipse parameters and the best approximation of a binary ellipse image E whose 1-valued pixels locate the ellipse boundary.

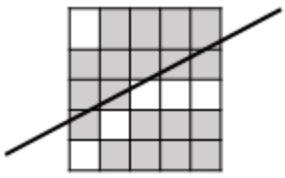

Figure 4. Estimating tangent lines at ellipse points

Goodness of Fit Measures

The primary metrics used to produce a score in [0, 1] and evaluate the goodness of a fit is two-fold. The first is computed using the normalized average distance between the particular ellipse and those points of the broken curves image B belonging to the connected curves that the ellipse shares a point with. The second is the normalized average intensity of ellipse boundary pixels retrievable from R.

Distance Score:

For an ellipse obtained as the output of a particular fit, some connected curves in B have a point in common with it and others do not. Only the points of those curves that have a common point with the ellipse are considered and the average Euclidian distance between curve points and the ellipse boundary is computed. We note that the curves image B and the ellipse image E are discrete but distance computation involves points in B with integer coordinates and the idealized ellipse points (with non-integer coordinates in

general) computable using ellipse parameters. With d_i denoting the Euclidian distance between the ith point of involved connected curves in B with n_c points in total and the ellipse (the shortest distance between the ith point and an ellipse point), the average distance is $\bar{d}$ as shown in Eq. (6):

$$\bar{d} = \frac{\sum_{i=1}^{n_c} d_i}{n_c} \quad (6)$$

Assuming all ellipses are somehow normalized to a certain frame, smaller values of this metric would indicate better fits. Since ellipses cannot directly be viewed in a normalized frame, another action must be followed to achieve normalization. This can be performed by considering the combined geometry of the ellipse and involved connected curves. Let x_m and x_M be the minimum and maximum x-coordinates of all the points of the combined geometry including all ellipse points and points of involved connected curves. Let y_m and y_M be that for y-coordinates. Then, the diagonal of the bounding box of the combined geometry has length l expressed in Eq. (7):

$$l = \sqrt{(x_M - x_m)^2 + (y_M - y_m)^2} \quad (7)$$

The distance normalization can be achieved by using $\bar{d}/l$. For the metric to be a score that favors small normalized distances, the distance score s_d can be defined as in Eq. (8):

$$s_d = 1 - \bar{d}/l \quad \textbf{(8)}$$

Intensity Score:

Boundaries (i.e. outlines) of transcerebellar skulls, in general, are known to have higher intensities than the rest of the image. Feature points used to fit ellipses are also derived from edge segments that separate pixels with higher intensity from those with lower intensity. This suggests that ellipses whose points occupy pixels with a high average intensity are more likely to be good fits. n_e being the number of pixels of an ellipse in E and t_i being the intensity of the pixel in R corresponding to the ith ellipse pixel, the average ellipse intensity $\bar{t}$ can be computed using Eq. (9):

$$\bar{t} = \frac{\sum_{i=1}^{n_e} t_i}{n_e} \quad (9)$$

Since lighting conditions may be different for input images, this value must also be normalized. This can be done by using the maximum intensity t_M in the input R and compute an intensity score s_t by Eq. (10):

$$s_t = \bar{t}/t_M \quad (10)$$

Combined Score:

With a hypothetic view that distance score and intensity score are equally important, a combined fit score s_f can be formulated as the average of both scores as Eq. (11) shows:

$$s_f = (s_d + s_t)/2 \quad (11)$$

DRAFT

Valid and Invalid Fits:

It should be stated that some fit attempts or actual fits are skipped over and not counted as valid due to several reasons. Some reasons are related to issues arising during or at the end of ellipse fitting stage and thus before score computation. Some others become evident with observations encountered during score computation. Deeming an actual fit as invalid is always based on meta information specific to the problem context such as the trustworthiness of a fit depending on the ratio of points of connected curves intersecting the fit ellipse to the number of ellipse points (i.e. circumference of the ellipse), how transcerebellar fetal skulls are supposed to look like, the intensity distribution of their neighborhoods, etc.

First, if linear algebraic issues arise while computing Q^{-1} such as singularity or numerical inconvenience (e.g. very small or large values), the attempt to fit an ellipse for the particular set of 3 points is ignored and a new attempt is initiated. Such attempts are repeated until a sufficient number of "valid" ellipses are fit using feature points (pixels) in F. Some of the fits may result with identical valid ellipses. Nevertheless, each such fit (either unique or repeating) is OK and counted. Provided that a fit attempt is successful, cases that make the fit "invalid" and further cause the initiation of a new attempt are the following:

- The assumption on ellipses modelling transcerebellar fetal skulls is that they entirely lie within image boundaries. Therefore, if an ellipse has a point with either x or y coordinate outside the image, such a fit is rejected.
- An ellipse is expected to have major and minor radii lengths with a ratio of around 1,2. The implementation analytically computes this ratio for each ellipse and rejects the fit if it is not in the (1,1 1,3) interval.
- If the area of an ellipse is too small, it is foreseen that the fit is useless. The implementation assumes that if the area of the ellipse, as measured by the number of pixels its region covers, is less than one sixty-fourth of the total number of pixels of the input image (its underscaled version R) the ellipse must be rejected. The number of pixels the elliptical region spans is analytically measured using its major and minor radii lengths and usually is not an integer value. The number of pixels of an input image is 50 x 65 = 3250. Thus, the implementation rejects ellipses with areas less than 3250/64 = 50,78125 pixels.
- If the ratio of the total number of points of broken curves involved in distance computation (these are broken curves in B that the one-pixel thick ellipse boundary image E intersects with) to an accurate enough approximation of the circumference of the ellipse is less than 0.4, the fit is rejected. This is because a small ratio would indicate a rather non-representative set of points that should ideally be definitive for E.
- If the average intensity of pixels in R whose coordinates coincide with those of E (t_{Eavg}) is not more than the average intensity of pixels in R, whose coordinates coincide with those of the internal region of E (t_{IEavg}), the fit is rejected because boundary pixels, on average, must have higher intensities.
- t_{Eavg} and t_{IEavg} must not be very close because skull boundaries and interiors differ in intensity values at least to some extent. Knowing that t_{Eavg} is more than t_{IEavg}, a fit is rejected if $(t_{Eavg} - t_{IEavg})/t_{Eavg}$ is not more than 0.15.
- Going deeper in the internal region of E and excluding another one-pixel thick boundary of the internal region produces a so-called "deeper" region of E (i.e. there is a one-pixel thick borderline between E and the deeper region of E). What is desired for a valid fit is that this deeper region D must not contain too many points from the broken curves image B. This is because, skull interiors which coincide with D do not contain too many points that are extracted from the edge image which

could potentially cause fitting other useless ellipses. In fact, the actual meta information indicates that skull interiors do not contain too many pixels that an edge detector outputs. If the ratio of pixels that are both in B and D to pixels in D is not less than 0.25, the fit is rejected.

Number of Valid Fits:

In order to select the best fit among many ellipses, a decision on how many valid ellipses should be fit before the selection must be made. These ellipses could be either unique in the set of all fits or they may be repeating. Since the followed procedure is RANSAC-like, the classical methodology to determine the number of iterations N with RANSAC (Fischler and Bolles, 1981) is adopted and the estimated N is used as the number of valid ellipses from which the best is selected. This estimation uses the number of model points n, desired probability of a successful fit p and an estimate of outlier ratio ε shown in Eq. (12):

$$N = \frac{\log(1-p)}{\log(1-(1-\varepsilon)^n)} \qquad (12)$$

Experiments on the available data set of this work show that a much smaller N is sufficient to produce satisfactory results and the estimation in Eq. (13) is used:

$$N = \left\lceil \left(\frac{\log(1-p)}{\log(1-(1-\varepsilon)^n)} \right) / 4 \right\rceil \qquad (13)$$

Selection of the Best Fit:

The "best" fit is to be selected from the members of a subset W of all valid fits. Heuristically, W contains those fits with highest distance scores s_d and should not exclude those fits among which potentially the best fit can be selected. This further requires that a minimum number of elements n_N must be present in W. After determining the elements of W, the member with the highest combined score s_f is selected as the best fit. Although unlikely for disparate fits, ties are broken arbitrarily. The selection procedure requires parameters some of which could be updated in the flow and is as follows:

1. Retrieve maximum distance score value max_s_d of all $N = 511$ fits.
2. Set minimum number of subset elements $n_N = \lceil N \; x \; 0.02 \rceil = \lceil 511 \; x \; 0.02 \rceil = 11$.
3. Set minimum distance score threshold value $min_thr_s_d = 0.990 \; x \; max_s_d$.
4. Set current distance score threshold value $thr_s_d = 0.996 \; x \; max_s_d$.
5. Set step size for distance score values $step_s_d = 0.002 \; x \; max_s_d$.
6. Retrieve the set of those fits W with distance scores $s_d > thr_s_d$.
7. If the number of elements of W is at least n_N ($|W| \geq n_N$), goto 12.
8. Update $thr_s_d = thr_s_d - step_s_d$.
9. If thr_s_d equals $min_thr_s_d$ goto 10, else goto 6.
10. If $|W| \geq 1$ goto 12 (If the minimum distance score threshold value is reached, nonempty W is sufficient and no more members are forced.), else goto 11.
11. Update $min_thr_s_d = min_thr_s_d - step_s_d$ and $n_N = 1$. (If the minimum distance score threshold value has undergone an update, nonempty W is sufficient from then on.). Goto 6.
12. Retrieve, from W, the fit with highest combined fit score s_f. Break ties arbitrarily.

RESULTS AND DISCUSSION

The available data set contains 357 US images each of which allows viewing one and exactly one transcerebellar fetal skull in its entirety. No partial existence or occlusion takes place. Figure 5 shows the discussed scheme on six inputs and associated outputs.

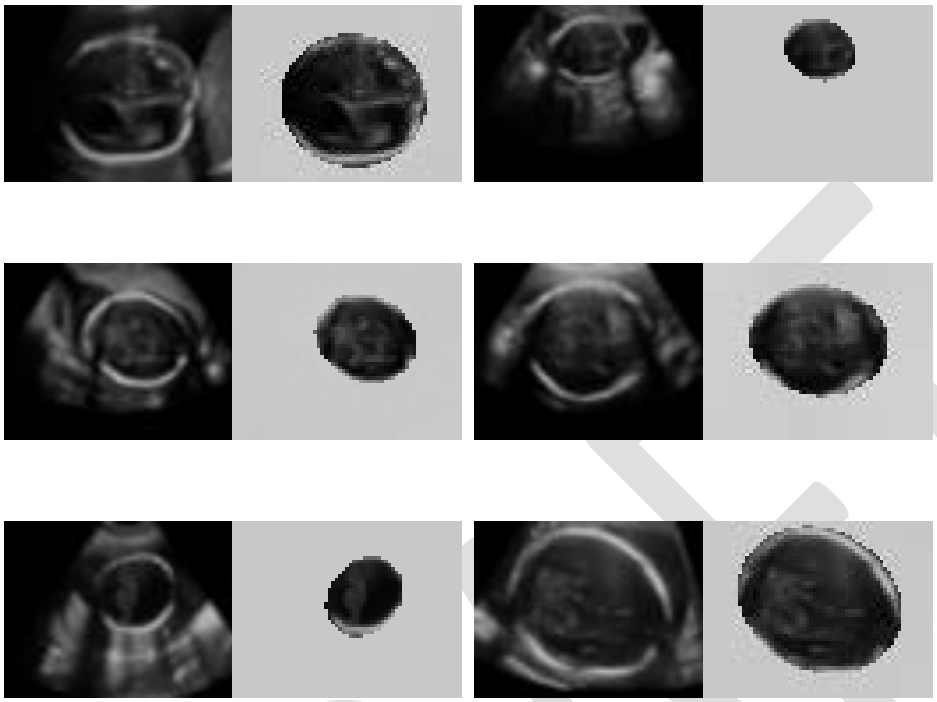

Figure 5. Undersampled inputs and associated outputs

It can be observed that visually satisfactory results are obtained for the majority of the inputs in the data set. In fact, the majority of all available inputs of transcerebellar skulls have been well-localized and accurate segmentations are very likely to be obtained after further refinements on localization outputs. In this work, rather heuristic ways are proposed for evaluating how good fit ellipses are and selecting the best one from among them. These are based on many factors, arguable and perhaps can be improved with better capture and exploitation of meta information. The demonstrations are not based on numerical indicators since the quality of segmentation can generally (if not always) be visually assessed by human experts and localization outputs cannot be considered ultimate segmentation.

CONCLUSION

The proposed scheme to localize fetal skulls is not a full segmenter but only a start that would lead for more proper segmentation after other processing. Hence, expectations for perfect localization may also be redundant and roughness (i.e. imprecision) can be acceptable to some extent assuming that proper post-processing will refine localization outputs and arrive at good enough segmentation outputs. Since the potential applications that can benefit from localizing skulls are not supposed to be real-time and the time it takes to produce an output is not critical, arguments on how fast (or slow) localizations are obtained is out of discussion. Indeed, for most inputs execution lasts in the order of a couple of minutes. One can assess that spending minutes or hours or even a day before reaching an output is actually worthy. Finally, a clear advantage is to perform with no training at all and it is evident that there is room for future work.

ACKNOWLEDGEMENTS

The author expresses his gratitudes to İbrahim Kalelioğlu and Füsun Varol from Obstetrics and Gynecology Departments of the Medical Faculties of Istanbul University and Trakya University, respectively, for providing ultrasound data whose research-aimed use has been ethically approved.

Özet

Adezyon, farklı yüzeyler arasında moleküller ya da kristallerin çekim kuvvetleriyle birbirine yapışması olarak tanımlanmakta olup; kristal köprü oluşumu, elektrostatik adezyon ve mekanik kilitlenme gibi mekanizmalarla gerçekleşmektedir. Toz gıdalarda adezyon kapasitesi; nem ve su aktivitesi, elektrostatik yüklenme, yüzey pürüzlülüğü, parçacık boyutu ve şekli gibi birçok faktörden etkilenmektedir. Adezyon, özellikle gıda işleme ve paketleme süreçlerinde kalite ve raf ömrü açısından önemli bir parametre olup; üretim hattında yapışma, paketleme sorunları ve üründe topaklanma gibi problemlere neden olabilmektedir. Bu nedenle, gıdalarda adezyonun özellikle depolama ve işleme süreçlerinde kalite kontrolü açısından izlenmesi gerekmektedir. Bu derleme çalışmasında; toz gıdalar, bu ürünlerde adezyon kapasitesini etkileyen faktörler, raf ömrü süresince meydana gelen fiziksel, kimyasal ve morfolojik değişiklikler ile bunların önlenmesine yönelik yaklaşımlar ele alınmaktadır.

Anahtar Kelimeler: Adezyon, Toz Gıdalar, Raf ömrü, Kalite Kontrol

Powdered foods and adhesion-related quality changes during shelf life

Abstract

Adhesion refers to the phenomenon of molecules or crystals sticking together due to attractive forces between different surfaces, which may occur through mechanisms such as crystal bridge formation, electrostatic attraction, and mechanical interlocking. In powdered foods, adhesion capacity is influenced by various factors including moisture content and water activity, electrostatic charging, surface roughness, and particle size and shape. Adhesion is a critical factor in food processing and packaging, as it can significantly affect product quality and shelf life. It often leads to issues such as sticking on production lines, packaging difficulties, and caking in the final product. Therefore, monitoring and controlling adhesion in powdered food products during processing and storage is essential for maintaining quality standards. This review discusses powdered foods, factors affecting their adhesion capacity, the physical, chemical, and morphological changes that occur during shelf life, and strategies to prevent adhesion-related problems.

Keywords: Adhesion, Powdered Foods, Shelf Life, Quality Control

1. GİRİŞ

Adhezyon, farklı cins moleküller veya yüzeyler arasındaki çekim kuvveti nedeniyle meydana gelen yapışma olayını ifade eden bir fizikokimyasal kavramdır (Mittal, 2011) ve intermoleküler etkileşimlere dayanmaktadır (Israelachvili, 2011). Adhezyon gerçekleşirken iki yüzey arasında belirli fiziksel veya kimyasal bağlar oluşmakta ve böylece mekanik, kimyasal ve elektrostatik yapışma ile dispersiyon kuvvetleri oluşmaktadır. Mekanik adezyon, bir molekülün diğer bir molekül üzerine fiziksel olarak tutunması ile gerçekleşmektedir (Kinloch, 1987). Farklı yüzeyler arasında kovalent, iyonik veya hidrojen bağları gibi bağların oluşumu ile kimyasal adezyon gerçekleşmektedir (Pocius, 2002). Farklı malzemelerin yüzeyleri arasında elektrik yükü farkı nedeniyle elektrostatik adezyon meydana gelmektedir (Derjaguinve ark., 1987). Moleküller arasında geçici dipol etkileşimleri sonucu ortaya çıkan zayıf çekim kuvvetlere van der Waals Kuvvetleri adı verilmekte olup daha çok sıvı damlacıkların katı yüzeylere tutunmasına neden olmaktadır. Sıvı yağların ambalajlandığı paket materyaline yapışarak akması bu mekanizmaya örnek gösterilmiştir.Toz gıdalarda ise nem ve su aktivitesi artışına bağlı olarak higroskopik adezyon gerçekleşmektedir (Israelachvili, 2011).

Adhezyon, doğada ve endüstride birçok önemli süreçte gerçekleşmekte ya da zaman içinde ortaya çıkabilmektedir. Moleküllerin veya hücrelerin birbirlerine ve bulundukları ortama tutunmasında önemli rol oynamaktadır (Alberts et al., 2014). Kompozit malzeme, kaplama ve yapıştırıcı ürünlerinin geliştirilmesinde de adezyon kritik bir faktördür (Kinloch, 1987). Benzer şekilde biyosensör, protez, yara bandı, mikroelektromekanik sistemlerin üretilmesi ve nano ölçekli kaplama materyallerinin geliştirilmesinde yine moleküllerin adezyon kapasitesi önemli bir parametredir (Peppas ve ark., 2004). Diğer taraftan, toz gıda üretiminde adhezyon kapasitesine bağlı kalite kusurları da gelişebilmektedir.Bunlardan en önemlisi, higroskopik adhezyona bağlı topaklanma fiziksel kusuru (Ueda ve ark., 2023), kimyasal reaksiyonlar (Hedegaard & Skibsted, 2024) veya morfolojik bozunmalardır (Ueda ve ark., 2023). Sunulan derlemede bu kusurlar tartışılmıştır.

2. TOZ GIDALAR

Genellikle amorf ya da kristal yapıya sahip toz gıdalar katı formda olup partikül boyutları küçültülerek bu forma getirilmiş endüstriyel ürünlerdir (Ermiş, 2015). Endüstriyel öneme sahip toz gıdalara başlıca baharatlar, süt tozu, toz çorba karışımları, tuz, un, şeker, yumurta tozu, bebek mamaları, kahve çeşitleri, kakao ve katkı maddeleri ile katkı maddeleri karışımları örnek olarak verilebilir (Ueda ve ark., 2023). Gıda hammaddelerinin çeşitli mühendislik uygulamalarıyla toz forma getirilmesi, üretim, taşıma, depolamada pek çok avantaj sağlamaktadır (Forny ve ark., 2011). Buna en güzel örneklerden biri, raf ömrü çok kısa olan süt yerine süt tozu kullanımıdır. Son yıllarda verimli ve sürdürülebilir gıda üretimi konusunda yapılan çalışmalar büyük önem kazanmıştır. Bu çalışmalar, ürüne ait proses tasarımı, maliyetlerin azaltılması, paketleme ve depolama kusurları ile nihai tüketiciye ulaşıncaya kadar meydana gelecek kalite kusurlarını önlemeye yöneliktir. Sunulan derlemede, başlıca toz gıdalar, bunların önemi, üretimden tüketilinceye kadarki süreçte meydana gelebilecek adezyona bağlı kalite kusurları tanımlanmış olup muhtemel önleme yöntemleri tartışılmıştır.

Baharatlar, toz formunda satışı yapılabilen ve adhezyon kusurları gözlemlenebilen gıda ürünlerindendir. Bu bağlamda, baharatların üretiminde yüksek nemlilik, higroskopik özelliklerinden dolayı partiküllerinin birbirine yapışarak aglomere olmasına sebep olabilmektedir. Baharatların toz formunda taşınması ve depolanması sırasında, yüzey etkileşimlerinin kontrol edilmesi, tozun akışkanlık özelliklerini ve ürün kalitesini doğrudanetkilemektedir.Kalite kaybını önlemek için baharatların düşük nemli ortamlarda depolanması ve uygun paketleme tekniklerinin kullanılması gereklidir (Fitzpatrick, 2017).

Süt tozu, adhezyonun çok belirgin olduğu gıda ürünlerinden biridir. Üretim sürecinde süt, suyun uzaklaştırılmasıyla toz hale gelir ve bu noktada partikül boyutunun küçültülmesi işlemi gerçekleştirilir. Bu işlemler sırasında adhezyon, özellikle higroskopik özelliklerden kaynaklanan topaklanma ve akışkanlık sorunları yarattığı bildirilmiştir(Fitzpatrick ve ark., 2007). Ayrıca, depolama koşullarının uygunsuzluğu süt tozu partiküllerinin birbirine yapışarak işlenebilirliklerini ve çözünürlüğünü de etkilemektedir. Süttozu su ile karıştırıldığında homojen bir çözeltinin oluşmamasına ve nihayetinde besleyici değerde önemli kayıplara yol açmaktadır. Ayrıca, sütün içerdiği protein ve yağlar, partiküllerin birbirine yapışma kapasitesini artırarak, uzun süreli depolama sırasında ürünün kalitesinin hızla düşmesine neden olmaktadır. Bu nedenle süt tozunun üretiminde, adhezyon gücünün minimize edilmesi için uygun koruyucu tedbirler alınması gerekli görülmüştür(Huppertz ve ark., 2016).

Toz çorba karışımları, pratik kullanımı açısından önemli bir ürün kategorisidir. Bu tür tozlar, genellikle yüksek oranda tuz ve baharat içermekte bu da partiküller arasındaki adhezyonun artmasına yol açmaktadır. Üretim sırasında, tozun nem içeriği, partiküllerin birbirine yapışma kapasitesini doğrudan etkiler. Fiziksel ve kimyasal özellikleri farklı katkı maddelerini de içeren çok bileşenli karışımlar olan hazır çorba tozlarında, her bir bileşenin adhezyon kapasitesi birbirinden farklı olabileceğinden homojen bir karışım elde edilmesi daha zordur. Ayrıca,her bileşenin adhezyon özelliklerinin dikkate alınarak doğru oranda karıştırılması ve nemin minimize edilmesi gereklidir. Bu nedenle, adhezyonun kontrol edilmesi hem üretim verimliliği hem de son ürünün kalitesi için önemlidir(Fitzpatrick ve ark., 2007).

Tuz, genellikle kristal yapıya sahip bir bileşik olup rafine edilerek ya da edilmeden farklı formlarda işlenen bir endüstriyel üründür. Yüksek nemli ortamlar, tuz kristallerinin birbirine yapışarak topaklanmasına yol açmakta bu da ürünün taşınmasını ve depolanmasını zorlaştırmaktadır. Tuzun adhezyon özellikleri, özellikle gıda endüstrisinde büyük önem taşır çünkü tuzun etkinliği ve kullanım kolaylığı, doğru bir şekilde paketlenmesi ve depolanması ile doğrudan ilişkili olduğu tespit edilmiştir. Tuzun ideal koşullarda saklanması, nemden korunması ve gerektiğinde topaklanma önleyici ajanlarının kullanılması kalite kusurlarını önlemeye yardımcı olmaktadır. Depolama sırasında tuzların topaklaşması ve topakların sertleşmesi özellikle tuzun toz formda kullanıldığı ürünlerde tüketici memnuniyetini de düşürmektedir(Li ve ark., 2019).

Un, çok yaygın kullanılan bir toz gıda maddesidir ve endüstriyel gıda üretiminin temel bileşenlerinden biridir. Un partikülleri arasında adhezyon, genellikle nem oranı ve sıcaklık gibi çevresel faktörlere bağlı olarak değişir. Özellikle yüksek nem, un partiküllerinin birbirine yapışmasına neden olmaktadır. Unun ambalajlanması, taşınması ve depolanması sırasındaüreticiler adhezyonun minimuma indirilmesi için kontrollü ortamlar sağlamayı hedeflemektedirler. Un üretiminde uygun nem seviyelerinin korunması ve paketleme sırasında hava geçirmez malzemelerin kullanılması pek çok kalite problemlerinin önlenmesine yardımcı olmaktadır(Hasmadi, 2020).

Şeker, özellikle toz formunda, higroskopik özelliklerinden dolayı adhezyon sorunlarının yaygın yaşandığı gıdalardan biridir. Şeker kristallerinin etkileşimleri, çevresel koşullar altında birbirine yapışmalarına sebep olmaktadır. Bu özellik, şekerin taşınması, depolanması ve işlenmesi sırasında çeşitli zorluklara neden olmaktadır. Özellikle nemli ortamlarda, şeker kristallerinin birbirine yapışarak topaklanması, ürünün istenilen akışkanlık özelliklerini kaybetmesine yol açar. Bu da şekerin kullanımını ve paketlenmesini zorlaştıran faktörlerin başında gelmektedir(Li ve ark., 2017).

Yumurta tozu, özellikle yüksek protein içeriği ve yağ oranı ile bilinmektedir.Nem içeriğinin yükselmesi ile birliktepartiküller arasındaki adhezyon kapasitesini artarak topaklanmaya neden olmaktadır. Bu nedenle yumurta tozu üretiminde topaklanma önleyici kimyasalların kullanılması gerekmektedir(Mazalli ve ark., 2007)

Bebek mamaları, genellikle kolloidal sıvı formdaki karışımlarda hacim azaltma amacıyla kurutularak toz formunda üretilmekte olup yüksek besin değerine sahiptir. Bebek mamalarının üretim aşamaları sırasında adhezyonun önlenmesi, ürünün besin değerini ve kullanım kolaylığını etkilemektedir. Bebek mamaları üretiminde ve depolanmasında, adhezyonla ilişkili sorunların minimize edilmesi için, genellikle modifiye atmosfer uygulamaları tercih edilmektedir(De ve ark., 2016).

Kahve, dünya genelinde çok tüketilen bir gıda maddesidir ve genellikle toz formunda veya öğütülmüş olarak satılır. Kahve tozlarının adhezyon kapasitesi, partiküllerin boyutu ve şekliyle doğrudan ilişkilidir. Kahve partiküllerinin nemli ortamlarda birbirine yapışma eğilimi, kahve kalitesini azaltmaktadır. Bu nedenle kahve üreticileri, kahvenin öğütülmesi ve paketlenmesi sırasında, partiküllerin akışkanlık özelliklerini korumak için kontrollü atmosferde işleme, paketleme ve depolama yapılmaktadır (Dogan ve ark., 2019).

Kakao, zengin aroması ve besin içeriği ile bilinen bir toz gıda maddesidir. Kakao tozunda yağ içeriği yüksek olup toz partiküllerinin birbirine yapışmasını hızlandırmaktadır. Paketleme ve depolamada nem kontrolü son ürünün kalitesi açısından oldukça önemlidir(Guehi ve ark., 2010).

Son olarak, toz formdaki gıda katkı maddeleri, yüksek higroskopik özelliklere sahip olduğundan bu ürünlerin ambalajlanması, depolanması ve satışı sırasında topaklanma en önemli sorun olarak görülmektedir. Katkı maddelerinin homojen bir şekilde dağılması ve etkileşiminin kontrol edilmesi, ürünün son kalitesini ve raf ömrünü etkileyen önemli bir faktördür.

3. TOZ GIDALARDA KALİTE KUSURLARI VE ÖNLENMESİ

Toz gıdalarda, gıda hammaddelerinde veya gıda katkı maddelerinde adezyona bağlı en sık karşılaşılan sorun topaklanma sorunudur (Zafar ve ark., 2017). Ancak, yukarıda açıklanan herhangi bir nedenle topaklanma başladığı andan itibaren besin değeri kaybı, aroma kaybı ya da değişikliği, kötü koku oluşumu, renk ve tekstür bozulmaları, reolojik değişimler, yüzde çözünür madde miktarında değişim, besin yapısındaki homojen matrisin bozulması gibi fiziksel, tekstürel veya kimyasal birincil kalite kusurları meydana gelmektedir (Afrassiabian ve ark., 2016).

Toz gıda üretiminde adhezyona bağlı sorunların önlenmesi için sanayide ürünlerin fiziksel ve kimyasal kalitesini korumaya yönelik çeşitli yöntemler uygulanmaktadır.Bunlardan ilki proses koşulların ayarlanması ve prosese uygun makine kullanılmasıdır. İkincisi topaklanma önleyici katkı maddelerinin kullanılmasıdır. Yaygın kullanılan diğer bir yöntem ise ürün paketlemede hava ve nem geçirmeyen bariyer içeren ambalaj materyallerinin kullanılmasıdır (Chen ve ark., 2015).

Toz gıda üretiminde, özellikle mikserler ve öğütücüler, partiküllerin daha homojen bir şekilde karışmasını sağlamak için kullanılmaktadırlar. Bu makineler, adhezyonun önlenmesine yardımcı olmak amacıyla düşük hızda ve kontrollü ortamda çalıştırılmaktadır. Ayrıca, sıkıştırma ve topaklanma eğilimlerini azaltacak şekilde tasarlanmış olan yüksek kaliteli mikserler ve vibrasyonlu öğütücüler kullanılarak, partikül boyutu ve dağılımı üzerinde kontrol sağlanabilmektedir. Bu yöntem, özellikle çorba karışımları ve süt tozu gibi ürünlerde, adhezyonun önlenmesi açısından önemli rol oynamaktadır(Chen ve ark., 2018).

Toz gıdalarda, adhezyona bağlı kusurları engellemek için sıklıklatopaklanma önleyici katkı maddeleri kullanılmaktadır. Türk Gıda Kodeksi Gıda Katkı Maddeleri Yönetmeliği'ne göre, topaklanmayı önleyici katkı maddeleri, E 500 ile E 599 arasında sınıflandırılan ve "topaklanmayı önleyici" fonksiyonel sınıfına dahil edilen maddelerdir.Bu maddeler arasında E500 (sodyum karbonat), E504 (magnezyum karbonat), E552 (kalsiyum silikat), E553 (magnezyum silikat), E559 (alüminyum silikat) ve E551 (silikon dioksit) yer alır. Örneğin, E551 ve E553 maddelerinin kullanımı, yalnızca kurutulmuş toz formdaki gıdalarda ve belirli gıda kategorilerinde sınırlıdır. E500 (Sodyum Karbonat), unlu mamuller, kabartma tozu ve bazı içeceklerde kullanılır. E504 (Magnezyum Karbonat), şeker, tuz, çikolata, reçel, marmelat ve süt tozu gibi gıdalarda topaklanmayı önlemek amacıyla kullanılır. E552 (Kalsiyum Silikat), tuz, baharatlar, süt tozu, şeker, kabartma tozu, pudra şekeri, hazır çorbalar ve hububat ürünleri gibi toz gıdalarda yaygın olarak kullanılır. E553 (Magnezyum Silikat), unlu mamuller, tuz ve baharatlar gibi toz gıdalarda kullanılır.E559 (Alüminyum Silikat), hazır kahve, süt tozu ve aromalar gibi ürünlerde kullanılır. E551 (Silikon Dioksit), tuz, un, toz çorbalar, kahve, vanilya tozu, kabartma tozu, kurutulmuş yumurta sarısı ve tortilla cipsleri gibi çok çeşitli ürünlerde kullanılır (TGK., 2013). Bu katkı maddeleri, tozların daha akışkan olmasını sağlayarak, ürünlerin taşınmasını, depolanmasını ve kullanılmasını kolaylaştırmaktadır. Ayrıca, bu maddeler, ürünlerin raf ömrünü uzatmaya ve nemle olan etkileşimini azaltmaya da yardımcı olmaktadır. Bu nedenle birçok toz formda paketlenmiş gıdada topaklanmayı önleyici katkı maddesi kullanılmaktadır.

Toz gıda ürünlerinin nem oranı, adhezyonun en büyük tetikleyicisi olduğundan üretim, depolama ve taşıma süreçlerinde nem kontrolü büyük önem taşımaktadır. Bu nedenle, ürünlerin paketleneceği ve depolanacağı ortamda nem oranı sürekli olarak izlenmekte, nem alıcılar veya su tutucular kullanılmakta ve iklimlendirme kontrol sistemleri kullanılmaktadır. Ayrıca, nem ve hava geçirmez özellikli uygun ambalaj materyali kullanılarak toz gıdaların nem alması engellenmektedir.Bu bağlamda, toz gıda ürünlerinde yaygın olarak kullanılan ambalaj materyalleri; Alüminyum Folyo (Alüminyum Laminantlar), Alüminyumun geçirimsizlik özelliği, ürünün dış ortamla etkileşimini minimize ederek topaklanma riskini önemli ölçüde azaltmaktadır. Yüksek nem, oksijen, ışık ve koku bariyeri sağlayan bu materyal, kurutulmuş çorba, baharat ve toz içecek gibi ürünlerde sıkça tercih edilmektedir. Metalize filmler, ince bir alüminyum tabakası ile kaplanmış plastik filmlerden oluşan bu yapı hem ışığa hem de neme karşı etkili bir bariyer sağlar. Baharat ve otlarda aroma kaybı ve topaklanmayı önlemek için kullanılır. BOPA (Çift Yönlü Gerdirilmiş Poliamid) Filmleri, Yüksek oksijen ve nem bariyeri özellikleri sayesinde, vakumlu ambalajlamada tercih edilen BOPA filmleri de etkili bir seçenektir. BOPP/BOPET Filmleri, Akrilik veya PVC (polivinilden klorür) kaplamalarla güçlendirilen bu filmler, oksijen ve nem geçişine karşı direnç göstererek, toz gıdaların uzun süre tazeliğini korumasına yardımcı olur. Süt tozu ve şeker gibi ürünlerde kullanmaktadır. PET/EVOH/PE Laminantlar, EVOH (etilen-vinil alkol) katmanı oksijen bariyeri sağlarken, PE (polietilen) katmanı nem geçişini önlemektedir. Bu çok katmanlı yapı, özellikle şarküteri ürünleri ve toz içeriğe sahip ürünlerde

kullanılmakta, topaklanmanın engellenmesinde önemli bir rol oynamaktadır. Uygun ambalaj materyallerinin kullanımı, toz gıdalarda karşılaşılan topaklanma gibi kalite problemlerinin önlenmesinde kritik bir rol oynamaktadır. Bu materyaller, hem fiziksel bariyer etkisi sağlayarak dış etkenlere karşı koruma sunmakta hem de tüketiciye güvenli, taze ve kaliteli ürün ulaştırılmasını mümkün kılmaktadır(Muller, 2017).

4. SONUÇ

Toz gıdalarda adezyon olgusu, ürünün kalitesi ve raf ömrü stabilitesi açısından kritik bir rol oynamaktadır. Özellikle depolama ve işleme süreçlerinde gözlenen topaklanma gibi fiziksel bozulmalar, yalnızca ürünün görünümünü ve akışkanlığını değil, aynı zamanda tüketici memnuniyetini ve endüstriyel uygulamalardaki verimliliği de olumsuz yönde etkileyebilmektedir. Bu durum, üretim hattında zaman kaybı, ambalajlama sorunları ve hatta ürün geri çağırmaları gibi ciddi sonuçlara yol açabilmektedir.

Toz gıdaların endüstriyel ve tüketici düzeyindeki kullanılabilirliği, yalnızca besinsel içeriğine değil; aynı zamanda fiziksel stabilitesine, serbest akış özelliklerine ve ambalaj içerisindeki davranışına da bağlıdır. Bu bağlamda, adezyonun kontrol altına alınması, ürünün hem işlenebilirliğini hem de raf ömrü boyunca kalitesini koruyabilmesi açısından stratejik öneme sahiptir.

Adezyonun, kristal köprü oluşumu, elektrostatik çekim ve mekanik kilitlenme gibi farklı mekanizmalarla ortaya çıkması; sürecin kontrolünü karmaşık hale getirse de nem kontrolü, uygun ambalajlama stratejileri, partikül mühendisliği ve yüzey modifikasyonları gibi çeşitli önleyici yöntemlerle bu etki azaltılabilmektedir. Bu nedenle, toz gıdaların üretim ve depolama aşamalarında; nem düzeyi, parçacık morfolojisi ve yüzey özelliklerinin dikkatle izlenmesi ve optimize edilmesi büyük önem taşımaktadır.

Mikroskobik ölçekteki yüzey etkileşimlerinin topaklanma, yapışma, dağılmama gibi makroskobik kalite kusurlarına dönüşmesi, gıda biliminde çok boyutlu bir değerlendirme gerektirmektedir. Bu nedenle, sorunun yalnızca fiziksel değil, aynı zamanda mühendislik ve malzeme bilimi perspektifinden de ele alınması gerekmektedir.

Modern üretim ortamlarında bu tür kalite kusurlarının öngörülmesi ve önlenmesi; yüzey kaplama teknolojileri, kontrollü ortam koşulları, formülasyon optimizasyonları ve süreç modellemeleri gibi disiplinler arası çözümlerle mümkün hale gelmektedir. Dolayısıyla, adezyon sadece bir zorluk değil, aynı zamanda daha rafine ve dayanıklı ürünler geliştirmek için bir fırsat alanı olarak da değerlendirilmelidir.

Gelecekte, nano-ölçekli yüzey analizleri, gelişmiş modelleme teknikleri ve yapay zekâ destekli kalite kontrol sistemlerinin kullanımıyla adezyon kaynaklı problemlerin daha etkin şekilde yönetilmesi mümkün hale gelecektir. Böylece hem üretim süreçlerinin sürdürülebilirliği artırılacak hem de nihai ürün kalitesinde istikrar sağlanabilecektir. Tüm bu bilgiler ışığında, toz gıdalarda gözlemlenen adezyona bağlı kalite kusurlarının bütüncül kalite yönetimi stratejilerinde temel bir kriter olarak değerlendirilmesi gerektiği çıkarımı yapılmıştır.

Abstract

Due to diminishing fly ash and slag supplies as a result of global decarbonization attempts, alternative supplementary cementitious materials are needed to ensure the long sustainability of cement industry. Clays offer an attractive opportunity as an abundant, low-cost and environmentally friendly material. Their use as supplementary cementitious materials is becoming increasingly interesting for cement industry. The suitability of clays to be used as SCMs varies according to their origin and composition as well as their treatment processes. This study aims at investigating the potential of natural and thermally treated selected clays from south-east part of Albania as SCM. After grinding and sieving, the clays are treated thermally for one hour in three different temperature values, 550, 650 and 750°C respectively. The raw and treated clays are analyzed with FTIR spectrometer in order to identify the structural changes induced by thermal treatment. The optimal value of the treating temperature that ensures the complete modification of clays has been identified.

Keywords: natural clays, thermal treatment, reactivity, FTIR spectra, binder, cement-based materials

INTRODUCTION

Sustainable development, understood as progress that meet the needs of the present without compromising the ability of future generations to meet their needs, is now the basic idea behind the current paradigm of technological progress. The greatest threat to the achievement of the objectives of sustainable development is the excessive emission of greenhouse gases including, above all, carbon dioxide, which results in global warming with many serious negative consequences for future development and its prospects. The building industry makes a significant contribution to increasing carbon dioxide content in the atmosphere (Jaskulsi et. al., 2020). Concrete is the most used material in the world. Ordinary Portland cement is the main cementitious material in concrete recipes, which acts as binder for coarse and fine aggregates (Cao et. al., 2021). The production process of cement is energy intensive and produces large quantities of CO_2 which are released into the atmosphere (Tironi et. al., 2012). The global production of cement is expected to grow with the development and urbanization of nations. The possibilities of reducing the energy intensity of cement production are limited, although it is already possible to reduce heat consumption to 2.9GJ/t of clinker. The use of alternative fuels further reduces carbon dioxide emissions from fossil fuels. However, the use of limestone in clinker production cannot be eleminated or reduced (Jaskulsi et. al., 2020). Scientists are looking for effective strategies to reduce carbon dioxide emissions. Currently, the most promising strategy is the use of supplementary cementitious materials, which are aluminosilicate materials with hydraulic and/or pozzolanic activity (Vallina et. al., 2024). According to ASTM C125, a pozzolan is a siliceous or siliceous – aluminous material that, on its own, has little or no cementitious value. However, when finely divided and in the presence of moisture, it chemically reacts with calcium hydroxide at normal temperatures to form compounds exhibiting cementitious properties (Drissi et. al., 2024). The most commonly used SCM so far is fly ash from coal power plants (Vallina et. al., 2024; Poussardin et. al., 2024). However this additive which is used in production of both cement and concrete, is slowly losing its primary importance due to the progressive decommisioning of coal and lignite power plants. As a result, the supply of fly ash will be significantly reduced in the near future. Another cement additive used to reduce clinker content is a granulated blast furnace slag (Vallina et. al., 2024). However, it has no potential to replace fly ash, not at least because its global supply is far below potential demand. Additionally, it is only available in countries where the steel industry exists (Jaskulsi et. al., 2020). The decreasing supply of fly ash from the power industry is encouraging the search for new sources of pozzolan additives for cement and concrete production. Ashes from biomass combustion, volcanic tuffs, clays are potential alternatives to be used as SCM. Among these SCMs, calcined clays are attracting interest due to their abundance and high

availability, and ease of activation (Vallina et. al., 2024, Hanein et. al., 2022). The advantage of using calcined clay as a SCM is related to both energy and CO_2 emissions. Compared to the calcination of limestone for the production of Portland cement, which releases large quantities of CO_2 due to the decomposition of limestone ($CaCO_3$) at temperatures of around 1450°C, clay calcination takes place at lower temperatures (between 600 and 800°C) and emits much less CO_2, resulting in lower energy consumption and lower greenhouse gas emissions (Pinheiro et. al., 2024). The quality and suitability of clays for use as supplementary cementitious materials is highly dependend on the specific mineral composition, particle morphology, and particle size (Stefanini et. al., 2024; Saikia & Parthasarathy, 2010; Djomgoue & Njopwouo, 2013). Natural clays have different ability to react in cementitious reactions. Usually they have moderate or low pozzolanic activity. In order to make them more reactive, they need to be activated. As a result of activation, clay minerals undergo processes of dehydroxylation and amorphisation and the accompanying change in coordination of Al ions (Hazarika et. al., 2024). The resulting Al and Si – containing amorphous phase can undergo a series of reactions with calcium hydroxide (from cement hydration) and other binder constituents, such as sulfates or carbonates, to form a variety of calcium silicate/aluminate hydrates (C-S(A)-H, hemi/mono-carboaluminates, monosulfoaluminates, ettringite, iron – silicon hydrogarnet, etc.). These hydrated compounds are responsible for the improved mechanical properties of cements containing SCMs (Vallina et. al., 2024). Among different methods of activation, thermal activation is more common. The optimum calcination temperature to reach the maximum pozzolanic activity depends on the mineralogy of the clays. A complete removal of hydroxyl groups upon calcinations results in collapsed and disarranged metastable structure with low crystallinity. Raw clays are often polymineral materials making it difficult to find the optimum calcinations temperature. If raw clays are heated at too high temperatures (>900°C), recrystallization can take place, resulting in a decreased reactivity (Jaskulsi et. a.l, 2020; Hanein et. al., 2022; Hazarika et. al., 2024; Danner et. al., 2018).

The aim of this experimental work is to explore the feasibility of using some selected clays from south-east part of Albania as SCM. Thermally activation is used to activate the clays. The effect of different calcination temperatures on the structure and morphology of clays has been studied. The optimal treating temperature has been predefined. Further analysis and tests will be used to further characterize their properties and efficiency as supplementary cementitious materials.

MATERIALS AND METHODS

Materials

The clay samples were obtained from different locations in south-east part of Albania. They were crushed, grinded and homogenized in order to remove any organic waste and to transform them in a powder form. They were stored in plastic containers for further experiments.

Methods

Calcination of clays

The thermal treatment of raw clays was performed at a laboratory muffle furnace. Three different temperatures (550, 650 and 750°C) were used as calcination parameters. The calcination was done for one hour for each clay and calcination temperature. The samples were left to cool down until room temperature. They were stored in plastic containers and further tested with FTIR spectrometer and pozzolanic test.

Fourier transform infrared spectroscopy (FTIR)

The raw and calcined clays were characterized for their vibrational spectra with Fourier transform infrared spectroscopy using Shimadzu model instrument in the range 400-4000cm^{-1} with ATR method. For each sample 20 scans in the 400 – 4000cm^{-1} spectral range were recorded with a resolution of 2cm^{-1}. A spectrum of the atmosphere was recorded for background correction of the samples.

DRAFT

Pozzolanic activity test

The pozzolanic activity of calcined clays was measured by Frattini test according to EN 196-5. The pozzolanic activities of untreated clays and thermally treated clays were compared. Three samples were prepared for each composition. 20g of blended cement (70% PC and 30% by mass of ground calcined clay) and mixed with 100ml of boiled distilled water. After preparation the samples were left for 8 days in a sealed plastic container in an oven at 40°C. The suspension was filtered in vacuum through a 8µm nominal pore size filter paper and allowed to cool down at room temperature. The filtrated solution was analyzed for [OH^-] by titration against HCl 0.1M with methyl orange indicator and for [Ca^{2+}] by pH adjustment to 13, followed by titration with 0.03M EDTA solution using Murexide indicator. The concentrations of hydroxyl and [Ca^{2+}] ions are plotted and show a concentration of CaO as a function of [OH^-] ions at 40°C.

RESULTS AND DISCUSSIONS

FTIR results of raw and thermally treated clays

The FTIR spectra of the raw and calcined clays at different temperatures are shown in figures 1-3.
In general, the constituent units of clay minerals include the hydroxyl groups, tetrahedral silicate/aluminate anions, octahedral metal cations, and interlayer cations.

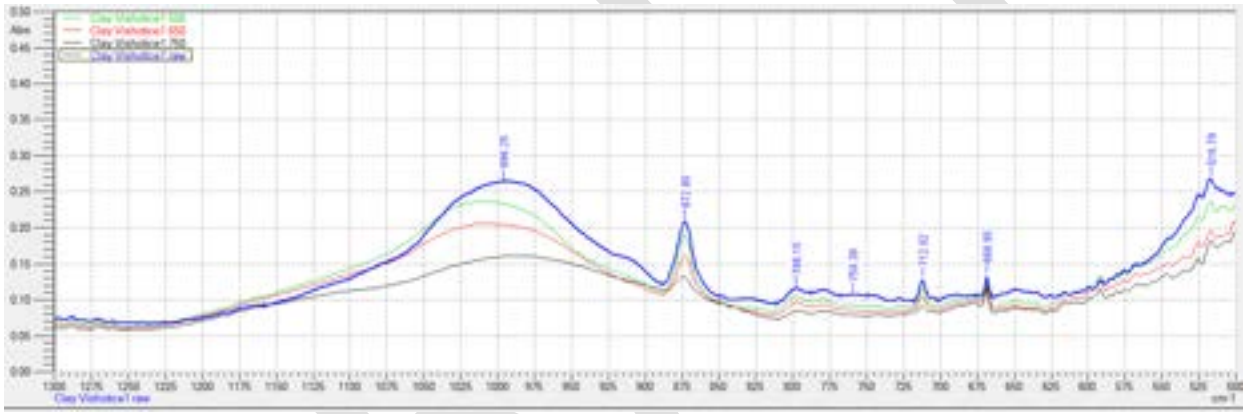

Figure 1. FTIR spectra of Vishotice1 clay, natural and thermally treated

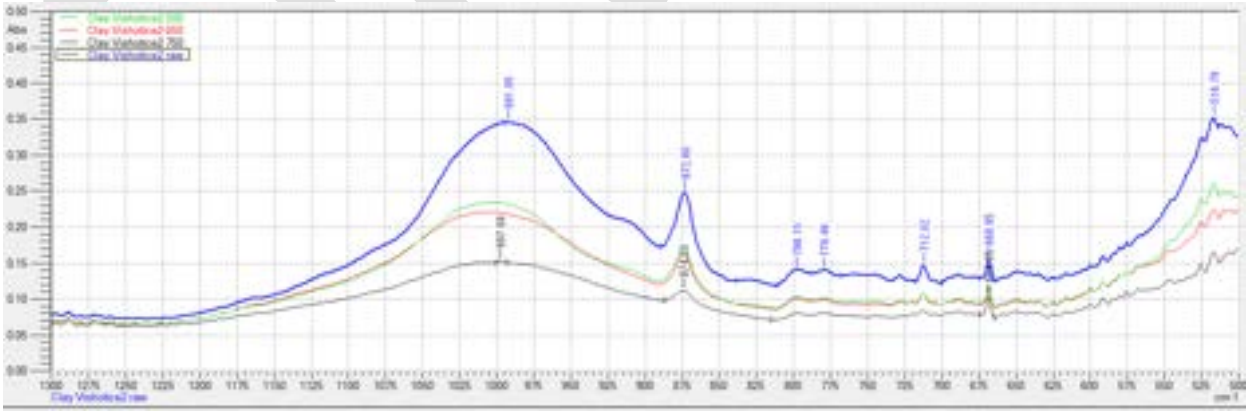

Figure 2. FTIR spectra of Vishotice2 clay, natural and thermally treated

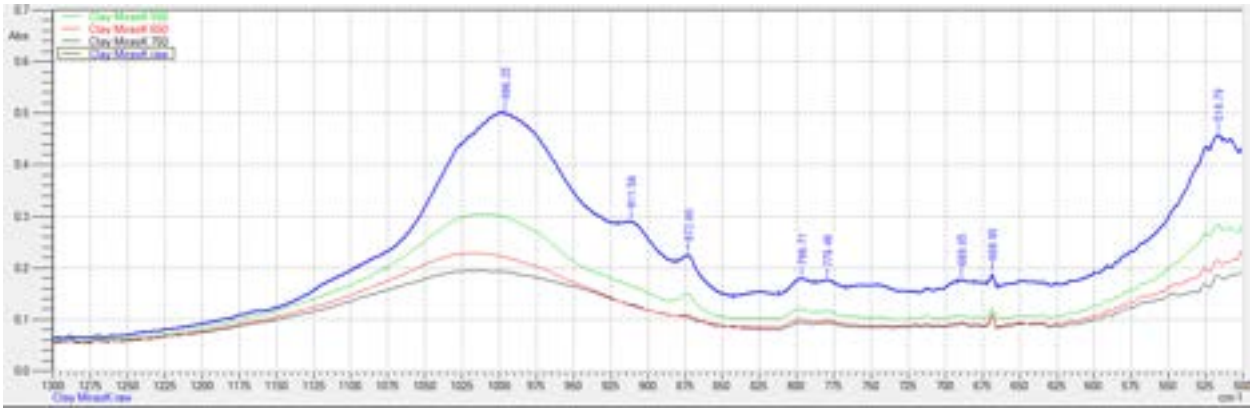

Figure 3. FTIR spectra of MirasK clay, natural and thermally treated

For all the raw clays, the band around 996cm^{-1} is attributed to Si-O stretching band in the kaolinite. The band located around 873cm^{-1} is attributed to calcite and is found in all the studied clays. The bands located around 770-795 cm^{-1}are attributed to the deformation vibrations of Si-O stretching (indicating the presence of quartz) and bands around 750cm^{-1} are from the deformation of Si–O vibrations (characteristic for kaolinite). The adsorption bands observed around 669cm^{-1} are attributed to Si-O-Al (octahedral Al) bending vibrations, characteristic for quartz. For all the clays, the bands located around 500-520cm^{-1} are attributed to Al-O-Si bending vibrations. For MirasK raw clay is observed a characteristic band around 900cm^{-1} which corresponds to the Al–OH deformation.

The FTIR spectrums of all calcined clays taken into the study present the absence of detectable –OH and Al-OH bands, the disappearance of the Si-O characteristic bands of kaolinite present in the raw clays, the disappearance of the Si-O-Al and Al-O-Si bands. All the obtained results from the FTIR analysis confirm the transformation and modification of raw clays through thermal treatment. These changes are more evident in higher temperatures of calcinations implying that 750°C is the optimal temperature for heat treatment of these selected clays from Albania.

The calcination of these clays at different temperatures causes decomposition of several minerals and the formation of new phases. The FTIR spectra of the raw clays indicates that these clays have high content of kaolinite which during thermal treatment forms meta-kaolinite. This is more evident in MirasK clay which has also a characteristic peak of kaolinite compared to the two other clays. This peak is completely disappeared after thermal treatment indicating the completely modification of the clay structure. This new phase has its influence in the reactivity of the clay since it is more reactive in the cementitious reactions. These results indicate that heat treatment is a good method of activation for kaolinitic clays. The same results are reported in literature.

Pozzolanic activity of clays

The Frattini test reults are plotted together with the lime solubility curve, which represents the concentration of Ca^{2+} in an alkaline solution at 40°C. The solubility curve was evaluated for [OH^{-}] in the range between 35mmol/l and 100mmol/l and a theoretical concentration of [CaO] was calculated by equation 1:

$$[CaO] = \frac{350}{([OH^{-}]-15)} \qquad (1)$$

Materials with an evident pozzolanic reactivity are located below the lime solubility curve while non-pozzolanic materials are above this curve. The experimental results obtained for our clays are shown in figure 4.

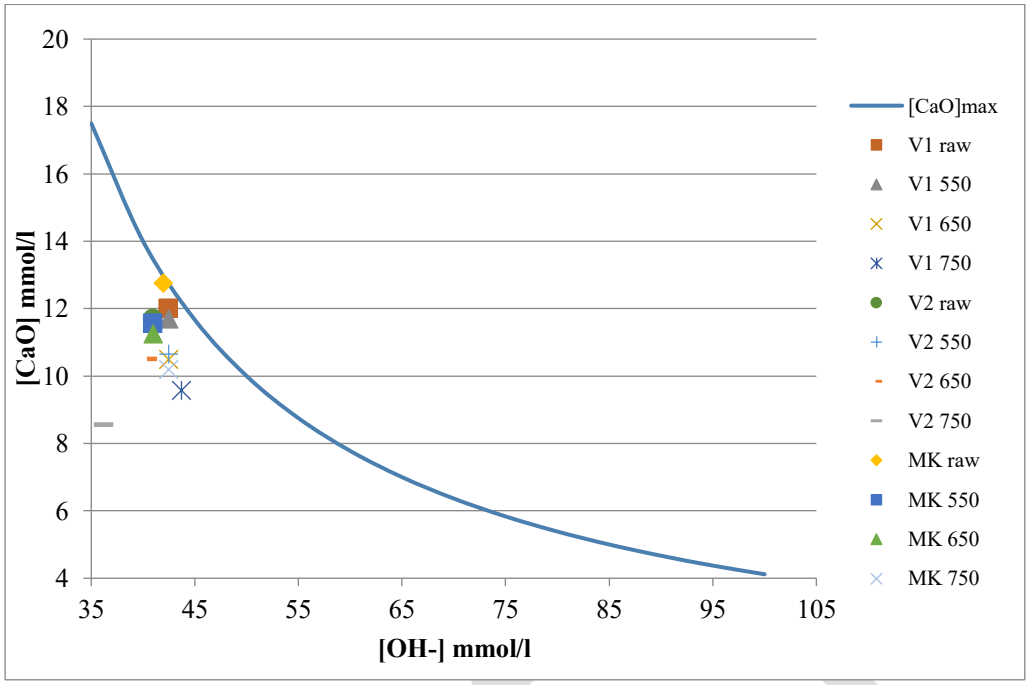

Figure 4. Frattini test results for cement paste containing 30wt% of different natural and treated clays after 8 days

All natural clays were under the solubility line thus indicating good pozzolanic reactivity. After 8 days, mixes containing activated clays showed an increased pozzolanic reactivity. Their points are located below the solubility line and below the points that represent the natural clays. According to the standard, below the solubility line indicates that the analysed material is a pozzolan and that a significant amount of Ca^{2+} ions produced by the cement hydration, was consumed in the pozzolanic reaction. Hence, all studied thermally treated clays were classified as pozzolanic materials and their pozzolanicity was increased proportionally with temperature.

CONCLUSIONS

Thermally treated clays are a valuable resource of supplementary cementitious materials. Enhancement of the pozzolanic reactivity of selected natural clays from south-east part of Albania after thermal treatment was investigated through FTIR and Frattini test. From the obtained results it is evident that thermal treatment of clays increases their reactivity. All the clays contained kaolinite in several amounts. Clays with higher kaolinite content were more reactive due to transformation of kaolinite to metakaolinite. The optimal treating temperature for all the clays was found to be 750°C. In this temperature most of the peaks were diminished and disappeared suggesting that the clays were modified structurally (got amorphised) and increased their reactivity as cementitious material. These results were confirmed by pozzolanic activity tests. Clays showed increased pozzolanic activity at higher treatment temperatures.

Özet
Bu çalışma, Amasya'daki Yedikır Baraj Gölü'nden örneklenen sazan balıklarının (*Cyprinus carpio*), diğer sazan popülasyonlarıyla filogenetik düzeyde karşılaştırılmasını amaçlamaktadır. Laboratuvar ortamında, örneklenen balıkların temel morfometrik ölçümleri yapılmış ve ardından genomik DNA izolasyonu gerçekleştirilmiştir. Türler arası filogenetik farklılıkların belirlenmesinde yaygın olarak kullanılan COI (Sitokrom Oksidaz I) gen bölgesi üzerinden filogenetik değerlendirmeler yapılmıştır. İzole edilen DNA örnekleri, evrensel primerler kullanılarak polimeraz zincir reaksiyonuna (PCR) tabi tutulmuştur. PCR ile elde edilen DNA dizileri dizileme yöntemiyle analiz edilmiş ve biyoinformatik yazılımlar aracılığıyla işlenmiştir. COI gen bölgesine ait filogenetik analiz için, GenBank ve BOLD (Barcode of Life Data System) veri tabanlarından *Cyprinus carpio* türüne ait dizi verileri toplanmıştır. 650 baz çiftinden kısa olan ya da doğrulanmamış olarak etiketlenen diziler analiz dışında bırakılmıştır. Elde edilen veriler öncelikle ülkelere göre gruplandırılmış; ardından Yedikır Baraj Gölü'nden elde edilen örnekler bu gruplara entegre edilerek filogenetik ağaçlar oluşturulmuştur. Veriler, nükleotid dizilerinin hizalanması ve filogenetik ilişkilerin belirlenmesi için MEGA yazılımı ile analiz edilmiştir. Sazan popülasyonlarının taksonomik durumlarını değerlendirmek amacıyla Neighbor-Joining (NJ) ve Maximum Likelihood (ML) yöntemleri kullanılmıştır. Analiz sonuçları, Yedikır Baraj Gölü'nden elde edilen sazanların belirgin grupları oluşturduğunu göstermiştir. Ayrıca, küresel popülasyonların genel olarak ülke temelli gruplandığı; ancak bazı haplotiplerin birden fazla ülkede yayılım gösterdiği de tespit edilmiştir.

Anahtar Kelimeler: *Cyprinus carpio*, COI, filogenetik analiz, biyoinformatik

Phylogenetic comparisons of common carp (*Cyprinus carpio*) using COI gene sequences

Abstract
This study aims to compare the common carp (*Cyprinus carpio*) sampled from Yedikır Dam Lake in Amasya with other carp populations at the phylogenetic level. In the laboratory, the basic morphometric measurements of the sampled fish were conducted, followed by genomic DNA isolation. Phylogenetic evaluations were performed using the COI (mitochondrial Cytochrome Oxidase I) gene region, which is widely used for interspecies phylogenetic differentiation. The isolated DNA samples were subjected to polymerase chain reaction (PCR) using universal primers. The DNA sequences obtained from PCR were analysed through sequencing and processed using bioinformatics software. For the phylogenetic analysis of the COI gene region, sequence data related to common carp were collected from the GenBank and BOLD (Barcode of Life Data System) databases, excluding sequences under 650 bp and those labelled as unverified. The collected data were initially grouped by country. Subsequently, the Yedikır Dam Lake samples were integrated into these groups, and phylogenetic trees were constructed. The data were analysed using MEGA software, which allowed for the alignment of nucleotide sequences and the detection of phylogenetic relationships. Neighbor-Joining and Maximum Likelihood methods were employed to evaluate the taxonomic status of carp populations. The analysis results indicated that the carp sampled from

DRAFT

Yedikır Dam Lake formed distinct haplotype groups. Additionally, it was found that global populations were generally grouped by country, although some haplotypes were distributed across multiple countries.

Keywords: *Cyprinus carpio*, COI, phylogenetic analysis, bioinformatics

GİRİŞ

Geleneksel balık sistematiği uzun yıllar boyunca morfolojik karakterlere dayanarak yürütülmüş olsa da, son yıllarda moleküler teknikler bu alanda devrim yaratmıştır (Nelson, 2006). Morfolojik benzerlikler bazen farklı türlerin ayırt edilmesini güçleştirdiğinden, genetik veriler türlerin daha doğru sınıflandırılmasını sağlamaktadır (Hebert ve Gregory, 2005). Moleküler sistematik, türler arasındaki evrimsel ilişkileri ortaya koymakta güçlü bir araç haline gelmiştir (Avise, 2000).

Moleküler analizler, yalnızca tür tanımlamada değil, aynı zamanda popülasyon yapısının ortaya konmasında, genetik çeşitliliğin ölçülmesinde ve göç yollarının belirlenmesinde de yaygın olarak kullanılmaktadır (Ward ve ark., 2005). Mitokondriyal DNA'ya dayanan analizler, özellikle de COI (*Cytochrome Oxidase I*) gen bölgesi, hayvanlar arasında yaygın olarak kullanılan bir moleküler barkodlama aracı haline gelmiştir (Hebert ve ark., 2003; Thai ve ark., 2004). COI dizileri üzerinden yapılan filogenetik çalışmalar, popülasyonlar arası ilişkileri anlamada yüksek çözünürlük sunmakta, bu sayede türler arası farklılıklar kadar tür içi varyasyonlar da detaylı biçimde incelenebilmektedir (Zhang ve Hanner, 2012).

Bu yöntemler, özellikle ekonomik ve ekolojik açıdan önemli türler için vazgeçilmez hale gelmiştir. Bunlardan biri de, hem doğal popülasyonları hem de yetiştiriciliği yaygın olan sazan balığıdır (*Cyprinus carpio*) (David ve ark., 2007). Sazan balığı, Asya ve Avrupa kökenli iki ana evrimsel hattı temsil eden geniş bir yayılım gösterir ve uzun süredir kültüre alınmış bir tür olması nedeniyle oldukça karmaşık bir genetik yapıya sahiptir (Xu ve ark., 2014). Yapılan çalışmalar, sazanın evcilleştirilme süreci boyunca çok sayıda stok transferi ve melezleme gerçekleştiğini ve bunun sonucunda farklı bölgelerde yaşayan popülasyonlar arasında genetik benzerliklerin oluştuğunu göstermektedir (Balon, 2004; Kalous ve ark., 2012). Avrupa'daki popülasyonların Asya kökenli bireylerle yüksek düzeyde genetik örtüşme gösterdiğini, bunun da kültürel taşınımın bir sonucu olabileceğini belirtmiştir. Aynı şekilde, coğrafi olarak uzak bölgelerdeki sazan popülasyonlarının benzer genotiplere sahip olması, bu türün doğal yayılımının çok ötesinde, insan eliyle gerçekleşen taşınım ve adaptasyon süreçlerinin etkili olduğunu düşündürmektedir (Kohlmann ve ark., 2005). Bu tür genetik karışımlar, yalnızca filogenetik analizlerde değil, aynı zamanda tür koruma, stok yönetimi ve biyoçeşitlilik politikaları açısından da dikkate alınması gereken önemli dinamiklerdir (Cawthorn ve ark., 2012).

Sazan balığı gibi geniş dağılıma sahip ve genetik olarak zengin türlerde, düzenli genetik izleme çalışmaları yapmak, mevcut genetik çeşitliliğin korunması ve potansiyel tehlikelere karşı önlem alınması açısından son derece önemlidir (Hänfling ve ark., 2005). Özellikle iç su ekosistemlerinde türlerin karşılaştığı çevresel baskılar, habitat değişiklikleri ve melezleşme gibi etkenler, genetik yapıyı hızla değiştirebilmekte; bu da türlerin uzun vadeli sürdürülebilirliğini tehdit edebilmektedir (Allendorf ve ark., 2012).

Bu çerçevede, Türkiye'nin farklı sucul ekosistemlerinde yayılım gösteren sazan balığı popülasyonlarının genetik yapısının ortaya konması, hem yerel hem de küresel düzeyde yapılan araştırmalara önemli katkılar sağlayacaktır. Bu çalışmada, Karadeniz Bölgesi'nde yer alan Amasya Yedikır Baraj Gölü'nden elde edilen *Cyprinus carpio* bireylerinin mitokondriyal COI gen bölgesi üzerinden genetik yapısı analiz edilerek, dünya genelindeki diğer popülasyonlarla filogenetik açıdan karşılaştırılması amaçlanmıştır. Bu sayede, hem türün evrimsel geçmişine dair yeni bilgiler edinilmesi hem de gelecekte yapılacak koruma ve yönetim stratejilerine genetik açıdan temel oluşturulması hedeflenmektedir.

DRAFT

MATERYAL VE METOD

Cyprinus carpio bireyleri Amasya Yedikır Baraj gölünden örneklenmiş ve bu balık örnekleri Ordu Üniversitesi Moleküler Biyoloji ve Genetik Bölümü Hidrobiyoloji Laboratuvarına getirilerek öncelikle balıkların ağırlık ve total boy verileri ölçülmüştür (Şekil 1). Morfometrik ölçümlerden sonra elde edilen balıklardan genetik çalışmalarda kullanılmak üzere bir miktar kuyruk yüzgeci dokusu makas yardımı ile kesilmiş ve 1.5 ml'lik mikrosantrifüj tüplerde %98'lik etanol ilave edilerek moleküler analizlerde kullanılmak üzere derin dondurucuda saklanmıştır.

Bu çalışmada *Cyprinus carpio* türünün moleküler analizleri ayrım gücünün yüksek olması sebebiyle DNA'nın COI gen bölgesi üzerinden gerçekleştirilmiştir.

Şekil 1. Sazan Balığının (*Cyprinus carpio*) genel görünüşü

DNA'nın eldesi derin dondurucuda saklanan kuyruk yüzgeci dokularından DNA izolasyonu yoluyla gerçekleştirilmiştir. Toplam DNA'nın ekstraksiyonunda Hibrigen DNA ekstraksiyon kiti kullanılmıştır. Total DNA izolasyonu için her bireyin kuyruk dokusundan parça alınmış ve alınan bu parçalardan DNA izole edilmiştir.

DNA'nın agaroz jel elektroforeziyle kontrolü aşamasında, 0.8 g agaroz 1xTBE buffer ile 100 ml'lik agaroz jel hazırlanmıştır. Isıtıcıda agarozu erittikten sonra, üzerine 4µl ethidium bromide ilave edilerek karışması sağlanacak ve hazırlanan jel elektroforez küvetine dökülmüştür. Küvet elektroforez tankının içine yerleştirilip tank 1xTBE buffer ile doldurulmuştur. Bundan sonraki aşamada her bir örnek için 3µl genomik DNA, 2 µl Nuclease Free Water ve 1 µl de 6xLoading Dye pipetajlanmış ve kuyucuklara sırasıyla yüklenmiştir (Şekil 2).

Yükleme işlemi bittikten sonra örnekler elektroforezde yürütülmüştür. Yürütme işlemi tamamlandıktan sonra jel UV görüntüleyici yardımıyla incelenmiş ve oluşan bantlar gözlemlenerek DNA kalitesi belirlenmiştir. Çalışma sonucunda istenilen kalitede bant veren örnekler PCR için ayrılmıştır.

COI Gen Bölgesinin PZR ile amplifikasyonu için uygun PZR koşulları belirlenmiştir (Şekil 3). Mitokondriyal gen bölgelerinin çoğaltılmasında kuyruk yüzgeci dokusundan elde edilmiş total DNA kullanılmıştır. DNA'nın COI bölgesi PZR ile çoğaltılmıştır. Çalışmamız kapsamında PZR ile çoğaltımda reaksiyon başına kullanılacak olan dNTP, $MgCl_2$, kalıp DNA ve primer miktarları ve konsantrasyonları optimize edilmiştir.

Şekil 2. DNA'nın Agaroz Jel Elektroforeziyle Kontrolü

Şekil 3. Çalışmada kullanılan PZR koşulları

Sazan balığı türü için literatür doğrultusunda belirlenmiş olan aşağıdaki primer dizileri kullanılmıştır (Ward vd., 2005).

FishF1	TCAACCAACCACAAAGACATTGGCAC
FishR1	TAGACTTCTGGGTGGCCAAAGAATCA

Çoğaltılan COI gen bölgesinin agaroz jel elektroforeziyle kontrolünde PZR ürünlerinin istenilen görüntüyü verebilmesi için çalışmada agaroz jel konsantrasyonu %1 olarak ayarlanmıştır. Daha önceden de belirtilen elektroforez aşamaları uygulanmış ve her bir örnek için 3 µl PZR ürünü, 2 µl NFW ve 1 µl 6x Loading Dye pipetajlanarak kuyucuklara sırasıyla yüklenmiş ve 100V'da 45dk yürütme işlemi yapılmıştır. Yürütme işlemi tamamlandıktan sonra jel UV görüntüleyici yardımıyla oluşan bantlar gözlemlenerek ilgili bölgenin varlığı ve kalitesi belirlenmiştir. Çalışma sonucunda istenilen kalitede bant veren örnekler sekans için ayrılarak -20°C'de muhafaza edilmiştir.

PZR ürünlerinin saflaştırması ve dizilerin elde edilmesi aşamasında DNA izolasyon kitleri kullanılmıştır. Saflaştırılan PZR ürünlerinin nükleotid dizileri Macrogen firmasından hizmet alımı yapılarak gerçekleştirilmiştir. Hizmet alımı sonrasında elde edilen ham sekans verileri biyoinformatik programlarla işlenmiş ve tür için filogenetik ağaçlar oluşturulmuştur.

Yedikır Baraj Gölü'nden elde edilen *Cyprinus carpio* bireylerine ait COI (mitokondriyal Cytochrome c Oxidase I) gen bölgesi dizileri, filogenetik analiz amacıyla dünyanın farklı bölgelerinden GenBank ve BOLD (Barcode of Life Data System) veritabanlarından temin edilen COI sekansları ile karşılaştırılmıştır. Analize dahil edilecek diziler seçilirken, 650 baz çifti altında kalan ya da "unverified" (doğrulanmamış) olarak işaretlenen kayıtlar çalışma dışı bırakılmıştır. Seçilen sekanslar FASTA formatında toplanmış ve

analiz öncesi ChromasPro 2.2.0 yazılımı ile manuel olarak temizlenip hizalanmıştır. Ardından, filogenetik ilişkileri ortaya koymak amacıyla MEGA (Molecular Evolutionary Genetics Analysis) programı kullanılmıştır. Diziler, MEGA yazılımı içerisinde ClustalW algoritması ile çoklu hizalamaya tabi tutulmuştur. Filogenetik ağaçlar, Neighbor-Joining (NJ) ve Maximum Likelihood (ML) yöntemleri kullanılarak ayrı ayrı oluşturulmuştur. NJ yöntemi için Kimura 2-parameter modeli, ML yöntemi içinse en uygun model otomatik olarak belirlendikten sonra uygulanmıştır. Her iki analizde de bootstrap analizi yapılarak ağaçların istatistiksel güvenilirliği değerlendirilmiştir. Analiz sonucunda, Yedikır Baraj Gölü'nden elde edilen örneklerin genetik olarak diğer ülke popülasyonlarına olan uzaklıkları ve filogenetik ilişkileri görselleştirilmiştir.

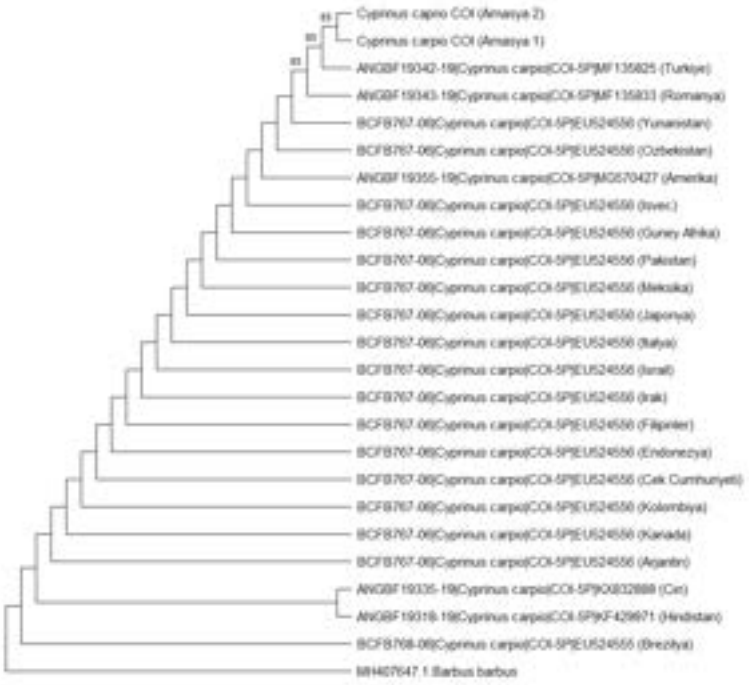
SONUÇLAR VE TARTIŞMA

Çalışmada elde edilen sazan bireylerinin ortalama total boyları 19,5±1,5 cm, ortalama ağırlıkları ise 114,5±5,2 g olarak hesaplanmıştır. Sazan bireylerinin çoğaltılan COI gen bölgesine ait PZR ürünleri, %1 agaroz jel kullanılarak elektroforez yöntemiyle incelenmiştir. Jel üzerinde gözlemlenen bantlar net, tekil ve yaklaşık 650 bp civarında olup istenilen amplifikasyonun başarıyla gerçekleştiğini göstermektedir. Bantların konumu DNA ladder ile karşılaştırıldığında hedef gen bölgesiyle uyumlu olduğu gözlemlenmiştir (Şekil 4). Ayrıca, jel görüntüsünde non-spesifik bantlara ya da primer-dimer oluşumlarına rastlanmamıştır. Bu durum hem kullanılan primer çiftinin uygunluğunu hem de PCR koşullarının başarılı şekilde optimize edildiğini göstermektedir (Şekil 4).

Şekil 4. Çalışmada çoğaltılan COI gen bölgesine ait verilerin jel görüntüsü

Yedikır Baraj Gölü'nden elde edilen *Cyprinus carpio* bireylerine ait COI gen bölgesine ait ham dizi verileri ChromasPro 2.2.0 programıyla analiz edilmiştir (Technelysium Pty. Ltd., Tewantin, Australia). Bu analizde forward ve reverse okumalara ait diziler karşılaştırılarak ve her bir örnek için consensus dizileri oluşturmuştur. Oluşturulan bu diziler ile GenBank ve BOLD veritabanlarından temin edilen farklı ülkelerde yayılış gösteren *Cyprinus carpio* tütüne ait diziler karşılaştırılmıştır.

MEGA yazılımı kullanılarak gerçekleştirilen filogenetik analizlerde, hem Neighbor-Joining (NJ) hem de Maximum Likelihood (ML) yöntemleri kullanılmış ve dış grup olarak da *Barbus barbus* türü tercih edilmiştir. MEGA yazılımı ile sazan bireylerinin COI bölgelerine ait veriler ve Kimura 2-parameter modeli kullanılarak oluşturulan Neighbor-Joining (NJ) ağacı Şekil 5'te sunulmuştur. MEGA yazılımı ile sazan bireylerinin COI bölgelerine ait veriler ve HKY (Hasegawa-Kishino-Yano) modeli kullanılarak oluşturulan Maximum Likelihood (ML) ağacı Şekil 6'te sunulmuştur.

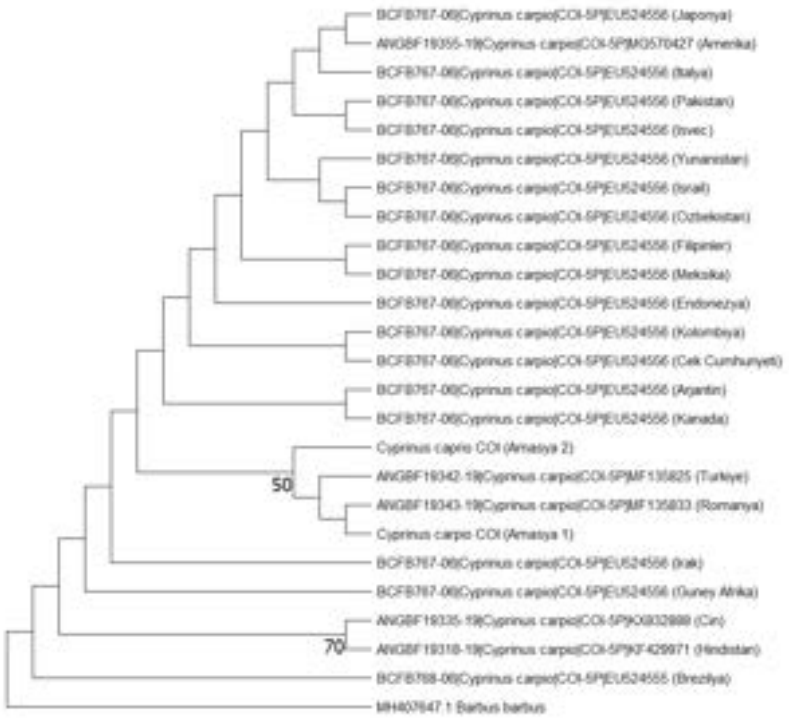


Şekil 5. *Cyprinus carpio* bireylerinin COI gen bölgesine ait Neighbor-Joining ağacı

Elde edilen sonuçlar, Amasya örneklerinin kendi içerisinde tutarlı olduğunu göstermiş olup bu örnekler öncelikle yine Türkiye örnekleriyle aynı filogenetik dalda yer almıştır. Ayrıca, Amasya örneklerinin özellikle Romanya örnekleriyle de benzerlik gösterdiğini ve bu iki grubun aynı klad içerisinde gruplanabildiğini ortaya koymuştur. Bu durum, coğrafi yakınlık veya tarihsel stok alışverişi gibi etkenlerin genetik benzerlik üzerinde etkili olabileceğini düşündürmektedir.

Buna karşılık, diğer ülkelerden elde edilen örneklerin kümelenmesinde ise belirgin bir coğrafi desenler görülmemiştir. Örneğin, Amerika Birleşik Devletleri ve Japonya, Filipinler ve Meksika örneklerinin aynı klad içinde yer alması, sazan balığının kültürel taşınımı ve insan eliyle yayılımı sonucunda dünya genelinde genetik olarak karışık yapılar oluşturduğunu göstermektedir. Aynı genotiplerin farklı kıtalarda bulunması, türün doğal yayılımı dışında geniş çaplı yetiştiricilik ve adaptasyon süreçlerinin bir sonucu olabilir. Ancak bazı dalların düşük bootstrap değerlerine sahip olması, COI gen bölgesinin tüm popülasyonları ayırt etmede sınırlı kalabildiğini ve genetik farklılıkların kesin bir şekilde yorumlanabilmesi için daha fazla gen bölgesi ile desteklenmesi gerektiğini göstermektedir.

DRAFT



Şekil 6. *Cyprinus carpio* bireylerinin COI gen bölgesine ait Maximum Likelihood ağacı

Bu çalışmada, Yedikır Baraj Gölü'nden elde edilen *Cyprinus carpio* örnekleriyle gerçekleştirilen filogenetik analizler, türün genetik yapısına dair bazı önemli ipuçları sunmuştur. Ancak analizlerin sınırlı sayıda gen bölgesine ve örneklem alanına dayanması, elde edilen verilerin geniş çaplı genetik yapı hakkında kesin yargılar vermesi açısından bazı kısıtlamalar doğurmaktadır. Yapılan analizlerde bazı uzak coğrafyalardaki örneklerin aynı klad içerisinde yer alması, insan eliyle gerçekleştirilen kültürel taşınımın sazan balığı popülasyonlarında genetik karışıklığa yol açtığını düşündürmektedir. Bu durum, doğal yayılımdan ziyade, türün yetiştiricilik, stok aktarımı ya da ticari transferler gibi süreçlerle global ölçekte yayılmış olabileceğine işaret etmektedir. Literatürde de benzer bulgular mevcuttur; örneğin Kalous ve ark. (2012) farklı kıtalardan yayılış gösteren balık örneklerinin benzer genetik özellikler taşıyabildiğini belirtmiştir. Bu tip genetik benzerliklerin belirlenmesi, türün kökenini anlamakla birlikte, mevcut stokların geçmişte ne tür müdahalelere maruz kaldığını da ortaya koyabilmektedir.

Özellikle bu çalışmada Türkiye örneklerinin Romanya örnekleriyle yüksek genetik benzerlik göstermesi, tarihsel stok alışverişlerinin veya coğrafi yakınlığın etkili olduğunu düşündürmektedir. Xu ve ark. (2014) ve Balon (2004) sazan balığının uzun süredir kültüre alınması, sık sık popülasyonlar arasında taşınım yapılması ve kontrollü melezlemelerin genetik çeşitliliği etkilediği belirtilmiştir. Bu yönüyle elde edilen bulgular, daha önceki çalışmalarla da örtüşmektedir. Öte yandan, bazı örneklerin düşük bootstrap değerleriyle ayrılması, yalnızca COI gen bölgesinin tüm popülasyonları ayırt etmede yeterli olmadığını göstermektedir. Thai ve ark. (2004) ile Zhang ve Hanner (2012) gibi araştırmalar da, tür içi varyasyonları ve daha hassas filogenetik ayrımları tespit edebilmek için çoklu gen bölgelerinin birlikte analiz edilmesi gerektiğini vurgulamaktadır. Bu bağlamda, ileriki çalışmalarda nükleer DNA işaretleyicileri veya mikrosatellit analizleriyle desteklenen daha kapsamlı bir yaklaşım, genetik yapının daha net anlaşılmasını sağlayacaktır. Ayrıca, bu tür çalışmalar yalnızca akademik düzeyde değil, aynı zamanda su ürünleri yetiştiriciliği, doğal popülasyonların korunması ve stok yönetimi açısından da kritik öneme sahiptir. Özellikle insan etkisiyle hızla değişen iç su ekosistemlerinde, türlerin karşı karşıya kaldığı genetik baskılar zamanla adaptasyon kapasitesini azaltabilir (Hänfling ve ark., 2005). Bu nedenle, yerel düzeyde yapılan bu tür çalışmalar, küresel biyoçeşitlilik politikaları açısından da değer taşımaktadır. Sonuç olarak, bu çalışma bölgesel düzeyde sazan balığının genetik yapısı hakkında temel bilgiler sağlamış; ancak türün evrimsel ilişkilerinin ve küresel dağılımının tam olarak anlaşılabilmesi için daha kapsamlı, çoklu genetik belirteçlerin ve geniş alanlı örneklemelerin kullanıldığı ileri analizlere ihtiyaç duyulduğunu ortaya koymuştur.

Abstract

Fast food consumption has become a global trend. The process of globalisation has significantly increased the number of outlets offering this service almost worldwide. This article aims to analyse trends in fast-food consumption across different countries, based on a cross-sectional study conducted to standardise the questionnaire. Within this framework, factors influencing dietary choices, including socio-economic and cultural aspects and their impact on health, will be examined.

Numerous studies in various countries focusing on the assessment of fast-food consumption have explored consumption patterns among young people in those countries. These studies highlight a shift from traditional home-cooked meals—which include healthy, nutrient-rich, locally available foods—towards fast and processed foods. This paper provides an extensive review of materials from several countries to analyse fast-food consumption patterns among young people, alongside data related to age and education levels from a cross-sectional study of 140 randomly selected cases.

Education is also a factor contributing to increased fast-food consumption, linked to a lack of information regarding the health effects of fast food compared to nutritious meals.

Keywords: fast food, consumption, globalisation, healthy foods

INTRODUCTION

Globally, traditional dietary patterns are being replaced by fast food. Local nutrient-rich recipes and dietary practices are now substituted with fast food. Despite its negative health impacts, fast food remains popular among young people.

Nutrients are essential for human growth and development. Daily choices of nutrient-rich foods are a fundamental part of a healthy lifestyle (1). However, fast-food consumption is steadily rising among youth and children. Fast food is defined as food that can be quickly prepared and served within a short timeframe (6). The term was first introduced in 1950 by Merriam-Webster in the UK. According to the National Institutes of Health (NIH), fast food is defined as easily accessible, quickly served, and an affordable alternative to home-cooked meals (8). This includes restaurants, street vendors, home-delivery services, online platforms, and more. Fast food is commonly available in public spaces such as colleges, schools, shopping centres, cinemas, parks, street corners, airports, petrol stations, and even hospitals (5). Fast food has some advantages include fast service, availability, affordability and convenience. The fast-food industry operates swiftly to fulfil orders and cater to customers. Fast food originated as a commercial strategy to meet the needs of time-constrained workers (7).

In recent years, there has been identified a significant rise in fast-food consumption, particularly among employees and among other people who provide services at institutions and several working places. Many workers even take fast food home for consumption as snacks or full meals. Fast food is typically pre-portioned, leaving consumers with no control over serving sizes or nutritional content (11). Studies indicate that individuals with higher-than-average monthly incomes, as defined by INSTAT (https://www.instat.gov.al/al/statistika/t%C3%AB-dh%C3%ABna-ky%C3%A7e/), consume more fast food. Fast food is calorie-dense but nutrient-poor, often containing refined flour, sugars, low-quality oils, trans fats, and harmful additives (15). The increasing fast-food consumption trends among adolescents and youth adults are concerning dietary issues, as they are loaded with calories and fat and are strongly linked to obesity and obesity-related chronic diseases (12).

Electronic media plays a significant role in advertising fast food. Other promotional methods, such as posters, magazines, billboards, radio, and cinema, are also used to encourage and promote fast food consumption (6). The existence of a wide variety of fast foods, affordable price, convenience and readily available fast-food options are also reasons for consuming fast foods and drives its popularity.

Regular fast-food consumption without physical activity leads to obesity. Fast food consumption among youth contributes to rising obesity rates, which is a global health concern (14).

MATERIALS AND METHODS

A standardised questionnaire was used to compare consumer behaviours internationally. International Comparison of Fast-Food Consumption, key consumption trends in developed vs. developing countries and cultural factors, the impact and the influence of globalization on food dietary choices.

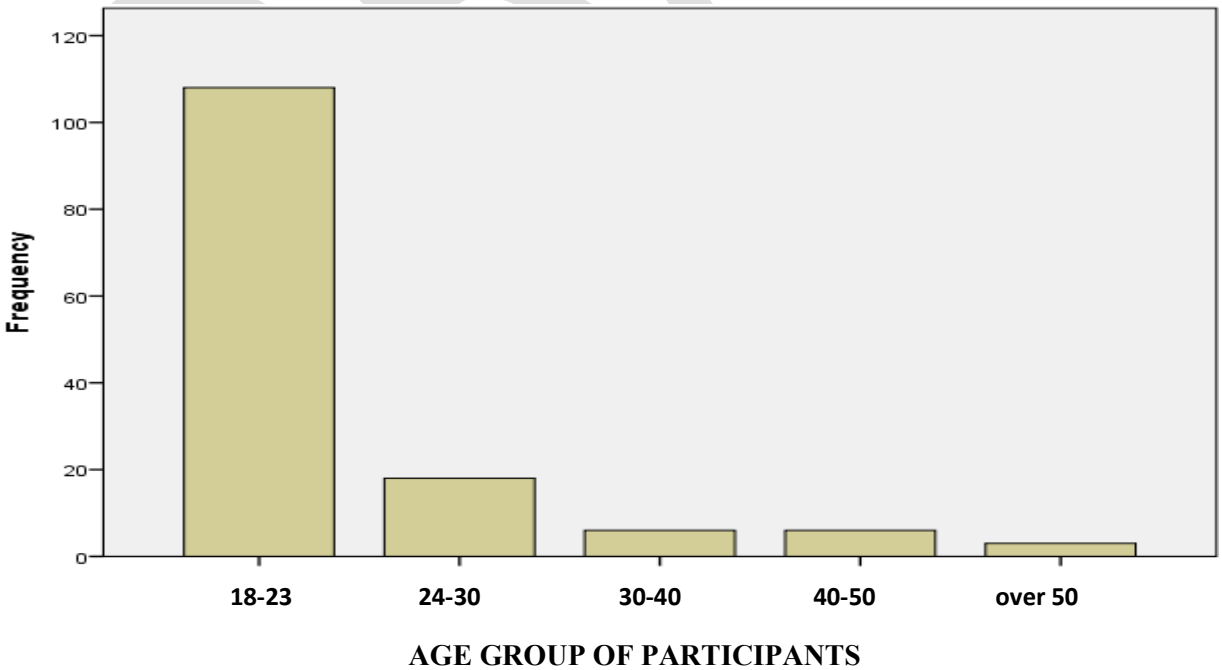
This study was focused on and analyses fast-food consumption trends among 141 randomly selected participants (simple random sampling) with the aim of validating the questionnaire that will be used further in many other people and that will be accompanied by data on physical and laboratory parameters (glycemia, lipidogram). The analysis was conducted using IBM SPSS Statistics 21, incorporating physical and laboratory parameters (blood glucose, lipid profiles).

RESULTS

Table 2: Descriptive Statistics of Participants

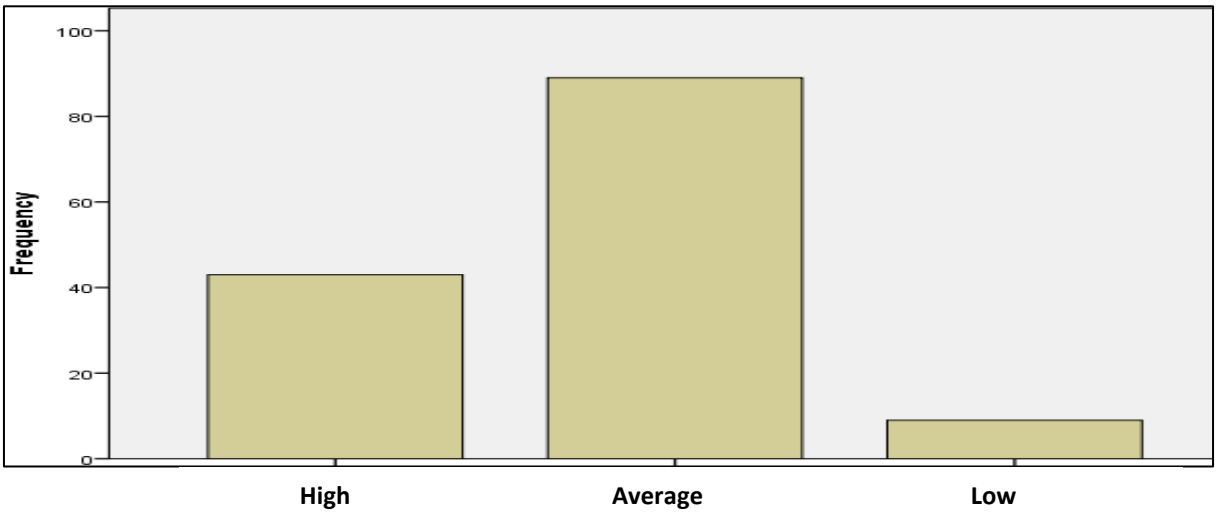
	N	Minimum	Maximum	Mean	Std. Deviation
Age of Participant	141	1	5	1.43	.920
Gender of Participant	141	1	2	1.14	.350
Family Economic Status (Reference INSTAT 2023)|	141	1	3	1.76	.559
Fast-Food Consumption	141	1	3	2.04	.985
Education Level of Participant	141	1	2	1.04	.186
Valid N (listwise)	141	1			

The table above presents descriptive statistics of the questionnaire results depending on the alternatives presented for each question.



Graph 1: Distribution of participants by age group

The graph above shows higher participation among 18–23-year-olds.



Family Economic Status (Referred to INSTAT 2023)

Graph 2: Family Economic Status

The graph above presents the economic status of the participants based on the average monthly income (400 euros per month per capita).

Table 3: Do you eat fast-food?

		Frequency	Percent %	Valid Percent %	Cumulative Percent
Valid	Yes	65	46.1	46.1	46.1
	No	5	3.5	3.5	49.6
	Rare	71	50.4	50.4	100.0
	Total	**141**	**100.0**	**100.0**	

Table 3 describes the frequency of fast food consumption among respondents, where it is noted that 96.5% of the participants consume fast food. And only 3.5% do not consume it at all.

Table 4: Correlation between age and fast-food consumption

Correlations[b]				
			Age of respondent	Do you consume fast-food?
Spearman's rho	Age of respondent	Correlation Coefficient	1.000	.291**
		Sig. (2-tailed)	.	.000
	Do you consume fast-food?	Correlation Coefficient	.291**	1.000
		Sig. (2-tailed)	.000	.
. Correlation is significant at the 0.01 level (2-tailed). b. Listwise **N = 141				

The table above shows a significant positive relationship between age and fast-food consumption in our respondents, which confirms the same results as those of the various countries considered during the study.

Table 5: Correlation between fast-food consumption and education level

Correlations[b]				
			Do you consume fast-food?	Education level of the respondent
Spearman's rho	Do you consume fast-food?	Correlation Coefficient	1.000	-.203*
		Sig. (2-tailed)	.	.016
	Education level of the respondent	Correlation Coefficient	-.203*	1.000
		Sig. (2-tailed)	.016	.
*. Correlation is significant at the 0.05 level (2-tailed).				
b. Listwise N = 141				

So, based on the above table, a significant correlation exists between education and fast-food consumption, and there was also no correlation between consumption and the economic status of the respondents.

DISCUSSION

Eating out of home and fast food consumption is a global concern; fast food consumption is highest in countries such as Australia, the United States, and the United Kingdom. According to a report from the National Health and Nutrition Examination Survey (NHANES, 2018) in the United States, between 2013 and 2016, 36.6% of American adults consumed fast food daily. A study of Australian youth on the consumption of fast food prepared for delivery showed that Australian males consumed more fast food for delivery than females (16).

Various European studies have shown that fast food consumption and the takeaway culture are growing every day. A government report in the UK found that 22% of residents bought takeaway food at least once a week and 58% bought it several times a month (9).

In a study in Romania among young people, it was found that the 18-24 age group consumed the most fast food products. The price of fast food and convenience were factors that influenced their decision to consume fast food (4)

A study in Germany reported that pizza was the most consumed fast food product among adolescents. In the same study, it was reported that girls received 6.5% of their daily energy from fast food, while boys received 7.8% of their daily energy from fast food (13)

The presence of excessive calories, saturated and trans fats, and a lack of many important nutrients, such as vitamins, minerals, dietary fibres, essential amino acids, phytochemicals, and antioxidants, is harmful to our body and health (2)

Frequent consumption of this type of food can lead to the development of deficiencies in many important nutrients. Fast food vendors mainly use hydrogenated oil to prepare fast food products and thus this type of food is rich in trans fats.

Regular consumption of fast food products leads to an increase in energy intake in adults and children which is linked to obesity and chronic diseases (10).

Studies have shown that fast food provides 158 to 163 calories per 100 grams and is also very poor in vitamin A, carotenoids and vitamin C, which are good for health and play a role in cancer prevention (3)

CONCLUSIONS

The dominant group in the study consists of young people aged 18-23, who represent 76.6% of the respondents, which indicates a high interest of this age group in the issue of fast food consumption. Participation by gender was uneven, with 85.8% of respondents being female and 14.2% male. The vast majority of participants (96.5%) have a high level of education, indicating that even individuals with advanced education tend to consume fast food. Despite higher education, 96.5% of respondents consume fast food, although with different frequencies. There is a statistically significant relationship between age, level of education and fast food consumption. The fast food industry is growing rapidly and is actively targeting youth through aggressive and intensive marketing and advertising strategies. Young adults report high rates of fast food consumption, which is a major public health concern due to associated risks. High consumption of fast food among young adults is associated with a number of serious health problems, while young people often lack the necessary information about these risks.

RECOMMENDATIONS

- Develop and implement awareness programs that inform young adults about the health risks associated with the consumption of fast food.
- Promote educational activities aimed at increasing knowledge about the negative consequences of unhealthy diets and the importance of a balanced diet.
- Provide support through individual or group nutritional counselling to help young people make informed decisions about their eating habits and dietary choices.
- Encourage the consumption of healthy foods in schools, universities and workplaces as a way to positively influence young people's behaviours, as well as undertake campaigns that promote lifestyle changes through inspiring stories, modelling healthy behaviours and rewards or incentives for active involvement.

Abstract

In recent years, the need for new technologies as sustainable alternatives to conventional methods has increased in line with goals such as sustainability, low energy, water, and chemical consumption, and reduction of environmental impact and processing times in the textile industry. In this context, radiation technologies offer the potential to increase the efficiency of production processes while improving the ecological sustainability of the textile industry. Radiation technologies such as plasma, microwave, and ultraviolet (UV) irradiation have provided many important benefits and improvements in surface modification and functional finishing of textile materials. These technologies can be used in textile applications like pre-treatment, dyeing, printing, and functional finishing. In this review, the operation mechanisms, important parameters and properties; the contributions to sustainable production; the present textile finishing applications, and the future perspectives of radiation technologies have been evaluated and discussed.

Keywords: Textile Finishing, Sustainability, Radiation, Plasma, Microwave, Ultraviolet

Introduction

The textile industry has searched for sustainable and innovative solutions as alternatives to conventional methods, due to fast-changing consumer demands and growing environmental awareness. Conventional dyeing, printing, and finishing processes involve using large amounts of water and chemicals, which cause serious environmental problems. Especially the wastewater generated from dyes, salts, and various auxiliary chemicals pollutes freshwater sources and poses significant risks to ecosystems (Diaz-Garcia et al., 2024). Additionally, since textile production is responsible for about 20% of global clean water pollution, the transition to sustainable practices in the textile industry is quite essential (European Parliament, 2023).

In response to these growing concerns, many research projects and programs have been developed to reduce the environmental impact of wet textile processes. These efforts mainly focus on lowering energy use, reducing wastewater discharge, and limiting chemical consumption (H. Catarino et al., 2024). While some of these technologies are already used in industry, others are still under development and require more studies to improve their performance, cost-effectiveness, and scalability.

One innovative approach that supports this transformation in textile finishing is the use of radiation-based technologies. Applications such as plasma, microwave, and ultraviolet (UV) offer promising alternatives for sustainable textile production due to their potential to reduce environmental impact and improve processing efficiency.

Radiation technologies in textile finishing are processes that use ionizing or non-ionizing radiation energy to improve the physical and chemical properties of fabrics. Compared to conventional methods, these technologies offer more efficient, eco-friendly, and sustainable solutions (Teker et al., 2024).

In this study, the prominent applications of common radiation technologies like plasma, microwave, and ultraviolet, benefits to sustainability, future perspectives, and limitations in textile finishing have been reviewed.

DRAFT

Plasma Technology and Its Applications in Textiles

Plasma technology is an innovative method that allows textile surfaces to be modified in an eco-friendly and energy-efficient way. Plasma is a partially ionized gas made up of ions, free electrons, and excited molecules. Thanks to this structure, it can cause physical and chemical changes on the textile surface and improve the functional properties of the material (Haji & Kan, 2021).

Plasma treatments are 'dry' processes that do not require water or chemicals. Compared to conventional wet treatments, they reduce environmental impact and save energy. Low-pressure (vacuum) and atmospheric plasma systems are used to improve adhesion, enhance color fastness, increase hydrophilicity, and apply functional finishes to textile surfaces. (Donkor et al, 2024).

Textiles treated with plasma show improved dyeability, print quality, lamination compatibility, and response to functional coatings. Moreover, low operating temperatures enable the synthetic and delicate fibers to be treated without damage. This makes plasma especially useful for difficult-to-dye fibers such as polyester, polypropylene, and PTFE (Primc & Mozetič, 2024).

Plasma technology imparts hydrophilic and adhesive characteristics to textile fiber surfaces by polymerization, cleaning, etching, grafting, and activation reactions with the help of excited and energetic species like ions, free radicals, electrons, and metastables (Zhang et al 2022). In this way, plasma treatment improves the wetting, dyeing affinity, and reactivity of textile fibers in an environmentally benign approach (Hamida et al 2024). The important parameters that affect the efficiency of the plasma treatments are the nature of the gas, pressure, flow rate, power, frequency, and duration (Haji and Naebe 2020) (Zhang et al 2022).

However, there are some limitations to the widespread use of plasma technology. High initial investment costs, the temporary effect of some plasma treatments, and challenges in achieving uniform surface treatment can restrict its industrial use.

In the study by Serrano-Martínez et al. (2023), the effects of low-pressure oxygen plasma treatment on the surface properties and printing performance of cotton fabrics were investigated. The plasma treatment introduced hydrophilic functional groups on the fabric surface, increasing the surface energy. This modification led to improved pigment adhesion and enhanced print quality, especially in metallic pigment-based printing processes. Additionally, improvements in color fastness values were observed, highlighting the potential of plasma treatment as an eco-friendly and effective method for textile surface modification.

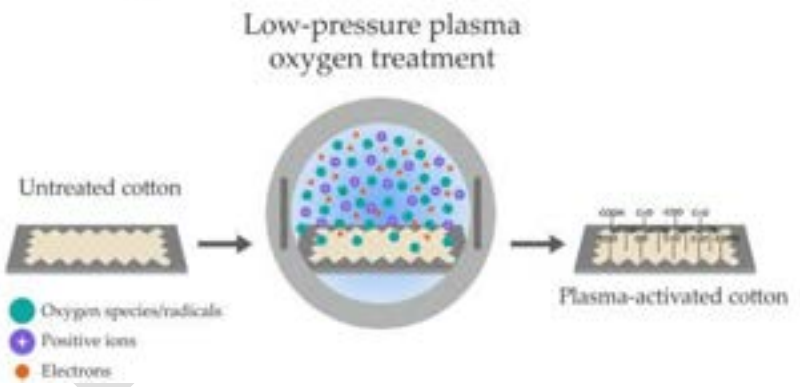

Figure1. Stretch of the low-pressure oxygen plasma activation treatment of cotton textiles. (Serrano-Martínez et al., 2023).

Ghasemian et al. (2025) applied atmospheric pressure plasma to wool fibers, followed by treatment with protease and glutaminase enzymes. This combined treatment changed the surface morphology of the wool and improved the color depth and wash fastness properties of the natural dyed fabrics. The synergistic effect of plasma and enzymatic treatment increased dye affinity and made the dyeing process more environmentally friendly.

Microwave Technology and Its Applications in Textiles

Microwave technology is gaining more and more attention as an innovative and sustainable approach to textile finishing. This technology covers the frequencies of the electromagnetic spectrum between 300 MHz and 300 GHz, with the frequency of 2.45 GHz generally preferred in industrial applications. Microwaves

provide direct heat generation by vibrating polar molecules in the textile material under a high-frequency electric field. This significantly shortens the process time, increases energy efficiency, and reduces environmental impacts (Adeel et al., 2023).

Microwave-assisted dyeing processes are carried out at lower temperatures compared to conventional methods, reducing energy consumption and providing more homogeneous dye uptake. In addition, the dyestuff uptake increases due to physical changes in the surface properties of the fabrics subjected to microwave pretreatment, resulting in stronger color depth and high fastness values (Rehman et al., 2022).

Recent studies have shown that microwave-treated natural and synthetic dyes give effective results, especially in protein-based fibers such as silk, wool, and nylon. Microwave radiation physically modifies the surface of such fibers, increasing the diffusion of dye molecules and thus improving the dyeing quality (Adeel et al., 2023; Rehman et al., 2022). In addition, the color fastness of fabrics treated with this method was evaluated as good to very good according to ISO standards, and less waste generation was observed from an environmental point of view (Adeel et al., 2023).

Rehman et al. (2022) showed that microwave radiation can be successfully used for dyeing polyamide (nylon) fabrics with natural dyes such as saffron and safflower. The dyes extracted with microwave support were obtained in a shorter time and demonstrated high performance in terms of color fastness and intensity.

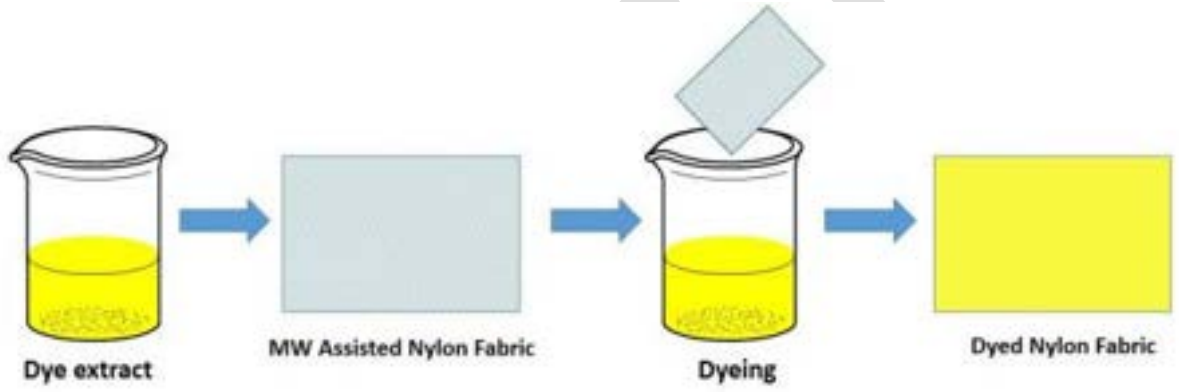

Figure2. A shematic representation of the nylon fabric dyeing process. (Rehman et al. 2022)

Adeel et al. (2023) found that microwave treatment caused physical changes on the fabric surface, which enhanced the penetration of dye molecules, resulting in darker and more vibrant shades. Additionally, fabrics dyed with microwaves showed better results in washing, light, and rubbing fastness tests.

Ultraviolet (UV) Technology and Its Applications in Textiles

Ultraviolet (UV) technology is a sustainable method used in many textile applications, including surface modification, color fastness improvement, and curing of functional coatings. UV treatment improves the coloring process of textiles due to surface modification of the textile substrate. UV technology can be used for bleaching and surface modification processes before coloring processes such as dyeing and printing. This technology works only on the surface without changing the volume properties of the fabrics. It is used to improve dye absorption, increase color fastness, and reduce the pilling problem (Lara et al. 2022).

In conventional bleaching, chemicals like hydrogen peroxide (H_2O_2) are widely used. When combined with UV, the same or better whiteness levels can be achieved with less chemical usage. This UV-assisted bleaching process reduces environmental impact and lowers energy and water consumption (Wang et al, 2020). Similarly, pretreating fibers like polyester and cotton with UV rays improves dye bonding, color depth, and wash fastness.

UV curing technology has emerged as a sustainable method in textile finishing to impart functional properties such as conductivity, antibacterial activity, flame retardancy, and smart responsiveness. For instance, graphene oxide has been reduced to graphene under UV light to render cotton and wool fabrics conductive. UV irradiation has also been applied to modify cotton fiber surfaces, resulting in light-activated antibacterial properties. Furthermore, low-toxicity flame retardants have been successfully grafted onto polyester/cotton fabrics using UV curing, enhancing fire resistance. Additionally, UV-curable photochromic inks have enabled the development of UV-sensing smart textiles capable of reversible color

change under sunlight. These examples highlight the versatile and eco-friendly potential of UV technology in modern textile treatment processes (Catarino et al. 2025)

However, industrial-scale use of UV technology is still limited. There are challenges such as operational costs, safety for workers, and its effectiveness being limited to fabric surfaces. Still, pilot applications and UV-curing solutions developed by companies like Rudolf GmbH and Trelleborg show promising potential for wider use (Rudolf GmbH & Trelleborg, 2023).

Wang et al. (2020) developed a UV/H_2O_2 system as an alternative to conventional bleaching for cotton fabrics. This system produced perhydroxyl radicals (HOO^-) under UV light, enabling effective bleaching and reducing chemical use and environmental impact. The treated fabrics reached similar whiteness levels by using lower NaOH concentrations.

Čuk et al. (2021) found that UV treatment on cotton fabric surfaces increased dye uptake. Both the fabric and the reactive dye were exposed to UV light, activating reactive groups and forming reactive carbon on the fiber surface. As a result, high color depth and wash fastness were achieved with low chemical and energy consumption. This method was proposed as a sustainable alternative to conventional pretreatments.

Conclusion

Radiation technologies used in textile finishing make significant contributions to the industry in line with sustainability goals. Methods such as plasma, UV, and microwave help to create eco-friendly production processes by reducing energy and water consumption. At the same time, they shorten processing times and improve the physical and chemical properties of textile materials.

Plasma technology offers an effective solution for surface modification and functionalization, while microwave energy ensures energy efficiency with uniform heat distribution. UV radiation is used in many areas such as adding antimicrobial properties, surface modification, improving color fastness, and surface disinfection.

However, some disadvantages limit the widespread use of these technologies, such as high initial investment costs, limited material compatibility, and potential health risks. In the future, overcoming these obstacles will require proper infrastructure investments and innovative studies to make these technologies more widely available.

In conclusion, the broader application of radiation technologies in textile finishing will play a critical role in achieving environmental and economic sustainability goals. New research in this field will increase the effectiveness of these technologies and lead to the transformation of the textile industry.

Özet

Katı ve sıvı yağlar, insan beslenmesinin temel bileşenleri arasında yer almakta olup, günümüzde dünya genelinde üretilen yağların yaklaşık %80'ini sıvı yağlar oluşturmaktadır. Ancak bu yağların kalitesi ve stabilitesi, içerdiği bileşikler nedeniyle olumsuz etkilenebilmektedir. Aynı zamanda bu yağlar üretim süreçlerinde çeşitli kontaminantlara maruz kalabilmektedir. Bu kontaminantlardan mineral yağlar, gıda güvenliği açısından önemli risk faktörü olup sağlık üzerinde olumsuz etkiler oluşturabilmektedir. Mineral yağlar birçok gıda ürününde ve özellikle işlenmiş yağlarda bulunmakla birlikte üretim sürecinin herhangi bir aşamasında ve tedarik zinciri boyunca bulaşma riski taşımaktadır. Başlıca kontaminasyon kaynakları; yakıt kalıntıları, egzoz gazları, toz önleyici ve yüzey temizleme ürünleri, ambalaj malzemeleri, proses kaynaklı bulaşılar olarak sıralanmaktadır. Yapılan çalışmalarda mineral yağların en fazla yemeklik yağlarda olduğu tespit edilmiştir. Mineral yağ bileşenleri, MOSH (Mineral Yağ Doymuş Hidrokarbonlar) ve MOAH (Mineral Yağ Aromatik Hidrokarbonlar) olmak üzere iki ana gruba ayrılmaktadır. Mineral yağ olan MOSH/MOAH, fosil kökenli karmaşık hidrokarbonların karışımından oluşmaktadır. Bulaşı kaynakları; paketleme kaynaklı, proses kaynaklı, plantasyon kaynaklı, çevresel etmenler kaynaklı ve sevkiyat kaynaklı olarak gruplandırılmaktadır. MOSH bileşikleri insan vücudunda birikerek özellikle karaciğer fonksiyonları üzerinde olumsuz etkilere yol açarken, MOAH bileşiklerinin genotoksik özellikler gösterebildiği ve hücrelerde DNA hasarına neden olarak kanserojen potansiyel taşıdığı belirlenmiştir. Bu nedenle, MOSH/MOAH bileşiklerinin gıdalardaki varlığı ve seviyelerinin yakından takip edilmesi gerekmektedir. MOSH/MOAH tespiti için en yaygın kullanılan yöntemler arasında gaz kromatografisi ile birleştirilmiş sıvı kromatografisi (LC-GC) ve kapsamlı çok boyutlu gaz kromatografisi (GC-GC) teknikleri yer almaktadır. Ancak bu bileşiklerin doğada yaygın bulunması ve çapraz kontaminasyona açık olması nedeniyle analizin doğruluğu zorlaşmaktadır. Mineral yağların insan sağlığı üzerindeki potansiyel riskleri göz önüne alındığında, MOSH/MOAH bulaşının azaltılması için kontaminasyon kaynaklarının belirlenmesi ve önleyici tedbirlerin geliştirilmesi büyük önem taşımaktadır. Bu doğrultuda, gıda endüstrisinde üretim süreçlerinin gözden geçirilmesi, ambalaj malzemelerinin güvenliğinin sağlanması ve ileri analiz tekniklerinin kullanılması gerekmektedir. Bu çalışmada, mineral yağların sağlık üzerine etkileri, kontaminasyon kaynakları, tespit yöntemleri ve MOSH/MOAH seviyelerinin azaltılmasına yönelik stratejiler ele alınacaktır.

Anahtar Kelimeler: MOSH, MOAH, mineral yağlar, kontaminant

MOSH/MOAH Contamination: Sources, Analytical Detection, and Health Effects

Abstract

Fats and oils are fundamental components of human nutrition, with liquid oils currently accounting for approximately 80% of the total fat production worldwide. However, the quality and stability of these oils can be adversely affected by their chemical composition. Additionally, these oils may be exposed to various contaminants during production processes. Among these contaminants, mineral oils pose significant risk factors in terms of food safety and can have negative impacts on human health. While mineral oils are found in many food products, especially processed oils, there is a risk of contamination at any stage of the production process and throughout the supply chain. The main sources of contamination include fuel residues, exhaust gases, anti-dust and surface cleaning agents, packaging materials, and process-related

contaminations. Studies have identified that mineral oils are most commonly found in edible oils. Mineral oil components are classified into two main groups: MOSH (Mineral Oil Saturated Hydrocarbons) and MOAH (Mineral Oil Aromatic Hydrocarbons). These compounds are mixtures of complex fossil-derived hydrocarbons. Sources of contamination are categorized as packaging-related, process-related, plantation-related, environmental, and transport-related. MOSH compounds can accumulate in the human body, particularly affecting liver functions, while MOAH compounds have been shown to exhibit genotoxic properties and may cause DNA damage in cells, indicating their potential carcinogenicity. Therefore, the presence and levels of MOSH/MOAH compounds in foods must be closely monitored. The most commonly used methods for the detection of MOSH/MOAH include liquid chromatography coupled with gas chromatography (LC-GC) and comprehensive two-dimensional gas chromatography (GC-GC) techniques. However, due to the widespread occurrence of these compounds in the environment and the possibility of cross-contamination, achieving analytical accuracy is challenging. Considering the potential health risks of mineral oils, it is crucial to identify the sources of MOSH/MOAH contamination and develop preventive measures. In this context, it is necessary to review production processes in the food industry, ensure the safety of packaging materials, and utilize advanced analytical techniques. This study will address the health impacts of mineral oils, sources of contamination, detection methods, and strategies for reducing MOSH/MOAH levels.

Keywords: MOSH, MOAH, mineral oils, contaminant

GİRİŞ

Tüketiciler, gıda zincirinde bulunan çeşitli mineral yağ hidrokarbonlarına (MOH) maruz kalabilmektedir (Bratinova ve ark., 2023). Mineral yağ hidrokarbonları (MOH), çevresel ve proses kaynaklı kontaminantlardır. Genellikle petrol türevli olup 10 ile 50 arasında karbon atomu içeren lipofilik (yağda çözünebilen) bileşiklerin kompleks bir karışımını temsil etmektedir (Bratinova ve ark., 2023; Xue ve ark., 2024). Gıdalardaki mineral yağ hidrokarbonlarının (MOH) başlıca kaynakları; gıda ile temas eden malzemelerden (FCM) migrasyon, gıda sınıfına uygun olmayan yağlayıcıların neden olduğu istem dışı kontaminasyon, çevresel kaynaklar veya katkı maddesi ve proses yardımcı maddesi olarak rafine mineral yağların kullanımıdır (Bratinova ve ark., 2023). Bu kontaminantlar, kimyasal yapılarına göre mineral yağ doymuş hidrokarbonlar (MOSH) ve mineral yağ aromatik hidrokarbonlar (MOAH) olmak üzere iki ana kategoriye ayrılmıştır. Her iki kategori, kendi içerisinde çeşitli alt sınıflara ayrılabilmektedir (Albendea ve Purcaro, 2025). MOSH ve MOAH'ın toksikolojik etkileri ve analitik zorlukları farklıdır (Bauwens ve Purcaro, 2024). MOAH fraksiyonunda sınıflandırma, bileşiklerin içerdiği aromatik halka sayısına göre yapılmakta olup, özellikle 3 ila 7 aromatik halka içeren bileşiklerin kanserojen, genotoksik ve mutajenik etkilerle ilişkili olduğu belirtilmiştir (Albendea ve Purcaro, 2025). Bu durum göz önüne alınarak Avrupa Gıda Güvenliği Otoritesi (EFSA), gıdaların MOAH içermemesi gerektiğini önermiştir ve Avrupa Komisyonu, gıdalarda ve gıda ile temas eden malzemelerde mineral yağ hidrokarbonlarının (MOH) varlığının izlenmesi gerekliliğini belirten (AB) 2017/84 sayılı tavsiye kararı yayımlamıştır (EFSA, 2012; Commission, 2017; Jaen ve ark., 2022a). MOSH bileşikleri açısından ise parafinler (doğrusal ve dallanmış alkanlar) ile naftenler arasında bir sınıflandırma yapılmaktadır. Mevcut toksikolojik veriler, MOSH bileşiklerinin hem hayvan hem de insan organ ve dokularında birikebildiğini ortaya koymakta olup bu birikimin ise karbon zincir uzunluğuna (genellikle C16–C35) ve hidrokarbonların yapısal özelliklerine bağlı olarak değişkenlik gösterdiğini belirtmektedir (Albendea ve Purcaro, 2025).

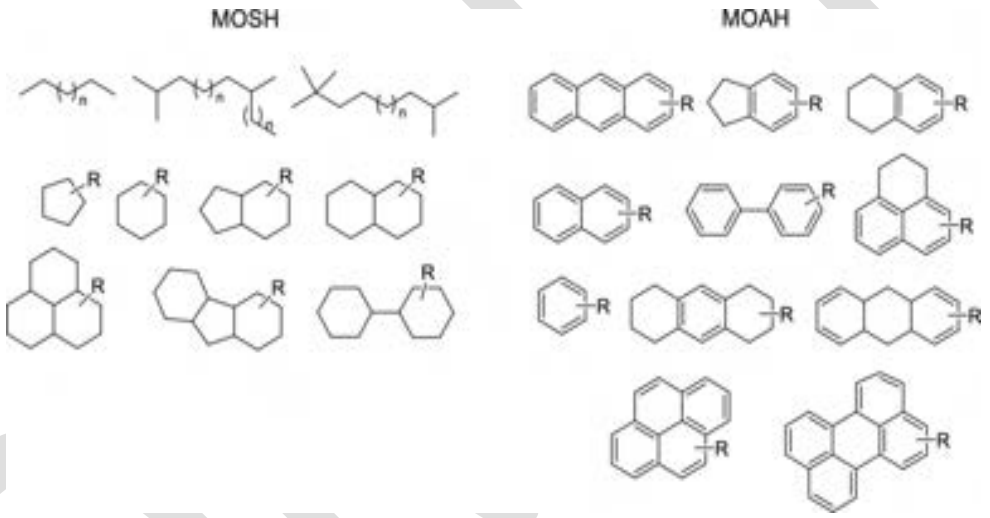
Geçmişte belirli ürünler için geçici limitler getirilmiştir; örneğin, 2008–2014 yılları arasında, mineral yağla kontamine olmuş Ukrayna ayçiçek yağı tedariki sonrasında Avrupa Komisyonu tarafından bu ürün için 50 mg/kg'lık geçici bir limit uygulanmıştır (Purcaro ve ark., 2016). 2022 yılında Avrupa Birliği Üye Devletleri ile Avrupa Komisyonu, yağlar ve katı yağlardaki toplam MOAH için 2 mg/kg'lık bir limit belirleme konusunda anlaşmaya varmışlardır (EC, 2022). Bu limit, Avrupa Komisyonu Ortak Araştırma Merkezi'nin (JRC) güncellenmiş kılavuzunda belirtilen en yüksek kabul edilebilir kantifikasyon sınırına karşılık gelmektedir (Bratinova ve ark., 2023). 2023 yılı sonunda Avrupa Komisyonu Sağlık ve Gıda Güvenliği Genel Müdürlüğü, bu sınır değerinin zeytinyağları da dâhil olmak üzere çoğu bitkisel yağ için geçerli olmasını öngören ve (AB) 2023/915 sayılı Yönetmelik'te değişiklik yapılmasına ilişkin bir taslak düzenlemeyi paydaşlara sunmuştur. Bu düzenlemenin 1 Ocak 2026 tarihinde yürürlüğe girmesi beklenmektedir. Bununla birlikte, zeytin küspe yağı için başlangıçta daha yüksek bir limit olan 10 mg/kg kabul edilmiştir; bu değerin 2030 yılına kadar kademeli olarak 2 mg/kg'a düşürülmesi planlanmaktadır (Craig, 2024).

Diğer yandan, mineral yağ doymuş hidrokarbon (MOSH) içeriğine ilişkin olarak, bitkisel yağlar ve katı yağlar için 15 mg/kg düzeyinde bir gösterge değer belirlenmesine yönelik bir öneri gündemdedir. Bu değerin aşılması halinde, gıda işletmecilerinin kontaminasyon kaynağını belirlemeye yönelik araştırmalar yürütmeleri ve gerekli risk azaltıcı önlemleri uygulamaları beklenmektedir (Ursol ve ark., 2025).

MOSH&MOAH'ın Gıdalarda Bulunma Kaynakları

Gıda tedarik zinciri, birbirine bağlı birçok adımdan oluşmakta olup hem doğal olarak bulunan hem de kontaminant niteliğindeki hidrokarbonlar bu zincirin herhangi bir aşamasında gıdaya bulaşabilmektedir. Mineral hidrokarbonların gıda hammaddelerinde ve işlenmiş ürünlerde tespit edilmesi; çevresel hava ve su kaynakları, tarımsal faaliyetler, işleme aşamaları ile gıda ile temas eden materyallerden kaynaklanan kontaminasyonlardan ileri gelebilmektedir (Bevan ve ark., 2020).

Gıda ürünlerinin korunması, taşınması ve depolanması amacıyla birincil, ikincil ve üçüncül ambalaj malzemesi olarak yaygın biçimde kullanılan kağıt ve karton, çeşitli kaynaklardan kaynaklanan mineral yağ hidrokarbonları (MOH) ile kontaminasyona açık hale gelebilmekte ve bu bileşikler ambalajdan gıdaya geçebilmektedir. Gıdalar, bu tür kimyasal bulaşanların yanı sıra dağıtım ve depolama sırasında mikrobiyal kontaminasyona karşıda hassastır. Bu durum, hem gıda güvenliğini tehdit etmekte hem de ekonomik kayıplara yol açmaktadır (Jaen ve ark., 2022b; Zhang ve ark., 2025).



Şekil 1. Mineral yağ doymuş hidrokarbonlarda (MOSH) ve mineral yağ aromatik hidrokarbonlarda (MOAH) bulunan temsili bileşiklerin kimyasal yapıları (Weber ve ark., 2018).

MOSH bileşikleri; lineer, dallanmış ve siklik yapıda doymuş hidrokarbonlardan oluşurken, MOAH fraksiyonu ise farklı sayıda yoğunlaştırılmış benzen halkası içeren ve büyük oranda (%98'in üzerinde) alkillenmiş aromatik hidrokarbonları kapsamaktadır. Bu yapısal farklılıklar Şekil 1'de detaylı olarak gösterilmektedir (Ursol ve ark., 2025; EFSA, 2012).

MOSH&MOAH'ın kimyasal yapılarından kaynaklanan apolar özellikleri, bu bileşiklerin yağlı matrislerle yüksek düzeyde etkileşim göstermesine neden olmakta ve bu durum, özellikle bitkisel yağlarda yaygın olarak bulunmalarını beraberinde getirmektedir. Yapılan analizlerde, MOSH'ın çevresel kontaminasyona bağlı seviyeleri, elle toplanmış hammaddeden laboratuvar ortamında doğrudan ekstrakte edilen örnekler de dahil olmak üzere neredeyse tüm bitkisel yağlarda tespit edilmiştir. Ancak mevcut miktarların düşük olması ve oksidasyona uğrama olasılığı nedeniyle çevresel kirlenmeye maruz kalmış örneklerde MOAH varlığına dair güçlü bir kanıt bulunmamaktadır (Menegoz Ursol ve ark., 2022).

Gıdalarda mineral yağ hidrokarbonları (MOH) kontaminasyonu çeşitli kaynaklardan kaynaklanabilmekte olup, özellikle geri dönüştürülmüş karton materyallerin ambalaj malzemesi olarak kullanımı önemli bir risk faktörü olarak değerlendirilmektedir. Gazete kâğıdı gibi geri dönüştürülmüş kağıtlara mineral yağ bazlı mürekkeplerle baskı yapılması, MOH kontaminasyonunun başlıca nedenlerinden biri olarak öne çıkmaktadır (Nestola ve Schmidt, 2017). Bu kontaminasyon, özellikle oda sıcaklığında buharlaşabilen

<C25 zincir uzunluğuna sahip hidrokarbonların gıdaya göç etmesiyle meydana gelmektedir. Her ne kadar mineral yağ içermeyen mürekkeplerle basılmış saf (virgin) kartonların kullanımıyla bu sorun büyük ölçüde giderilmiş olsa da, ambalaj üretiminde kullanılan tutkallar hâlâ potansiyel bir MOH kaynağı olmaya devam etmektedir. Ayrıca tarımsal üretim sürecinde kullanılan hasat makinelerine ait yağlayıcılar ve dizel yağları da mineral yağ hidrokarbonları (MOH) açısından önemli bir kontaminasyon kaynağı oluşturmaktadır. Bu duruma örnek olarak, ayçiçeği tohumlarında yağlayıcılardan kaynaklı yaklaşık 5 mg/kg ve dizel yağlarından kaynaklı yaklaşık 3 mg/kg düzeylerinde MOH tespit edilmiştir (Bevan ve ark., 2020).

Gıda ile temas eden malzemelerde sıcak eriyen yapıştırıcılar en çok kağıt, karton, belirli plastik filmler, metal ve cam gibi substratlarda kullanılır. Yapıştırıcılar çoğunlukla doğrudan gıdayla temas etmese de, yapılan bilimsel araştırmalar, üretimde kullanılan katkı maddeleri ile bileşenlerin bozunması ya da safsızlıklardan kaynaklanan istem dışı eklenen maddeler nedeniyle yapıştırıcılardan gıdaya çeşitli bileşiklerin geçiş yaptığını ortaya koymuştur. MOAH ise geri dönüştürülmüş kağıt ve karton ile bu yüzeylere uygulanan baskı mürekkeplerinden gıdaya geçebilmektedir. Çünkü mineral yağ hidrokarbonları (MOH), plastik ürünler, mumlar, yağlayıcılar ve yapıştırıcıların üretiminde kullanılmaktadır (Jaen ve ark., 2022c).

Albendea ve Purcaro (2025) tarafından yürütülen çalışmada, farklı et örneklerinde tespit edilen MOH kontaminasyon düzeylerinin önemli derecede değişkenlik gösterdiği rapor edilmiştir. Bu durum, nihai kontaminasyon seviyesinin; hayvanın mineral yağ hidrokarbonlarına (MOH) maruziyet derecesi, MOH'un farklı türlerdeki sergilediği toksikokinetik özellikler ile etin ticarileştirilmeden önce maruz kaldığı potansiyel dış kontaminasyon kaynakları gibi çok sayıda faktöre bağlı olarak değişebileceğini ortaya koymaktadır.

Mineral yağ bileşikleri, kozmetik ürünlerde içerik olarak bulunabileceği gibi, gıdalarda katkı maddesi veya istenmeyen kirletici olarak da bulunabilmektedir. Paketleme malzemeleri gibi gıda ile temas eden malzemeler de dahil olmak üzere teknik ürünlerde geniş uygulama alanı olması nedeniyle bu bileşiklerin özellikle yağ içeriği yüksek olan çikolata ve benzeri yağ bazlı gıdalara geçişi daha kolay gerçekleşmektedir (Weber ve ark., 2018). Hot melt (sıcak eriyen) yapıştırıcılar, katlanabilir kutuların yapıştırılması gibi gıda ambalajlarında yaygın olarak kullanılmaktadır. Düşük moleküler ağırlıklı hidrokarbonların bir kısmı, hot melt yapıştırıcılar doğrudan gıda ile temas edecek şekilde uygulanmadığından gaz fazı yoluyla gıdaya göç edebilmektedir. Yapılan bir çalışmada geri dönüştürülmüş ve saf lifli karton malzemeden üretilen katlanabilir kutulardan makarnaya hot melt yapıştırıcılardan doymuş hidrokarbonların göç ettiği bildirilmiştir (Lommatzsch ve ark., 2016). Mineral yağların diğer uygulama alanları arasında baskı mürekkepleri, kozmetik ürünler, ayırıcı maddeler (örneğin fırıncılık ve şekerleme endüstrileri için), gıda ambalaj malzemeleri (örneğin mumlu kağıt ve mumlu karton) ile teknik ürünler (örneğin yağlama yağları) gibi çeşitli kullanım alanları yer almaktadır (Weber ve ark., 2018). EFSA raporlarına göre, makinelerde kullanılan mineral yağlar nedeniyle çikolata ve fırıncılık ürünlerinde mineral yağ hidrokarbonlarına (MOH) rastlanmıştır (EFSA, 2012). Özellikle fırın ve çikolata sektörlerinde, ürünlerin kalıptan kolay ayrılmasını sağlamak ve yüzeylerin yağlanmasını kolaylaştırmak amacıyla parafin bazlı yağlar yaygın olarak kullanılmaktadır. Bu uygulamalar sonucunda ürünlerde 500–3000 mg/kg arasında MOH seviyeleri tespit edilmiş; bazı bisküvi örneklerinde ise 11 000 mg/kg'a kadar ulaşan yüksek düzeyler rapor edilmiştir (Bevan ve ark., 2020).

MOSH&MOAH'ın Analitik Tespiti

Mineral yağlar üzerine yapılan çok sayıda çalışmaya rağmen, bu maddelerin kimyasal analizleri hâlâ önemli bir analitik zorluk oluşturmaktadır. Bu zorluğun başlıca nedeni, mineral yağların kimyasal yapılarının son derece karmaşık olması ve bileşenlerin kromatografik olarak etkin bir şekilde ayrılmasının güçlüğüdür. Özellikle MOSH ve MOAH fraksiyonları, çözünmemiş çok sayıda bileşeni içeren geniş ve belirsiz tepe (hump) yapıları sergilemekte, bu da farklı yapıdaki bileşenlerin tespit edilmesini zorlaştırmaktadır (Biedermann & Grob, 2015; Gharbi ve ark., 2017). Bu durum, analiz edilen bileşenlerin doğru bir şekilde ayırt edilememesine ve dolayısıyla hatalı kantitatif sonuçlara yol açabilmektedir. Yapılan bir çalışmada, mineral yağ hidrokarbon (MOH) kontaminasyonunun düşük seviyelerde olduğu durumlarda mevcut analitik yöntemlerin kontaminasyonun varlığına ilişkin güvenilir sonuçlar sağlayamadığı belirtilmiştir. Bu nedenle, analizlerin doğruluğunu artırmak amacıyla iki boyutlu gaz kromatografisi (GC×GC), kütle spektrometresi (MS) ve kimyasal belirteçlerin kullanımı gibi tamamlayıcı tekniklerin uygulanması önerilmektedir. MOH kontaminasyonunun kaynağını belirlemede kimyasal belirteçlerin kullanımı oldukça

önemlidir. Örneğin, geri dönüştürülmüş kâğıt veya karton kaynaklı kontaminasyonu tespit etmek amacıyla diizopropilnaftalin yaygın bir gösterge bileşik olarak kullanılmaktadır. Kontaminasyonun karmaşık yapıda olduğu durumlarda, MOSH ve MOAH bileşiklerinin karakterizasyonu için kütle spektrometresi ve gösterge bileşiklerin kullanımı önerilmektedir. Ayrıca, kütle spektrometresinin tanımlayabildiği belirteç madde sayısının artmasıyla birlikte bu tekniğin ayırt edici gücünün de artacağı sonucuna varılmıştır (Jaen ve ark., 2022a).

Avrupa Komisyonu Ortak Araştırma Merkezi'nin (JRC) MOH'ların gıdalar ve gıda ile temas eden malzemelerdeki örnekleme ve analizine ilişkin rehberine göre alev iyonizasyon detektörü (FID) ile eşleştirilmiş çevrim içi yüksek performanslı sıvı kromatografi (LC)-gaz kromatografi (GC) yöntemi, MOH analizinde referans yöntem olarak kabul edilmektedir (Bratinova ve Hoekstra, 2019; Menegoz Ursol ve ark., 2022).

Kimyasal açıdan bakıldığında, MOAH çoğunlukla dallanmış aromatik halkalar içeren bileşiklerden oluşur ve genellikle doymuş hidrokarbonlar (MOSH) ile birlikte bulunurlar. Bu nedenle, MOAH'ın analiz edilebilmesi için MOSH'tan ayrılması gerekmektedir. MOAH analizinde tavsiye edilen yöntem, alev iyonizasyon detektörlü çevrimiçi sıvı kromatografi-gaz kromatografi (HPLC-GC-FID) tekniğidir (Jaen ve ark., 2022a). Gıdalar, gıda ile temas eden materyaller, dokular ve kozmetik ürünler gibi matrislerde mineral yağ doymuş hidrokarbonları (MOSH) ve aromatik hidrokarbonların (MOAH) analizi, çoğunlukla normal faz yüksek performanslı sıvı kromatografisinin (HPLC) gaz kromatografisi (GC) ve alev iyonizasyon dedektörü (FID) ile çevrimiçi bağlantılı kullanıldığı HPLC-GC-FID yöntemiyle gerçekleştirilmektedir (Biedermann ve ark., 2017).

Yapılan bir çalışmada, LC-GC × GC-FID/MS tekniğinin kullanımı, mineral yağ hidrokarbonlarının (MOH) rutin tayininde yaygın olarak kullanılan LC-GC-FID tekniğiyle karşılaştırılmıştır. Çalışma sonucunda, her iki yöntemin benzer sonuçlar sağladığı belirlenmiştir. Bununla birlikte, LC-GC × GC-FID/MS tekniği, özellikle işlenmemiş et numunelerinde tespit edilen MOSH ve MOAH kontaminasyon profiline ilişkin daha ayrıntılı ve kapsamlı bilgiler sunma açısından avantaj sağlamıştır (Albendea ve Purcaro, 2025). LC-GC-FID yöntemi, mineral yağ hidrokarbonlarının kantitatif analizinde güçlü ve güvenilir bir teknik olup, günümüzde rutin analizlerde yaygın olarak tercih edilmektedir. Ancak, bazı durumlarda hidrokarbonların türlerine ilişkin daha ayrıntılı bilgiye ihtiyaç duyulabilmektedir. Bu gibi durumlarda, kapsamlı iki boyutlu gaz kromatografisi (GC×GC) yöntemi, daha gelişmiş ayırım gücü sayesinde tercih edilen bir teknik olarak öne çıkmaktadır (Weber ve ark., 2018).

Günümüzde geliştirilen ileri düzey kromatografik yaklaşımlarda, LC-GC-FID ile elde edilen pozitif sonuçlar, doğrulama amacıyla GC×GC-MS analizleriyle desteklenmektedir. Weber ve ark. (2018), MOSH fraksiyonlarının bir kısmının MOAH olarak yanlış sınıflandırılması durumunda anlamlı düzeyde aşırı kantifikasyonun meydana gelebileceğini belirtmişlerdir. Bu nedenle, analitik özgüllüğün artırılması amacıyla, şüpheli numunelerin karakterizasyonunun LC-GC-FID, LC-MS, GC-MS veya GC×GC-MS gibi gelişmiş kromatografik tekniklerden biri kullanılarak gerçekleştirilmesi gerektiği sonucuna varılmıştır (Weber ve ark., 2018). Hot-melt yapıştırıcılardan kaynaklanan, düşük moleküler ağırlığa sahip hidrokarbonlar (en az C50 karbon numarasına kadar), MOSH ve MOAH analizlerinde yaygın olarak kullanılan çevrimiçi HPLC-GC-FID yöntemi ile analiz edilebilmektedir (Lommatzsch ve ark., 2016).

MOSH&MOAH'ın Sağlık Üzerindeki Etkileri

Mineral yağlar, günümüzde birçok gıda ürününde ve işlenmiş yağda tespit edilmekte olup, üretim sürecinin herhangi bir aşamasında ve tedarik zinciri süresince kalabilmektedirler (Grob, 2018). Bu kontaminasyonun potansiyel kaynakları arasında yakıtlar, egzoz gazları, toz önleyici ve yüzey temizleyici ürünler, yağlar ve ambalaj malzemeleri yer almaktadır (Polyakova ve ark., 2022). İnsanlarda MOH emilimini değerlendiren kontrollü çalışmalar sınırlı olsa da, MOSH'un karaciğer, dalak, yağ dokusu, mezenterik lenf nodları, akciğer ve anne sütü gibi farklı insan dokularında tespit edilmesi; bu bileşiklerin emildiğini, vücutta dağıldığını ve bazı dokularda biriktiğini ortaya koymaktadır (Bevan ve ark., 2020).

Yapılan çalışmalarda fare denekleri üzerine mineral yağ uygulandığında deri tümörlerine rastlandığı gözlenmiştir (Carrillo ve ark., 2022). Yapılan bir başka çalışmada, farklı MOSH fraksiyonları içeren diyetlerle beslenen farelerde karaciğer granülomlarının oluştuğu tespit edilmiştir. Ancak araştırmacılar, granülom oluşumunun artan MOSH maruziyetinden ziyade, MOSH bileşiklerinin karbon zinciri

uzunluğuna bağlı olarak arttığını belirtmişlerdir. Özellikle karbon sayısı >C25 olan MOSH'lara maruz kalımın, granülom oluşumunu daha fazla teşvik ettiği saptanmıştır (Nygaard ve ark., 2019).

İnsanlar üzerinde yapılan çalışmalar sınırlı olmakla birlikte, mevcut karaciğer biyopsi/otopsi örneklerinde MOH içeriğinin analizi yapıldığında kaynağın tıbbi kullanım veya ambalajdan kaynaklandığı şeklinde yorumlanmıştır. Ayrıca, insan dokularında biriken MOSH bileşiminin dokular arasında C uzunluklarına göre farklılık gösterdikleri gözlemlenmiştir. Örneğin, C25–C30 aralığındaki MOSH bileşikleri karaciğer ve dalakta birikirken, C16–C36 aralığındaki bileşiklerin ise karın dokusunda birikme eğiliminde olduğu bildirilmiştir. Bu aralıkların dışında kalan karbon zinciri uzunluğuna sahip MOSH bileşiklerinin doku birikimi ise net olarak belirlenememiştir (Bevan ve ark., 2019).

Hayvan deneylerine ilişkin mevcut verilerin büyük bir kısmı, çeşitli mineral yağ ve mumların yüksek diyet konsantrasyonlarında (%2'ye kadar) sıçanlara uygulanmasına dayanmaktadır ve bu çalışmaların odak noktası çoğunlukla karaciğer, dalak ve mezenterik lenf düğümlerinde (MLN) granülom oluşumunun değerlendirilmesidir (Barp ve ark., 2017).

Sezaryen sırasında alınan karın yağ dokusu örneklerinde, kadın gönüllülerde MOSH seviyeleri 15–360 mg/kg arasında değişmiş; ortalama 60.7 mg/kg, medyan ise 52.5 mg/kg olarak raporlanmıştır. Bu örneklerin %80'inin 30–200 mg/kg arasında olduğu bildirilmiştir (Bevan ve ark., 2020). Barp ve ark. (2014) tarafından yapılan bir diğer çalışmada ise, 25–91 yaş aralığında (ortalama 67) bulunan 37 bireyin çeşitli dokularında MOSH düzeyleri incelenmiş ve bireylerin %25'inde toplam MOSH birikiminin 5 gramı aştığı belirlenmiştir. Bu birikimin zamanla oluştuğu düşünülürken, örneklerde MOAH varlığına rastlanmamıştır. En yüksek MOSH düzeyleri mezenterik lenf nodlarında saptanmış; bunu sırasıyla karaciğer, yağ dokusu, dalak ve akciğer takip etmiştir. Böbrek, kalp ve beyin dokularında ise oldukça düşük düzeylerde bulunmuştur.

SONUÇ

Mineral yağlar, petrol kökenli maddeler olup doymuş ve aromatik hidrokarbonlardan oluşan karmaşık ve değişken bir bileşime sahiptir. Avrupa Gıda Güvenliği Otoritesi (EFSA), 2012 yılında yayımladığı "Gıdalarda Mineral Yağ Hidrokarbonları" konulu bilimsel görüşünde, bazı MOSH'ların (özellikle dallanmış ve siklo-alkanlar) insan dokularında birikim gösterebileceğine dikkat çekmiştir. Bununla birlikte, mevcut birikim verilerinin sınırlı olması nedeniyle, gıdayla maruziyete ilişkin güvenli alım düzeylerinin türetilemediği ifade edilmiştir (Isola ve ark., 2023). Karbon sayısı C20'nin altında olan alkanlar vücutta etkin bir şekilde emilmekte ve hızla metabolize edilerek birikmeleri engellenmektedir. Buna karşılık, C35'in üzerindeki alkanlar hücre zarlarını geçebilecek özellikte olmadıkları için biyoyararlanımları oldukça düşüktür ve bu nedenle dokularda anlamlı düzeyde birikim göstermemektedir. Karbon zincir uzunluğu C20–C35 aralığında olan alkanlar ise bazı dokularda birikme potansiyeline sahiptir. Güncel literatür verileri, aromatik hidrokarbonların insan dokularında tespit edilmediğini ortaya koymaktadır. Bu durum söz konusu bileşiklerin biyolojik olarak tutulma potansiyelinin bulunmamasına veya gıda ile temas eden materyaller üzerindeki düzenleyici kontrollerin etkili olması nedeniyle maruziyetin gerçekleşmemesine bağlanmaktadır (Barp ve ark., 2014). İnsan dokularında birikim gösteren MOSH fraksiyonları (özellikle C20–C35 aralığında yer alan yüksek derecede dallanmış alkanlar ve yoğunlaşmış sikloalkanlar) hayvan dokularında da bulunmakta ve karaciğer örneklerinde gerçekleştirilen GCxGC-FID kromatogramlarında "gri bulut" şeklinde görselleştirilebilmektedir (Isola ve ark., 2023).

MOSH bileşenlerinin karaciğer ve lenf düğümlerinde birikme eğiliminde olduğu bilinmekte olup, bu durum inflamasyon ve doku hasarına yol açabilmektedir. Öte yandan, MOAH fraksiyonu içerisinde yer alan polisiklik aromatik hidrokarbonlar (PAH'lar) potansiyel kanserojen özellikleriyle öne çıkmaktadır. Bu bileşikler metabolik aktivasyon sonucu DNA adükleri oluşturabilmekte, gen ekspresyonunu bozarak mutasyonlara neden olabilmekte ve dolayısıyla kanser riskini artırabilmektedir. Ayrıca, mineral yağların gıdalarda uzun süreli birikimi karaciğer fonksiyonlarını olumsuz etkileyerek bağışıklık sisteminin zayıflamasına neden olabilmekte ve kronik toksik etkiler ortaya çıkarabilmektedir (Deng ve ark., 2025).

Mineral yağ hidrokarbonları; çevresel yaygınlıkları, çapraz kontaminasyona açıklıkları ve doğal olarak bulunan birçok bileşenle birlikte ekstrakte edilmeleri nedeniyle analizi güç, yüksek belirsizlik içeren bileşiklerdir. Bu nedenle, bu kontaminantların güvenilir biçimde tespiti ve nicelendirilmesine yönelik analitik yöntemlerin geliştirilmesi, günümüzde hâlâ devam eden önemli bir araştırma konusudur. Sonuç olarak mineral yağ hidrokarbonları, doğrudan gıda bileşenlerinden ziyade, genellikle dış kaynaklı

kontaminasyon yoluyla gıdalara bulaşmakta ve bu durum gıda güvenliği açısından ciddi bir risk oluşturmaktadır. MOSH&MOAH kontaminasyonunun temel nedenleri arasında; gıda ile temas eden malzemelerden migrasyon, çevresel bulaşılar, proses ekipmanlarının yetersiz hijyeni veya aşınması sonucu yağlayıcı kullanılması ve ambalaj malzemelerinden kaynaklanan bulaşılar gibi endüstriyel ve çevresel faktörler yer almaktadır. Bu faktörlerden kaynaklı kontaminasyonlar gıdada istenmeyen MOH varlığına yol açmaktadır. Bu bağlamda, Avrupa Birliği'nin 2030 yılına kadar zeytin küspe yağı için MOAH sınırını kademeli olarak 2 mg/kg düzeyine indirme hedefi bu kontaminantların yönetiminde daha sıkı bir yaklaşımın benimsenmesini zorunlu kılmaktadır. Benzer şekilde, MOSH için önerilen 15 mg/kg'lık gösterge değer, üretici firmaların kontaminasyon kaynaklarını daha dikkatli izlemelerini ve düzeltici önlemler geliştirmelerini gerektirmektedir.

Özet
Sağlık Riski Değerlendirmesi (SRD), çevresel kirleticilerin insan sağlığı üzerindeki olası etkilerini belirlemek ve bu riskleri yönetmek için kullanılan bilimsel bir yaklaşımdır. Bu çalışmada, sağlık riski analizi: tehlike tanımlama, doz-tepki değerlendirmesi, maruziyet değerlendirmesi ve risk karakterizasyonu olmak üzere dört aşamada açıklanmıştır. Tehlike tanımlama aşamasında, belirli bir kimyasal maddenin insan sağlığına zarar verip vermediği belirlenmektedir. Doz-tepki değerlendirmesi, belirli bir maruziyet seviyesinin insan sağlığı üzerindeki etkilerini belirlemek için yapılmaktadır. Maruziyet değerlendirmesinde, insanların çevresel kirleticilere ne kadar ve hangi yollarla maruz kaldığı incelenmektedir. Son aşama olan risk karakterizasyonunda ise elde edilen veriler birleştirilerek sağlık riskleri niceliksel olarak belirlenmektedir. Bu çalışmada kriter hava kirleticilerinden olan partikül maddenin (PM) sağlık riski değerlendirmesi için lireratür taraması yapılmış ve yukarıda bahsedilen aşamaların açıklanmasında literatürde PM ile ilgili çalışmalara vurgu yapılmıştır. Çalışmada ayrıca risk değerlendirme sürecinde karşılaşılan belirsizlikler, kullanılan modeller ve veri eksiklikleri gibi faktörler de ele alınmıştır. Literatür taraması sonucunda, SRD'nin çevresel politikaların oluşturulmasında ve halk sağlığının korunmasında önemli bir araç olduğu, doğru ve kapsamlı analizlerin yapılabilmesi için güncel veri kaynakları ve gelişmiş modelleme tekniklerinin kullanılması gerektiği sonucuna varılmıştır.

Anahtar Kelimeler: Sağlık Riski, Hava Kirliliği, Partikül Madde, Kanser, Kanser Dışı, Soluma, Yutma, Deri Yolu.

Health risk assessment of environmental pollutants-literature review

Abstract
Health Risk Assessment (HRA) is a scientific approach used to determine and manage the potential effects of environmental pollutants on human health. This study explains health risk analysis in four stages: hazard identification, dose-response assessment, exposure assessment, and risk characterization. In the hazard identification stage, it's determined whether a specific chemical substance harms human health. Dose-response assessment aims to establish the effects of a particular exposure level on human health. Exposure assessment investigates how much and by what means people are exposed to environmental pollutants. Finally, in the risk characterization stage, the gathered data are combined to quantitatively determine health risks. In this study, a literature review was conducted for the health risk assessment of particulate matter (PM), a criterion air pollutant, emphasizing PM-related studies in the explanation of the aforementioned stages. The study also addressed factors such as uncertainties encountered in the risk assessment process, the models used, and data deficiencies. The literature review concluded that HRA is a crucial tool in shaping environmental policies and protecting public health, and that accurate and comprehensive analyses require the use of up-to-date data sources and advanced modeling techniques.

Keywords: Health Risk, Air Pollution, Particulate Matter, Cancer, Non-Cancer, Inhalation, Ingestion, Dermal Route.

DRAFT

GİRİŞ

Hızlı sanayileşme nedeniyle hava kirliliği küresel bir sorun haline gelmiş, hava kalitesini düşürerek çevresel dengesizliklere ve yılda 7 milyondan fazla erken ölüme yol açmaktadır (Fowler et al., 2020; Fadel et al., 2022; WHO 2016). Hava kirliliğinin sağlık etkileri tek bir maddeye bağlanamaz; atmosferdeki farklı gaz, partikül ve sıvıların birleşik etkileri söz konusudur (Elkama et al., 2021). Özellikle partikül madde (PM), ciddi bir tehdit olup Uluslararası Kanser Araştırma Ajansı (IARC, 2016) tarafından Grup 1 kanserojen olarak sınıflandırılmıştır. Gelişmekte olan bölgelerde PM maruziyeti, miyokard enfarktüsü, vasküler disfonksiyon, pulmoner yetersizlik, akciğer kanseri, KOAH ve astım gibi kardiyovasküler ve solunum yolu hastalıklarıyla ilişkilendirilmiştir (Du et al., 2016; Manisalidis et al., 2020; Fadel et al., 2022).

Hava kirleticileri organik ve inorganik olarak iki ana kategoriye ayrılır. Organik kirleticiler arasında polisiklik aromatik hidrokarbonlar (PAH'lar) ve benzen, toluen, etilbenzen, ksilen (BTEX) gibi bileşikler bulunur. BTEX, kentsel alanlarda en yaygın uçucu organik bileşikler (VOC'ler) olup sağlık riski taşırken (Kermani et al., 2020; Fadel et al., 2022), PAH'lar mutajenik ve kanserojenik etkileri nedeniyle tehdit oluşturur (Niu et al., 2017; Kermani et al., 2020). İnorganik kirleticiler arasında kurşun, kadmiyum, cıva, krom gibi ağır metaller ve asbest lifleri yer alır. Bu metaller çevrede kalıcı olup insan sağlığına ve ekosistemlere zarar verir (Wang et al., 2019; Kermani et al., 2020), asbest ise mezotelyoma ve akciğer kanserine yol açabilir (Taghizadeh et al., 2019; Kermani et al., 2020).

Atmosferik PM'nin bileşimi emisyon kaynakları, kimyasal olaylar ve kirletici taşınımı gibi faktörlere bağlıdır (Yu & Park, 2021; Fadel et al., 2022). Kentsel bölgelerde, toplam PM kütlesinin %20-70'ini oluşturan karbon bazlı aerosoller (organik karbon (OK) ve elementel karbon (EK)), hava kalitesini ve iklim değişikliğini olumsuz etkiler (Sharma et al., 2020). OK ve EK, organik materyallerin eksik yanması sonucu oluşur (Valle-Hernández et al., 2024). PM'deki OK, EK ve PAH'lar, reaktif oksijen türleri (ROT) üreterek oksidatif stres, iltihaplanma, astım ve diğer solunum hastalıklarını tetikleyebilir (Morgenstern et al., 2008; Yadav et al., 2021). Özellikle PM2.5 içindeki EK konsantrasyonları ile akciğer kanseri arasında güçlü bir ilişki bulunmuştur (Gauderman et al., 2004; Yadav et al., 2021).

İnsanların hava kirleticilerine maruz kalması başlıca soluma, yutma ve deri yoluyla emilim ile gerçekleşir. Solunan partiküller, boyut, şekil ve bileşime bağlı olarak solunum sistemi içinde farklı bölgelerde tutulur (Bell et al., 2009; Cochard et al., 2020). Özellikle PM2.5, alveollere ulaşarak kana karışabilir ve erken ölümlere neden olabilir (WHO, 2021; Fadel et al., 2022). Solunamayan partiküller yutma yoluyla vücuda girip ince bağırsakta emilebilir (Fadel et al., 2022). Deri yoluyla maruziyet ise kimyasalların deriden kana karışmasıyla olur, ancak diğer yollara göre daha sınırlıdır (Tuncel & Atimtay, 2023).

Sağlık risk değerlendirmesi çalışmaları, kimyasallara maruziyetin potansiyel olumsuz etkilerini tahmin etmek için önemlidir (USEPA, 2022; Fadel et al., 2022). Bu değerlendirmeler kanser ve kanser dışı sağlık risklerini inceler (OEHHA, 2001; Fadel et al., 2022). Değerlendirme araçları arasında BenMap-CE, COBRA, Air Q+ ve HAPIT bulunur (Gao et al., 2015; Farzaneh, 2019; Fadel et al., 2022). Ancak bu araçlar genellikle kükürt oksitler, azot oksitler, ozon ve partikül madde gibi temel kirleticilerin risklerini değerlendirmekle sınırlıdır (Fadel et al., 2022).

BULGULAR ve TARTIŞMA

1. Risk Değerlendirme Süreci

Sağlık riski değerlendirmesi (SRD), kimyasal maruziyetin insan sağlığı üzerindeki olası etkilerini belirlemeye yönelik dört aşamalı, yapılandırılmış bir yaklaşımdır (Tuncel & Atimtay, 2023). İlk iki aşama kimyasalın özelliklerini ve toksikolojik etkilerini incelerken, son iki aşama belirli maruziyet senaryolarına odaklanır (Tuncel & Atimtay, 2023).

1) Tehlike Tanımlama: Bu aşama, maruz kalınan kimyasalların olumsuz sağlık etkilerine yol açma potansiyelini belirleme sürecidir (Masters, 1991; OEHHA, 2001; Fadel et al., 2022). Dünya Sağlık Örgütü (WHO, 2021) gibi küresel sağlık kuruluşlarının toksisite sınıflandırmaları da değerlendirilir (Fadel et al., 2022). Bir kimyasalın kanserojen olup olmadığı, insanlardaki kanser insidansı, hayvan deneyleri, genotoksisite testleri, metabolik ve farmakokinetik özellikler ile fiziksel ve kimyasal özellikler dikkate alınarak belirlenir (Tuncel & Atimtay, 2023). Toksik kimyasalların kanserojen etkisi, "Weight of Evidence" (WoE) yaklaşımıyla vaka çalışmaları, epidemiyolojik araştırmalar ve hayvan deneyleri üzerinden değerlendirilir (Tuncel & Atimtay, 2023).

2) Doz-Tepki Değerlendirmesi: Bu aşamada, bir kirleticiye maruz kalınan doz ile canlının bu doza karşı gösterdiği sağlık tepkisi arasındaki ilişki incelenir (Patterson vd, 2002; Tuncel & Atimtay, 2023). Sağlık tepkisi, gözlemlenen olay sayısı veya bir popülasyonda tepkinin meydana gelme olasılığı olarak tanımlanabilir (USEPA, 1997; Tuncel & Atimtay, 2023). Bu ilişkinin doğası, kimyasalın özelliklerine ve kanserle ilişkili olup olmadığına göre değişir (OEHHA, 2001). Kanserojen kimyasallara çok düşük dozlarda bile maruz kalmak kanser riskini artırabilirken, kanser dışı tepkiler için bir eşik doz kabul edilir (Tuncel & Atimtay, 2023). Bazı kimyasallar her iki tür tepkiye de neden olabilir (Masters, 1991).

Kanser Risk Değerlendirmesi

USEPA'ya göre (1991), hiçbir maruziyet seviyesi tamamen kansersiz kabul edilemez; en düşük seviyelerde bile kanser riski bulunur. Moleküler olaylar mutasyonları tetikleyerek hücre hasarına ve kansere yol açabilir (Haber et al., 2012; Fadel et al., 2022). Bu etkiler, eşik değeri olmayan etkiler olarak sınıflandırılır ve herhangi bir maruziyet düzeyinde olumsuz sonuçlar doğurabilir (Fadel et al., 2022). Bu nedenle, kanserojen kirleticilere maruz kalmanın, doğrusal doz-tepki ilişkisi varsayımıyla, en düşük seviyelerde bile kanser riskini artırdığı kabul edilir (Fadel et al., 2022).

Kanser risk değerlendirmesi, kanserojen kimyasallara maruz kalma sonucu bireyin yaşamı boyunca kansere yakalanma olasılığını tahmin etmeyi amaçlar (OEHHA, 2001; Fadel et al., 2022). Bu risk, genellikle 70 yıllık bir yaşam süresi boyunca her bir milyon kişi başına tahmin edilen kanser vakası sayısı olarak ifade edilir (OEHHA, 2001; Fadel et al., 2022). Doz-tepki eğrisinin eğimi, potansiyel faktör (PF) veya eğim faktörü (EF) olarak adlandırılır ve birim doz başına kanser riskini tanımlar (USEPA, 1997; Tuncel & Atimtay, 2023). Belirli bir maruziyet yoluna ilişkin kanser riski, yaşam boyu ortalama günlük dozun, kanserojen eğim faktörüyle çarpılmasıyla hesaplanır (USEPA, 1989; Fadel et al., 2022).

Kanser Dışı Risk Değerlendirmesi

Kanser dışı sağlık riskleri, kanser risklerinin aksine, belirli bir eşik değerinin altında zararlı etki oluşturmadığı varsayılan sağlık sorunlarını içerir. Bu durum, vücudun adaptif koruyucu mekanizmalarına dayanır (Haber et al., 2012). Astım, nörolojik bozukluklar, doğum kusurları ve kardiyovasküler hastalıklar gibi sorunlar, kimyasal maruziyet arttıkça kötüleşebilir (OEHHA, 2001; Fadel et al., 2022).

Eşik değeri belirlemek için hayvan deneylerinde kirleticilere farklı dozlarda maruziyet uygulanır. Toksisite testleri, eşik altındaki dozların tepki oluşturmadığını, eşik üzerindeki dozların ise tepki vereceğini gösterir (Robson ve Toscana, 2007; Tuncel & Atimtay, 2023). Toksik etkilerin sınırları, Gözlemlenebilir Tepki Olmayan En Yüksek Doz ve En Düşük Dozda Gözlemlenen Tepki Düzeyi terimleriyle tanımlanır (Robson ve Toscana, 2007). Gerçek eşik, bu iki değer arasında bir noktadadır.

Farklı sağlık kuruluşları güvenli maruziyet sınırlarını farklı şekillerde tanımlar. USEPA Referans Doz (RfD) ve Referans Konsantrasyon (RfK) kavramlarını kullanırken, Dünya Sağlık Örgütü (WHO) Kabul Edilebilir Günlük Alım (KEGA) terimini tercih eder (Fadel et al., 2022). RfK, ömür boyu zararlı etki riski taşımayan tahmini soluma konsantrasyonunu, RfD ise günlük kabul edilebilir oral maruziyet değerini belirtir (USEPA IRIS, 2021; Tuncel & Atimtay, 2023). Uluslararası Kimyasal Güvenlik Programı ve Toksik Maddeler ve Hastalıklar Kaydı Ajansı (ATSDR) ise sırasıyla Tolere Edilebilir Alım (TEA) ve Minimum Risk Seviyesi (MRS) kavramlarını benimsemiştir (Pohl & Abadin, 1995; Fadel et al., 2022).

USEPA'ya (1989) göre, kanser dışı sağlık riski Tehlike Katsayısı (TK) ile ölçülür. TK, bireyin maruziyet düzeyinin (Ortalama Günlük Doz, OGD) RfD veya RfK gibi bir referans değere oranlanmasıyla hesaplanır (Fadel et al., 2022). Birden fazla kimyasal veya maruziyet yolundan kaynaklanan riskleri değerlendirmek için ise birden fazla tehlike katsayısının toplamı olan Tehlike İndeksi (Tİ) kullanılır (USEPA, 1991; Fadel et al., 2022). Belirsizlik faktörleri, genellikle on kat olarak belirlenir ve hamileler, bebekler, yaşlılar gibi hassas gruplar ile sağlıklı bireyler arasındaki farkları hesaba katmak için kullanılır. İnsan veya hayvan verileri yetersiz olduğunda da 10 katlık bir faktör geçerli olabilir. Her kimyasal için eğim faktörü, referans doz ve referans konsantrasyon farklıdır. Bu parametreler, EPA'nın IRIS Programı veri tabanında listelenmektedir (USEPA IRIS, 2021; Tuncel & Atimtay, 2023).

3) Maruziyet Değerlendirmesi: Bu aşama, insanların bir kimyasala ne kadar ne sıklıkla ve ne süreyle maruz kaldığını ölçme veya tahmin etme sürecidir (USEPA 1992; Tuncel & Atimtay, 2023). Özellikle hava yoluyla ya da diğer maruziyet yolları incelenir (USEPA, 1991; Fadel et al., 2022). Kimyasal alımını tahmin etmek için yaş, cinsiyet, vücut ağırlığı, solunum oranları ve günlük aktiviteler gibi faktörler dikkate alınır. Bu parametrelerle ilgili çalışmalar belirli bir popülasyon üzerinde gerçekleştirilmiş veya modelleme

yoluyla elde edilmiş olup literatürde yer almaktadır. Ancak, bu verilere ulaşılamadığında, maruziyet tahmini küresel referans değerler kullanılarak yapılır (USEPA, 1997; Tuncel & Atimtay, 2023).

4) Risk Kategorizasyonu: Bu son aşamada, önceki adımlardan elde edilen tüm veriler birleştirilerek maruz kalan nüfus için genel sağlık riski tahmini yapılır (Fadel et al., 2022). Doz-tepki değerlendirmesi sırasında elde edilen veriler, belirli bir popülasyonda kanserojen ve kanserojen olmayan etkileri içeren sayısal risk tahmini yapmak amacıyla maruziyet değerlendirmesinden sağlanan verilerle birleştirilir (USEPA, 1992; Tuncel & Atimtay, 2023). Kanser risk hesaplamaları, USEPA, IRIS (2021) tarafından sağlanan birim risk veya eğim faktörü değerleri temel alınarak gerçekleştirilir.

2. Risk Değerlendirme Metodolojisi

Sağlık risk değerlendirmesi, maruziyetin şiddetini belirlemek için kirletici madde konsantrasyonu, alım oranı ve maddenin toksik özellikleri gibi birden fazla faktörü göz önünde bulundurur (Fadel et al., 2022). Ayrıca vücut ağırlığı, maruziyet süresi ve sıklığı gibi bireysel özellikler de önemlidir. Bu parametreler, zararlı bileşiklerin insan sağlığı üzerindeki potansiyel etkilerini değerlendirmeye yardımcı olur.

İnsanların kirleticilere maruz kalma düzeylerine bağlı olarak sağlık risklerini değerlendirme yöntemi ilk kez 1970'lerde uygulanmaya başlanmış, ardından farklı risk türleri ve değerlendirme kriterleri için çeşitli yöntemler geliştirilmiştir (Tuncel & Atimtay, 2023). Birleşik Devletler Çevre Koruma Ajansı (USEPA), sağlık risk değerlendirme çerçevesini ilk olarak 1989 ve 1991 yıllarında tanıtmıştır (USEPA, 1989; 1991; Fadel et al., 2022). O zamandan bu yana, bu yaklaşım, çeşitli partikül madde bileşenlerine geniş bir şekilde uygulanmıştır (Fadel et al., 2022). Hem kanser hem de kanser dışı risk değerlendirmeleri, günlük maruziyet düzeylerinin değerlendirilmesini gerektirir. Bu değerler, mg/kg-gün cinsinden doz veya mg/m^3 cinsinden konsantrasyon olarak ifade edilebilir. Kanser dışı risk için günlük maruziyet dozu, ortalama günlük doz (OGD_i) olarak adlandırılırken, soluma maruziyet konsantrasyonu, havadaki maruziyet konsantrasyonu (MK_i) olarak belirtilir (Fadel et al., 2022). Bu değerler, birden fazla maruziyet yolunu dikkate alan ve solunum riskini hesaplamaya yönelik denklemler (Eşitlik 1, 2, 3 ve 4) kullanılarak belirlenir.

$$OGD_{i-soluma} = \frac{C_i \times MO_{soluma} \times TMSü \times MSı \times 10^{-6}}{VA \times OZ} \quad (1)$$

$$OGD_{i-yutma} = \frac{C_i \times MO_{yutma} \times TMSü \times MSı \times 10^{-6}}{VA \times OZ} \quad (2)$$

$$OGD_{i-deri} = \frac{C_i \times YA \times DYF \times DAF \times TMSü \times MSı \times 10^{-6}}{VA \times OZ} \quad (3)$$

$$MK_i = \frac{C_i \times MSü \times TMSü \times MSı \times 10^{-6}}{OZ} \quad (4)$$

Havadaki konsantrasyon (C_i), kirleticinin havadaki ortalama seviyesini (ng/m^3) ifade eder (USEPA, 2011; Fadel et al., 2022). Solunum yoluyla maruziyet oranı (MO_{soluma}), yetişkinler için 20 m^3/gün, çocuklar için ise 10 m^3/gün olarak belirlenmiştir (USEPA, 2011; Fadel et al., 2022). Yutma oranı (MO_{yutma}) ise çocuklar için 100 mg/gün, yetişkinler için 50 mg/gün raporlanmıştır (USEPA, 2011; Fadel et al., 2022). Solunum ve yutma oranları gibi bazı parametreler vücut ağırlığı (VA) gibi bireysel özelliklerle ilişkilidir. Maruziyet sıklığı (MSı) ve süresi (MSü) ise kirletici maddeyle temasa dair verileri yansıtır (Fadel et al., 2022).

Kanser riski değerlendirmesi için maruziyet süresi genellikle 70 yıl (25.500 gün) olarak kabul edilir ve yaşam boyu ortalama günlük doz (YB-OGD_i) Denklemler 1–4 kullanılarak hesaplanır (USEPA, 1989; 2011; Fadel et al., 2022). Maruziyet parametreleri yaş grubu (yenidoğan, çocuk, ergen, yetişkin), cinsiyet, meslek ve bölgesel demografik özelliklere göre değişir. Veri eksikliğinde USEPA tarafından belirlenen standart değerler kullanılır; örneğin, standart vücut ağırlığı değerleri yenidoğanlar için 7.8 kg, çocuklar için 25 kg, ergenler için 61 kg ve yetişkinler için 70 kg'dır (USEPA, 1991, 1997, 2011; Fadel et al., 2022). USEPA, maruziyet değerlendirmelerini desteklemek amacıyla 2011 yılında güncellenmiş bir Maruziyet Faktörleri El Kitabı geliştirmiştir (USEPA, 2011; Fadel et al., 2022). Benzer şekilde, Çin Çevre Bilimleri Araştırma Akademisi (CRAES) de kendi nüfusuna yönelik bir el kitabı yayınlamıştır (Duan, 2016; Fadel et al., 2022). Bu veri setleri, araştırmacıların nüfusa özgü maruziyet risklerini değerlendirmesine yardımcı olur.

Maruziyet sıklığı (MSı) mesleğe ve yaşam biçimine göre değişir; saha çalışanları ve kapalı alan çalışanları için 250 gün/yıl, sakinler için 350 gün/yıl belirlenmiştir (USEPA, 2002, 2004; Fadel et al., 2022). Maruziyet süresi (MSü) çocuklar için 6 saat/gün, yetişkinler için 8 saat/gün olarak tanımlanmıştır (Liu et al., 2018; Fadel et al., 2022). Toplam maruziyet süresi (TMSü) USEPA rehberine göre yenidoğanlar için 1 yıl,

çocuklar için 11 yıl, ergenler için 6 yıl ve yetişkinler için 52 yıldır (USEPA, 2011; Fadel et al., 2022). Ortalama zaman (OZ) ise kanserojen olmayan maddeler için OZ = TMSü × 365 gün, kanserojenler için ise OZ = 70 yıl × 365 gün olarak kabul edilmiştir (USEPA, 1989; Fadel et al., 2022).

Cilde maruz kalan yüzey alanı (YA) çocuklar için 2800 cm^2, yetişkinler için 5700 cm^2, açık alan çalışanları ve inşaat işçileri için 3300 cm^2'dir (USEPA, 2002, 2011; Fadel et al., 2022). Dermal yapışma faktörü (DYF) çocuklar için 0.2 mg/cm^2, yetişkinler için 0.07 mg/cm^2, açık alan çalışanları için 0.2 mg/cm^2 olarak verilmiştir (USEPA, 2002; Fadel et al., 2022). Dermal adsorpsiyon faktörü (DAF) bileşiğin türüne bağlıdır: poliaromatik hidrokarbonlar için 0.13, arsenik için 0.03, kadmiyum için 0.001 ve diğer elementler için 0.01 (USEPA, 2002, 2011; Fadel et al., 2022). Bu parametreler, çeşitli çevresel etkenlerin sağlık üzerindeki potansiyel etkilerini anlamada kritik bir rol oynar.

Kanser Dışı Risk Değerlendirmesi

Kanser dışı risk değerlendirmesi, tahmin edilen maruziyetin belirlenmiş referans değerlerle karşılaştırılmasını içerir. Ortalama günlük doz (OGD_i), referans doz (RfD_i) ile karşılaştırılırken, hava içindeki maruziyet konsantrasyonu (MK_i), solunum için referans konsantrasyon (RfK_i) ile karşılaştırılır. Referans doz (RfD_i), mg/kg/gün cinsinden ölçülen, insanlarda, özellikle hassas popülasyonlar arasında, yaşam boyu olumsuz sağlık etkilerine yol açma olasılığı düşük olan tahmin edilen günlük maruziyet seviyesini temsil eder (USEPA, 2022; Fadel et al. 2022). Benzer şekilde, referans konsantrasyon (RfK_i), mg/m^3 cinsinden ifade edilerek solunum risklerini değerlendirmek için kullanılır (Fadel et al. 2022). OGD_i ile RfD_i veya MK_i ile RfK_i arasındaki oran, kanser dışı risk değerlendirmesinde önemli bir gösterge olan tehlike katsayısını (TK_i) belirler. Bu oran, USEPA (1989, 1991, 2011) tarafından belirlenen Denklem 5 kullanılarak hesaplanır.

$$TK_i = \frac{OGD_i}{RfD_i} = \frac{MK_i}{RfK_i} \quad (5)$$

Fadel et al. (2022) tarafından derlenen referans doz (RfD_i) ve referans konsantrasyon (RfK_i) değerleri, polisiklik aromatik hidrokarbonlar (PAH'lar), ağır metaller, ftalatlar, dioksinler, furanlar ve dioksin benzeri poliklorlu bifeniller (PCB'ler) gibi çeşitli kimyasal sınıflar için kapsamlı bir kaynak sunmaktadır. Bu değerler, farklı maruziyet yolları ve türler için özel olup, kanser dışı risk değerlendirmesinde yardımcı olur. USEPA (2011) tarafından belirtilenlere göre, standart olmayan popülasyonlar için vücut ağırlığı düzeltmesi gerekmemektedir, çünkü Entegre Risk Bilgisi Sistemi (IRIS), RfD_i ve RfK_i değerlerini belirlerken varsayılan 70 kg vücut ağırlığını kabul etmemektedir (Fadel et al. 2022). Ayrıca, deri yoluyla maruziyet değerlendirilirken, dermal referans doz (RfD_{dermal}) ağız yoluyla alınan referans doz (RfD_{oral}) ile gastrointestinal emilim faktörü (GEF) kullanılarak Eşitlik 6'da açıklandığı şekilde türetilebilir (Fadel et al. 2022).

$$RfD_{dermal} = RfD_{oral} \times GEF \quad (6)$$

Risk değerlendirmesinde, gastrointestinal emilim faktörü (GEF) genellikle 1 olarak kabul edilir (USEPA 2004). Ancak antimon, baryum, berilyum, kadmiyum, krom (VI), manganez, nikel, gümüş ve vanadyum gibi bazı inorganik bileşikler için spesifik değerler (sırasıyla 0.15, 0.07, 0.007, 0.025, 0.025, 0.04, 0.04, 0.04 ve 0.026) kullanılır (USEPA 2004).

Kanser dışı risk değerlendirmesi, birden fazla kimyasal maddeye maruziyeti de kapsar (Fadel et al., 2022). Bu riskler; birden fazla maruziyet yoluyla bireysel tür bazında, belirli bir maruziyet yolu için tüm türlerin risklerini toplayarak veya tüm yollar boyunca tüm türlerin risklerini birleştirerek değerlendirilebilir (USEPA 1989, 1991, 2011). Toplam tehlike katsayısı (TTK_i), bir kimyasalın birden fazla maruziyet yolu boyunca kümülatif kanser dışı riskini temsil eder ve Denklem 7 kullanılarak hesaplanır. Bir kimyasal ailesinin belirli bir maruziyet yolu için toplu kanser dışı riskini değerlendirirken tehlike indeksi (Tİ) Denklem 8 ile hesaplanır. Son olarak, bir kimyasal ailesi için birden fazla maruziyet yolundan kaynaklanan toplam kanser dışı riski tahmin etmek için toplam tehlike indeksi (TTİ) Denklem 9'da gösterilmiştir. USEPA'ya (1997; 2011) göre, TK_i, TTK_i, Tİ ve TTİ değerlerinin 1'i aşması, kanser dışı sağlık etkilerinin daha yüksek olasılığını ve artan bir endişe seviyesini gösterir.

$$TTK_i = TK_{i-soluma} + TK_{i-yutma} + TK_{i-deri} \quad (7)$$

$$T\dot{I}_{soluma/yutma/deri} = \sum_i TK_{i-soluma/yutma/deri} \quad (8)$$

$$TT\dot{I} = T\dot{I}_{soluma} + T\dot{I}_{yutma} + T\dot{I}_{deri} \quad (9)$$

Kanser Riski Değerlendirmesi

Bir kimyasalın belirli bir maruz kalma yoluyla kanser riski (KR_i), maruziyet konsantrasyonu (MK_i) veya yaşam boyu ortalama günlük doz ($YB\text{-}OGD_i$) kullanılarak Denklem 10 ve Denklem 11 ile belirlenir (Fadel et al. 2022). Soluma yoluyla kanser riskini tahmin etmek için Soluma Birimi Riski (SBR_i) (m^3/mg cinsinden) kullanılır (USEPA 1997; Fadel et al. 2022). Benzer şekilde, kanser eğim faktörü (KEF_i) (kg gün/mg cinsinden), belirli bir maruziyet yolu için birim doz başına kanser riskini nitelendirir. Partikül madde içinde bulunan farklı bileşikler için KEF ve SBR değerleri Fadel et al. (2022) çalışmasında özetlenmiştir. Bu değerler, standart dışı vücut ağırlığına sahip bireyler için $(VA/70)^{1/3}$ düzeltme faktörü kullanılarak ayarlanır (USEPA 1997; Fadel et al. 2022). Ayrıca, deri kanser eğim faktörü, gastrointestinal emilim faktörü (GEF) mevcutsa, oral KEF değerlerinden Denklem 12 ile türetilebilir (Fadel et al. 2022).

$$KR_{i-soluma} = MK_i \times SBR_i \quad (10)$$

$$KR_{i-soluma/yutma/deri} = YB - OGD_i \times KEF_i \quad (11)$$

$$KEF_{deri} = KEF_{oral}/GEF \quad (12)$$

Belirli bir kimyasalın toplam kanser riski, birden fazla maruz kalma yolu boyunca risklerin toplamı olarak hesaplanır, bu Denklem 13'de gösterilmektedir (Fadel et al. 2022). Bir maruz kalma yolu içinde bir kimyasal grubu için, bir kimyasal ailesinin kanser riski Denklem 14 kullanılarak belirlenir (Fadel et al. 2022). Ayrıca, tüm yollar boyunca kümülatif maruz kalmayı göz önünde bulundururken, kümülatif kanser riski (KKR) Denklem 15 kullanılarak hesaplanır (Fadel et al. 2022).

$$Toplam\ KR_i = KR_{i-soluma} + KR_{i-yutma} + KR_{i-deri} \quad (13)$$

$$KR_{soluma/yutma/deri} = \sum_i KR_{i-soluma/yutma/deri} \quad (14)$$

$$Kümilatif\ KR\ (KKR) = KR_{soluma} + KR_{yutma} + KR_{deri} \quad (15)$$

USEPA'ya (1991; 1997) göre, 10^{-6}'lık bir kanser riski eşiği (bir milyon kişi başına bir ek kanser vakası) kabul edilebilir risk seviyelerini tanımlamak için kullanılır. 10^{-6} ile 10^{-4} arasındaki riskler, potansiyel endişe yaratırken, 10^{-4}'ün üzerindeki değerler yüksek kanser riski anlamına gelir (Chiang et al. 2009; Fadel et al. 2022). Ayrıca, kanser riski değerlendirmeleri yaş gruplarına göre sınıflandırılabilir ve ömür boyu kanser riski (ÖBKR) veya artan ömür boyu kanser riski (ÖBKR) tahmin etmek için Denklem 16 kullanılarak hesaplanabilir (Fadel et al. 2022).

$$\ddot{O}BKR = (KKR_{bebek} \times \frac{Es\ddot{u}_{bebek}}{70}) + (KKR_{çocuk} \times \frac{Es\ddot{u}_{çocuk}}{70}) + (KKR_{genç} \times \frac{Es\ddot{u}_{genç}}{70}) + (KKR_{yetişkin} \times \frac{Es\ddot{u}_{yetişkin}}{70}) \quad (16)$$

3. Risk Değerlendirmesinde Türlerin Konsantrasyonu

Hava kirleticilerinin risk değerlendirmesi hem gaz hem de partikül fazındaki bileşenlere maruz kalmayı inceler (Fadel et al. 2022). Değerlendirilen kimyasal sınıflar arasında elementler, polisiklik aromatik hidrokarbonlar (PAH'lar), ftalatlar, dioksinler, furanlar ve dioksin benzeri poliklorobifeniller bulunur. PAH'lar, çevrede uzun süre kalan ve toksisite açısından farklılık gösteren hidrofobik bileşiklerdir (Abdel-Shafy & Mansour 2016; Fadel et al. 2022). Ftalatlar, plastiklerde yaygın kullanılan sentetik kimyasallardır (USEPA 2012). Dioksinler, furanlar ve dioksin benzeri poliklorobifeniller ise uzun mesafeli atmosferik taşınıma izin veren yarı uçucu organik kirleticilerdir (Srogi 2008; Koukoulakis et al. 2020). Bu organik ve inorganik kirleticiler, partikül maddede az miktarda bulunsa da toksisiteye önemli katkı sağlarlar (Akhtar et al. 2010; Fortoul et al. 2015). Amonyum, sülfatlar, deniz tuzları ve kabuk elementleri gibi partikül madde kütlesinin büyük kısmını oluşturan bileşenlerin toksisitesi ise minimaldir (Borm et al. 2007; Fadel et al. 2022).

Elementler ve ftalatlar için risk değerlendirmesi genellikle bireysel yapılır. Örneğin, diethylftalat ve dibutylftalat sadece kanser dışı etkiler için değerlendirilirken, bis(2-ethylhexyl) ftalat ve butil benzilftalat hem kanser hem de kanser dışı riskler için değerlendirilir (Fadel et al. 2022). PAH'lar ve dioksinler arasında, benzo[a]piren (B[a]P) ve 2,3,7,8-tetrahlorodibenzop-diyoksin (2,3,7,8-TCDD) insan kanserojenleri olarak bilinir (IARC 2021; Fadel et al. 2022). Toksisitelerini nicelendirirken, toksik eşdeğer faktörü (TEF) uygulanır ve B[a]P ile 2,3,7,8-TCDD'ye referans toksisite değeri olarak 1 atanır (Berg et al. 2006; Fadel et al. 2022). PAH'lar, dioksinler ve furanlar için sağlık riski değerlendirmesi, benzo[a]piren eşdeğer konsantrasyonu ($B[a]P_{eq}$) ve 2,3,7,8-TCDD'nin toksik eşdeğer konsantrasyonu (WHO-TEK) kullanılarak yapılır. Bu değerler, Denklem 17 ve Denklem 18 kullanılarak belirlenir.

$$WHO - TEK = \sum_{i=1}^{n} C_i \times TEF_i \quad (17)$$

$$B[a]P_{eq} = \sum_{j=1}^{n} C_j \times TEF_j \quad (18)$$

C_i ve C_j (ng/m^3), dioksin, furan, dioksin benzeri PCB'ler, PAH'lar ve bunların türevlerinin konsantrasyonlarını temsil eder. TEF_i ve TEF_j, 2,3,7,8-TCDD ve B[a]P'ye göre toksik eşdeğer faktörleri belirtir (Collins ve diğerleri, 1998; Berg ve diğerleri, 2006; Fadel et al. 2022). İlgili TEF_i ve TEF_j değerleri, her konjenörün 2,3,7,8-TCDD ve B[a]P'ye kıyasla göreli toksisitesini belirten değerler Fadel et al. (2022)'in çalışmasında detaylandırılmıştır. Hesaplanan $B[a]P_{eq}$ veya WHO-TEK değerleri, günlük doz veya maruz kalma konsantrasyonunu belirlemek için daha sonra Denklemler 1-4'e dahil edilir, ardından kanser ve kanser dışı risklerin tahmin edilmesinde kullanılır.

4. Risk Değerlendirmede Belirsizlikler

Hava kirliliğinin insan sağlığına etkilerini niceliksel olarak değerlendiren çalışmalar, somut veriler sunsa da hava kirliliğinin karmaşık yapısı nedeniyle belirli gruplar ve genel popülasyon için kullanılan parametreler farklılık gösterebilir (Tuncel & Atimtay, 2023). Özellikle hayvan deneylerinden elde edilen verilerin insanlara uyarlanması gibi faktörler, sağlık riski modellerinde belirsizliklere yol açar. Bu belirsizliklerin derecesi; seçilen modeller, kullanılan parametreler ve veri eksikliği gibi etkenlere bağlı olarak değişir (IPCS, 2014; Tuncel & Atimtay, 2023) ve yalnızca analiz yapan uzmanlara değerlendirme aralıklarını ve olasılıkları göstermekle kalmaz, aynı zamanda karar vericiler ve toplum için sağlık risklerinin yorumlanmasını da etkileyebilir (ENHEALTH, 2012; Tuncel & Atimtay, 2023). Sağlık riski tahmininde bu belirsizlikler dört temel aşamada karşılaşılabilmektedir: maruziyet değerlendirmesinde; betimsel ve toplulaştırma hataları, model yapısı, doğrulama süreçleri ve parametre seçimleri belirsizliğe neden olur. Doz-tepki ilişkisi aşamasında ise veri kalitesi, çalışmalar arasındaki tutarsızlıklar ve farklı türler arası ekstrapolasyon gibi unsurlar belirsizlik kaynaklarıdır. Ayrıca, maruziyet süresi, dozu tahmin etme ve model seçimi gibi faktörler de sonuçları etkileyebilir. Son olarak, risk karakterizasyonunda; toksisite kriterleri ve senaryo değerlendirme süreçleri karar verme aşamasında belirsizliğe yol açmaktadır (Dong vd., 2015).

SONUÇ

Bu çalışma, hava kirleticilerine maruziyetin insan sağlığı üzerindeki etkilerini değerlendirmek için kullanılan Sağlık Riski Değerlendirmesi (SRD) sürecinin önemini vurgulamaktadır. PM2.5 ve PM10 gibi ince partiküller, solunum ve dolaşım sistemi hastalıkları açısından önemli bir risk faktörü oluşturmakta ve özellikle hassas gruplar (çocuklar, yaşlılar ve kronik hastalar) için ciddi sağlık sorunlarına yol açabilmektedir. Çalışmada ele alınan maruziyet değerlendirmesi, doz-tepki analizi ve risk karakterizasyonu, hava kirliliğine bağlı sağlık risklerini anlamada kritik bileşenlerdir. Ancak, bu süreçler belirsizlikler ve veri eksiklikleri nedeniyle kesin tahminler sunmakta zorlanmaktadır. Daha doğru risk değerlendirmeleri yapmak için maruziyet ölçümlerinin geliştirilmesi, modelleme tekniklerinin iyileştirilmesi ve uzun vadeli sağlık etkilerini içeren epidemiyolojik çalışmaların artırılması gerekmektedir. Gelecekteki araştırmalar, risk tahminlerindeki belirsizlikleri azaltmaya odaklanmalı ve politik karar alıcılara hava kirliliğinin sağlık üzerindeki etkilerini minimize etmeye yönelik daha sağlam kanıtlar sunmalıdır. Sağlık riski değerlendirme süreçlerinin iyileştirilmesi, çevre politikalarının geliştirilmesine ve halk sağlığının korunmasına önemli katkılar sağlayacaktır.

Özet

Bu çalışma, grafik tasarım alanında sürdürülebilirlik ilkesinin teorik temelleri ile uygulama alanlarını kapsamlı biçimde incelemektedir. Artan çevresel sorunlar karşısında tasarımcıların sorumluluk üstlenmesi gerektiği vurgulanarak, çevre dostu tasarım anlayışının tarihsel gelişimi, temel ilkeleri ve güncel uygulamaları ele alınmıştır. Geri dönüştürülmüş malzemelerin kullanımı, çevreye duyarlı baskı teknikleri, düşük enerji tüketimli dijital araçlar ve minimalist tasarım yaklaşımı gibi başlıklarda somut önerilere yer verilmiştir. Ayrıca grafik tasarım yoluyla çevresel farkındalık oluşturma gücü örnek kampanyalar üzerinden değerlendirilmiş; bireysel tasarımcılar ve kurumsal yapıların bu süreçte üstlenebileceği sorumluluklar tartışılmıştır. Kavramsal bir çerçevede ilerleyen çalışma, sürdürülebilir grafik tasarımın sadece çevreyi korumakla kalmayıp, aynı zamanda toplumsal bilinç oluşturma ve davranış değişikliği yaratma potansiyeline sahip olduğunu ortaya koymaktadır. Sonuç olarak, sürdürülebilirlik yaklaşımı, tasarım sürecine yeni olanaklar kazandıran bir etik çerçeve olarak ele alınmakta ve tasarımcıların bu dönüşümde aktif rol üstlenmesi gerektiği vurgulanmaktadır.

Sustainable Graphic Design: Eco-Friendly Design Principles

Abstract

This study comprehensively examines the theoretical foundations and application areas of the principle of sustainability in the field of graphic design. Against the backdrop of mounting environmental challenges, the text emphasises the responsibility of designers to embrace environmentally friendly design principles, tracing their historical evolution, fundamental principles, and contemporary applications. The text provides concrete recommendations on topics such as the use of recycled materials, environmentally friendly printing techniques, low-energy digital tools and minimalist design approaches. Additionally, the power of graphic design to raise environmental awareness is evaluated through exemplary campaigns, and the responsibilities that individual designers and corporate entities can take on in this process are discussed. The conceptual framework of the study reveals that sustainable graphic design not only protects the environment, but also has the potential to create societal awareness and behavioural change. In conclusion, the sustainability approach is considered to be an ethical framework that can open up new possibilities in the design process, and it is emphasised that designers must play an active role in this transformation

Keywords: Graphic Design, Sustainability, Eco-Friendly Design, Design Principles, Minimalist Approach.

GİRİŞ

Günümüzde iklim değişikliği, doğal kaynakların tükenmesi, çevre kirliliği ve ekosistem tahribatı gibi küresel çevre sorunları, yalnızca çevre bilimleri alanında değil, yaratıcı endüstrilerde de sorumluluk bilincini tetikleyen temel dinamiklerden biri haline gelmiştir. Bu bağlamda, grafik tasarım gibi görsel iletişimi merkezine alan disiplinlerin, sürdürülebilirlik ilkeleriyle uyumlu bir yaklaşım geliştirmesi kaçınılmazdır. Grafik tasarımın yalnızca estetik ve işlevsel bir iletişim aracı olmanın ötesine geçerek, çevresel etkileri göz önünde bulunduran bir üretim süreci haline gelmesi, tasarım pratiğinin yeniden tanımlanmasını gerektirmektedir (Papanek, 1971; Jedlicka, 2010).

Sürdürülebilir grafik tasarım, sadece geri dönüştürülebilir malzemelerin tercih edilmesiyle sınırlı kalmayıp; baskı tekniklerinden dijital üretim araçlarına, kullanıcı arayüzlerinden görsel dil tercihlerine kadar tüm süreçlerde doğaya duyarlı stratejiler geliştirilmesini kapsayan bütüncül bir yaklaşımdır (Allameh ve Jozam, 2020; Mirković ve ark., 2019). Bu kapsamda, kaynak kullanımını azaltan, karbon ayak izini düşüren ve

üretim döngüsünde ekolojik dengeyi gözeten tasarım çözümleri ön plana çıkmaktadır. Grafik tasarımcılar bu süreçte, geleneksel yöntemleri sorgulayan ve sürdürülebilir alternatifleri benimseyen karar vericiler olarak konumlanmaktadır (Regions, 2014). Aynı zamanda grafik tasarım, çevresel sorunlara ilişkin farkındalık yaratma ve toplumsal davranışları etkileme potansiyeline sahip güçlü bir iletişim aracıdır. Etkileyici görseller aracılığıyla geniş kitlelere ulaşabilen tasarımlar, çevre duyarlılığını artırmak ve sürdürülebilir yaşam alışkanlıklarını teşvik etmek açısından kritik bir rol üstlenmektedir (Strawzell, 2013; Utoyo ev ark., 2021). Bu bağlamda, grafik tasarım yalnızca mesaj taşıyan bir araç değil, aynı zamanda çevresel bilinç üretme sürecinin aktif bir bileşenidir. Örneğin, Şekil 1'de yer alan ve çevre ikonlarıyla dijital olarak bütünleştirilmiş bir deniz kaplumbağası görseli, tasarım ile doğa arasındaki ilişkinin sembolik temsillerinden biridir. Bu tür görseller, grafik tasarımın sürdürülebilirlik kavramını estetik düzlemde nasıl görünür kılabileceğine dair güçlü bir örnek sunar.

Şekil 1. Sürdürülebilir grafik tasarım kavramını sembolik olarak ifade eden bir görsel. Çevre ikonları ve bir deniz kaplumbağası, tasarım ile ekoloji arasındaki bağı vurgulamaktadır.

Dijitalleşmenin tasarım üretiminde merkezi bir konuma gelmesiyle birlikte, enerji verimliliği sağlayan dijital içerikler, çevre dostu kullanıcı arayüzleri ve minimalist tasarım anlayışları da sürdürülebilirlik ekseninde yeniden değerlendirilmelidir (VanEenoo, 2011; Palafox, 2019). Böylece grafik tasarım, yalnızca fiziksel üretim değil, aynı zamanda dijital ortamda da ekolojik sorumluluk taşıyan bir faaliyet alanı haline gelmektedir.

Bu çalışma, sürdürülebilir grafik tasarım kavramını kuramsal, tarihsel ve uygulamalı yönleriyle ele almakta; çevre dostu tasarım ilkelerinin tasarım sürecine entegrasyonunu örneklerle destekleyerek ortaya koymayı amaçlamaktadır. Malzeme seçimi, üretim teknikleri, dijital araç kullanımı ve toplumsal farkındalık kampanyaları bağlamında sürdürülebilirlik ilkesinin grafik tasarıma nasıl yansıtılabileceği analiz edilmekte; bireysel tasarımcılar ve kurumlar düzeyinde üstlenilebilecek roller kapsamlı biçimde değerlendirilmektedir. Sonuç olarak bu çalışma, grafik tasarımı yalnızca estetik bir ifade aracı olarak değil, aynı zamanda çevresel dönüşümün destekleyicisi olan stratejik bir iletişim pratiği olarak konumlandırmaktadır.

SÜRDÜRÜLEBİLİR GRAFİK TASARIM: TANIM VE KAVRAMSAL ÇERÇEVE

Grafik tasarımda sürdürülebilirlik, tasarım ürünlerinin yaşam döngüsü boyunca çevreye en az zarar verecek şekilde planlanması anlamına gelir. Bu yaklaşım, sadece geri dönüştürülebilir malzemeler kullanmak veya "yeşil" temalı görseller oluşturmakla sınırlı kalmayıp, tasarım sürecinin her aşamasında çevresel sorumluluk bilinciyle hareket etmeyi gerektirir. Fikir geliştirme, üretim, dağıtım ve kullanım aşamalarında çevresel etkileri minimize etmek sürdürülebilir grafik tasarımın temelini oluşturur. Sürdürülebilir grafik tasarım, "tüm yaşamın iyiliğini gözeten tasarım" olarak da tanımlanabilir ve bugünün ihtiyaçlarını karşılarken gelecek nesillerin kaynaklarını tehlikeye atmayan tasarımlar ortaya koymayı hedefler. Geleneksel grafik tasarım uygulamalarının önemli bir çevresel ayak izi olabilir. Kağıt kullanımı ormansızlaşmaya ve atık oluşumuna sebep olurken, kullanılan mürekkepler ve baskı kimyasalları üretim ve bertaraf süreçlerinde zararlı organik bileşikler yayarak hava ve su kirliliğine neden olabilir (Regions, 2014). Baskı süreçleri, enerji tüketimi ve nakliye de düşünüldüğünde karbon salınımına yol açabilir. Dijital grafik tasarım da enerji tüketimi açısından tamamen zararsız değildir; bilgisayarlar, sunucular ve veri merkezlerinin çalışması elektrik tüketimine neden olur ve bu enerjinin fosil yakıtlardan sağlanması karbon emisyonlarına yol açar. Sürdürülebilir grafik tasarımın önemi, hem tasarım sektöründe hem de toplumda giderek daha fazla anlaşılmaktadır. Tasarımcılar, mesajlarını görselleştirirken doğal kaynakları sorumlu bir şekilde kullanma yükümlülüğünü taşırlar. Bu yaklaşımın benimsenmesi, çevreye doğrudan fayda sağlamanın yanı sıra topluma da örnek olur. Tüketiciler, üzerinde "FSC sertifikalı kağıda basılmıştır" ibaresi bulunan bir broşür veya geri dönüştürülmüş malzemelerle üretilmiş bir ambalajla karşılaştıklarında, markaların ve tasarımcıların çevreye duyarlılığı hakkında olumlu bir algı geliştirirler. Sürdürülebilir

tasarım, doğru olanı yapmanın ötesinde, iletişim kurduğu kitleyi eğiten ve farkındalık kazandıran bir araç haline gelir (Allameh ve Jozam, 2020).

ÇEVRE VE TASARIM İLİŞKİSİNİN TARİHİ GELİŞİMİ

Grafik tasarım ile çevre bilincinin kesişimi yeni bir olgu değildir. 20. yüzyılın ikinci yarısından itibaren tasarımcılar, toplumsal ve çevresel meselelere görsel iletişimle dikkat çekmeye başlamıştır. Özellikle 1960'lar ve 1970'lerde yükselen çevre hareketi, grafik tasarımcılar için de ilham kaynağı olmuştur. 22 Nisan 1970'de kutlanan ilk Dünya Günü, çevresel farkındalık adına dönüm noktasıydı. Bu etkinlik kapsamında ünlü sanatçılar ve tasarımcılar çevre temalı posterler tasarladılar. Örneğin, Amerikalı sanatçı Robert Rauschenberg, ilk Dünya Günü için bir poster tasarlayarak çevre kirliliğine dikkat çekti. (Şekil 2)

Şekil 2. Robert Rauschenberg, ilk Dünya Günü için yaptığı poster (Rauschenberg, 1970)

Benzer şekilde karikatürist Walt Kelly, "Pogo" karakterini kullanarak "We have met the enemy and he is us" sloganıyla çevre sorunlarına insanın kendi etkisini vurgulayan bir poster hazırladı. Bu dönemden bir başka çarpıcı çalışma da grafik tasarımcı Seymour Chwast'ın 1968 tarihli "End Bad Breath" posteri idi. Her ne kadar Chwast'ın posteri doğrudan çevre kirliliğinden ziyade Vietnam Savaşı'na atıf yapsa da, kullanılan metafor (Uncle Sam'in ağzından dumanlar çıkması) hava kirliliği ve zehirli propagandayla özdeşleştirilerek dönemin protest ruhunu yansıtıyordu. Tasarımcılar, güçlü mesajlar içeren görsellerle kamusal tartışmalara katılmış ve değişim çağrılarını desteklemişlerdir (Strawzell, 2013).

1970 yılındaki ilk Dünya Günü'nde bir tasarım öğrencisi olan Gary Anderson, bugün tüm dünyada tanınan geri dönüşüm sembolünü yarattı (Şekil 3). Üç kıvrımlı oktan oluşan bu simge, kağıt geri dönüşümünü teşvik etmek amacıyla bir yarışma kapsamında geliştirilmiş ve hızla evrensel bir işaret haline gelmiştir. Sembolün üç okla çizdiği döngü, azalt-yeniden kullan-geri dönüştür (3R: reduce, reuse, recycle) prensiplerini temsil eder. Bu logo, belki de sürdürülebilir tasarımın grafik alandaki ilk ikonik örneğidir ve kamu malı (public domain) olarak serbestçe kullanıma açık olduğundan, çevre dostu uygulamaların yaygınlaşmasında büyük payı olmuştur. Geri dönüşüm sembolü, baskı tasarımında önemli bir yere sahiptir (Strawzell, 2013).

Şekil 3. Evrensel geri dönüşüm sembolü. (Container Corporation of America, 1970)

1980'ler ve 1990'lar, sürdürülebilir tasarım kavramının farklı tasarım disiplinlerinde kuramsal olarak ele alınmaya başlandığı dönemlerdir. 1987'de yayınlanan Brundtland Raporu ile sürdürülebilir kalkınma kavramı uluslararası ölçekte dikkat çekmiş; bu durum tasarım dünyasında da yankı bulmuştur. 1990'larda özellikle mimarlık ve endüstriyel tasarım alanlarında "yeşil tasarım" hareketi ivme kazanırken, grafik tasarım topluluğu da matbaa endüstrisindeki çevre sorunlarına eğilmeye başlamıştır. Bu dönemde Amerikan Grafik Tasarımcılar Birliği gibi mesleki kuruluşlar, tasarım ve baskı süreçlerinde çevresel sorumluluğu teşvik eden kılavuzlar yayımlamışlardır. Örneğin, AIGA'nın "Design and Environment" girişimleri, tasarımcılar ile kağıt/başım tedarikçileri arasındaki diyaloğu geliştirmeyi ve daha sürdürülebilir seçimleri özendirmeyi amaçlamıştır. 2000'lere gelindiğinde, dijital devrim ile birlikte grafik tasarımın

üretim ve dağıtım yöntemleri değişirken, sürdürülebilirlik boyutu yeni sorular ve fırsatlarla gündeme gelmiştir (örneğin çevrimiçi tasarımın enerji maliyeti, elektronik atıklar, vb.). Son yıllarda ise sürdürülebilir grafik tasarım, tasarım eğitiminin ve profesyonel pratiklerin ayrılmaz bir parçası haline gelmeye başlamıştır. Tasarım konferanslarında, akademik yayınlarda ve endüstri bloglarında sürdürülebilirlik sıkça tartışılan bir konu olmuş; genç tasarımcılar arasında eko-inovasyon, döngüsel tasarım ve sosyal sorumluluk kavramları önem kazanmıştır (Alahira ve ark., 2024). Özetle, grafik tasarımcılar tarih boyunca toplumsal meselelere duyarlı olmuş ve çevre hareketine de yaratıcı katkılar sunmuştur. Geçmişteki bu birikim, günümüz tasarımcılarına ilham vermekte ve sürdürülebilirlik odaklı bir tasarım kültürünün temellerini oluşturmaktadır.

SÜRDÜRÜLEBİLİR GRAFİK TASARIM İLKELERİ

Grafik tasarımda sürdürülebilirlik, teori kadar pratikte de kendini göstermelidir. Bir tasarımın sürdürülebilir olması, onu hayata geçirme sürecindeki tercihlerin çevre dostu olmasıyla mümkündür. Bu bölümde, sürdürülebilir tasarım anlayışının somut uygulama alanları ele alınacaktır: Geri dönüştürülmüş malzeme kullanımı, çevre dostu baskı teknikleri ve düşük enerji tüketimli dijital araçlar. Bu uygulamalar, grafik tasarımcının karar verebileceği farklı aşamalara karşılık gelir ve birlikte ele alındığında tasarım sürecinin bütününde bir dönüşümü ifade eder.

GERİ DÖNÜŞTÜRÜLMÜŞ MALZEMELERİN KULLANIMI

Basılı tasarım ürünlerinde en temel malzeme kağıttır ve kağıdın sürdürülebilir kaynaklardan gelmesi, çevresel etkinin azaltılmasında kritik bir rol oynar. Sürdürülebilir grafik tasarımın en önemli uygulamalarından biri geri dönüştürülmüş kağıt kullanımıdır. Geri dönüşüm kağıdı, atık kağıtların toplanıp yeniden hamur haline getirilmesiyle üretilir ve bu sayede yeni odun hamuruna duyulan ihtiyacı azaltır. Bu süreç, hem ağaç kesimini azaltır hem de kağıt atıklarının çöp sahalarında birikmesini önler. Geri dönüştürülmüş kağıt kullanımının karbon ayak izini küçülttüğü ve atık miktarını düşürdüğü belirtilmektedir. Günümüzde geri dönüşüm kağıtları, geçmişe kıyasla çok daha yüksek kalitede üretilebilmektedir. Farklı dokulara ve dayanıklılıklara sahip geri dönüştürülmüş kağıtlar, kartvizitlerden parlak dergilere kadar çeşitli ihtiyaçlara cevap verebilmektedir. Bu gelişmeler, tasarımcıların estetik veya kalite kaygısı duymadan geri dönüşümlü kağıda yönelebilmelerini sağlamaktadır. Kağıt seçiminde bir diğer sürdürülebilir yaklaşım, alternatif liflerden üretilmiş kağıtlar kullanmaktır. Örneğin, ağaç dışı kaynaklardan (keten, kenevir, buğday sapı gibi tarımsal atıklardan) yapılan kağıtlar son yıllarda dikkat çekmektedir (Plazonić ve ark, 2016). Bu tip kağıtlar, odun lifi yerine hızlı yenilenebilir veya atık lifleri kullandığı için ormanlar üzerindeki baskıyı azaltır. Tasarımcıların mümkün olduğunca odun dışı kağıtları veya %100 post-tüketici atıklardan üretilmiş kağıtları tercih etmesi önerilmektedir. PCW ibaresi, kağıdın tamamının tüketici sonrası atıklardan geri dönüştürüldüğünü, yani çöpe gidecek malzemelerin yeniden değerlendirildiğini gösterir. Bu tür kağıtlar, aksi halde çöplüklerde çürüyecek ve metan gazı salacak atıkları değerli bir kaynağa dönüştürür. Kağıt üretimi sırasında uygulanan işlemler de sürdürülebilirlik açısından önemlidir. Örneğin, beyazlatma (ağartma) işlemlerinde geleneksel olarak kullanılan klor, zararlı yan ürünler oluşturur. Bu nedenle, klor içermeyen (TCF – Totally Chlorine Free) veya elemental klor içermeyen kağıtlar tercih edilmelidir. Geri dönüştürülmüş kağıtlarda ise mümkünse PCF yöntemle, yani geri dönüştürme sürecinde klor kullanılmadan beyazlatma yapılmış kağıtlar kullanılabilir. Bu sayede klor kaynaklı dioksin gibi toksik maddelerin su sistemlerine karışmasının önüne geçilir. Kağıt tedarikinin sürdürülebilir olması sadece geri dönüşümle değil, aynı zamanda sorumlu ormancılık uygulamalarıyla da ilgilidir. Eğer bakir (geri dönüştürülmemiş) kağıt kullanılıyorsa, bunun FSC sertifikalı olmasına dikkat edilmelidir (FSC Paper, 2024). Forest Stewardship Council sertifikası, ilgili kağıdın veya ahşap ürünün sürdürülebilir orman yönetimi kriterlerine uygun kaynaklardan geldiğini garanti eder. FSC sertifikalı ormanlar, ağaç kesiminin kontrollü yapıldığı, biyoçeşitliliğin korunduğu, orman işçilerinin ve yerel halkın haklarının gözetildiği işletmelerdir. FSC'nin "Recycled", "FSC 100%" ve "FSC Mix" gibi etiketleri bulunmaktadır; örneğin "FSC Recycled" etiketi taşıyan bir kağıdın tamamen geri dönüştürülmüş içerikten yapıldığı anlamına gelir. Benzer şekilde PEFC sertifikası da dünya genelinde kabul gören bir diğer orman sertifikasyon sistemidir ve sürdürülebilir orman yönetimini teşvik eden standartları vardır

Sonuç olarak, bir grafik tasarım projesinde kağıt seçimi yapılırken sürdürülebilirlik adına sorulacak temel sorular şunlardır: Bu kağıt geri dönüştürülmüş mü? Değilse, sertifikalı sürdürülebilir bir kaynaktan mı geliyor? Üretiminde klor gibi zararlı kimyasallar kullanılmış mı? Bu sorulara verilen yanıtlar, tasarım

ürününün çevresel profilini belirler. Sürdürülebilir malzeme kullanımı, tasarımcıların kontrol edebileceği somut bir alandır ve nispeten küçük bir tercih değişikliğinin (örneğin kuşe kağıt yerine geri dönüştürülmüş kâğıt seçmek) bile ölçek etkisiyle ciddi kazanımlar sağlayabileceği unutulmamalıdır.

ÇEVRE DOSTU BASKI TEKNİKLERİ

Baskı süreçlerinde çevresel etkilerin azaltılması, sürdürülebilir grafik tasarım uygulamalarının temel hedeflerinden biridir. Özellikle kullanılan mürekkep türleri ve baskı sonrası işlemler, çevreye olan etkinin belirleyicileri arasında yer alır. Geleneksel ofset baskılarda kullanılan petrol türevi mürekkepler, üretim ve uygulama sırasında yüksek oranda uçucu organik bileşikler (VOC) salımı yapar. Bu bileşikler hem insan sağlığına zararlıdır hem de hava kalitesini olumsuz etkiler. Buna karşılık, soya ve diğer bitkisel yağ bazlı mürekkepler, VOC oranı düşük, yenilenebilir kaynaklara dayalı çevre dostu alternatiflerdir. Ayrıca bu tür mürekkepler, geri dönüşüm sırasında kâğıttan daha kolay ayrışarak geri kazanımı kolaylaştırır (Mirković ve ark., 2019). Renk ve efekt katkı maddeleri de sürdürülebilirlik açısından dikkatle seçilmelidir. Fosforlu veya metalik mürekkepler genellikle ağır metaller içerdiğinden, çevre dostu baskı prensipleri bu tür katkıların kullanımını sınırlandırır. Aynı şekilde, parlak selefon kaplamalar ve UV lak gibi uygulamalar da geri dönüşüm sürecini zorlaştırır. WWF, biyolojik olarak parçalanabilir laminatların dahi yapıştırıcıları nedeniyle geri dönüşüme engel oluşturabileceğini belirtmektedir (Sürdürülebilir Grafik Tasarım: Çevre Dostu Tasarım İlkeleri, n.d.). Bu nedenle, su bazlı vernikler veya kabartma gibi geri dönüşüm dostu tekniklerin tercih edilmesi önerilir.

Teknolojideki gelişmeler, baskı sektöründe daha çevreci uygulamaların yaygınlaşmasını sağlamaktadır. Eko-solvent yazıcılar, geleneksel solventlere göre daha az toksik çözücüler kullanarak dış mekân baskılarında güvenli seçenekler sunar. UV-LED baskı teknolojisi ise solvent içermez; UV ışığı ile anında kürlenen mürekkepler sayesinde VOC salınımı engellenir ve enerji verimli LED sistemleri kullanılır (Hall, A., 2024). Bunun yanı sıra, su kullanmayan ofset sistemleri ve kimyasalsız baskı kalıpları sayesinde hem su tüketimi azalır hem de atık suya karışan kirleticiler engellenir. Baskı sürecinde atık yönetimi de sürdürülebilirlik açısından kritik bir başlıktır. Sayfa yerleşimlerinin, kâğıt ölçüleri ve baskı tekniklerine uygun planlanması; kesim sonrası oluşabilecek fire miktarını en aza indirir. Ayrıca, sayfa üzerindeki mürekkep kaplama oranının azaltılması (yoğun renkli zeminler yerine açık tonlu arka planlar gibi) hem malzeme hem de enerji tasarrufu sağlar. Baskı sonrası ciltleme aşamasında kullanılan malzemelerin de çevreye etkisi göz önünde bulundurulmalıdır. Termal tutkallı veya plastik spiralli ciltleme yöntemleri geri dönüşüm açısından zorluk yaratırken; tel veya iplik dikişli ciltleme yöntemleri, kolay ayrıştırılabilir olmaları sayesinde çevre dostu seçenekler olarak öne çıkar (Abed El Salam, S. H.).

Sonuç olarak, tasarımcıların baskı öncesi süreçleri dikkatle planlaması ve matbaalarla etkin iletişim kurması sürdürülebilir uygulamaların başarısı açısından büyük önem taşır. Tasarım kararları, yalnızca estetik değil; aynı zamanda malzeme seçimi, baskı yöntemi ve geri dönüşüm uygunluğu gibi çevresel faktörleri de gözetmelidir. Bu yaklaşımla, baskı süreçleri boyunca çevre üzerindeki etki en aza indirilebilir.

DÜŞÜK ENERJİ TÜKETİMLİ DİJİTAL ARAÇLAR

Dijital ekranlar karşısında geçirilen sürenin artmasıyla birlikte, dijital grafik tasarım giderek daha merkezi bir rol oynamaktadır. Ancak dijital tasarım süreçlerinin fiziksel kaynak kullanmaması her zaman çevre dostu olduğu anlamına gelmez. İnternetin altyapısını oluşturan veri merkezleri ve kullanılan cihazlar, yüksek enerji tüketimi ve elektronik atık gibi çevresel sorunlara yol açabilir. Bu nedenle, dijital sürdürülebilirlik; yalnızca ürün değil, üretim araçları ve barındırma altyapısıyla birlikte düşünülmelidir. Tasarımcılar, kullandıkları donanımın enerji verimliliğine dikkat ederek sürece katkı sağlayabilirler. Energy Star gibi sertifikalı düşük tüketimli cihazların kullanımı, uyku modlarının etkinleştirilmesi ve gereksiz durumlarda cihazların kapatılması, toplam enerji tüketimini azaltan basit ama etkili adımlardır (Pimentel ve ark., 2008). Dijital ürünlerin enerji verimliliği ise özellikle web ve mobil arayüz tasarımında belirginleşir. Bu alanda gelişen “yeşil UX/UI” yaklaşımı, görsel ve işlevsel unsurların veri transferini minimumda tutacak şekilde optimize edilmesini önerir. Gereksiz animasyonlar, yüksek çözünürlüklü medya dosyaları ve karmaşık sayfa yapıları, cihazlarda ve sunucularda fazladan enerji tüketimine neden olabilir. Buna karşılık, sadeleştirilmiş tasarım, sıkıştırılmış görseller ve temiz kod yapısı, hem performansı artırır hem de çevresel etkiyi azaltır. Koyu arka plan tasarımları da özellikle OLED ve AMOLED ekranlı cihazlarda enerji tasarrufu sağlamaktadır. Bu nedenle birçok uygulama, kullanıcıya karanlık mod seçeneği

sunmaktadır. Ancak bu stratejinin her ekran türü için geçerli olmadığını ve erişilebilirlik açısından dikkatle uygulanması gerektiğini unutmamak gerekir. Barındırma altyapıları da dijital tasarımın sürdürülebilirliğinde kritik bir rol oynar. Web sitelerini destekleyen sunucular sürekli çalıştığından, bu sistemlerin yenilenebilir enerjiyle çalışıp çalışmadığı çevresel etkiyi doğrudan etkiler. Yeşil enerjiyle çalışan veri merkezlerini tercih eden hosting firmaları, daha sorumlu bir dijital tasarım yaklaşımının parçası olabilir (Website Sustainability, 2024). Tasarımcılar bu konuda farkındalık oluşturarak, müşterilerini de bilinçli tercihlere yönlendirebilir. Ayrıca, dijital içeriklerin dosya formatı ve boyutu da enerji tüketimini etkileyen önemli bir unsurdur. Statik görsellerin tercih edilmesi, animasyonların sınırlı kullanımı ve gereksiz medya öğelerinin kaldırılması; sunucu yükünü ve veri aktarım ihtiyacını azaltarak sürdürülebilirliği destekler. Örneğin, LED ekranlar için hazırlanan koyu zeminli dijital posterler, daha az enerji tüketir.

Sonuç olarak, dijital grafik tasarım sürecinde sürdürülebilirlik yalnızca estetik kararlarla sınırlı kalmamalı; kullanılan araçlardan, tasarım stratejilerine ve barındırma altyapısına kadar bütüncül bir yaklaşım benimsenmelidir. Enerji verimliliği, temiz enerji kullanımı ve veri yönetimi gibi faktörler dikkate alındığında, dijital tasarım çevresel sorumlulukla uyumlu bir üretim alanı haline gelebilir.

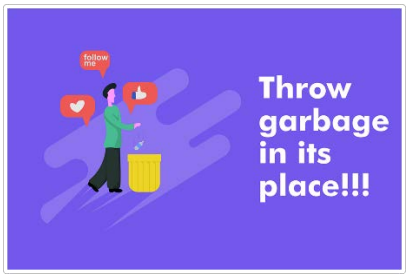
MİNİMALİST TASARIM İLE ENERJİ VE KAYNAK TASARRUFU

Minimalizm, tasarımda yalnızca estetik bir tercih değil, aynı zamanda sürdürülebilirlik açısından da önemli bir yaklaşımdır (vanEenoo, 2011). “Az çoktur” anlayışıyla hareket eden minimalist tasarım, gereksiz unsurları ortadan kaldırarak yalnızca temel öğelere odaklanır. Bu sadeleştirme, hem üretim hem de kullanım aşamalarında kaynakların daha verimli kullanılmasına katkı sağlar. Basılı materyallerde minimalizm; daha az mürekkep kullanımı, sınırlı sayfa sayısı ve kompakt boyutlar gibi avantajlar sunar. Örneğin, geniş beyaz alanlar içeren sade bir poster tasarımı, malzeme ve enerji tasarrufu sağlar. Ambalaj tasarımlarında ise gereksiz katmanlardan kaçınmak bu yaklaşımı destekler. Dijital mecralarda da minimalist tasarım enerji tüketiminin azaltılmasına katkı sunar. Basit arayüzler, cihazların işlem gücünü daha az kullanarak web sitelerinin daha hızlı yüklenmesini ve mobil cihazların pil ömrünün uzamasını sağlar (Selcová, 2014). Küçük dosya boyutları ve statik içerikler veri transferini ve enerji kullanımını düşürür (Palafox, 2019). Bu yönüyle minimalizm, tasarımcının kaynak kullanımına dair bilinçli kararlar almasını gerektirir. Tasarım sürecinin başında "Bu kadar sayfaya ihtiyaç var mı?" veya "Bu grafik mesajı gerçekten güçlendiriyor mu?" gibi sorgulamalar yapılmalıdır. Renk sayısını azaltmak ise doğrudan mürekkep tüketimini azaltarak çevresel etkiyi sınırlar. Minimalist tasarımlar aynı zamanda uzun ömürlüdür; geçici trendlere bağlı kalmaz ve zamansız nitelikleri sayesinde yıllarca kullanılabilir (Gumber, 2023). Sade bir logo, güçlü bir görsel kimlik sunarken sürekli yenileme ihtiyacını da azaltır. Her ne kadar her proje için uygun olmasa da minimalizmin temel ilkesi, yalnızca gerekli olanı korumak ve fazlalıkları elemektir. “Bu öğe olmazsa ne kaybederim?” sorusu, tasarımın işlevselliğini ve sürdürülebilirliğini değerlendirmek açısından önemli bir yol göstericidir.

Özetle, minimalizm sürdürülebilir grafik tasarımın görünmeyen ancak etkili bir dayanağıdır. Gösterişten uzak, amacı merkeze alan her tasarım; daha az kaynakla üretim yapılmasını, kullanım sırasında daha az enerji tüketilmesini ve dolayısıyla çevresel etkilerin azaltılmasını sağlar. Minimalist yaklaşım, tasarımcılara hem estetik hem de etik bir çerçeve sunar. Nihayetinde, en sürdürülebilir malzeme hiç tüketilmeyen malzemedir — minimalizm ise bunu baştan hedefler: Gereksiz tüketimi önlemek.

GRAFİK TASARIM YOLUYLA ÇEVRESEL FARKINDALIK

Grafik tasarım, çevresel sorunlara dikkat çekmek ve toplumsal farkındalık oluşturmak açısından güçlü bir iletişim aracıdır. Görsel tasarımlar; karmaşık çevre meselelerini sadeleştirerek geniş kitlelere etkili biçimde aktarabilir. Özellikle afişler, sosyal kampanya görselleri ve infografikler, çevresel farkındalık oluşturma süreçlerinde önemli rol oynar (Utoyo et al., 2021). 1970'lerden bu yana grafik tasarım, çevre hareketlerinin görsel yüzü haline gelmiş; bu dönemde tasarımcılar ormansızlaşma, kirlilik ve iklim değişikliği gibi sorunlara dikkat çekmek amacıyla çarpıcı görsel metaforlar geliştirmiştir.



Şekil 4. Basit ve etkili bir çevre farkındalığı posteri örneği.

Benzer şekilde, küresel ölçekte düzenlenen kampanyalar için geliştirilen grafik tasarımlar da çevresel iletişimde kritik rol oynar. Dünya Saati etkinliği kapsamında tasarlanan "60+" logosu, karanlık zemin üzerinde dünya sembolüyle enerji tasarrufu çağrısında bulunur. Bu logo, yalnızca bir saatlik eylemle sınırlı kalmayıp, sürdürülebilir yaşam alışkanlıklarına dikkat çekmeyi amaçlamaktadır. Kampanya sürecinde şehir silüetlerinin karartılması gibi sembolik görseller, bu mesajı daha da pekiştirmiştir. Grafik tasarım ayrıca, infografikler aracılığıyla çevresel verileri sadeleştirip anlaşılır hale getirmekte de etkilidir. Örneğin, plastik atıkların okyanuslara etkisini gösteren infografikler; konunun hem bilimsel hem de duygusal boyutuna hitap ederek izleyicide farkındalık yaratır. Ayrıca grafik tasarım, çevre odaklı protesto ve aktivizmin de görsel dilini oluşturur. İklim grevlerinde kullanılan dövizler, yaratıcı tipografiler ve "There is no Planet B" gibi küresel sloganlar, genç kuşağın çevresel kaygılarını görünür kılar. Bu süreçte Do The Green Thing, Poster for Tomorrow gibi platformlar, tasarımcıların çevreci mesajlarını paylaşabilecekleri ortamlar sunar ve katılımcı farkındalığı teşvik eder.

Sonuç olarak, grafik tasarım; bilgi aktarımı, toplumsal etki ve duygusal bağ kurma potansiyeli sayesinde çevresel iletişimde vazgeçilmez bir araçtır. Etkili bir görsel, karmaşık bir rapordan daha hızlı ve kalıcı biçimde etki yaratabilir. Tasarımcılar bu potansiyelin farkında olarak, çevre temelli projelerde yalnızca estetik değil, etik sorumluluk da üstlenmelidir. Bu bağlamda grafik tasarım, yalnızca bir iletişim biçimi değil, aynı zamanda sürdürülebilir bir gelecek için dönüşüm aracı olarak değerlendirilmelidir.

SÜRDÜRÜLEBİLİR GRAFİK TASARIM UYGULAMALARINA YÖNELİK ÖNERİLER

Sürdürülebilir grafik tasarım ilkelerini hayata geçirmek, hem bireysel tasarımcıların hem de kurumların bilinçli çabalarını gerektirir. Yalnızca tasarımcıların kendi pratiklerini değiştirmesi yetmez; müşterilerin, baskı tedarikçilerinin ve genel iş kültürünün de bu değişime uyum sağlaması önemlidir. Bu bölümde, bireysel düzeyde tasarımcıların neler yapabileceği ve kurumsal düzeyde hangi politikaların uygulanabileceği ele alınacaktır.

Bireysel Tasarımcılar Olarak: Grafik tasarımcılar, projelerin her aşamasında sürdürülebilirlik için adımlar atabilirler. Tasarımcılar, her projede "Bu işi daha çevre dostu nasıl yapabilirim?" sorusunu sormalıdır. Örneğin, kağıt seçiminde müşteriyi geri dönüşümlü kağıda yönlendirebilir veya tek renkli tasarımlar önerebilirler. Sürdürülebilirlik konusunda güncel kalmak ve yeni çıkan çevre dostu malzemeler hakkında bilgi edinmek önemlidir. Re-nourish gibi kaynaklar ve karbon ayak izi hesaplama araçları tasarımcılara yardımcı olabilir. Müşteri iletişiminde sürdürülebilirlik elçisi olarak, önerilen çözümlerin çevresel faydalarını vurgulamak önemlidir. Ofis içinde kağıt israfını önlemek ve elektronik cihazları verimli kullanmak da bireysel düzeyde atılabilecek adımlardır. Uzaktan çalışma ve dijital onay süreçleri yaygınlaştırılarak karbon ayak izi düşürülebilir. Sürdürülebilir tasarım, çevresel, sosyal ve ekonomik faktörleri ön planda tutarak kaynakların verimli kullanılmasını ve gelecek nesillerin ihtiyaçlarının karşılanmasını sağlar.

Kurumsal Düzeyde (Ajanslar ve Şirketler): Kurumsal düzeyde, grafik tasarım hizmeti veren ajanslar, matbaalar veya tasarıma ihtiyaç duyan şirketler, sürdürülebilirliği iç politikalarıyla teşvik edebilirler. Kurumlar, üst yönetim desteğiyle kapsamlı bir sürdürülebilirlik politikası oluşturup uygulayabilirler. Örneğin, bir reklam ajansı, tedarikçi seçiminde yeşil kriterler belirleyebilir ve sadece FSC sertifikalı kağıt kullanan matbaalarla çalışabilir. Şirketler, tasarım çalışmalarının etkisini azaltmak için basit önlemler alabilirler (Alahira ve ark., 2024). Örneğin, katalog boyutlarını küçültebilir, geri dönüştürülmüş kağıt seçebilir ve baskı adedini optimize edebilirler. Kurumlar, basılı iletişimi dijital ortama kaydırarak kağıt

tüketimini azaltabilirler. Kurum içi tasarım ekipleri veya ajanslar, çalışanlarına yönelik eğitimlerle sürdürülebilir tasarım farkındalığı yaratmalıdır. Şeffaflık ve hesap verebilirlik mekanizmaları kurmak da önemlidir; şirketler, yıllık sürdürülebilirlik raporlarında iletişim faaliyetlerinin çevresel etkisini raporlayabilirler. Tedarik zinciri iş birlikleri de kurumsal düzeyde kritik bir faktördür. Tasarım ajansları, birlikte çalıştığı matbaaları yeşil uygulamalar konusunda teşvik edebilir (Studio Carbon Negative, 2013). Kurumlar arası iyi uygulama paylaşımları da önemlidir (MaCher: Sustainable Promotional & Packaging Design, 2025). Sektör dernekleri veya mesleki konferanslar yoluyla, firmalar sürdürülebilir tasarım yolculuklarını ve öğrendiklerini birbirine aktarmalıdır (Harris, 2021).

Son olarak, hem bireysel hem de kurumsal düzeyde belki de en kritik unsur, tutarlılık ve samimiyettir. "Yeşil yıkama" (greenwashing) olarak bilinen, sadece çevreci görünmek için yüzeysel adımlar atıp bunu abartılı biçimde pazarlama hatasına düşmemek gerekir. Tasarımcılar, eğer bir proje gerçekten çevreci değilse onu öyleymiş gibi göstermemeli; kurumlar da sürdürülebilirlik ilkelerini reklam sloganı yapıp iç uygulamalarında bunu boşlamamalıdır. Bu denge kurulduğunda, yapılan işler hem etik hem de iletişim açısından güçlü olacaktır.

SONUÇ

Sürdürülebilir grafik tasarım, gezegenimizin geleceği için tasarım disiplininin üstlendiği kritik bir sorumluluktur. Bu yaklaşım, grafik tasarım süreçlerinde ekoloji, ekonomi ve estetiğin dengeli bir biçimde bir araya getirilmesini gerektirir. İncelediğimiz üzere, sürdürülebilirlik kavramı basılı malzeme seçiminden baskı tekniklerine, dijital tasarım uygulamalarından minimalist anlayışa kadar geniş bir yelpazede somut adımlara dönüşebilmektedir. Her bir adım, tek başına küçük görünse de birleştiğinde anlamlı bir fark yaratır. Elbette sürdürülebilir tasarım, bir gecede tamamlanacak bir hedef değildir; bu daha çok süreklilik arz eden bir yolculuktur. Tasarımcılar ve kurumlar, teknolojinin ve bilginin gelişimiyle birlikte sürekli öğrenmeli, uygulamalarını güncellemelidir. Örneğin, bugün ideal gördüğümüz bir malzeme veya teknik, yarın daha iyisi bulunduğunda değişebilir. Bu yüzden esneklik ve yeniliğe açıklık önemlidir. Sürdürülebilirlik, tasarım pratiğine yerleştiğinde, aslında inovasyonu da beraberinde getirir – çünkü daha iyiyi, daha verimliyi arama çabası, yaratıcılıkla beslenecektir. Bu makalede vurguladığımız gibi, grafik tasarım yoluyla sadece ürünlerin çevresel ayak izi azaltılmakla kalmaz, aynı zamanda toplumun çevre konusundaki algısı da şekillendirilebilir. Tasarım, bir sorun karşısında umutsuzluğu değil, aksine çözümün parçası olma motivasyonunu tetiklemelidir. Çarpıcı bir poster, ilham verici bir logo, bilgi dolu bir infografik – bunların her biri insanları düşünmeye ve eyleme geçmeye davet edebilir. Sürdürülebilir grafik tasarım, "gelecek nesillerin ihtiyaçlarını tehlikeye atmadan bugünün ihtiyaçlarını karşılamak" şeklindeki genel sürdürülebilirlik prensibinin tasarım alanındaki yansımasıdır. Grafik tasarımcılar, bu prensibi rehber edinerek işlerini yürüttüklerinde, mesleklerini gezegenimiz için bir fayda unsuruna dönüştürürler. Sonuçta, gezegenimizin kaynakları sınırlıdır ve yaratıcı endüstriler olarak bizler de üzerimize düşeni yapmalıyız. Küçük başlayıp büyük düşünerek, her tasarım projesini sürdürülebilirlik ekseninde değerlendirmek, uzun vadede kültürel bir değişimi tetikleyecektir.

Özetle, sürdürülebilirlik tasarımın kısıtlayıcı bir unsuru değil, aksine yeni imkanlar açan bir çerçevedir. Bu çerçeve içinde üretilen işler, hem tasarımcısına etik bir tatmin sağlar, hem kullanıcılarına değer katar, hem de dünyamızın sürdürülebilir geleceğine katkıda bulunur. Grafik tasarımın yaratıcılığı ile sürdürülebilirliğin gereklilikleri buluştuğunda, ortaya çıkan sonuç, bugünün ve yarının dünyası için umut vadeden bir iletişim olacaktır. Tasarımcılar olarak unutmamalıyız ki "doğayı tasarlayamayız, ama tasarımla doğayı koruyabiliriz".

Abstract
The limited solubility of plant proteins is a significant factor in determining the range of applications for these proteins. This results in the prevention of interactions with other proteins and limits their application in food products, as well as offering reduced solubility. One potential solution to this issue may be to optimise the factors that can influence solubility, as opposed to modifying the protein structure to enhance low solubility. Current research is focusing on the functionality and applications of pea protein, and various processes are under investigation with a view to improving the technofunctional properties and processing qualities of pea proteins. ANN-GA was utilised to optimise and study the effects of solvents, including distilled water, sodium chloride (NaCl) and potassium phosphate buffer (PPB), as well as different centrifugation speeds and times on pea protein isolate (PPI) solubility with maximum solubility. The response parameter that demonstrated optimal performance was the solubility value. The optimal states for the ANN-GA model were as follows: distilled water as the solvent, a centrifugation speed of 10407 g and a duration of 17 min, which resulted in a maximum protein solubility of 9.35%. The generated artificial neural network (ANN) model demonstrates a high degree of predictive capability. Consequently, solubility values were enhanced by optimising solely the conditions of the solubility analysis, without modifying the structure of PPI. In subsequent studies, the solubility values of proteins may be enhanced by modifying the conditions of the solubility analysis, in addition to the application of diverse treatments.
Keywords: Pea protein isolate, Solubility, ANN-GA, Optimization

INTRODUCTION

The demand for plant protein is increasing on a daily basis. The reasons for this increasing trend include changes in consumers' diets and lifestyles, strong factors associated with plant protein production compared to animal proteins, and less environmental impact (Akharume et al., 2021; Yüzer, 2023). Pea (*Pisum sativum*) is a pulse that can be widely cultivated across the globe, and its shell can be readily removed. Its primary application is as a commercial source of starch, protein and fibre when compared to other pulses (Arntfield and Maskus, 2011). It has been reported that peas can contain up to 30% protein (Chen et al., 2019; Aluko et al., 2009). Pea seeds are processed to obtain pea proteins commercially (Chen et al., 2019). There is a significant amount of research demonstrating the antioxidant potential of pea proteins (Ndiaye et al., 2012; Sun & Xiong, 2012; Sun & Xiong et al., 2012). In addition, these proteins have been demonstrated to possess antioxidant properties (Ge et al., 2020), with some studies even attributing a role in lowering cholesterol (Sirtori et al., As demonstrated in the studies conducted by Swiatecka et al. (2011, 2012), Sun and Xiong (2015), Aluko et al. (2015) and Liao et al. (2019), the properties of the substance in question include the regulation of intestinal bacteria, the provision of antihypertensive effects and the attenuation of inflammation. Collectively, these characteristics are associated with a range of health benefits. Pea protein isolate (PPI) is a prominent ingredient in the realm of plant protein, characterised by its high nutritional value, minimal allergenicity, and cost-effectiveness. However, its wide range of applications in various food systems is greatly limited due to its low solubility (Gao et al., 2024).

Determining the functional properties of proteins, it is possible to have information about how that protein isolate will be used in which food system. One of the most important of these functional properties is the solubility of protein. Changing the chemistry of protein or the test system in order to eliminate or improve these deficiencies of proteins that do not function at the desired level can change the functional properties of the isolates (Arntfield and Maskus, 2011). Plant based proteins characteristically possess a globular and rigid structural configuration, which hinders their interaction with other proteins and limits their application in food products as well as offering lower solubility (McClements & Grossmann, 2021; Higa et al., 2024). The utilisation of a multitude of plant proteins is constrained by their suboptimal solubility characteristics.

DRAFT

Furthermore, solubility is contingent upon the state of protein denaturation or aggregation. Consequently, one should aim to minimise protein denaturation and ensure that proteins are in a suitable aggregation state. The development of protein isolation and purification procedures is of potential significance for this purpose. This involves controlling factors such as solvent conditions, temperature, time, pH and ionic strength (McClements & Grossmann, 2021). To overcome the lack of technofunctional functionality of proteins, plant proteins can be subjected to different treatments to modify their structure, which can lead to an improvement in their functional properties. One solution may be to optimise the factors that can influence solubility rather than changing the structure of the protein with modifications to improve low solubility. With current research focusing on the functionality and applications of pea protein, various processes are being investigated to improve the technofunctional properties and processing qualities of pea proteins. These treatments include ultrasound, glycation, hydrolysis, acetylation, heat-assisted pH shift and treatment with enzymes. However, there is no research on optimising the conditions of solubility analysis without changing the PPI structure.

There are many different solubility measurements for measuring protein solubility. Although the principles of the methods are similar, the solvent used and the centrifugation conditions preferred during the analysis affect the solubility. In different studies in which the solubility of PPIs was determined, water (Gao et al., 2022; Gao et al., 2024; Othmeni et al., 2025; Schumacher et al., 2025), phosphate buffers (Mozafarpour et al., 2022; Vatansever et al., 2022; Zhang et al., 2022), citrate buffers (Kravchenko et al., 2024) and solutions containing NaCl (Xu et al., 2023) were used as solvents. Similarly, different centrifugation conditions were preferred in these studies. Therefore, a comparative study of these factors that may affect solubility will provide information about the most effective conditions.

In recent decades, there has been a notable shift in preference towards the utilisation of artificial neural networks (ANNs) for the purpose of nonlinear multivariate modelling. ANN is a technique that is trained on data in the experimental range and thus can predict responses and develop generalization and predictive modeling. Thus, a computational and mathematical modeling will be developed that examines the effect of input variables on the investigated outputs (Raj and Dash, 2020). The application of this technique has been extensively and successfully implemented across multiple disciplines. Furthermore, genetic algorithm (GA) is an AI-based optimization algorithm that optimizes the independent variables in ANN models. The hybrid methodology of artificial neural network and genetic algorithm (ANN-GA) has become increasingly common in the field of AI-based approaches (Desai et al., 2008; Patra et al., 2022).

The present study has two objectives; (i) to determine the effect of different solvents and differences in experimental conditions on solubility of PPI, and (ii) to determine the performance of artificial intelligence-based optimisation techniques to be used in the optimisation of these effects. ANN-GA was used to optimise and study the effects of solvents such as distilled water, sodium chloride (NaCl) and potassium phosphate buffer (PPB) and different centrifugation speeds and times on PPI solubility with maximum resolution. The optimum conditions given by this approach were experimentally verified. To our knowledge, this is the first study on the use of ANN-GA for the optimization of PPI solubility. Thus, it is expected to improve the solubility analysis without changing the structure of the PPI, only by optimising its conditions.

MATERIALS AND METHODS

Materials

Pea protein isolate (81.7%) used in the study was purchased directly from a local market. All chemicals were purchased from Sigma Aldrich for analytical purity. Ultrapure water was obtained by passing distilled pure water through an additional activated carbon purification system (Millipore, Bedford, USA).

Experimental Design

A Box-Behnken experimental design was used to evaluate the solubility property of PPI. Different solvents (10 mM PPB with pH 7, 0.5 M NaCl solution and ultrapure water), different centrifugation speeds (8000, 10000 and 12000 g) and times (10, 15 and 20 min) were selected as independent variables. Box-Behnken experimental design from Design-Expert software (V13, Stat-Ease Inc., Minneapolis, USA) helped to obtain combinations of process parameters and total experimental runs. Table 1 shows the experimental design and results.

Determination of Solubility

Percent solubility of the samples was determined at pH 7 by modifying Yüzer (2023). Protein isolate at 10 mg/mL concentration was prepared with the indicated solvents. 1 N HCl or 1 N NaOH was used to adjust the pH of the dispersions. The dispersions were stirred with a magnetic stirrer for 30 min at room temperature, then centrifuged (Hermle Z216, Hermle Labortechnik GmbH, Wehingen, Germany) at different centrifugation speeds and for different times given in the experimental design. After centrifugation, the supernatant was analysed for protein using the method of Bradford (1976). For this purpose, 50 µL of the supernatant was taken and 1.5 mL of Bradford reagent was added and the absorbance of the mixture was read at 595 nm wavelength in a spectrophotometer (Shimadzu, UV-1201V, Japan) after 10 min. Bovine serum albumin standard curve was used to calculate the protein content. The solubility was calculated by the following equation:

$$\text{Solubility (\%)} = \frac{\text{Protein content of the supernatant}}{\text{Total protein content of the sample}} \text{x} 100 \quad (1)$$

ANN Modeling and GA Optimization

The implementation of neural network fitting in MATLAB (R2021a, The Math Works, Inc., Natick, MA, USA) was facilitated by the utilisation of an ANN modelling tool. The artificial neural network (ANN) model comprised three layers: an input layer, a hidden layer, and an output layer. The input layer consists of three independent variables: solvent, centrifuge speed and time. In the output layer, the dependent variable is expressed as a percentage of resolution (Figure 1). A trial-and-error approach was adopted, with the number of neurons varying between 10 and 20. Following this, the number of hidden neurons was finalised at 16, in order to achieve the optimum model performance. The protein resolution results were represented by a neuron that formed the output layer. The ANN model was created by encoding the input and output data points. The tansig function was utilised as the transfer function for the hidden layer, while purelin represented the transfer function of the output layer. The Levenberg-Marquardt (LM) back propagation (trainlm) method was utilised in the training of the data. Of the total data, 70% was allocated to training, 15% to testing and 15% to validation. The network was trained until it reached the lowest mean squared error (MSE) and maximum R^2. Subsequent to the training of the ANN, the weights and bias values were determined by means of the following equation. These values were then utilised to determine the predicted outputs.

$$y_i = purelin\{W_{OH} \times tansig\,(U_{IH} \times x_i + TH) + TO\} \quad (2)$$

Where x_i and y_i are the input and estimated coded output parameters. W_{OH} are the weights between the hidden and output layers, while U_{IH} are the weights between the input and hidden layers. TO and TH are the bias values of the output and hidden layer neurons, respectively (Patra et al., 2022).

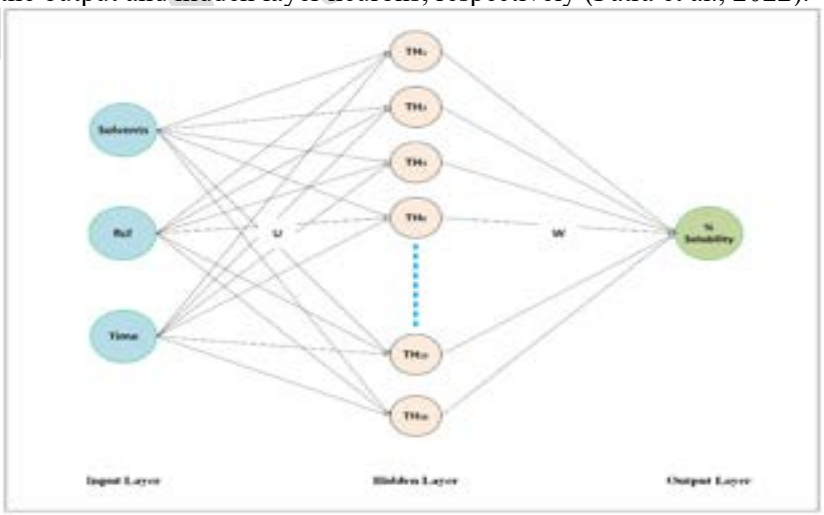

Figure 1. The architecture of artificial neural network model

The GA optimisation procedure was performed using MATLAB's GA package. GA optimisation mimics natural selection, using biologically inspired operators such as selection, mutation and crossover to improve solutions (Patra et al., 2022). The three basic parameters chosen for GA optimisation were population type (double vector), size (50) and crossover rate (0.8). The fitness function (f), shown below, was created to maximise the output responses.

$$f = -(y_i) \tag{3}$$

Where y_i is the actual values of the protein solubility (%) response predicted by the ANN and the maximisation of the specified function (f) in the GA has a negative sign.

Statistical Analysis

In order to verify the performance of the developed ANN model, the average absolute deviation (AAD), mean squared error (MSE), normal mean squared error (NMSE), mean percentage error (MPE), root mean squared error (RMSE), normal root mean squared error (NRMSE) and coefficient of determination (R^2) between the predicted and experimental responses were calculated using the formulae given below. The model that shows the lowest values for AAD, MSE, RMSE, NMSE, NRMSE and MPE and the highest R^2 value is considered to be the most effective model in accurately representing the responses.

$$AAD\ (\%) = \left[\frac{\sum_{i=1}^{n}(|Y_{pre}-Y_{exp}|/Y_{exp})}{n}\right] x100 \tag{4}$$

$$MSE = \frac{\sum_{i=1}^{n}(Y_{pre}-Y_{exp})^2}{n} \tag{5}$$

$$NMSE = \frac{MSE}{Y_m} \tag{6}$$

$$RMSE = \sqrt{\frac{\sum_{i=1}^{n}(Y_{pre}-Y_{exp})^2}{n}} \tag{7}$$

$$NRMSE = \frac{RMSE}{Y_m} \tag{8}$$

$$MPE = \frac{100}{n}\sum\left|\frac{(Y_{pre}-Y_{exp})}{Y_{pre}}\right| \tag{9}$$

$$R^2 = 1 - \frac{\sum_{i=1}^{n}(Y_{pre}-Y_{exp})^2}{\sum_{i=1}^{n}(Y_m-Y_{exp})^2} \tag{10}$$

Where Y_{exp} is the observed value, Y_{pre} is the predicted value obtained from ANN, Y_m is the mean value of experimental data and n is the number of experiments (n=34).

RESULTS and DISCUSSION

The solubility of a protein is not only considered as a primary functional property, but is often a prerequisite for other functional properties (Wang et al., 2016). Table 1 shows the solubility values of PPI obtained in different solvents and solubility test conditions. It is seen that the solvent with the lowest solubility is NaCl solution. The highest solubility values were determined in the samples in which ultrapure water was used as solvent.

DRAFT

Table 1. Experimental design, predicted and actual values of responses of solubility (%)

Run	Solvents	Rcf (g)	Time (min)	Exp. value	ANN Predict
1	NaCl	10000	20	5,14	5,14
2	Water	10000	15	9,33	9,25
3	PPB	10000	20	6,96	6,96
4	Water	12000	20	8,08	8,08
5	Water	10000	15	8,98	9,25
6	NaCl	8000	15	4,20	4,16
7	NaCl	12000	15	4,47	4,41
8	Water	8000	10	6,59	6,41
9	PPB	12000	15	6,04	5,96
10	PPB	10000	10	6,08	6,08
11	Water	12000	10	7,67	7,67
12	PPB	8000	15	5,67	5,67
13	Water	10000	15	9,20	9,25
14	NaCl	10000	10	4,41	4,37
15	Water	10000	15	9,53	9,25
16	Water	10000	15	9,18	9,25
17	Water	8000	20	7,81	7,71

Detection of hidden layers, determination of connection weights and generation of bias values were performed as explained in the methods section. The connection weight and bias values for response resolution are given in the following matrices.

$$U = \begin{bmatrix} -3.5581 & 1.0355 & 0.6507 \\ -2.6580 & 0.2116 & 2.2747 \\ 2.0650 & 1.1006 & 2.4704 \\ 2.9846 & 1.7670 & 0.3342 \\ -3.0099 & -1.1022 & 1.5320 \\ -2.5538 & -2.3024 & -0.7012 \\ -2.5296 & 0.4843 & -2.4495 \\ -1.0877 & 1.9962 & -2.7485 \\ -0.9075 & 2.7998 & -1.9465 \\ 2.6607 & -2.2209 & 0.7548 \\ -0.4263 & -1.7149 & -2.9614 \\ 2.3373 & -2.5313 & -0.5142 \\ -3.0692 & -1.4684 & 0.7243 \\ -2.0183 & -2.5300 & 1.6212 \\ -2.5242 & -1.7430 & 1.6468 \\ 0.9360 & -2.6839 & 2.3272 \end{bmatrix} \quad TH = \begin{bmatrix} 3.2971 \\ 3.0866 \\ -2.7152 \\ -2.1735 \\ 1.6334 \\ 1.3163 \\ 0.2684 \\ 0.0605 \\ -0.2911 \\ 0.4981 \\ -1.3316 \\ 1.8278 \\ -2.2610 \\ -2.4624 \\ -3.0588 \\ 3.3882 \end{bmatrix} \quad TO = -0.0874$$

$$W = \begin{bmatrix} -0.6721 & 0.4405 & -0.0593 & 0.4046 & -0.4249 & 0.3158 & 0.2061 & -0.8895 & 0.0787 \\ -0.7427 & -0.2999 & 0.4908 & 0.4607 & -0.4323 & -0.2324 & -0.4855 \end{bmatrix}$$

U is the link weights between the input and hidden layers and W is the link weights between the hidden and output layers. TH and TO are the bias values of the hidden and output layer, respectively.

The best ANN model for the resolution value was reached in the 4th period. At this point, the experimental studies used during the training of the models were categorised as training (1, 2, 3, 4, 7, 8, 11, 12, 13, 15, 17), validation (5, 6, 10) and testing (9, 14, 16), respectively. Similarly, the R^2 values were 0.996, 0.996 and 0.996 for training, validation and testing, respectively (Figure 3a), while the R^2 value of the solubility was 0.9951 according to the developed model. The error histogram and the performance graph of each response are shown in Figure 3 (b and c). The error values are calculated between the experimental responses and the output responses predicted from the ANN model.

The optimization process was executed using the genetic algorithm (GA), with the objective of attaining the maximum resolution value. As demonstrated in Figure 2, the optimisation was concluded following the 10th generation, with an average fitness value of -9.4389 being attained. At this best-fit point, centrifugation speed of 10407 g, processing time of 17 min and ultrapure water as solvent were determined as optimum conditions. The solubility value during these optimum conditions was estimated to be 9.44%. As a result of the experiment performed using the optimum conditions to verify the GA optimisation, the solubility was determined as 9.35%.

DRAFT

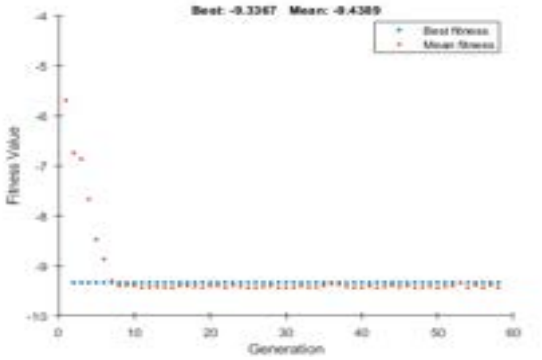

Figure 2. The variation of fitness value with respect to generations during genetic algorithm optimization of solubility

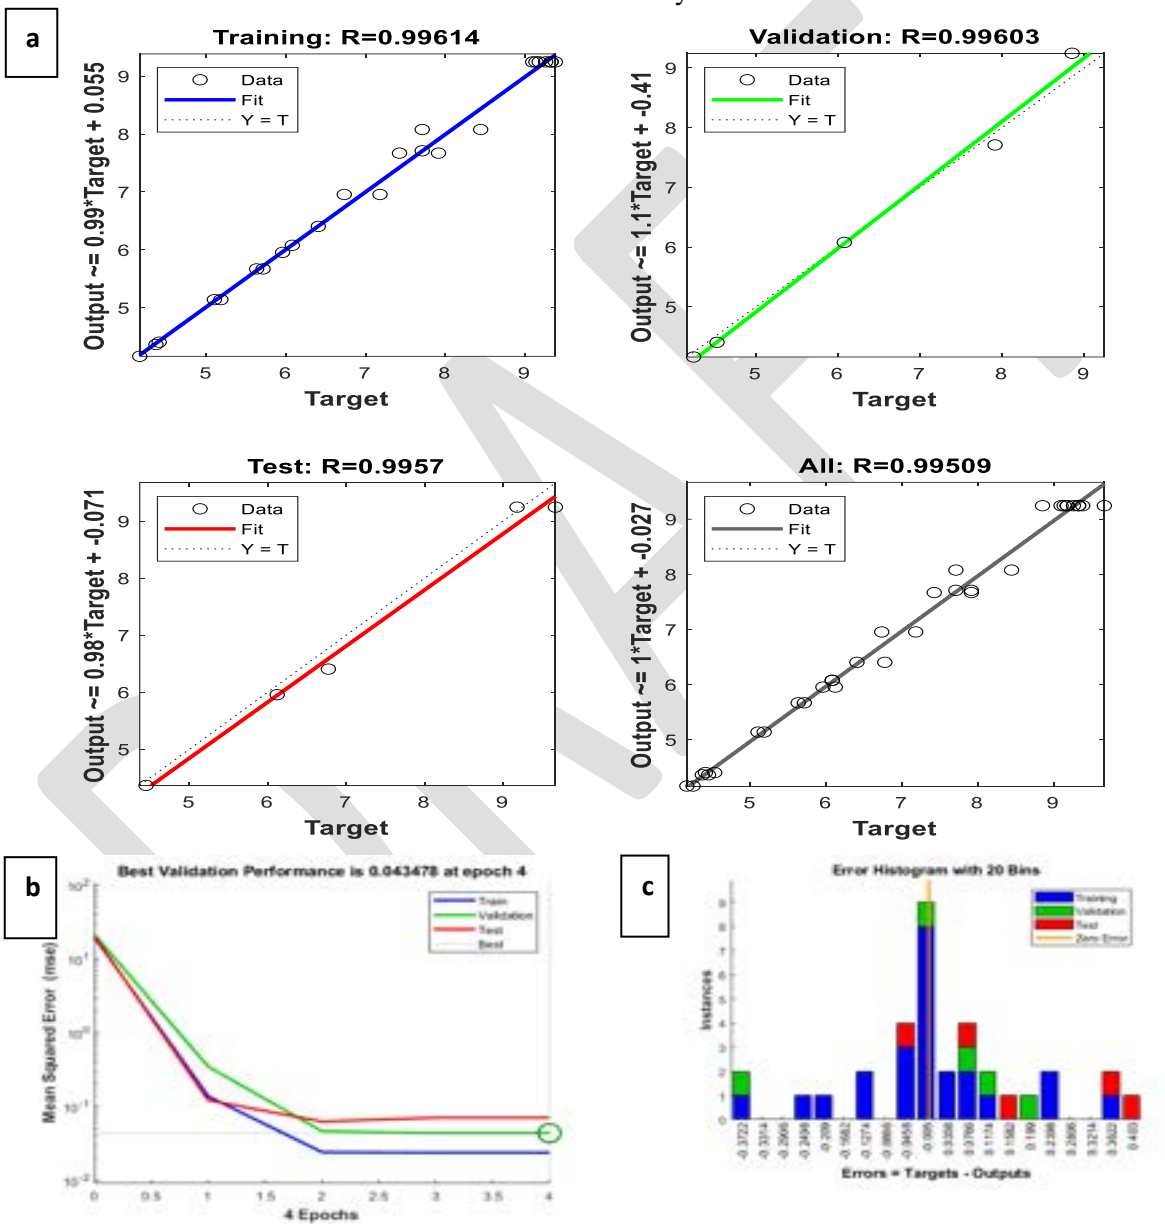

Figure 3. Post-training performance (a), best validation performance (b) and error histogram of solubility (c) of generated artificial neural network model

Using MATLAB (version R2021a), the prediction performance of the ANN model was evaluated using various metrics including R^2, MPE, MSE, NRMSE, AAD, RMSE and NMSE (Table 2). The ANN model demonstrated robust performance metrics in predicting protein solubility. The model demonstrated a high R^2 value of 0.9899. With regard to precision, the ANN model displays a low RMSE value of 0.1825 for solubility. Furthermore, the mean absolute deviation (AAD) value was found to be 1.73% for the artificial

neural network (ANN) model. In a similar manner, the ANN model demonstrated a reduced MSE value of 0.033 for resolution. The obtained results highlight that the ANN model, which performs well in the calculated evaluation criteria, is superior in optimizing protein solubility. The superiority of the ANN model over the RSM model is attributable to the former's utilisation of nonlinear polynomials, which ensure a higher level of prediction accuracy (Ware et al., 2025). In contrast, the RSM model is constrained to the use of quadratic equations for the generalisation of data. As evidenced by numerous scientific papers, the ANN model has been shown to outperform RSM modelling (see Shende et al., 2024; Ware et al., 2025).

Table 2. Summary of all statistical parameters of protein solubility

Coefficient	Value
AAD (%)	1,73
MSE	0,033
NMSE	0,0098
RMSE	0,1825
NRMSE	0,0260
MPE	0,4235
R^2	0,9899

CONCLUSION

Optimization of protein solubility was successfully performed using ANN-GA with different solvents, centrifugation speeds and times. The optimised response parameter was the solubility value. The optimum conditions for the ANN-GA model were pure water as solvent, centrifugation speed of 10407 xg and time of 17 min, which gave a maximum protein solubility of 9.35%. The generated ANN model is highly predictive. It can thus be concluded that the ANN-GA model is a quantitatively effective tool for the optimisation of process parameters with regard to the solubility of pea protein isolate. Studies to improve protein solubility usually focus on improving solubility by including a different treatment. In this study, only the analysis conditions were optimised. In future studies, the solubility property of proteins developed with different modifications can be further increased by changing the conditions of solubility analysis in addition to these treatments.

Abstract
The concept of sustainable development has taken an important place in school curricula by giving students and teachers a wider access to each of their fields, while also learning to make informed decisions and people, both individually and collectively, for other society and to protect the planet. The treatment and importance of the concept of sustainable schools is to equip students and teachers with knowledge, values, values to address issues such as development, university skills, economic biodiversity, global warming. The research used random samples of respondent groups (N=150) including Aldent University, the Faculty of Natural Sciences, the University of Vlora, and the Andon Zako Cajupi, Petro Nini Luarasi, and Sinan Tafaj High Schools. Most of them agreed that many factors such as energy conservation practices and solid waste recycling influence the development of the sustainable concept.
Keywords: Concept of sustainable development, teaching, biological knowledge, curriculum, correlation, education

INTRODUCTION
The concept of sustainable development is gaining particular importance in today's society, to address the pressure that the challenges of environmental degradation, social inequality and economic instability impose. Education plays an important role in shaping pupils and students with knowledge and concepts on sustainable development, skills and values to give voice and solutions to complex issues (Borg et al., 2014). The concept of sustainable development is complex and includes many disciplines of knowledge. Sustainable development as an approach has three dimensions: that of the environment, society and economy, and to achieve its realization, education in schools constitutes a key element. On the other hand, traditional methods of scientific education in our schools are not sufficient to achieve the cultivation of an advanced mindset of sustainable development, therefore this constitutes the challenge of today's educational system in our country and around the globe (Freeman & Morgan, 2009). Determining the knowledge and competencies that need to be given to students regarding the formation of appropriate concepts for sustainable development is and remains an issue under discussion (Aarnio-Linnanvuori, 2019). In this context, it is of great importance how students perceive and interact with the concept of sustainable development within the framework of science education at school. The purpose of this study focuses on assessing the perception that students have about sustainable development. By analyzing the level of their knowledge, attitudes and awareness of the principles of sustainable development, this study aims to create an efficient model for effective sustainable development education in pre-university and university education.
The study was conducted using a research design and supported by two research questions that were used during the study:
1. Is economic development, nature conservation, biodiversity, global warming important for understanding the concept of sustainable development and do these situations affect school curricula?
2. Do energy conservation practices, construction and renovation of buildings based on green design principles, solid waste recycling, poverty eradication, political instability on the concept of sustainable development matter?

DRAFT

The research study was conducted in Google Forms where the data were processed using descriptive methods. The conclusion of the study should result in 3 main variables: the importance that external factors offer on the understanding of sustainable development among students of the pre-university and university systems, the institutions and the importance that they offer and treat these on the understanding of sustainable development for student learning, as well as the curriculum of which subject has the concept of sustainable development more in focus. In an effort to move beyond the rhetoric of sustainability and pursue a more meaningful agenda for sustainable development in education, a clear definition of this concept and an explanation of its main dimensions are needed (Gray, Citation2010; Mensah & Enu-Kwesi, Citation2018). This need, according to Gray (Citation2010), as cited in Giovannoni and Fabietti (Citation2014), has been supported by both academics and practitioners with the aim of promoting sustainable development to make teaching and learning as successful as possible so that students learn as quickly as possible. The development of the concept of sustainability in education is defined as an evolutionary process in which human capacity increases in terms of initiating new structures, confronting problems, adapting to continuous change, and striving purposefully and creatively to achieve new goals and high results in different subjects (Peet, Citation 1999 cited in Du Pisani, Citation2006). Todaro and Smith (Citation2006) also define development as a multidimensional process that includes major changes in social structures, attitudes, and institutions, as well as economic growth, reducing inequality, and eradicating absolute poverty. Several theories have been presented to explain the concept of development. They include theories of modernization, dependency, world systems, and globalization, which also influence the approach to school curricula. In the development literature, most academics, researchers and practitioners (Gray & Milne, Citation2013: Tjarve, & Zemīte, Citation2016; Mensah & Enu-Kwesi, Citation2018; Thomas, Citation2015) apply the concept to provide a mechanism through which students can interact with the environment without risking damaging the resource for the future. The concept of sustainable development constitutes a lifelong learning effort, providing students with the cognitive, socio-emotional and behavioral dimensions essential for addressing interconnected global challenges such as climate change, biodiversity loss, unsustainable resource use and social inequality (UNESCO, 2023a). The preceding factors highlighted the reinforcing calls for strengthening systems thinking, interdisciplinary collaboration, and sustainability-focused educational leadership as imperatives to drive sustainability advances in biology and nursing education (Osingada and Porta 2020; Lopez-Medina et al. 2019). The concept attributes and defining components similarly provide a strategic framework to guide curriculum development, the design of sustainability learning objectives, and content delivery models.

MATERIALS AND METHODS

Preparation of the questionnaire with multiple choice questions, Likert scale and discussion questions. The sample selection will be done by randomly selecting students and pupils while maintaining a balance between gender representation, academic programs and profile of high schools and years of study. Pre-pilot testing will be carried out with a small group to test the clarity of the questionnaire, understandability and on this basis the necessary adjustments will be made. Data collection will be done according to an appropriate method such as conducting online or in-person questionnaires, or combined. Before data collection, each participant in the study will sign a consent statement, to guarantee voluntariness and anonymity. Data analysis will be done quantitatively, using statistical programs, such as descriptive analysis, frequencies, means and standard deviations, and qualitatively by analyzing the developmental questions. Care will be taken to maintain ethics in the study, that is, to respect anonymity and confidentiality. In this research, respondents (N= 150) were used, 120 females and 30 males, where the schools and universities that participated were: Aldent University, Faculty of Natural Sciences, University of Vlora, and Andon Zako Cajupi High School, Petro Nini Luarasi, Sinan Tafaj

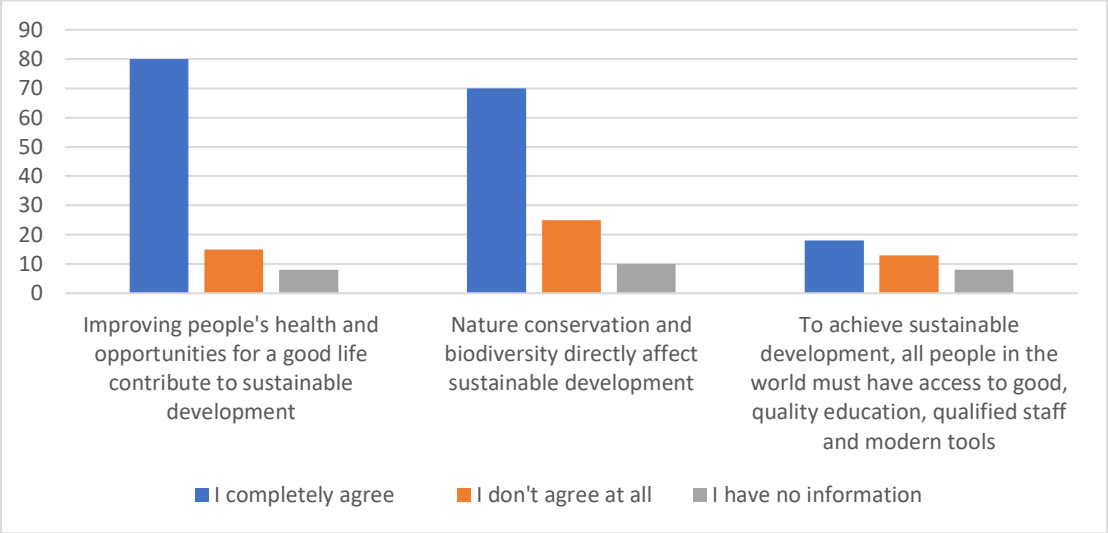

Figure 1. The importance of environmental and health factors in understanding the concept of sustainable development

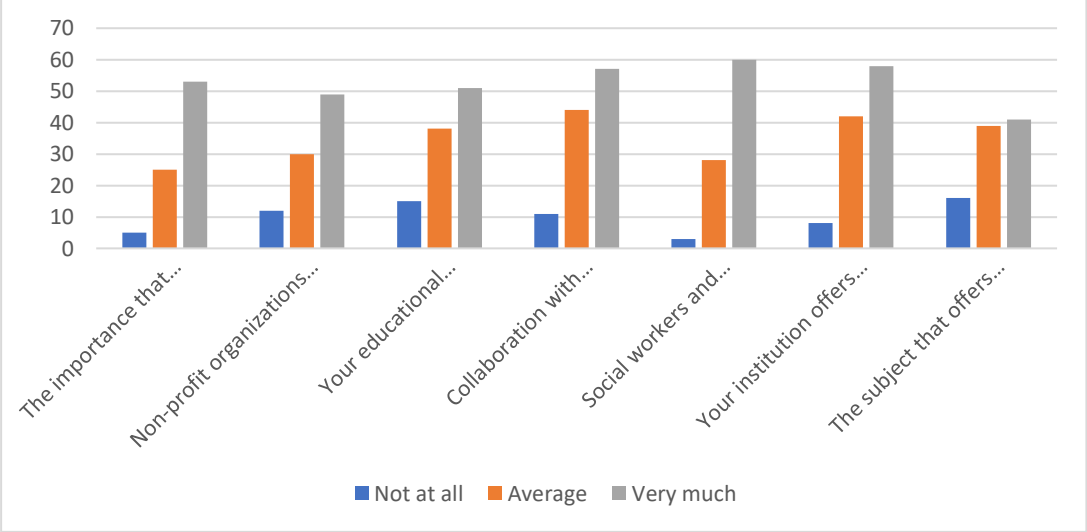

Figure 2. The importance that the educational institution offers to various organizations for the concept of sustainable development

RESULTS and DISCUSSION

The statistical results of the correlation were used to understand the relationship between the importance that external factors provide on the understanding of sustainable development among students of the pre-university and university systems, the institutions and the importance that they provide and treat on the understanding of sustainable development for student learning, as well as the curriculum of which subject has the concept of sustainable development more in focus

●To achieve sustainable development, all people in the world must have access to good, quality education, qualified staff and modern tools

The survey of respondents shows that 18% completely agree with this, 13% do not agree at all and 8% have no information on this

●The importance that your school or university offers for extracurricular courses or training to expand the concept of sustainable development

The survey of respondents shows that about 5% of these institutions do not offer any training and courses at all, and about 25% offer average courses and training, and about 53% offer a lot of extracurricular courses and training to understand the concept of sustainable development.

● Non-profit organizations offer financial assistance for material bases that help you in the process of understanding the concepts
The survey of respondents shows that about 12% of these institutions do not provide financial assistance and material support at all, and about 30% provide average and about 49% of them provide a lot of financial assistance and material support.

● Your educational institution offers a variety of scientific literature, also giving you access to examples or good practices of implementing the principle of sustainable development
.The survey of respondents shows that about 15% offer a variety of scientific literature, also giving access to examples or good practices of implementing the concept of sustainable development, and about 38% provide an average of this variety of literature and about 51% of them offer a lot of literature to help understand the concept of sustainable development.

● Collaboration with environmental organizations to practice various activities to understand how development concepts are related to each other in the way they function and their use
The survey of respondents shows that about 11% offer collaborations with environmental organizations to practice various activities to understand how development concepts are related to each other in the way they function and their use, and about 44% offer average collaborations and about 57% of them offer collaborations with these organizations.

● Social workers and psychologists at your institution offer you meetings with people with disabilities so that you can explain to them the basic concepts of sustainable development
The survey of respondents shows that about 3% offer meetings with social workers and psychologists with people with disabilities in order to explain to them the basic concepts of sustainable development, and about 28% offer an average of meetings, and about 60% of them offer many meetings with psychologists and social workers to increase the effectiveness of the concept of sustainable development.

● Your institution offers meetings with electrical engineers or renewable energy businesses (wind, solar, water) to understand the importance of implementing the principle of sustainable development in the renewable energy sector
The survey of respondents shows that about 8% of educational institutions offer meetings with electrical engineers or renewable energy businesses (wind, solar, water) to understand the importance of implementing the principle of sustainable development in the renewable energy sector, and about 42% offer an average of meetings with electrical engineers and about 58% of them offer many of these meetings to learn as much as possible about the concept of sustainable development.

● Improving people's health and opportunities for a good life contribute to sustainable development
The survey of respondents shows that about 80% completely agree that improving people's health contributes to a better life, 15% do not agree at all about this aspect, and about 6% have no information about it.
● Nature conservation and biodiversity directly affect sustainable development
The survey of respondents shows that 70% agree with it, about 25% do not agree at all that it affects sustainable development, and about 10% do not have any information.

CONCLUSION

The majority of pupils and students are well acquainted with the concept of sustainable development, whether from school curricula or under the influence of social networks or the media. Most of them agreed that many factors such as: economy, nature conservation, biodiversity or global warming influence the development of the sustainable concept. On the other hand, they indicate that the educational institutions where they study offer, on average, extracurricular training or meetings with non-profit organizations or conversations with social workers to exchange experiences or to better understand the functionality and practice of the sustainable concept. The vast majority of them think that energy conservation practices, solid waste recycling, political instability, effective management of natural resources also have great importance and great impact, causing sustainable concepts to evolve over time and this brings a major benefit to increase the quality of education in the process of effective teaching and learning. The majority of them believe that energy conservation practices, solid waste recycling, political instability, and effective management of natural resources are also of great importance and impact, causing the concepts of sustainable development to evolve over time and this brings a major benefit to increasing the quality of education in the process of effective teaching and learning. The results of this study are very important for understanding the importance of all the above-mentioned factors for the concept of sustainable development and for understanding how they influence these concepts for the most effective teaching and learning for students in the pre-university and university systems.

Abstract
In this study, an AlNi-Gr composite was obtained by interacting AlNi, which was prepared using a simple hydrothermal method and low-cost, readily available metals, with graphene. Using the AlNi-Gr composite, a photothermal paste was prepared and immobilized onto the surface of natural wool (NW) material to produce AlNi-Gr/NW. The AlNi-Gr/NW photothermal material demonstrated a high evaporation rate (3.4 $kg \cdot m^{-2} \cdot h^{-1}$) due to the combined photothermal activity of both AlNi and graphene structures, and exhibited high thermal efficiency (88%) owing to the thermal insulation property of the NW material. It was also determined that AlNi-Gr/NW maintained a steam generation performance close to that in pure water, even in systems containing saline, acidic, basic, heavy metal-contaminated, or dye-polluted water. Consequently, AlNi-Gr/NW, with its high steam generation performance, was employed as a photothermal material in a solar steam generator system for obtaining potable water from wastewater and seawater, achieving a salt and metal ion removal efficiency of 93%.
Keywords: AlNi, Graphene, Photothermal material, Solar steam generator.

INTRODUCTION

The rapid urbanization and population growth, along with the swift advancements observed in modern industry, have significantly increased the demand for both energy and potable water. In response to this growing need, traditional technologies such as multi-stage flash evaporation, thermal distillation, ion exchange, and reverse osmosis are widely used for seawater desalination (Ghaffour at al.,2013; Fan et al., 2027; Li et al., 2011, Qasim et al., 2019). The solar steam generation method has garnered attention due to its use of natural and sustainable solar energy as the input, low cost, and low carbon footprint (Liu et al., 2020; Geng et al., 2029; Xiao et al., 2021). A solar steam generation system typically consists of a region with high water adsorption capacity for continuous water supply and a photothermal absorber region that converts solar energy into thermal energy to produce steam (Ginting et al., 2022; Ginting et al., 2022; Lau et al. 2029).
There are five essential features of an ideal photothermal evaporator:

(i) the ability to absorb solar energy across a broad spectral range,

(ii) uniform heat distribution on the surface,

(iii) good wettability of the porous material,

(iv) excellent chemical and mechanical stability, and

(v) salt resistance to prevent salt accumulation (Ni et al., 2026; Shi et al., 2020).

Extensive research has been conducted to minimize heat losses in photothermal materials and improve solar steam generation efficiency. In this context, natural wool (NW), which is low-cost, readily available, and has a high water transport capacity, is considered highly effective as a 3D base material in solar steam

DRAFT

generator systems. NW is commonly used in yarn production and household textile products. However, in recent years, the usage of wool has declined due to the emergence of alternative materials in home textiles.

Thanks to its excellent thermal and sound insulation properties, natural wool is being reconsidered—especially in solar steam generator applications due to its natural structure, ease of access, low cost, and biodegradability. In recent years, modifying inexpensive and easily accessible natural materials like NW with new materials possessing different chemical structures for various applications has become a popular topic. There is growing interest in the design of inorganic materials with hierarchical and complex morphologies. Accordingly, parameters such as synthesis environment, type of surfactant, and polymer templates have been altered to synthesize inorganic materials with different crystal structures, particle sizes, and morphologies (Zhang et al., 2023; Li et al., 2016; Zhang et al., 2026).

In this regard, layered double hydroxides (LDHs) have gained increasing attention due to their anion exchange properties and potential applications in catalysis, environmental remediation, bionanocomposites, and biosensors. Recently, various synthetic techniques such as sonochemistry, microwave, hydrothermal, and sol-gel methods have been employed for LDH synthesis to control crystal growth. New LDH morphologies have also been reported through the use of organic solvents, surfactants, macromolecules, and biomolecules (Zhang et al., 2012; Cheng et al., 2013).

Graphene, with its planar structure and highly negative charge centers due to oxygen-containing functional groups, has been reported to interact effectively with positively charged LDHs (Li et al., 2017). The resulting composite material retains both the physical and chemical properties of graphene and LDHs.

To date, numerous photothermal materials have been developed through immobilizing various chemical materials including carbon-based, metallic, and semiconducting materials onto 3D base substrates. At this point, a composite material was prepared by doping AlNi LDH, synthesized via a simple hydrothermal method, with graphene. The AlNi-LDH-Gr-based photothermal paste was immobilized onto NW, and the resulting composite material was used as a photothermal agent in a solar steam generation system. Composites containing different ratios of AlNi-LDH and graphene were prepared, and their steam generation performances were compared. It was found that the optimally composed AlNi-LDH-Gr/NW material had a steam generation rate of 3.41 $kg \cdot m^{-2} \cdot h^{-1}$, while AlNi-LDH/NW and Gr/NW exhibited lower rates of 1.8 and 1.6 $kg \cdot m^{-2} \cdot h^{-1}$, respectively. Moreover, the AlNi-LDH-Gr/NW material demonstrated over 90% removal efficiency of salts and heavy metals from wastewater, indicating its effectiveness and practicality in clean water production from polluted sources.

MATERIALS AND METHODS

Hydrothermal Synthesis of NiAl-LDH

A 75 mL solution containing 0.2 M $Ni(NO_3)_2 \cdot 6H_2O$ and 0.1 M $Al(NO_3)_3 \cdot 9H_2O$ was prepared and stirred for 15 minutes to obtain Solution A. Then, 15 mmol of urea solution was slowly added to Solution A to form Solution B. After stirring for another 15 minutes, Solution B was transferred into a Teflon-lined autoclave and subjected to hydrothermal treatment at 180 °C for 12 hours. After the autoclave was cooled down, the resulting AlNi-LDH was filtered, washed several times with ethanol and water, and dried at 60 °C for 12 hours to obtain solid NiAl-LDH (Li et al., 2017).

Synthesis of the NiAl-Gr Composite

During the NiAl-LDH preparation procedure, various volumes (2, 4, 6 mL) of a GO dispersion at a concentration of 7 mg/mL were added into the previously described Solution B. The resulting composite solution was first subjected to ultrasonic treatment for 30 minutes. It was then transferred into a 50 mL Teflon-lined autoclave and treated hydrothermally at 180 °C for 12 hours. After cooling, the resulting AlNi-Gr composites with varying compositions were filtered, washed with ethanol and water several times, and dried at 60 °C for 12 hours, yielding AlNi-Gr composites with different AlNi/Gr ratios.

Preparation of NiAl-LDH, NiAl-Gr, and Gr Gels and Their Immobilization on NW Material
Different mixtures were prepared by adding NiAl-LDH, AlNi-Gr composites, or graphene (Gr) individually at a concentration of 5 mg/mL into a solution containing 5 wt% polyvinyl alcohol (PVA). The mixtures were heated at 85 °C for 2 hours to ensure complete dissolution of the PVA (33). Figure 1.b shows the gel preparation procedures along with digital photographs of the gels. The prepared NiAl-LDH gel, Gr gel, and composite gels (AlNi-Gr-1, AlNi-Gr-2, and AlNi-Gr-3) were applied onto NW substrates (natural wool) with a diameter of 2 cm and a height of 0.5 cm using a brush. The coated materials were then dried in an oven at 80 °C for 12 hours and made ready for use in the solar steam generation system.

Steam Generation Experiments
Solar steam generation experiments were carried out using the setup shown in Figure 5.a. The prepared AlNi/NW, Gr/NW, and AlNi-Gr/NW materials were directly used as photothermal materials. During the process, surface temperatures were monitored using an IR camera (FLIR), and water weight loss was measured using an electronic balance (Shimadzu). A solar simulator (Optosence) with an intensity ranging from 1 sun (1 kW/m²) to 10 suns (10 kW/m²) was used as the light source. All purification experiments were conducted under 10 suns. All experiments were performed at room temperature.

RESULTS AND DISCUSSION

Photothermal Performance and Solar Steam Generation Efficiency

The photothermal performance of the fabricated Gr/NW, AlNi/NW, and AlNi-Gr/NW materials was comprehensively investigated for solar steam generation applications.

The evaporation rates of these materials after 1 hour of irradiation under 1 sun (1 kW m^{-2}) were found to be 1.68, 1.82, 2.2, 3.4, and 2.9 kg m^{-2} h^{-1} for Gr/NW, AlNi/NW, AlNi-Gr1/NW, AlNi-Gr2/NW, and AlNi-Gr3/NW, respectively. Among these, the AlNi-Gr2/NW composite exhibited the highest evaporation rate, highlighting the synergistic effect of the layered double hydroxide (LDH) and graphene components.

To further optimize the system, the diameter of the photothermal material and the mass of the immobilized AlNi-Gr2 composite were systematically varied. When the composite mass was kept constant at 1.5 g, the effect of varying diameters (3.0–5.0 cm) on the evaporation rate was studied. It was found that a 4.0 cm diameter yielded the maximum evaporation rate, whereas further increases led to slight reductions, likely due to decreased photothermal conversion efficiency per unit area. However, the diameter showed no statistically significant influence on overall evaporation performance.

Subsequently, the effect of the immobilized composite mass (0.5–2.5 g) was investigated with a constant material diameter of 4.0 cm. The evaporation rate increased with composite loading up to 1.5 g but declined beyond this point. This decline was attributed to partial blockage of the NW scaffold's pores, leading to reduced water transport capacity and consequently lower evaporation efficiency, consistent with previous findings. Hence, 1.5 g was determined to be the optimal composite loading.

Surface Temperature Profiles and Photothermal Conversion Efficiency

Surface temperature changes of Gr/NW, AlNi/NW, and AlNi-Gr2/NW were monitored under 1 sun irradiation for 120 seconds using infrared thermography (Figure 1a). Compared to the bare water surface, which showed a modest temperature increase from 20 °C to 23 °C, the photothermal materials exhibited significantly higher surface temperatures: Gr/NW reached 44 °C, AlNi/NW reached 46 °C, and AlNi-Gr2/NW exceeded 64 °C within 45 seconds. The exceptional thermal response of AlNi-Gr2/NW was attributed to efficient electron delocalization within the conjugated graphene layers and the presence of Ni and Al atoms, which facilitated rapid conversion of absorbed light into thermal energy.

Thermal camera images taken after 60 seconds of irradiation further confirmed the superior photothermal activity of AlNi-Gr2/NW compared to AlNi/NW and Gr/NW (Figure 1.b). Based on the calculated evaporation enthalpies, the solar steam generation efficiencies were determined as 50% for Gr/NW, 53% for AlNi/NW, and 88% for AlNi-Gr2/NW, as presented in Figure 5f. Moreover, the AlNi-Gr2 composite

layer served as an insulating barrier that minimized heat loss, further enhancing its photothermal conversion capability.

(b) Thermal camera images displaying the surface temperatures of AlNi-Gr2/NW, AlNi/NW, Gr/NW, and the bare water surface after 60 seconds of irradiation under 1 sun (1 kW/m²). (f) Graph showing the photothermal conversion efficiencies (%) of Gr/NW, AlNi/NW, and AlNi-Gr2/NW materials. (g) Graph illustrating the changes in evaporation rate and photothermal efficiency (%) of the AlNi-Gr2/NW material with increasing solar irradiance intensity.

Evaluation in Various Water Matrices

To assess the practical applicability of AlNi-Gr2/NW, solar evaporation performance was evaluated in various water matrices, including pure water, acidic (pH 2), basic (pH 12), saline (3.5% NaCl), heavy metal-containing (100 mg/L Cu^{2+}), and dye-containing (1.0 g/L methyl blue) solutions under optimized conditions. The results are depicted in Figure 2.a. Remarkably, the material exhibited consistent evaporation performance across all tested conditions, with an average standard deviation of 4.27% in steam generation efficiency and 0.68 in evaporation yield, indicating strong tolerance to varying water chemistries.

Corresponding surface temperature changes during irradiation were monitored (Figure 2.b), and thermal images after 60 seconds are shown in Figure 2.c. The surface temperature variations remained within a 3.2% standard deviation, further confirming the stability and robustness of AlNi-Gr2/NW under diverse water compositions.

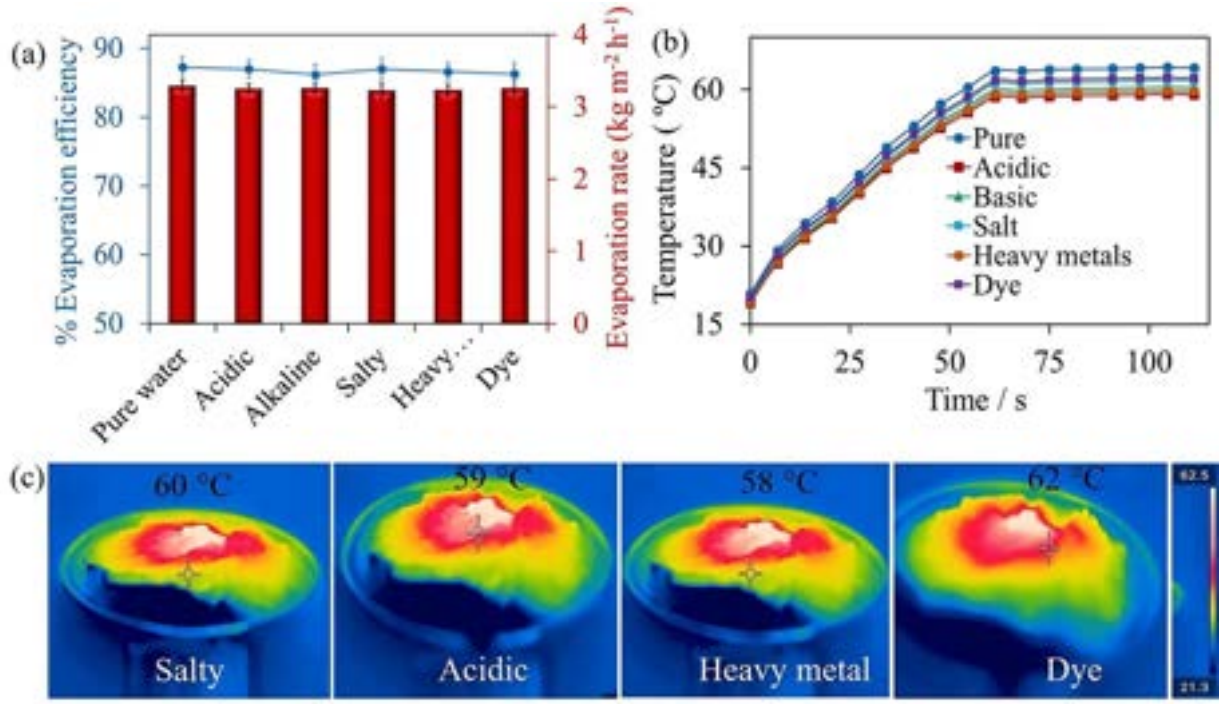

Figure 2. (a) Evaporation efficiency and evaporation yield of AlNi-Gr2/NW material after 1 hour of irradiation under 1 sun intensity (1 kW m^{-2}) in various water samples: pure water, acidic (pH 2), basic (pH 12), saline (3.5% NaCl), heavy metal-contaminated (100 mg/L Cu^{2+}), and dye-contaminated (1.0 g/L methyl orange) solutions. (b) Surface temperature changes of AlNi-Gr2/NW recorded as a function of irradiation time for different water matrices. (c) Thermal camera images showing the surface temperatures of AlNi-Gr2/NW after 60 seconds of irradiation under 1 sun for each water type.

Desalination Performance of AlNi-Gr2/NW Material

The applicability of the synthesized AlNi-Gr2/NW material for potable water production from saline water was investigated. A synthetic salt solution containing 0.1% Na^+, K^+, Mg^{2+}, and Ca^{2+} ions was prepared, and the desalination process was carried out under 10 sun irradiation using a closed experimental setup until approximately 10 mL of distilled water was collected from an initial 20 mL of saline feed solution. The experimental system used for the desalination studies is depicted in Figure 3.a. Ion concentrations before and after distillation were analyzed, and the results presented in Figure 3.a and Table 1 demonstrate that the AlNi-Gr2/NW photothermal material achieved a salt removal efficiency of 91%.

Table 1. The ion contents after solar desalination of solution containing 0.1% Na^+, K^+, Mg^{+2} ve Ca^{+2} with AlNi/NW, Gr/NW, and AlNi-Gr/NW.

Material	Na^+ (ppm)	K^+ (ppm)	Mg^{+2} (ppm)	Ca^{+2} (ppm)
AlNi-Gr/NW	0.9	1.1	2.2	3.0
AlNi/NW	0.8	0.9	2.5	3.0
Gr/NW	1.1	1.2	1.9	3.0
Initially, 900 ppm Na+, 935 ppm K^+, 550 ppm Mg^{+2}, and 905 ppm Ca^{+2} were detected in 0.1% ion solution.				

DRAFT

Heavy Metal, Acid-Base, and Dye Removal Performance of AlNi-Gr2/NW Photothermal Material

In a similar manner to the salt removal experiments, aqueous solutions containing 225 mg/mL Pb^{2+}, 100 mg/mL Cu^{2+}, 90 mg/mL Ni^{2+}, 75 ppm Cr^{3+}, and 150 mg/mL Zn^{2+} were prepared. Following the distillation process, the ion concentrations in the distilled water collected from the bottom chamber were analyzed using ICP-MS. The pre- and post-distillation ion concentrations are presented in Figure 3.b and Table 2. According to the data, the heavy metal removal efficiency of the AlNi-Gr2/NW photothermal material was calculated as 97.5%.

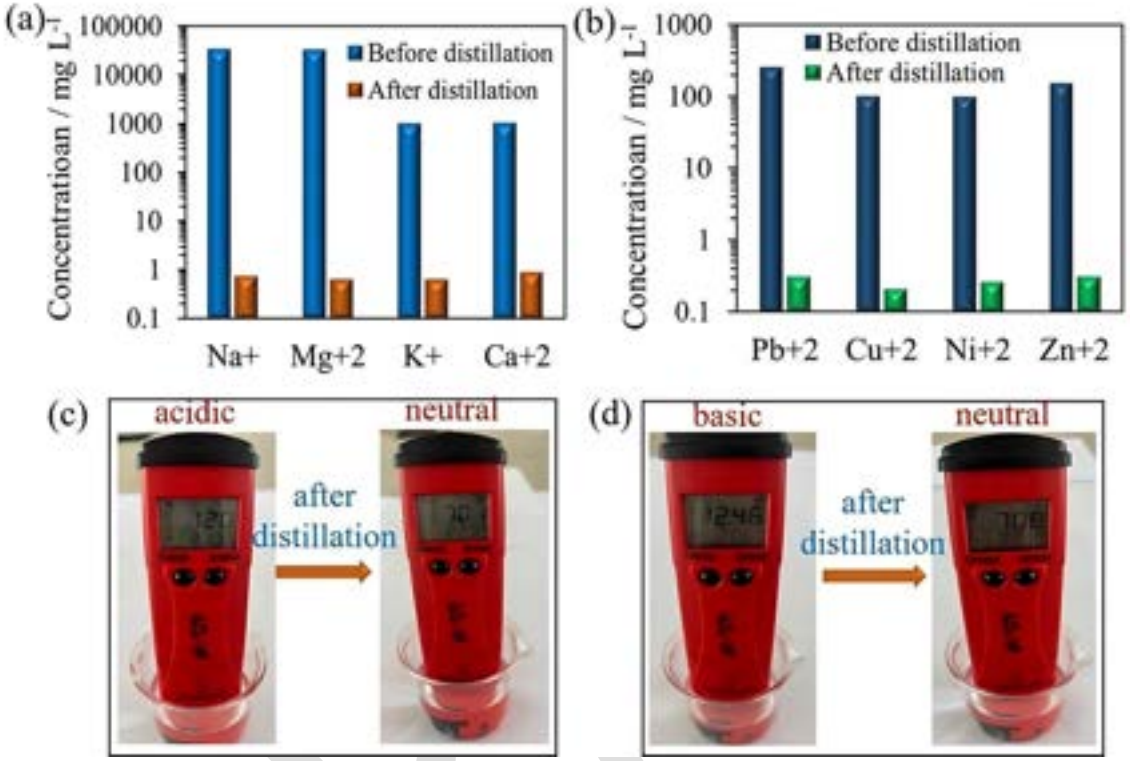

Figure 3. (a) Graph showing the changes in ion concentrations after distillation using the AlNi-Gr2/NW photothermal material on a solution containing 0.1% Na^+, K^+, Mg^{2+}, and Ca^{2+} ions; (b) Graph illustrating the changes in ion concentrations after distillation using a solution containing 225 mg/mL Pb^{2+}, 100 mg/mL Cu^{2+}, 90 mg/mL Ni^{2+}, 75 ppm Cr^{3+}, and 150 mg/mL Zn^{2+} ions; (c) Photographs displaying the pH values of an acidic solution before and after treatment; and (d) Photographs displaying the pH values of a basic solution before and after treatment, all obtained using the AlNi-Gr2/NW photothermal material.

Table 2. The ion contents after solar purification of heavy metal solution with AlNi-Gr/NW, AlNi/NW, and Gr/NW.

Material	Pb^{+2} (ppm)	Cu^{+} (ppm)	Ni^{+2} (ppm)	Cr^{+2} (ppm)	Zn^{+2} (ppm)
AlNi-Gr/NW	0.15	0.23	0.12	0.11	0.14
AlNi/NW	0.16	0.26	0.13	0.11	0.15
Gr/NW	0.17	0.27	0.13	0.12	0.15
Initially, 900 ppm Na+, 935 ppm K^+, 550 ppm Mg^{+2}, and 905 ppm Ca^{+2} were detected in heavy metal solution.					

In addition to desalination and heavy metal removal, the AlNi-Gr2/NW material was evaluated for its performance in treating acidic (pH 2) and basic (pH 12) solutions. The pH values of the distilled water were measured using a pH meter. As illustrated in Figure 3.c, after the distillation of the acidic solution using

AlNi-Gr2/NW, the pH of the distillate approached neutrality. Similarly, Figure 3.d shows that the initially basic solution also yielded a neutral pH after distillation, indicating the material's suitability for purifying solutions with extreme pH values.

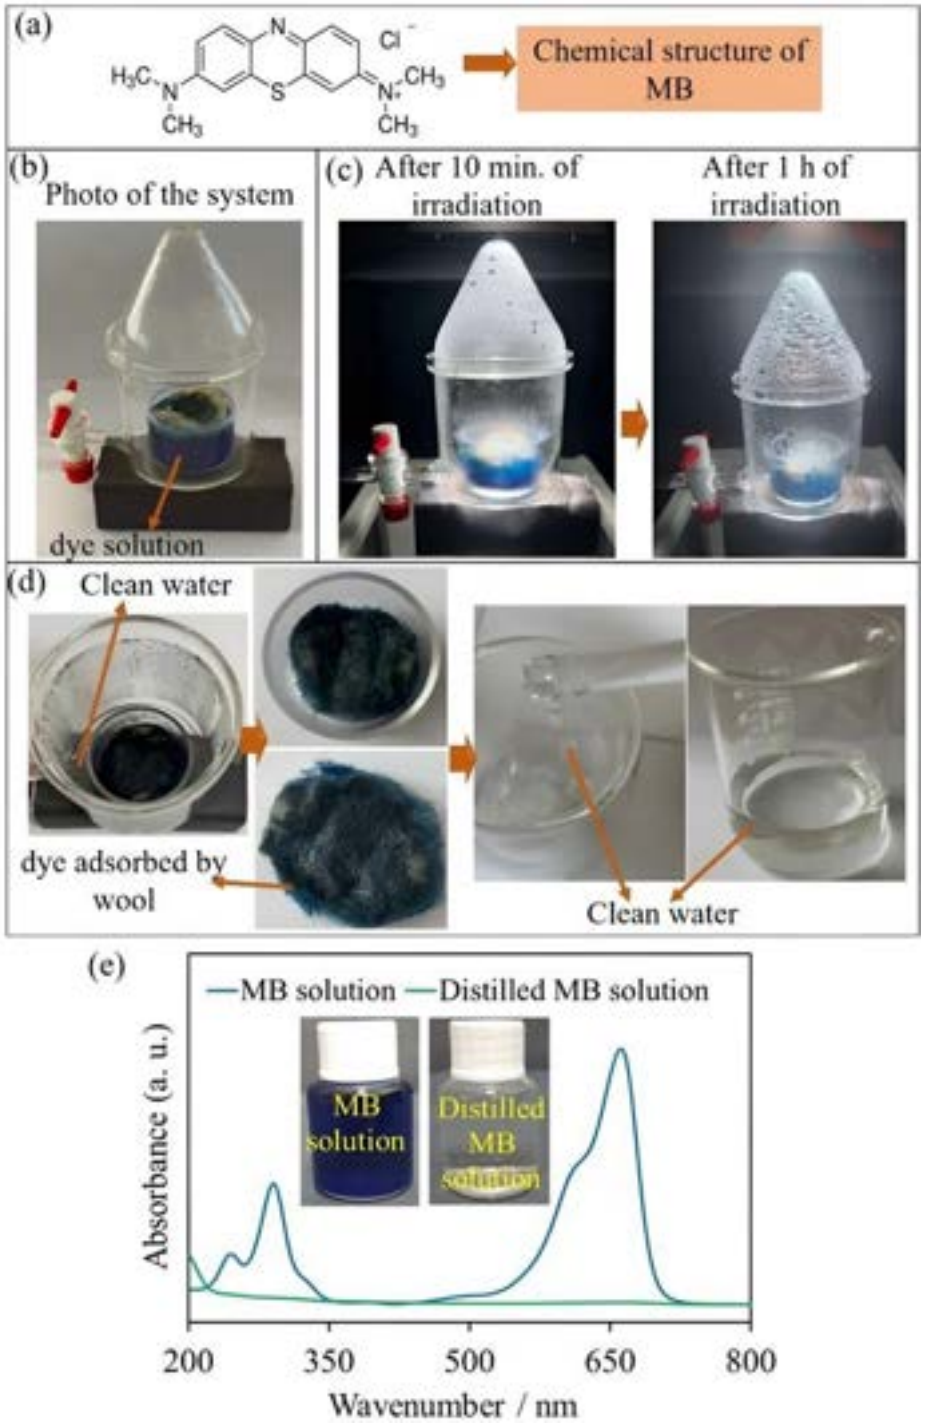

Figure 4. (a) Chemical structure of methylene blue (MB). (b) Schematic of the experimental setup used for dye removal via solar-driven distillation. (c) Photographs of the distillation system at various irradiation times. (d) Images of the AlNi-Gr2/NW photothermal material after MB adsorption and the collected distillate. (e) UV-Vis absorption spectra of the initial MB solution and the collected distillate, along with corresponding visual images, demonstrating complete dye removal.

The AlNi-Gr2/NW material was further tested for its capacity to treat dye-contaminated water. A 1.0 g/L methylene blue (MB) solution was subjected to solar distillation under 10 sun illumination. The distillation process is illustrated in Figure 4.a–d. Initial and intermediate stages of distillation were documented

photographically (Figure 4.b–c), and the final distillate collected in the receiving container was observed to be colorless and clear (Figure 4.d). Furthermore, the AlNi-Gr2/NW material exhibited visible adsorption of MB dye, as indicated by a blue coloration after distillation (Figure 4.c).

UV-visible absorption spectroscopy of the collected distillate revealed the absence of any MB characteristic absorption peaks, confirming effective dye removal (Figure 4.d, inset). These results demonstrate the potential of the AlNi-Gr2/NW photothermal material in the treatment of dye-contaminated wastewater.

CONCLUSION

In summary, a 3D AlNi-Gr/NW photothermal material with a highly porous structure and excellent light absorption capacity was successfully fabricated for clean water generation from wastewater using solar energy a natural and sustainable energy source. NW substrate, selected for its high water transport capacity, low cost, easy availability, and exceptional thermal insulation, significantly minimized heat loss during operation. Moreover, due to the unique morphology of the NW, incident light undergoes multiple reflections, thereby enhancing the overall light absorbance of the system.

The surface-deposited AlNi and Gr structures demonstrated broad-spectrum solar absorption and superior photothermal activity, resulting in a high steam generation rate of 3.4 kg m^{-2} h^{-1} and rapid surface temperature elevation to above 65 °C within just 1 minute under solar irradiation. The synergistic integration of AlNi-Gr's high photothermal efficiency and NW's excellent transport properties yielded an impressive thermal conversion efficiency of approximately 88%.

Thanks to the NW's 3D penetration channels and anisotropic macroporous architecture, the AlNi-Gr/NW system showed outstanding performance in extracting clean water from saline and wastewater, along with excellent fluid circulation and self-cleaning stability. Designed using cost-effective and readily available materials, the AlNi-Gr/NW photothermal material demonstrates strong potential for widespread application in solar driven water purification systems, particularly in addressing the global challenges of clean water supply from seawater and wastewater.

Abstract

In high-voltage power transmission systems, corona rings are essential components designed to mitigate electric field concentrations at critical points of insulator assemblies, thereby enhancing system reliability and longevity. This study presents a comprehensive design optimization of corona rings aimed at controlling electric field distributions using the Finite Element Method (FEM). To reduce the electric field intensity on the surface of composite insulators, particularly near the end fittings, three primary corona ring design parameters are considered for optimization. These parameters are the ring's outer radius, the tube radius, and its vertical positioning relative to the insulator. This geometric optimization is achieved through a parametric sensitivity analysis, systematically varying each parameter to assess its impact on the electric field distribution. The optimized configuration is analyzed using the ANSYS Maxwell electromagnetic solver. Simulation results indicated that the maximum electric field strength is reduced to 228 kV/m, significantly below the target threshold of 450 kV/m. This substantial reduction confirms the effectiveness of the optimization process in enhancing the electric field distribution along the insulator surface. The findings underscore the importance of precise corona ring design in improving the performance and durability of composite insulators in high-voltage applications.

Keywords: Corona Ring, Design Optimization, Electric Field Distribution, Composite Insulator, Finite Element Method.

INTRODUCTION

In high-voltage (HV) power transmission systems, composite insulators have become increasingly popular due to their superior mechanical strength, lighter weight, and enhanced resistance to pollution compared to traditional porcelain or glass insulators. Despite these advantages, composite insulators are still vulnerable to electric field intensification, particularly near metallic end fittings where abrupt geometric transitions lead to localized field enhancements. These intensified electric fields can initiate partial discharges, surface tracking, and corona effects, ultimately compromising the insulator's long-term performance and reliability (Doshi et al., 2011; Saleem and Akbar, 2022).

Khajavi et al. (2023) optimized corona ring design for a 230 kV composite insulator by considering the effects of the tower structure, conductor, hardware, and mutual phases, which were previously overlooked. Using 3D FEM simulations in COMSOL, the Nelder-Mead (NM) and BOBYQA algorithms were applied to minimize electric field intensity (EFI) along the creepage distance. The NM method achieved a 76.5% reduction in EFI at the triple point and increased the insulator's voltage withstand length. The results emphasized the importance of including environmental factors in EFI modeling for more effective high-voltage insulator design. Jthear et al. (2023) focused on the use of corona rings at the ends of 765 kV and 500 kV polymer insulators to minimize electric field strength and improve voltage distribution. By applying a two-dimensional Finite Element Method and optimizing corona ring parameters with the Nelder-Mead algorithm, the research successfully reduced electric field strength by 69% for the 765 kV insulator and 32% for the 500 kV insulator. This approach demonstrated high performance and speed, providing an efficient methodology that can be applied to insulators of various voltage levels, ensuring better insulation reliability in power transmission systems. Li et al. (2012) used FEM to optimize grading ring configurations for ceramic insulators in 1000 kV UHV substations, improving potential distribution and reducing corona effects. By adjusting parameters like mounting height and diameter, the research finds that double rings at terminal insulators and proper jumper configurations can enhance electric field uniformity. The optimized design, validated through testing and applied in a pilot project in China, successfully prevented corona in the field. Ahsan et al. (2024) presented a grading device design for insulated cross-arms (ICA) on a 132 kV

lattice tower, using FEA to optimize electric field stress. The grading devices, including a ring for the LV end and a single-piece device for the HV end, reduced electric field stress by 70% and 80%, respectively. The study demonstrates the value of FEA in accelerating the design process and improving the reliability of ICA in power transmission systems.

To mitigate these adverse effects, corona rings are installed to redistribute electric field lines more uniformly along the insulator surface. Properly designed corona rings reduce the electric field magnitude near critical points, thereby preventing corona inception and minimizing the risk of dielectric degradation (Aramugam et al., 2023). However, the effectiveness of corona rings is highly sensitive to their geometric configuration, including factors such as the outer diameter of the ring, the tube radius, and the axial position relative to the insulator. Suboptimal designs may fail to sufficiently suppress field intensity, especially under high-voltage operation or polluted environments (Illias et al., 2021).

The optimization of corona ring geometry has gained significant attention in recent years, driven by both empirical testing and numerical simulation approaches. Among these, the Finite Element Method (FEM) has emerged as a powerful computational tool for modeling complex electromagnetic phenomena and predicting electric field distributions around HV components (Aziz et al., 2023). FEM-based tools such as ANSYS Maxwell enable parametric studies and design iterations, offering insights into how geometric changes influence local electric fields.

This study aims to optimize the design of corona rings used with composite insulators in high-voltage applications by systematically evaluating three primary parameters: the ring's outer radius, the tube radius, and its vertical positioning with respect to the insulator. A parametric sensitivity analysis is conducted to assess the impact of each factor on the electric field distribution, with the goal of minimizing the peak field strength near the end fittings. The optimized configurations are validated using FEM simulations in ANSYS Maxwell. The study presents that geometric optimization of corona rings can substantially improve the electrical performance and reliability of composite insulators, supporting safer and more durable HV transmission systems.

MATERIALS AND METHODS

A 3D composite insulator is designed using the FEM and ANSYS Maxwell software to analyse the electric field (EF) distribution and voltage profile along the insulator surface under clean and dry conditions. By incorporating corona rings (CRs) at both ends of the insulator, the electric field intensity is both enhanced and regulated to remain below the critical threshold.

Finite Element Method

FEM is a widely adopted numerical technique used for solving complex boundary value problems that arise in electromagnetics, structural analysis, and other physical systems governed by partial differential equations. In this study, FEM is employed within the ANSYS Maxwell simulation environment to analyse the electric field distribution around high-voltage composite insulators under specified boundary conditions. The electrostatic field behaviour in dielectric materials is governed by Poisson's equation, derived from Maxwell's equations under static conditions. The general relationship between electric field E and electric potential V is given by Equation 1.

$$E = -\nabla V \tag{1}$$

Equation 2 is obtained by substituting Equation 1 into Gauss's law for electric fields.

$$\nabla \cdot (\varepsilon \nabla V) = -\rho \tag{2}$$

In Equation 2, ρ represents the volume charge density within the dielectric medium, measured in coulombs per cubic meter (C/m³). The term ε denotes the absolute permittivity of the material, defined as the product of the vacuum permittivity ε_0 and the relative permittivity ε_r. The vacuum permittivity ε_0 is a physical

constant with a value of 8.854×10^{-12} 8farads per meter (F/m), while ε_r is a dimensionless quantity that characterizes the material's ability to permit electric field lines relative to a vacuum.

These equations are solved numerically in ANSYS Maxwell through its electrostatic solver, which computes the electric field distribution and potential profile throughout the simulation domain. Boundary conditions such as voltage sources, grounded surfaces, and material interfaces are defined explicitly to reflect the operational scenario under analysis.

Parametric Sensitivity Analysis

Parametric Sensitivity Analysis (PSA) in ANSYS Maxwell is a method used to evaluate how variations in design parameters influence the performance of an electromagnetic system. By identifying which parameters are most influential, PSA helps guide subsequent optimization efforts and reduces computational complexity by narrowing the focus to only those variables that significantly impact system performance.

To optimize the electric field distribution around high-voltage composite insulators, a parametric sensitivity analysis was performed using ANSYS Maxwell. This analysis focuses on evaluating how variations in key geometric parameters of the corona ring namely, the outer radius of the ring, the tube radius, and the vertical distance from the insulator affect the local electric field intensity. These parameters are selected due to their critical role in shaping the electric field distribution, particularly near the high-stress regions at the insulator terminals. The 400 kV composite insulator, illustrated in Figure 1, consists of high-voltage and ground-side end fittings, a silicone rubber housing, and a fiberglass-reinforced plastic (FRP) core that provides enhanced mechanical strength. For simulation purposes, external elements such as towers, conductors, and associated accessories are excluded. The insulator features 22 sheds, with alternating diameters of 160 mm and 98 mm, and a uniform spacing of 40 mm between them. The total length of the insulator structure is 2400 mm.

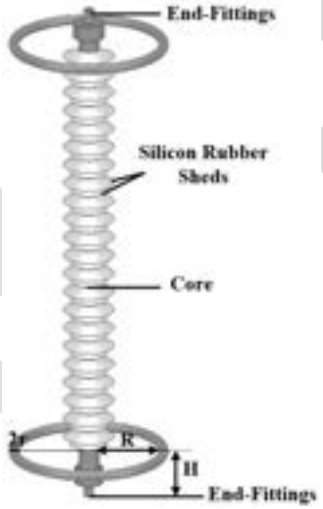

Figure 1. 3D model of a designed composite insulator in ANSYS/Maxwell

The parametric sensitivity analysis is conducted within a parametric simulation framework, allowing for systematic variation of each parameter while monitoring the corresponding changes in maximum electric field values along the insulator surface. By analyzing the trends, the most influential parameters are identified, forming the basis for targeted geometric optimization. The design parameters of the composite insulator and the corona ring are given in Table 1.

Table 1. The parameters of designed composite insulator and corona ring

Material	Parameter	Value
Composite Insulator	Rated Voltage	400 kV
	Number of Sheds	22
	Shed Spacing	40 mm
	Shed Diameters	160/98 mm
Corona Ring	Radius (R)	215 mm
	Ring Tube Thickness (r)	30 mm
	Vertical Ring Position (H)	200 mm

Material properties must vary throughout the model rather than being uniform. The model is discretized into smaller elements such as squares, triangles, or lines to accurately analyze complex geometries. This process applies to 3D models and follows key steps, including completing the geometry, assigning appropriate material properties, and defining boundary conditions. Accordingly, Table 2 presents the permittivity values assigned to various parts of the insulator and its surrounding environment.

Table 2. The permittivity values of the designed system component

Material	Relative Permeability
Air (Region)	1
Sheds (Silicon Rubber)	3.5
Aluminum (Corona Ring)	1
FRP (Core)	6
Aluminum (End Fittings)	1

In this study, completing the FEM analysis requires defining two essential boundary conditions. These are one at the grounded end and one at the high-voltage (active) end. Under steady-state conditions, the grounded end or connected to the transmission tower is assigned to a zero-voltage boundary condition. Meanwhile, the active end is set to the appropriate applied voltage specific to each insulator. In ANSYS Maxwell, these conditions are implemented by assigning voltage values and excitation forces to the active terminals.

RESULTS and DISCUSSION

Based on industry standards and manufacturer guidelines, corona rings are typically mounted at the high-voltage end of the insulator. For systems operating at voltages of 230 kV or below, a single CR is generally sufficient. However, for higher voltage levels, such as 345 kV and above, it is recommended to install CRs at both ends of the insulator (M'Hamdi et al., 2022). When determining the design parameters of CRs, a range of values is selected for each variable. For instance, the outer radius of the ring is typically varied between 150 mm and 250 mm. Importantly, the minimum ring radius must exceed the diameter of the largest insulator shed to avoid physical contact between the two components. The initial dimensions of designed corona ring and the range variations used for optimization are presented in Table 3.

Table 3. The initial dimensions of designed corona ring and the range variations

Parameter	Original Value	Lower Value	Upper Value
Radius (R)	215 mm	150 mm	250 mm
Ring Tube Thickness (r)	30 mm	20 mm	40 mm
Vertical Ring Position (H)	200 mm	0 mm	600 mm

This section presents the simulation results for all insulator configurations, highlighting the impact of incorporating corona rings and optimizing their positioning and dimensions. The analysis clearly demonstrates that the presence and proper adjustment of corona rings significantly reduce the electric field intensity along the insulator surface, particularly at critical stress points near the energized end. As shown in Figure 2, a significant concentration of electric field occurs at the critical junction where the core rod, polymer sheath, and metallic end fitting converge. This interface is widely recognized as the most vulnerable point of the composite insulator structure due to its susceptibility to intensified electric field stress.

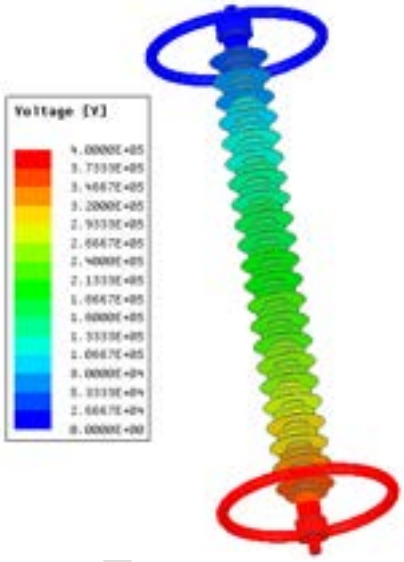

Figure 2. Voltage distribution of composite insulator

To mitigate these stresses particularly in high-voltage applications, it becomes essential to implement corona rings. These devices play a crucial role in redistributing the electric field, effectively diverting high-intensity fields away from the interface region and reducing the risk of partial discharge or long-term degradation. The impact of corona rings on electric field distribution is further analyzed and presented through simulation results in Figures 3, which demonstrate the effectiveness of this approach in enhancing the electrical performance and reliability of the insulator.

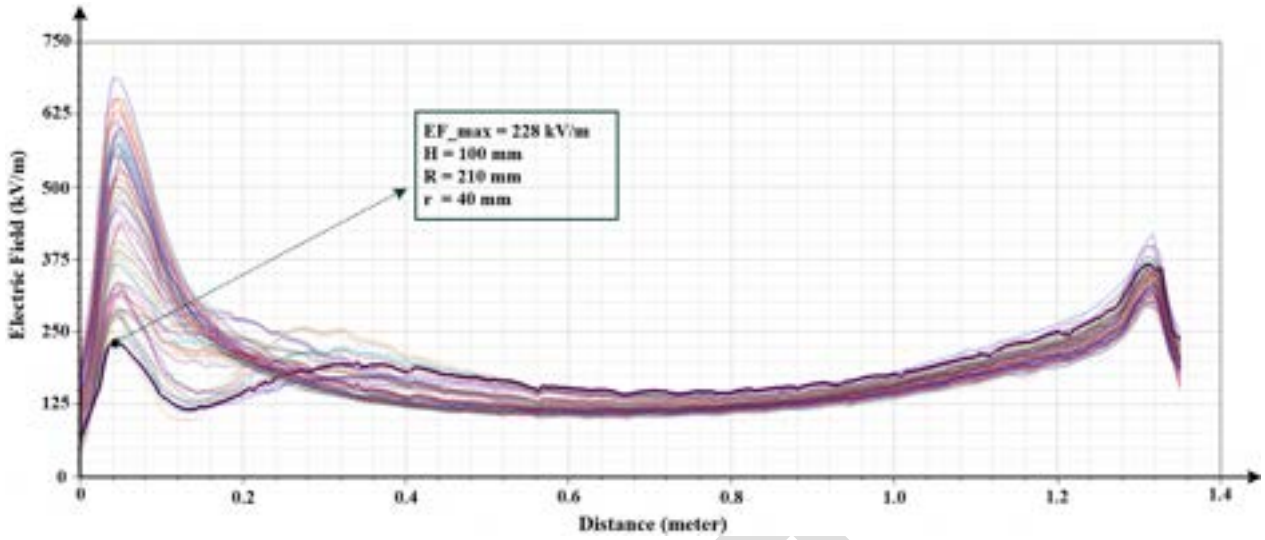

Figure 3. EF distribution of composite insulator after the parametric optimization of the corona ring

Figure 4 illustrates the potential distribution curves along the surface of the composite insulator for both the nominal and optimized designs. The comparison reveals how the optimized corona ring parameters contribute to a more uniform voltage distribution, effectively reducing the electric field concentration at critical points such as the high-voltage end. This improvement enhances the dielectric performance and reliability of the insulator under high-voltage stress.

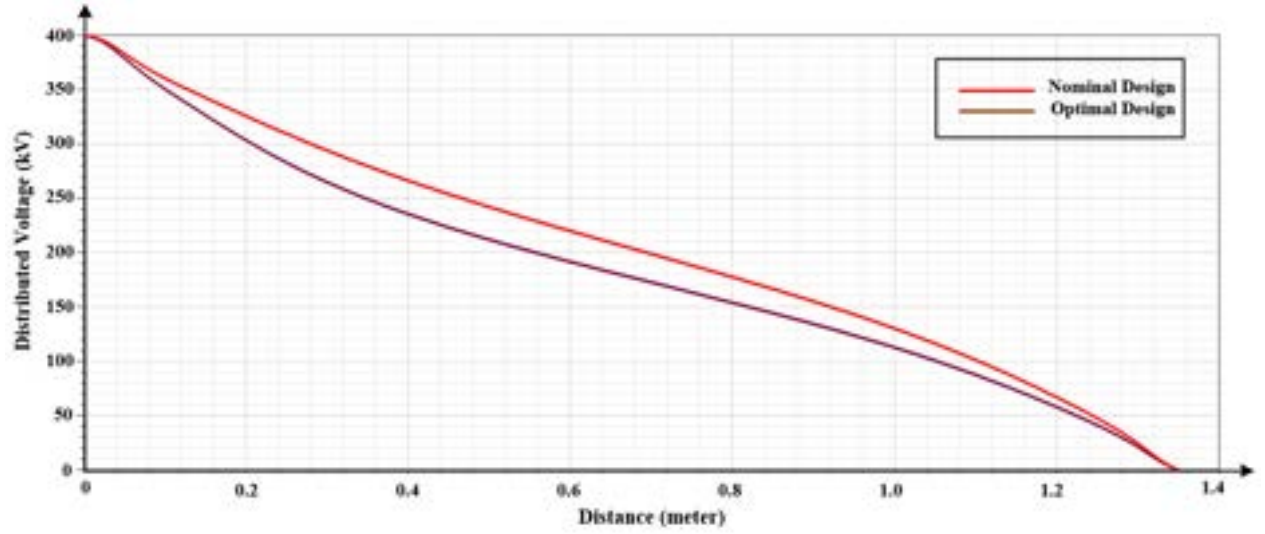

Figure 4. Potential distribution curves of composite insulators

CONCLUSION

The study demonstrates the effectiveness of optimizing corona ring geometry to improve the EF distribution along composite insulators used in high-voltage transmission systems. By employing Finite Element Method simulations and a parametric sensitivity analysis, key design parameters including the ring's outer radius, tube radius, and vertical position are systematically evaluated. The optimal configuration, identified as 210 mm outer radius, 40 mm tube radius, and 100 mm vertical distance from the insulator, significantly reduced the peak electric field intensity to 228 kV/m well below the 450 kV/m threshold. These results confirm that precise design and placement of corona rings play a critical role in enhancing insulator performance, reducing the risk of localized electrical stress, and increasing long-term reliability in high-voltage environments.

Abstract

Thanks to their unique combination of high spin polarization and structural tunability, half-metallic perovskites play a key role in the development of spintronic devices. Thus, we aim to study the structural, elastic, electronic, and optical properties of $CsIrI_3$ using density functional theory (DFT) to identify potential half-metallic behavior. The calculations are performed using generalized gradient approximation (GGA) with Perdew-Burke-Ernzerhof (PBE) functional. The results of the elastic calculations indicate that the material satisfies the Born stability conditions. Being a semiconductor in spin down state and a metal in spin up state demonstrates that the material is half-metallic and exhibits ferromagnetic or ferrimagnetic properties. We also found that total magnetic moment is an integer value of $1u_B$. In addition, the material exhibits strong optical activity in the ultraviolet region, highlighting its potential for applications in ultraviolet optoelectronics. These findings suggest that $CsIrI_3$ perovskite is a strong candidate for spintronic and ultraviolet optoelectronic devices, encouraging future experimental validation and exploration of its potential in technological and scientific domains.

Keywords: First-principles calculations, Half-Metallicity, $CsIrI_3$, Electronic Structure, Magnetic Properties, Elastic Properties

INTRODUCTION

Half-Metallic materials are indispensable for spintronics applications due to their excellent spin transport properties and complete spin polarisation at the fermi level. The growing need for spintronics technology arises from limitations of Moore's law, as well as the increasing complexity and inefficiencies encountered when scaling down transistor sizes. Major challenges such as excessive heat generation, increased power consumption, and the need for larger chip areas emerge as we attempt to enhance computer power and data storage capacities. Spintronics offers a promising solution to these challenges by utilizing electron's spin degree of freedom, rather than relying on solely on charge transport. Moreover, spin-dependent transport does not require excessive current resulting in reduced heat generation and, consequently, a lower demand for complex cooling systems, as well as the power required to operate them. In addition, the non-volatile nature of spin significantly reduces power consumption for data storage devices. Spintronic circuits also occupy less space compared to traditional charge-based circuits, enabling increased computing density and helping to overcome the scaling limitations of current technologies. Therefore, the development of spintronics is crucial, resulting the need for new half-metallic materials to support the advancement of these technologies.

As its name suggests, uniqueness of half-metals lies in their ability to act as metals for spin-up states, while behaving as semiconductor or insulator for spin-down states. When unpolarised current applied to a half-metal, only spin-up electrons contribute to current while spin-down electrons are either reflected, filtered out or do not participate at all, effectively behaving as perfect spin filter. This effect is one of the key reasons for the use of half-metals in spintronics and has also been studied experimentally. For instance, a study by (Zhou et al., 2008) investigated one-dimensional half-metallic iron-cyclopentadienyl sandwich molecular wires (SMWs) to assess their spin-filter efficiency, showing that SMWs exhibit perfect spin-filtering properties. Similarly, another study (Yang et al., 2019) shows that half-metallic Cr2NO2 exhibit excellent spin-filter performance. Despite this, many half-metals exhibit high Curie temperatures, which are essential for both thermal stability and compatibility with manufacturing processes that involve elevated

temperatures. For example, a study by (Zhehong et al., 2022) reported that half metallic compound $LaCu_3Fe_2ReO_{12}$ exhibits curie temperature of 710K. As a result, half-metallic materials remain among the most promising candidates for spintronics due to their remarkable electronic and magnetic properties.

Although Heusler alloys currently dominate materials used in spintronic devices, they often lack the structural and electronic tunability required for next-generation applications. In contrast, perovskite oxide materials have governed significant attention due to their wide compositional diversity, structural flexibility, and tuneable electronic applications. Among them, perovskite oxides such as $SrRuO_3$ (Gu et al., 2022) and $La_{1-x}Sr_xMnO_3$ (Chanu and Phanjoubam, 2023) have demonstrated promising spintronic behaviour and are extensively studied for their magnetic ordering and high Curie temperatures. However, the exceptional tunability of halide perovskites has led some researchers to explore their potential for half-metallic behaviour, making them intriguing candidates for spintronic applications (Khan et al., 2024). Despite this growing interest, the lack of experimental studies on single halide perovskites and the scarcity of theoretical work have created a gap for this material in spintronic research. In this context, the present study aims to explore the half-metallic characteristics of $CsIrI_3$ perovskite using first-principles calculations, to assess its suitability for spintronic applications.

MATERIALS AND METHODS

This calculations are performed with Density Functional Theory(DFT) with CASTEP. Ultrasoft psuedopotential and GGA_PBE functional are employed, with 20x20x20 k-point mesh. A cut-off energy of 550 eV is used in the calculations. The material under this study is cubic perovskite that belongs to the Pm3m space group. The atomic coordinates are as follows: Cs at (0, 0, 0), Ir at (0.5, 0.5, 0.5), and I at (0.5, 0.5, 0.0). In geometrical optimisation, the lattice parameter allowed to change while the shape remains fixed. Throughout the calculations, convergence criteria and SCF tolerance are set to ultra-fine quality, and spin polarisation is enabled to account for magnetism.

RESULTS and DISCUSSION

Geometrical optimisation calculations converged successfully at lattice parameter 5.68 Å, with total energy of -2050.029 eV. Additional structure parameters, including the cell volume and density, are presented in Table 1. It is important to note that the structure retained its cubic symmetry throughout the optimisation process, confirming the stability of cubic phase. Hirshfeld and Mulliken population analysis indicate that the magnetic moment is primarily contributed by the Iridium atom, while other atoms exhibit negligible contributions. This, combined with the observation of an integer magnetic moment of 1uB, rules out the possibility of antiferromagnetic ordering and suggests that the material is either ferromagnetic or ferrimagnetic nature.

Table 1. Structural Parameters of CsIrI3

Material	Lattice Parameter	Cell Volume	Density	Energy	Enthalpy
$CsIrI_3$	5.68 Å	184.01 $Å^3$	6.37 g / cm^3	-2050.029eV	-2050.032 eV

The elastic constants, as presented in Table 2, satisfy the Born stability criteria, thereby confirming the elasticity of the material. This indicates that CsIrI3 can maintain its structural integrity under small deformations, which is a critical requirement for practical device applications.

DRAFT

Table 2. Elastic Constants of CsIrI3

Index	11	12	44
Cij (GPa)	64.98	13.86	11.77

Some of the elastic properties are summarized in Table 3. The calculated bulk modulus indicates that the material exhibits low resistance to volume change in under applied pressure, which is characteristic of mechanically soft materials. Furthermore, the Pugh's ratio (B/G) exceeds 1.75, suggesting that the material is ductile. These mechanical characteristics imply that CsIrI3 is suitable for strain-sensitive spintronic applications. Additionally, the material is elastically anisotropic, as indicated by the elastic anisotropy index deviating from unity.

Table 3. Elastic Properties of CsIrI3

Property	Symbol	Value (GPa)
Bulk Modulus	B	30.90
Sheer Modulus	G	0.26
Pugh's Ratio	B/G	1.79
Poisson Ratio	V	0.26
Young Modulus	E	43.71
Elastic Anisotropy Index	A	0.46

To confirm half-metallic nature of the material, band structure calculations are essential. By enabling spin polarization in calculations, both the band structure and density of states (DOS) outputs provide separate results for spin-up and spin-down channels. This allows for a detailed analysis of the electronic states associated with each spin orientation, where a metallic behavior in one spin channel and semiconducting or insulating behavior in the other indicates half-metallicity. The results of the band structure calculations for spin-up channel are presented in **Figure 1(a),** while those for spin-down channel are shown in **Figure 1(b)**. Absence of a band gap near the Fermi level in **Figure 1(a)**, indicates that the spin-up channel exhibits metallic behavior, while the presence of clear band gap in **Figure 1(b)** demonstrates that spin-down channel behaves as semiconductor. This contrasting electronic behavior between the two spin channels is characteristics of half-metallicity.

The partial density of states (PDOS) calculations allows us to identify which atoms and orbitals contribute to the half-metallic behavior of CsIrI3. Through PDOS analysis, it is possible to distinguish the dominant atomic orbitals responsible for the metallic spin-up states and the semiconducting nature of the spin-down channel. The PDOS results for the spin-up and spin-down channels are presented in **Figure 2(a)** and **Figure 2(b)**, respectively. The PDOS analysis, as shown in **Figure 2(a)**, reveals both Ir and I atoms contribute significantly to the states at fermi level, primarily through hybridization between Ir d-orbitals and I p-orbitals. These orbitals are the main contributors to the metallic behavior observed in spin-up channel, while the Cs atom shows negligible participation near the Fermi level. In contrast to spin-up channel, a band gap is observed in the spin-down channel, as shown in the **Figure 2(b)**. This band gap is primarily associated with electronic states of Ir and I atoms, with Ir atoms contributing more significantly to the gap formation. Therefore, these results confirm the half-metallic nature of $CsIrI_3$, characterized by metallic behavior in the spin-up channel and semiconducting behavior in the spin-down channel.

To determine whether the material exhibits optical activity in specific energy regions, optical property calculations performed, and the absorption spectrum analyzed, as shown in **Figure 3**. This analysis helps to identify the energy ranges where $CsIrI_3$ strongly absorbs light, providing insight into its potential for optoelectronic or spintronic applications.

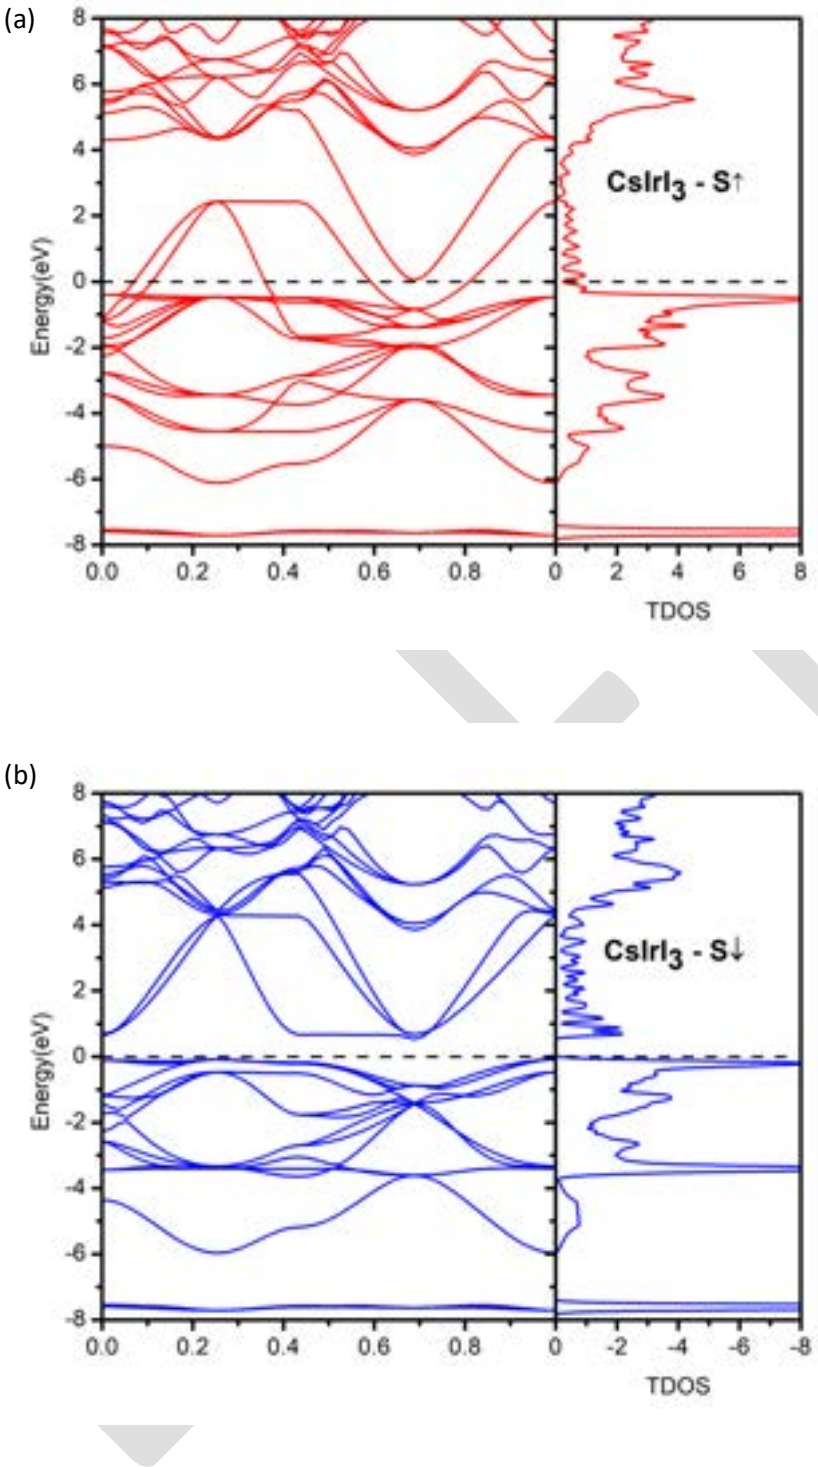

Figure 1. (a) Spin-polarized band structure of $CsIrI_3$ for the spin-up channel, showing metallic behavior with no band gap at the Fermi level. (b) Calculated band structure of $CsIrI_3$ for the spin-down channel. The presence of a band gap at the Fermi level indicates semiconducting behavior for this spin orientation.

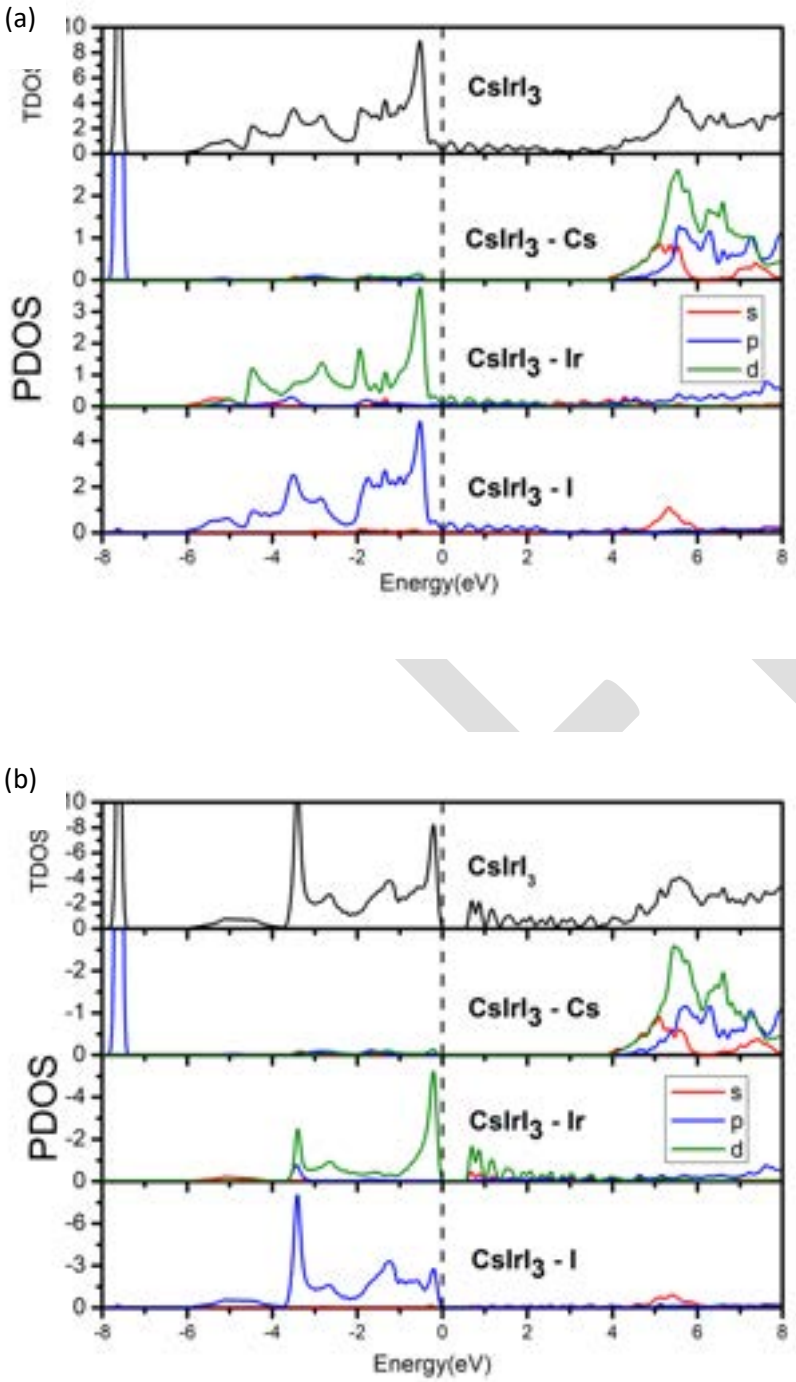

Figure 2. (a) Partial density of states (PDOS) of $CsIrI_3$ for the spin-up channel, showing metallic behavior mainly due to Ir d and I p orbital contributions. (b) Partial density of states (PDOS) of $CsIrI_3$ for the spin-down channel, showing a band gap at the Fermi level with dominant Ir d and I p orbital contributions.

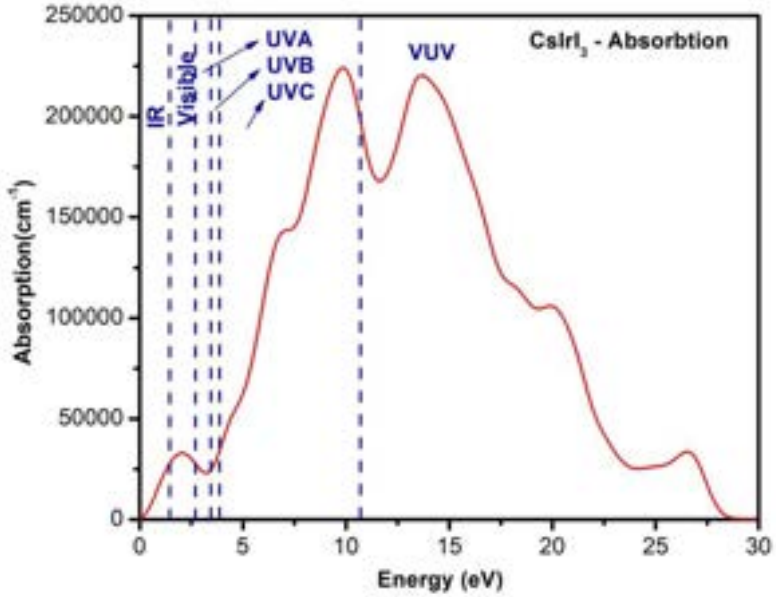

Figure 3. Optical absorption spectrum of $CsIrI_3$, showing strong absorption in the ultraviolet (UV) region, with negligible absorption in the infrared (IR) and weak absorption in the visible region.

As shown in **Figure 3,** the material exhibits negligible absorption in the infrared (IR) region and only weak absorption in the visible region, while demonstrating significantly stronger absorption in the ultraviolet (UV) region. Notably, two distinct absorption peaks are observed within the UV region. One peak lies in the far-ultraviolet(UVC) region, near the boundary of the vacuum ultraviolet(VUV), while the other is located within the vacuum ultraviolet region, close to the far-ultraviolet range. These peaks highlight strong UV absorption, supporting the potential use of $CsIrI_3$ in UV-sensitive spintronic applications.

CONCLUSION

These results, obtained through first-principles calculations, confirm that this material elastically stable and exhibits half-metallic behaviour. Half-metallicity is confirmed by metallic behaviour in spin-up channel, and semiconductor behaviour in spin-down channel, as revealed by band structure calculations. The behaviour is primarily influenced by the hybridisation between Ir d-orbitals and I p-orbitals, which are the main contributors to the electric states near Fermi level. The difference in spin channels also indicates the presence of magnetic behaviour, and with Hirshfeld and Mulliken population analysis the magnetic moment is 1uB. Additionally, elastic calculations show that the material is ductile and elastically anisotropic. The absorption spectrum indicates that the material exhibits strong optical activity in the ultraviolet (UV) region, while showing weak absorption in the visible region and negligible absorption in the infrared (IR) region. As a result, $CsIrI_3$ shows potential for use in spintronic applications that require strain sensitivity or optical activity in the ultraviolet (UV) region. Therefore, experimental validation and integration into device structures are essential to fully explore and realize the potential of $CsIrI_3$ for practical spintronic applications.

Abstract

This study aims to compare the performance of the advanced object detection architectures YOLOv8 and YOLOv11 in real-time vehicle detection and traffic density analysis. Traffic density assessment plays a critical role in smart city applications, traffic management systems, and enhancing driver safety. The study utilizes the 'Real-Time Traffic Density Estimation' dataset from Kaggle, previously trained on YOLOv8. Both models will be trained and tested on this dataset to evaluate and compare their effectiveness in detecting vehicles and analyzing traffic density. The results will highlight the improvements and evolutionary developments from YOLOv8 to YOLOv11, emphasizing their impact on solving real-time traffic monitoring challenges.
Keywords: YOLOv11, Nesne Tespiti, Trafik Yoğunluğu, Derin Öğrenme, Bilgisayarla Görü

INTRODUCTION

Günümüzde artan araç sayısı, şehir içi ulaşımı daha karmaşık hale getirmekte ve trafik yönetim sistemlerinin önemini her geçen gün artırmaktadır. Özellikle büyük şehirlerde, trafik yoğunluğunun etkin bir şekilde izlenmesi ve yönetilmesi, ulaşım planlaması, çevresel etki analizi ve sürücü güvenliği açısından kritik bir rol oynamaktadır. Bu bağlamda, gerçek zamanlı trafik yoğunluğu tespiti; akıllı şehir uygulamalarının temel bileşenlerinden biri haline gelmiştir.

Trafik yoğunluğunun belirlenmesinde geleneksel yöntemler, genellikle manyetik sensörler, döngü dedektörleri veya insan gücüne dayalı gözlemler gibi fiziksel altyapı gerektiren sistemleri içermektedir. Ancak bu yöntemler; kurulum maliyetlerinin yüksek olması, bakım zorlukları ve esnekliğin düşük olması gibi dezavantajlara sahiptir. Son yıllarda, bilgisayarla görme ve yapay zeka tekniklerindeki gelişmeler sayesinde, trafik izleme sistemlerinde kamera görüntüleri üzerinden otomatik analiz yapılması daha yaygın hale gelmiştir. Bu tür görüntü tabanlı çözümler, daha düşük maliyetli, kolay ölçeklenebilir ve gerçek zamanlı sonuçlar üretmeye uygun yapılar sunmaktadır.

Nesne tespiti (object detection), görüntülerdeki nesnelerin konumlarını ve türlerini belirlemeyi amaçlayan bilgisayarla görme problemlerinden biridir. Özellikle trafik yoğunluğu analizi gibi dinamik ortamlarda, doğru ve hızlı nesne tespiti yapan algoritmaların kullanılması, sistemin başarımını doğrudan etkilemektedir. Bu alanda en çok dikkat çeken ve yaygın kullanılan modellerden biri, "You Only Look Once (YOLO)" mimarisidir(Redmon & Farhadi, 2018). YOLO, gerçek zamanlı nesne tespiti konusunda yüksek hız ve doğruluk oranlarıyla öne çıkan bir algoritmadır. YOLO mimarisi, gelişen donanım ve yazılım olanaklarıyla birlikte sürekli evrim geçirmekte ve yeni sürümleriyle daha karmaşık senaryolara çözüm sunmaktadır.

Bu çalışma kapsamında, en güncel YOLO sürümlerinden biri olan YOLOv11 mimarisi kullanılarak gerçek zamanlı trafik yoğunluğunun tespiti amaçlanmaktadır. Çalışmada, Kaggle platformunda yer alan ve daha önce YOLOv8 ile eğitilmiş olan "Real-Time Traffic Density Estimation" veri seti kullanılacaktır . Bu veri seti; farklı hava koşulları, günün farklı zamanları ve çeşitli trafik senaryolarını içeren, etiketlenmiş görüntülerden oluşmaktadır. YOLOv11 ile bu veri seti üzerinde gerçekleştirilecek model eğitimi ve test süreci sonucunda elde edilen performans metrikleri, önceki nesil YOLOv8 mimarisi ile karşılaştırılarak analiz edilecektir.

Bu karşılaştırmalı analiz sayesinde, YOLO mimarisinin evrimsel gelişiminin, özellikle trafik yoğunluğu gibi gerçek zamanlı ve kritik öneme sahip problemlere olan katkısı değerlendirilecektir. Elde edilen

sonuçlar; yalnızca akademik düzeyde bir model başarımı değil, aynı zamanda akıllı şehirlerde uygulanabilirlik açısından da yol gösterici olacaktır.

YOLO mimarisi ilk olarak 2016 yılında Redmon ve arkadaşları tarafından tanıtılmıştır (Redmon et al., 2016). YOLOv1, gerçek zamanlı nesne tespitine olanak sağlayan ilk mimaridir ancak doğruluk konusunda bazı sınırlamaları bulunmaktaydı. Bu sorunlar, sırasıyla YOLOv2 ve YOLOv3 sürümlerinde çözülmeye çalışılmış; özellikle YOLOv3 ile daha derin mimariler, daha küçük nesne tespiti ve residual bağlantılar gibi iyileştirmeler yapılmıştır (Redmon & Farhadi, 2018).

Daha sonra tanıtılan YOLOv4, verimlilik odaklı bazı teknikleri (CSPDarknet53, PANet, Mish aktivasyon fonksiyonu) kullanarak hem hız hem de doğruluk açısından önemli iyileştirmeler sunmuştur (Bochkovskiy et al., 2020). YOLOv5 ve YOLOv6 ise açık kaynak topluluklarının katkısıyla geliştirilmiş, modülerlik ve kullanım kolaylığı açısından öne çıkmıştır. YOLOv7 ile hız ve doğruluk optimizasyonu daha ileriye taşınmış; YOLOv8 ise anchor-free yaklaşım, yeni veri artırma teknikleri ve otomatik öğrenme oranı gibi modern özelliklerle donatılmıştır (Jocher et al., 2023).

Son olarak geliştirilmiş olan YOLOv11, hem donanımsal kaynaklara uygunluğu hem de karmaşık sahnelerdeki doğruluk oranları açısından önemli iyileştirmeler sunmaktadır. Bu sürümde, yeni nesil transformer tabanlı katmanların entegre edildiği ve sinir ağı içerisindeki bilgi akışının daha etkili hale getirildiği görülmektedir. Ayrıca, YOLOv11'de kullanılan gelişmiş veri artırma yöntemleri (mosaic, mixup, cutmix vb.) sayesinde modelin genelleme yeteneği artmıştır. Backbone yapısında yapılan iyileştirmeler sayesinde hem küçük hem büyük nesne tespitlerinde daha başarılı sonuçlar alınmaktadır (Zhang et al., 2024).

Özetle, YOLO mimarisinin evrimsel gelişimi, trafik yoğunluğu gibi zaman duyarlı ve dinamik problemlerin çözümünde onu en uygun modellerden biri haline getirmiştir. YOLOv11, özellikle yüksek çözünürlüklü görüntülerde çoklu nesne tespiti yaparken dahi gerçek zamanlı çalışabilme kapasitesi ile bu alandaki ihtiyaçlara etkili bir çözüm sunmaktadır .

Ultralytics'in en son yinelemesi olan UltralyticsYOLO11, nesne algılama görevleri için hız ve doğruluk açısından mükemmel olacak şekilde tasarlanmıştır. gibi önceki YOLO modelleri üzerine inşa edilmiştir. YOLOv8 YOLO11 , uç cihazlardan bulut sunucularına kadar farklı donanım platformlarında performansı optimize etmek için mimari geliştirmeler içermektedir. Nesne algılama, örnek segmentasyonu, görüntü sınıflandırma ve poz tahmini dahil olmak üzere bir dizi bilgisayarla görme görevini destekleyen çok yönlülüğü ile öne çıkmaktadır.

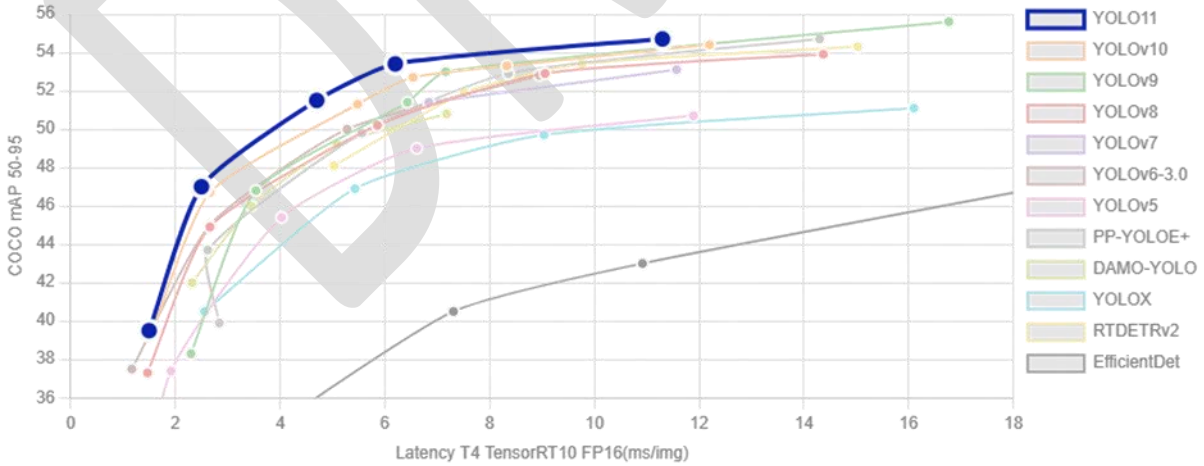

Figure 1. YOLOV11 mimarisi ve diğer mimarilerin karşılaştırılması.

YOLO11, farklı performans ihtiyaçlarına uygun bir dizi model (YOLO11n, YOLO11s, YOLO11m, YOLO11l, YOLO11x) sunmaktadır. Nano versiyon olan YOLO11n, sadece 2,6M parametre ve 56,1 ms CPU ONNX hızı ile 39,5 mAPval 50-95 değerine ulaşır. Daha büyük olan YOLO11x, doğruluğa öncelik

vererek 54,7'lik bir mAPval 50-95'e ulaşır. YOLO11 , çıkarım hızını daha da artırmak için karma hassasiyetli eğitim gibi teknikler kullanır.

Trafik yoğunluğu tahmini gibi gerçek zamanlı uygulamalarda, modelin hem hızlı hem de doğru sonuç üretmesi kritik öneme sahiptir. YOLO mimarisi bu gereksinimleri karşılamada öne çıkmaktadır. YOLOv3 ile birlikte küçük nesne tespiti gibi problemler üzerine yoğunlaşılmış, ardından gelen YOLOv4 ve YOLOv5 sürümleriyle doğruluk-hız dengesinde önemli gelişmeler kaydedilmiştir(Bochkovskiy & Wang & Liao, 2020). Daha sonra açık kaynaklı Ultralytics tarafından geliştirilen YOLOv8, modüler yapısı ve yüksek doğruluk oranıyla dikkat çekmiştir . Son olarak geliştirilen YOLOv11, farklı boyutlardaki modelleriyle (n, s, m, l, x) kullanıcıya esneklik sunmakta ve hem CPU hem de GPU ortamları için optimize edilmiş yüksek performanslı bir çözüm sunmaktadır.

Trafik yoğunluğu tahmini özelinde, YOLO algoritması görüntülerdeki araçların hızlı ve doğru şekilde tespit edilmesini sağlar. Bu sayede belirli bir zaman aralığında geçen araç sayısı belirlenerek yoğunluk tahmini yapılabilir. Bu yöntem, özellikle sabit kameralar veya dronlar gibi düşük maliyetli görüntü kaynaklarıyla entegre edildiğinde geleneksel sensör tabanlı sistemlere kıyasla daha esnek ve ekonomik çözümler sunar (Ma & Zhu & Li, 2021).

YOLO mimarisi, trafik sahnelerinin değişken yapısı (gün ışığı değişimleri, hava koşulları, araç çeşitliliği) karşısında da sağlam bir performans sergilemektedir. Özellikle YOLO'nun transfer öğrenme desteği sayesinde, önceden eğitilmiş modeller küçük veri setleriyle dahi etkin sonuçlar verebilmektedir (Tan & Le, 2019). Bu özellik, etiketleme maliyetlerinin yüksek olduğu trafik verisi gibi durumlarda büyük avantaj sağlamaktadır.

Bu çalışmada, YOLOv11 mimarisi kullanılarak Kaggle platformunda yer alan "Real-Time Traffic Density Estimation" veri seti üzerinde model eğitimi yapılmakta ve elde edilen sonuçlar, YOLOv8 ile kıyaslanarak analiz edilmektedir. Bu karşılaştırma ile YOLO mimarisinin sürümler arası gelişiminin trafik yoğunluğu tahminindeki başarım üzerindeki etkisi değerlendirilecektir.

MATERIALS AND METHODS

Bu çalışmada, gerçek zamanlı trafik yoğunluğu tespiti amacıyla, en güncel nesne tespiti algoritmalarından biri olan YOLOv11 mimarisi tercih edilmiştir. YOLO ailesinin en son sürümü olan YOLOv11, seleflerine kıyasla daha yüksek doğruluk oranı, iyileştirilmiş hız-performans dengesi ve gelişmiş model genel performansı ile öne çıkmaktadır. Bu bölümde, uygulanan yöntem, model eğitimi süreci ve kullanılan veri kümesine ilişkin detaylar açıklanacaktır.

YOLOv11, Ultralytics tarafından geliştirilen önceki YOLO sürümlerinin üzerine inşa edilmiş, optimize edilmiş bir nesne tespiti mimarisidir. YOLOv11'de Efficient Layer Aggregation Networks (ELAN++), Bidirectional Feature Pyramid Network (BiFPN) ve Dynamic Head (DyHead) gibi yeni nesil mimari bileşenler entegre edilmiştir. Bu sayede, hem düşük hem de yüksek çözünürlüklü özellik haritalarının etkin bir şekilde birleştirilmesi sağlanarak çok ölçekli nesne tespitinde doğruluk artırılmıştır.

Ayrıca YOLOv11, transformer tabanlı dikkat mekanizmalarını da desteklemektedir. Bu yapı, özellikle yoğun trafik gibi karmaşık senaryolarda araçların birbiriyle çakıştığı durumlarda, ayrım gücünü artırmakta ve nesne sınırlarının daha net belirlenmesini sağlamaktadır. Modelin temel yapı taşları aşağıdaki gibidir:

Backbone (Omurga): ELAN++ ile güçlendirilmiş CSP yapısı sayesinde özellik çıkarımı daha verimli hale gelmiştir.

Neck (Boyun Yapısı): BiFPN kullanılarak farklı katmanlardan gelen özellik haritaları optimize bir şekilde harmanlanmaktadır.

Head (Başlık Yapısı): Dynamic Head modülü ile farklı görevler (sınıflandırma, regresyon, nesne skoru) arasında görev odaklı dikkat mekanizmaları uygulanarak daha esnek öğrenme sağlanmaktadır.

Model eğitimi için Kaggle platformunda yayımlanan Real-Time Traffic Density Estimation veri seti kullanılmıştır. Bu veri seti; farklı trafik koşullarını temsil eden binlerce etiketlenmiş görüntüden oluşmakta olup, farklı hava koşulları, günün saatleri ve yol tiplerini içermektedir. Görüntüler, "car", "truck", "bus", "motorbike" gibi sınıflara ayrılmıştır. Veri seti eğitim (%70), doğrulama (%20) ve test (%10) olmak üzere üç alt kümeye bölünmüştür. Etiketleme formatı, YOLO'nun kullandığı bounding box (sınırlayıcı kutu) biçimine uygun olarak hazırlanmıştır.

Veri seti, her bir görüntünün 640x640 piksellik tekdüze bir çözünürlüğe yeniden boyutlandırıldığı bir standartlaştırma sürecinden geçer. Modelin genelleme yeteneğini güçlendirmek için, 536 görüntüden oluşan eğitim verilerine artırmalar uygulandı. Doğrulama seti 90 görüntü içerir ve performans değerlendirmesinin bütünlüğünü korumak için artırılmamış halde kalır.

Model eğitimi sürecinde YOLOv11-custom konfigürasyonu tercih edilmiştir. Eğitim işlemi için aşağıdaki hiperparametreler kullanılmıştır:

Table 1. YOLOv11 ve YOLOv8 Model Eğitiminde Kullanılan Hiper Parametreler

Parametre	**Değer**
Batch Size	32
Initial Learning Rate	0.0001
Learning Rate	0.1
Epoch Sayısı	100
Dropout	0.1
Optimizer	SGD (Momentum: 0.937)
Loss Function	CIoU Loss (box loss), Binary Cross Entropy (class loss)

Bu hiperparametreler literatürde var olan YoloV8 modeli ile tam bir karşılaştırma yapılabilmesi adına, YoloV8'de kullanılan parametreler ile birebir seçilmiştir.

Model eğitimi, Google Colab ortamında T4 GPU kullanılarak gerçekleştirilmiştir. Eğitim süreci boyunca her epoch sonunda doğrulama metrikleri izlenmiş, modelin overfitting eğilimleri kontrol edilmiştir. En iyi doğrulama başarımı gösteren model, test veri seti üzerinde değerlendirilerek YOLOv8 ile karşılaştırılmıştır.

YOLOv11'in Yolov8'den daha iyi performans göstermediği görülmüştür.

YOLOv8 ve YOLOv11 mimarileri kullanılarak elde edilen trafik yoğunluğu tahmin sonuçları karşılaştırılmıştır. Karşılaştırma; Box Loss Learning Curve, Classification Loss Learning Curve, Distribution Focal Loss Learning Curve metrikleri üzerinden yapılmıştır.

Öğrenme Eğrileri Analizi (Learning Curves Analysis) karşılaştırıldığında,

Figure 7. Eğitilen YOLOv8 modellinin test verileri üzerinde test edilmesi

Figure 8. Eğitilen YOLOv11 modellinin test verileri üzerinde test edilmesi

RESULTS

YOLOv8 ve YOLOv11 modelleri, trafik görüntüleri üzerinde eğitilerek nesne tespiti performansları karşılaştırmalı olarak analiz edilmiştir. Her iki model de aynı veri kümesi üzerinde, benzer eğitim koşulları altında eğitilmiş ve test edilmiştir. Elde edilen sonuçlara göre, YOLOv11 modelinin mimarisinde yapılan güncellemeler doğruluk, kararlılık ve hassasiyet açısından avantajlar sunsa da, incelenen trafik veri seti özelinde bu avantajlar sınırlı kalmış ve YOLOv8, özellikle trafik yoğunluğu ölçümü gibi gerçek zamanlı analizlerde daha verimli bir performans sergilemiştir.

YOLOv8'in başarısı, optimize edilmiş katman yapısı, daha kısa eğitim süresi ve yüksek işlem hızı ile dengeli bir doğruluk sağlamasından kaynaklanmaktadır. Bu yönleriyle gerçek zamanlı uygulamalarda öne çıkmaktadır. Öte yandan, YOLOv11 modeli, daha karmaşık yapısıyla bazı durumlarda daha doğru ve hassas tespitler yapabilse de, genel doğruluk artışı sınırlı kalmış ve işlem süresi açısından dezavantaj oluşturmuştur.

Sonuç olarak, trafik yoğunluğunu ölçme gibi hız ve verimlilik gerektiren senaryolarda YOLOv8 modeli daha uygun bir tercih olacaktır. Ancak, doğruluk ve hassasiyetin ön planda olduğu uygulamalarda YOLOv11 değerlendirilebilir. Gelecekte farklı veri setleri ve uygulama senaryoları ile yapılacak analizler, bu modellerin seçiminde daha isabetli kararlar verilmesine katkı sağlayacaktır.

DISCUSSION

Elde edilen sonuçlar, model seçiminin yalnızca doğruluk metriklerine değil, uygulama bağlamındaki ihtiyaçlara göre yapılması gerektiğini göstermektedir. YOLOv8'in daha kısa eğitim süresi ve dengeli performansı, gerçek zamanlı trafik yoğunluğu analizleri için daha uygun bir çözüm sunduğunu ortaya koymuştur. Buna karşılık, YOLOv11'in bazı metriklerde sağladığı sınırlı iyileştirmeler, doğruluk açısından potansiyel taşısa da işlem süresi ve kaynak kullanımı açısından dezavantaj oluşturabilir. Bu durum, model tercihlerinde doğruluk-hız dengesinin kritik bir rol oynadığını ve bağlama özgü değerlendirmelerin gerekliliğini vurgulamaktadır. Ayrıca, çalışmanın tek bir veri seti ile sınırlı olması, farklı koşullarda yapılacak deneylerle desteklenmesi gerektiğini göstermektedir.

CONCLUSION

Bu çalışma, YOLOv8 ve YOLOv11 modellerinin trafik yoğunluğu tespiti özelindeki performanslarını karşılaştırmalı olarak değerlendirmiştir. Elde edilen bulgular, YOLOv8'in daha kısa eğitim süresi ve dengeli doğruluk-hız performansı ile gerçek zamanlı uygulamalarda daha uygun bir seçenek olduğunu göstermiştir. Öte yandan, YOLOv11 belirli metriklerde sınırlı iyileştirmeler sunmakla birlikte, işlem süresi açısından daha maliyetlidir. Bu doğrultuda, model seçiminin kullanım senaryosuna göre yapılması gerektiği ve sadece doğruluk değil, sistem gereksinimleri ve hız gibi kriterlerin de dikkate alınmasının önemli olduğu sonucuna varılmıştır. Gelecek çalışmalarda farklı veri setleri ve uygulama alanlarında bu modellerin kapsamlı analizlerinin yapılması önerilmektedir.

Abstract

In this study, the inhibitory effects of synthesized Schiff bases (7-11) and bis-α-aminophosphonate (13-16) derivatives on α-glucosidase and tyrosinase enzymes and the molecular level mechanisms of these effects were investigated. As a result of *in vitro* studies, it was determined that bis-α-aminophosphonate derivatives were more potent inhibitors than Schiff bases. Among the tested compounds, compound 16 exhibited the strongest inhibition against α-glucosidase with an IC_{50} value of 32.54 ± 0.6 µg/mL, outperforming the reference compound acarbose (IC_{50} = 80.60 ± 2.1 µg/mL). In tyrosinase inhibition assays, compound 9 showed the highest activity among the synthesized molecules (IC_{50} = 187.34 ± 3.7 µg/mL), though still significantly less potent than the standard inhibitor tropolone (IC_{50} = 1.06 ± 0.4 µg/mL). Molecular docking studies, which are consistent with the experimental results, showed that these substances bind to the active sites of the target enzymes with high affinity. These findings indicate that compound 16 in particular can be evaluated among potential inhibitor candidates targeting the α-glucosidase enzyme.

Keywords: Schiff bazları, α-Aminofosfonatlar, α-Glikozidaz, Tirozinaz, Moleküler docking.

INTRODUCTION

Hyperglycemia, a defining characteristic of diabetes mellitus (DM), results from insufficient insulin production or action (Ke *et. al* 2024, Feitosa *et. al* 2024). As a major global health issue, DM is among the most prevalent chronic metabolic disorders. In 2021, approximately 10.5% of the global population aged 20–79—about 536.6 million individuals—were living with diabetes. This number is projected to rise to 12.2% (783.2 million people) by 2045 (Sun *et. al* 2022, Fayed *et. al* 2024). According to WHO estimates, diabetes may rank as the sixth leading cause of mortality worldwide by 2030 (Wahidin *et al*. 2024). A key target in diabetes management is the α-glucosidase enzyme, which facilitates the final step of carbohydrate digestion in the small intestine by converting complex carbohydrates into glucose (Peytam *et. al* 2025). Inhibiting this enzyme slows glucose absorption and helps regulate postprandial blood sugar levels (Peytam *et. al* 2025). α-Glucosidase inhibitors such as acarbose and miglitol are already approved for managing type 2 diabetes mellitus (T2DM), though their use is often limited by gastrointestinal side effects like bloating, diarrhea, and abdominal pain (Van de Laar *et al.* 2005). Despite advances in treatment, the global burden of diabetes persists (Bouchi *et al.* 2024, DiNicolantonio *et al.* 2015), prompting the search for safer and more effective α-glucosidase inhibitors. In recent years, many promising candidates have been identified with the potential to improve efficacy and minimize adverse effects (Adip *et al.* 2019, Peytam *et al.* 2020, Peytam *et al.* 2021, Singh *et al.* 2023, Mushtaq *et al.* 2023, Pan *et al.* 2024).

Hyperpigmentation, a condition characterized by localized skin darkening, results from excessive melanin accumulation and can arise due to UV exposure, hormonal imbalances, inflammation, or aging (Thawabteh *et al.* 2023, Kang *et al.* 2021). Tyrosinase (EC 1.14.18.1), a copper-containing oxidoreductase enzyme, catalyzes key reactions in melanogenesis, including the hydroxylation of L-tyrosine and its subsequent oxidation to dopaquinone (Pillaiyar *et al.* 2017). Inhibiting this enzyme reduces melanin synthesis, making tyrosinase a critical target for treating pigmentation disorders. Beyond dermatology, tyrosinase also plays roles in food spoilage, antibiotic resistance, and neurodegenerative processes (Min *et al.* 2019, Peng *et al.*

2022). Given its broad relevance in cosmetics, agriculture, and pharmaceuticals, extensive efforts have focused on discovering effective tyrosinase inhibitors (Moghadam *et al.* 2025).

Schiff bases represent an important class of nitrogen-containing heterocyclic compounds and exhibit a wide range of biological activities. These compounds are known for their anticonvulsant, antidepressant, anti-inflammatory, analgesic, antimicrobial, antimalarial, anticancer, and antioxidant properties (Gopalakrishnan *et al.* 2007, Das *et al.* 2012). First synthesized by the German chemist Hugo Schiff in 1864, Schiff bases are typically formed via the condensation of amines with aldehydes or ketones (Aytac *et al.* 2023). They are generally represented by the formula R-CH=N-Ar, where the imine (azomethine) bond is classified as an aldimine if derived from an aldehyde and as a ketimine if derived from a ketone (Karaca 2018). Acting as key intermediates in the synthesis of nitrogen-based heterocycles, Schiff bases have recently garnered attention for their enhanced biological activities and enzyme inhibitory potential (Shukla *et al.* 2016, More *et al.* 2019, Shokrollahi *et al.* 2020, Tunç and Alım, 2021). Similarly, organophosphorus compounds have become prominent in medicinal chemistry due to their chemical diversity and pharmacological significance (Gundluru *et al.* 2016). Among them, α-aminophosphonates stand out as structural analogs of amino acids, in which a phosphonic acid moiety replaces the carboxyl group (Amira *et al.* 2021, Baren *et al.* 2023, Mandour *et al*. 2023). These compounds exhibit broad biological effects, including enzyme inhibition and anticancer activity. Their structural versatility has led to increasing interest in developing multifunctional molecules, particularly through the combination of Schiff base and α-aminophosphonate frameworks, for potential therapeutic applications ranging from neurodegenerative diseases to cancer.

In this study, Schiff bases (**7–11**) and bis-α-aminophosphonate derivatives (**13–16**), previously synthesized by our research group (Ekinci *et al.* 2025), were assessed for their inhibitory potential against α-glucosidase and tyrosinase enzymes. Alongside in vitro enzyme inhibition assays, molecular docking simulations were carried out to investigate their binding interactions at the molecular level. By combining experimental techniques with computational modeling, this integrative strategy offers meaningful insights into the possible therapeutic relevance of these compounds.

MATERIALS AND METHODS

1. Enzyme Activity Studies

The α-glucosidase inhibitory activity was evaluated using p-nitrophenyl-α-D-glucopyranoside (PNP-G) as the substrate, following the method of Tao *et al.* (2013). In a 96-well plate, test compounds were incubated with α-glucosidase (0.5 U/mL) in phosphate buffer (100 mM, pH 6.8) at 37 °C for 15 minutes. The reaction was initiated by adding PNP-G (5 mM), and absorbance was recorded over 5 minutes. Tyrosinase inhibition was evaluated spectrophotometrically at 492 nm using mushroom tyrosinase and L-DOPA as substrate, following the method of Yırtıcı *et al.* (2022). The assay mixture contained phosphate buffer (100 mM, pH 6.8), deionized water, L-DOPA (2.5 mM), and enzyme solution. Each compound was tested at five concentrations, and IC_{50} values were determined from activity versus concentration plots.

Molecular Docking Analysis

Molecular docking studies were carried out to predict the binding conformations and non-covalent interactions between the molecules and the target enzymes. Docking calculations were performed using the Molegro Virtual Docker software. Additionally, two-dimensional and three-dimensional interaction diagrams were visualized using BIOVIA Discovery Studio. The crystal structures of the target proteins (α-glucosidase and tyrosinase, with PDB IDs 3A4A and 2Y9X, respectively) were obtained from the RCSB database (www.pdb.org). The active sites of α-glucosidase and tyrosinase were identified based on the experimentally determined structures (PDB codes 3A4A and 2Y9X), and the docking procedure was applied to analyze the interactions of compounds **7**–**11** and **13**–**16** within these active regions (Cheung *et al.* 2012, Nachon *et al.* 2013).

DRAFT

RESULTS and DISCUSSION

Enzyme Activity

In this study, the inhibitory effect of all compounds on α-glucosidase and tyrosinase was investigated at five different concentrations. Activity (%)-Concentration graphs were drawn for each compound and IC_{50} values were calculated. Enzyme activity results are given in **Table 1**.

Table 1. IC_{50} values of compounds against α-glucosidase and tyrosinase.

α-Glycosidase		Tyrosinase	
Compounds	**IC_{50} (µg/mL)**	**Compounds**	**IC_{50} (µg/mL)**
7	173,29±3,4	**7**	-
8	115,52±2,3	**8**	-
9	-	**9**	187,34±3,7
10	-	**10**	-
11	-	**11**	693,15±6,8
13	99,02±0,9	**13**	-
14	-	**14**	231,05±2,5
15	-	**15**	346,57±3,2
16	32,54±0,6	**16**	330,07±3,0

As a result of the activity studies performed, compounds **9**-**11** of Schiff bases and **14** and **15** of bis-α-aminophosphonates did not show inhibition against α-glucosidase. On the other hand, compounds **7** and **8** of Schiff bases showed inhibition with IC_{50} values of 173.29 and 115.52 µM, respectively. Among bis-α-aminophosphonates, compounds **13** and **16** showed inhibition with IC_{50} values of 99.02 and 32.54 µM, respectively. Therefore, it is clear that bis-α-aminophosphonates, when compared to Schiff bases, show stronger inhibition against α-glucosidase. In addition, according to the obtained IC_{50} values, compound **16** is the strongest inhibitor among the molecules. According to the tyrosinase activity study, compounds **7**, **8**, **10** and **13** did not show any inhibitory effect against tyrosinase. The IC_{50} values of compounds **9** and **11** from Schiff bases were calculated as 187.34 and 693.15 µM, respectively. On the other hand, the IC_{50} values of molecules **14**, **15** and **16** from bis-α-aminophosphonates were calculated as 231.05, 346.57 and 330.07 µM, respectively. According to the calculated IC_{50} values, compound **9** showed the best inhibitory properties among the compounds.

Molecular Docking

Molecular docking studies were performed to predict the binding conformations between Schiff bases, bis-α-aminophosphonates and the relevant enzymes. The compatibility of the results of the docking studies with in vitro studies was evaluated. The molecular docking results of the complexes formed between Schiff bases and bis-α-aminophosphonate molecules and the relevant enzymes are given in **Table 2**. Both Schiff bases and bis-α-aminophosphonates exhibited stronger interactions with α-glucosidase compared to the reference compound acarbose. Similarly, the compounds exhibited stronger interactions with tyrosinase compared to the reference molecule tropolene.

Table 2. Molecular docking results of compounds with α-glycosidase and tyrosinase enzymes.

α-Glycosidase		Tyrosinase	
Compound	**MolDock Score**	**Compound**	**MolDock Score**
7	-123,71	**9**	-96,10
8	-112,07	**11**	-93,19
13	-191,14	**14**	-142,93
16	-189,47	**15**	-171,32
Acarbose	-71,77	**16**	-123,63
		Tropolone	-64,36

Compound **16** formed a hydrogen bond with Arg442 and a π-donor hydrogen bond with Arg315 in the binding site of α-glucosidase. Additionally, π-anion interactions were observed with Asp242, Asp307, and Asp352, and a π-cation interaction with Arg315. Alky interactions were detected between compound 16 and Val216, Phe303, Phe178, Phe314, and Lys156, while π-alkyl interactions were observed with Val216 and Arg442. Moreover, π-sigma interactions were found with Tyr72 and Pro312. The benzene ring attached to the phosphonate group of compound **16** exhibited a π–π interaction with Phe303 (**Figure 1**). Compound **9** formed a hydrogen bond with Asn260 located in the binding site of tyrosinase. Additionally, π-sigma interaction was observed with His85. π-alkyl interactions were detected between compound **9** and Met257,

Phe264, and Val248. The benzene rings of compound **9** exhibited π–π interactions with Phe264 and His244 (**Figure 1**).

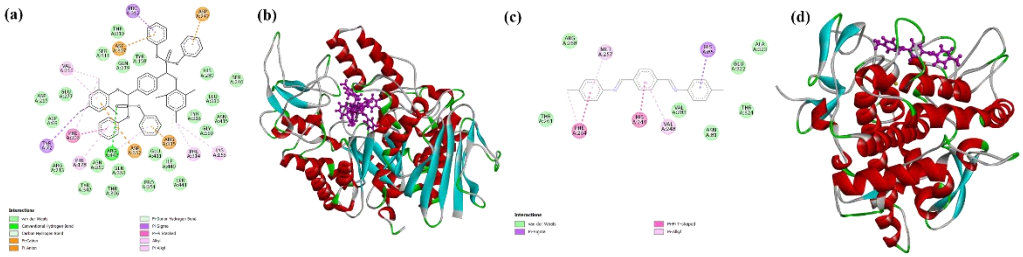

Figure 1. (a) 3D and (b) 2D docking poses of compound **16** with α-glucosidase, (a) 3D and (b) 2D docking poses of compound **9** with tyrosinase**.**

CONCLUSION

In conclusion, Schiff base and bis-α-aminophosphonate derivatives synthesized in our previous study were evaluated for their inhibitory activities against α-glucosidase and tyrosinase enzymes by both in vitro experiments and molecular docking studies. The results showed that bis-α-aminophosphonates, especially compound **16**, exhibited superior inhibitory potential against α-glucosidase. Compound **9** showed the most promising tyrosinase inhibition among the tested molecules. Molecular docking analyses supported the experimental findings, confirming the favorable binding interactions between the active compounds and the catalytic sites of the enzymes. Overall, compound **16** emerges as a promising lead for further development as an α-glucosidase inhibitor, potentially contributing to therapeutic strategies for diabetes management.

Abstract
In this study, the stabilisation of marl soil using Iron and steel cooling water sludge (SS) and polypropylene fibres (PPF) was investigated. Marl soil is a type of soil characterised by high clay and calcium carbonate content and is a poor subgrade for construction purposes due to its low strength and sensitivity to environmental stressors. SS is proposed as a soil modifier that can increase soil strength and provide environmental sustainability. PPF also help to improve soil cohesion, reduce cracking and improve overall mechanical properties. In this study, the strength and durability of marl soil stabilised withSS and PPF under freeze-thaw cycles were investigated. Freeze-thaw cycles can cause mechanical and structural changes in the soil, jeopardising the stability of the infrastructure. Therefore, it is important to develop soil stabilisation techniques, especially under such environmental conditions. In this research, the performance of different stabilisation materials under freeze-thaw conditions, optimisation of curing periods and development of predictive models to evaluate soil performance are discussed. The study showed that SS and PPF are potentially effective materials for stabilizing marl soil and can improve soil behaviour under freeze-thaw conditions.
Keywords: Freeze-Thaw Cycles, Soil Stabilisation, Marl Soil, Sewage Sludge (SS), Polypropylene Fibres (PPF).

INTRODUCTION

Soil stabilization is an important geotechnical technique that improves the mechanical and structural properties of weak soils, especially for construction purposes. Marl soil is a type of soil characterized by high clay and calcium carbonate content. They are difficult to work with due to their low strength, periodic swelling, and shrinkage[1]. Soil stability is crucial for infrastructure, but freeze-thaw cycles pose challenges by weakening soil structure, reducing strength, and increasing permeability. Conventional stabilization methods have limited success in addressing these effects [2]. To reduce these problems, SS, a by-product of wastewater treatment processes, is proposed as a potential solution. SS contains organic and inorganic components that increase soil strength by binding particles together and densifying the soil matrix, thus increasing the load-carrying capacity and resistance to soil deformation. In addition, SS reduces soil retention under freeze-thaw conditions, prevents the formation of ice lenses, and provides the capacity to maintain structural integrity for many cycles under freeze-thaw conditions [3]. Therefore, such materials offer the dual benefits of improved mechanical strength and freeze-thaw resistance.An innovative approach is using wastewater sludge (SS) as a soil modifier, offering both environmental and stability benefits by reducing waste and promoting resource recycling [4]. Additionally, polypropylene fibers (PPF) enhance soil strength and durability under freeze-thaw conditions [5]. When combined with SS, PPFs create a synergistic effect, improving soil cohesion and overall stability. Soıl stabılızatıon technıques lose theır effectıveness under freeze-thaw condıtıons, sıgnıficantly ımpactıng the long-term stabılıty and ıntegrıty of ınfrastructure. The problem becomes crıtıcal ın regıons wıth contrastıng clımates, where freeze-thaw cycles cause the soıl to expand and contract, leadıng to damage to structures. Therefore, there ıs an urgent need to ıdentıfy and develop ınnovatıve technıques and materıals that can enhance soıl resılıence agaınst the effects of freeze-thaw cycles [6].

DRAFT

Soil stabilization techniques lose their effectiveness under freeze-thaw conditions, significantly impacting the long-term stability and integrity of infrastructure. The problem becomes critical in regions with contrasting climates, where freeze-thaw cycles cause the soil to expand and contract, leading to damage to structures. Therefore, there is an urgent need to identify and develop innovative techniques and materials that can enhance soil resilience against the effects of freeze-thaw cycles

The limited comprehensive analysis of the performance of various stabilization materials under freeze-thaw conditions makes it difficult to develop effective soil improvement strategies in complex environmental conditions. Current deficiencies in optimization of curing time and additive ratios prevent consistent and predictable results from soil stabilization. Furthermore, the lack of reliable models to evaluate soil behavior under environmental stress conditions makes long-term performance analyses uncertain. This study aims to provide comprehensive and comparative data on the stabilization performance under different curing times and freeze-thaw cycles by investigating the effects of wastewater sludge (SS) and polypropylene fibers (PPF) on marl soil.

MARL SOIL AND SITE DESCRIPTION

Soil samples of marl were collected from the Karabük region, which is considered a complex geological area with significant seismic activity. This region is part of the highly active Alpine-Himalayan seismic belt and lies north of the North Anatolian Fault Zone, a high seismic hazard area. Marl soil is a fine-grained sedimentary material with a high calcium carbonate content, which increases its bearing capacity. However, it remains relatively weak under severe environmental stresses, such as freeze-thaw cycles and earthquakes.

The harsh climate and elevated seismic risks in the region make Karabük an ideal location for studying innovative techniques for marl soil stabilization. A picture of the sampling area around Karabük city is shown in Figure 1.

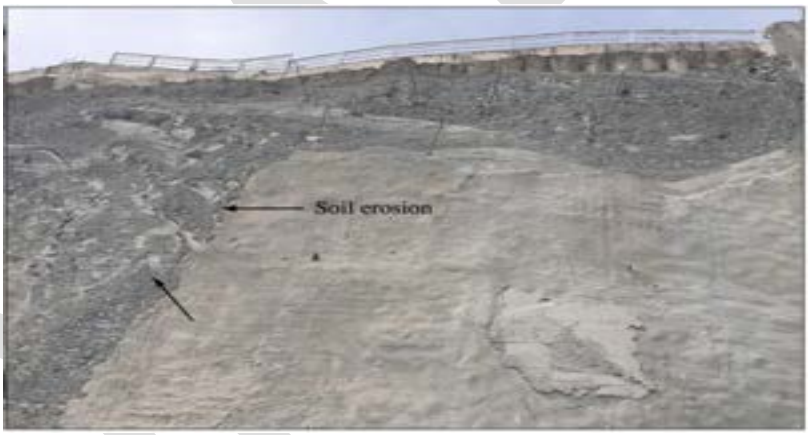

Figure 1. General view of the marl sampling site near Karabük, Turkey

MATERIAL FOR ENHANCING MARL STABILITY

Iron and steel cooling water sludge (SS)

Iron and Steel Cooling Water Sludge (SS) is a secondary by-product obtained from water used during closed circuit or single pass cooling processes in iron and steel production plants. This sludge consists primarily of iron oxides, metallic particles, corrosion products and deposited solids such as residual oil or grease originating from hot metal surfaces and circulating water. Due to its high iron content and fine particle size, ISCWS shows potential for reuse in geotechnical applications, especially as a soil stabilization agent. However, its chemical composition may vary depending on the raw material source, water quality and operational conditions. In this study, the chemical and physical properties of wastewater are presented in Table 1.

Table **Hata! Belgede belirtilen stilde metne rastlanmadı.**: Chemical and physical characteristics of SS

Component	SS	Component	SS
Na_2O	0.5422	TiO_2	0.6782
MgO	3.0748	MnO	0.0734
Al_2O_3	10.7019	Fe_2O_3	6.2635
SiO_2	35.0929	NiO	0.0143
P_2O_5	0.0758	ZnO	0.0143
SO_3	0.4224	Rb_2O	0.0153
K_2O	1.7467	Sro	0.2254
CaO	41.0612	Y_2O_3	0.0017

Polypropylene fiber (PPF)

Polypropylene fiber is a synthetic fiber derived from polypropylene; a thermoplastic polymer widely used in various applications due to its versatile properties. It is known for being lightweight, resistant to chemical and environmental degradations, and highly durable. These qualities make polypropylene fiber a preferred material in industries such as construction, textiles, and geotextiles. In construction, it is mainly used as reinforcement in concrete and composites, improving mechanical properties while reducing shrinkage cracking. Table 2 summarizes the key properties of polypropylene fiber examined in this study.

Table 2: Chemical and physical characteristics of PPF

Property	Value
Fiber type	Discrete
Unit weight (g/cm³)	0.91
Average diameter (mm)	0.034
Length (mm)	12
Breaking tensile strength (MPa)	350
Modulus of elasticity (MPa)	3500
Fusion point (°C)	165
Burning point (°C)	590
Acid and alkali resistance	Strong

IMPACT OF FREEZE-THAW CYCLES IN SAMPLE

The effect of freeze-thaw cycles on each of the four different groups was considered. The first group consisted of untreated marl soil, the second group included marl stabilized with the optimum dosage of sludge (15%), the third group consisted of marl reinforcement with the optimum dosage of PPF (1%), and the fourth group contained marl stabilized with the combination of the optimum dosages of sludge and PPF. All four groups were tested after three different curing periods: 7 days, 28 days, and 90 days. During these tests, the impact of freeze-thaw cycles was evaluated, and uniaxial compressive strength and compressive strength tests were conducted to characterize the performance of the samples References.

Freeze-thaw cycles

Freeze-thaw cycles are a common experimental method used to evaluate the behavior of materials under thermal fluctuations. This technique involves subjecting samples to repeated freezing and thawing processes to simulate natural environmental conditions, allowing for the assessment of physical and chemical property changes. The process begins with careful specimen preparation and conditioning to a reference state in terms of moisture or temperature. The sample is then frozen for 4 to 24 hours to ensure complete and uniform freezing, followed by thawing at temperatures ranging from 4°C to 20°C for a similar duration. These cycles are repeated a specific number of times based on the study's requirements, and material changes are monitored after each cycle using precise measurement tools. Observed changes may include weight loss, surface cracking, and variations in porosity, strength, and elasticity. The test concludes with a comparative analysis of pre- and post-cycle data to evaluate the material's resistance and stability

under freeze-thaw conditions. This method is widely applied in civil engineering, geotechnical studies, and environmental sciences to determine material durability and performance in thermally variable environments.

Sample preparation and test program

After preparing the uniaxial specimens, they were subjected to freeze-thaw cycles. Six different cycles were defined for the experiment, including 1, 2, 4, 6, 8, and 10 freeze-thaw cycles. In each cycle, for the freezing phase, a temperature of -17°C was considered, and the specimens were kept in the freezer for 12 hours. Then, for the thawing phase, a temperature of 24°C was applied, and the specimens were kept at this temperature for 12 hours. Each complete cycle freeze-thaw process was considered as one cycle. After completing each cycle, the test specimens were subjected to uniaxial compressive strength and compressive strength tests. Only the specimens that successfully passed these tests proceeded to the next cycle. It is discussed how the freeze-thaw cycle affects the specimens.

RESULTS AND DISCUSSIONS

Effect of freeze-thaw cycles on the UCS of untreated marl

These findings suggest that as the number of freeze-thaw cycles increases, a decline in UCS is observed. Furthermore, the greatest strength reduction is recorded in the 7-day curing period, indicating that shorter curing times provide lower resistance to freeze-thaw cycles (Figure 2).

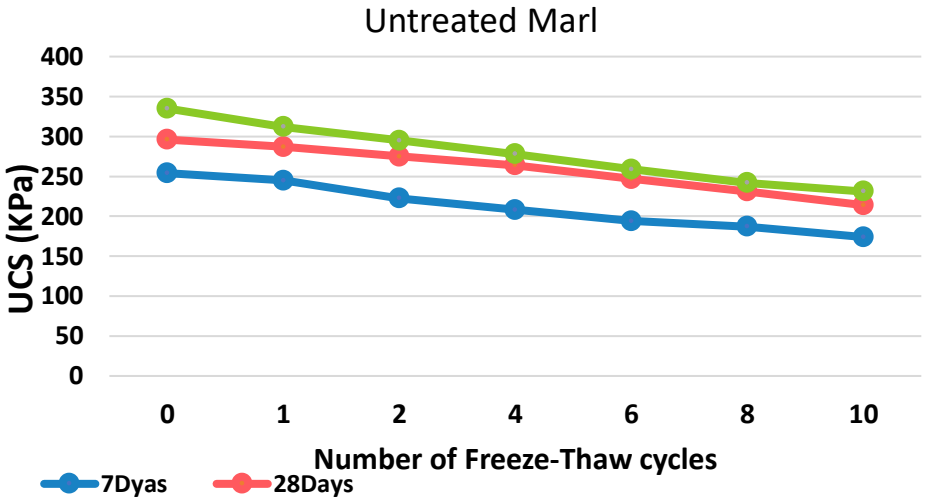

Figure 2. Effect of freeze-thaw cycles on the unconfined compressive strength (UCS) of untreated marl.

Effect of freeze-thaw cycles on the ucs of marl reinforced with 1% ppf

The addition of 1% PPF to untreated marl significantly improves UCS, with the most notable improvements observed over extended curing times. The maximum strength increase occurs at Cycle 6, showing a remarkable 87.3% improvement after 90 days of curing. However, after Cycle 10, a decline in performance is evident, particularly in the 7-day curing period, suggesting that excessive freeze-thaw cycles can adversely affect the soil's strength (Figure 3).

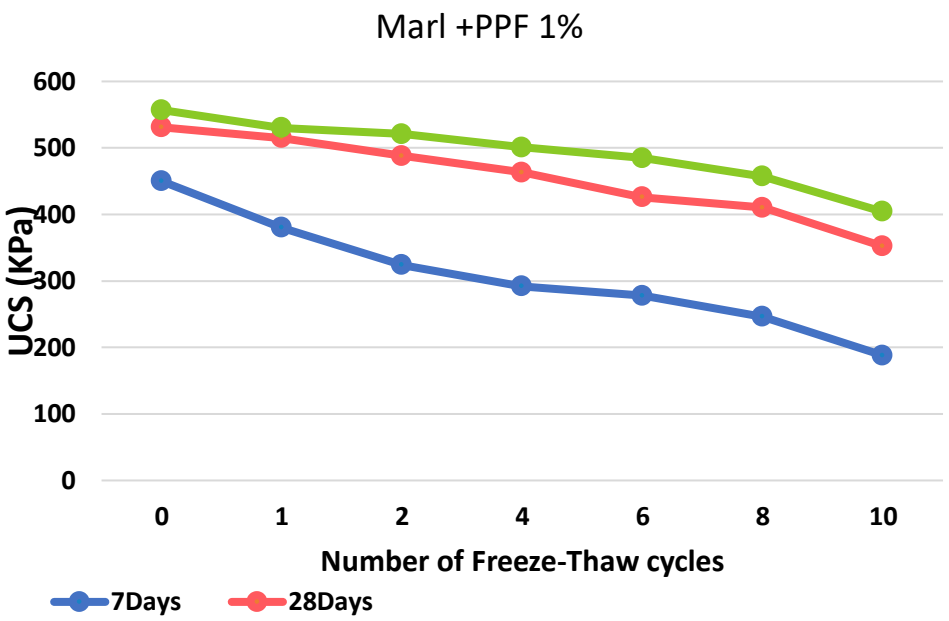

Figure 3. *UCS of marl soil reinforced with 1% PPF under different freeze-thaw cycles and curing periods.*

Effect of freeze-thaw cycles on the ucs of marl stabilized with 15% ss

The significant improvement in the UCS of the combination of Marl and 15% SS. The most remarkable performance improvement occurs in Cycle 6, with a 111.3% increase at 7 days. This treatment exhibits the best increasing trend over time, demonstrating its high effectiveness (Figure 4).

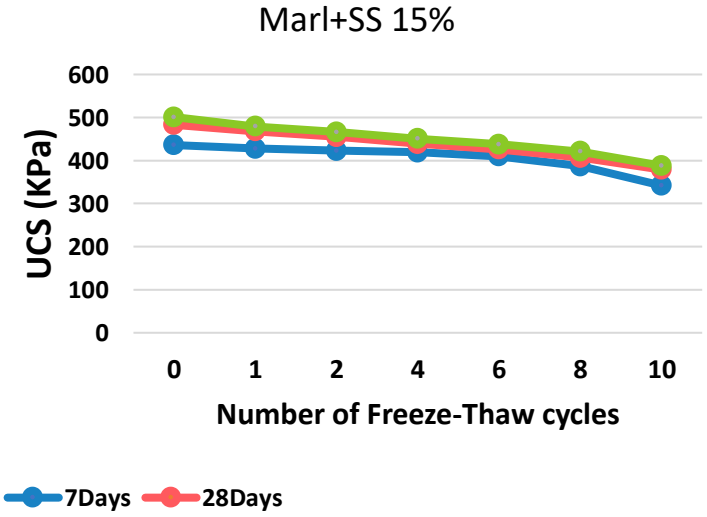

Figure 4. UCS of marl soil stabilized with 15% sewage sludge (SS) under different freeze-thaw cycles and curing periods.

Effect of freeze-thaw cycles on the ucs of marl treated with the optimum combination of 15% ss and 1% ppf

This analysis reveals that Marl + SS 15% + PPF 1% shows relatively good resistance to freeze-thaw cycles. The least decline in UCS over a 90-day curing period is observed in the combination of 15% SS and 1% PPF, thus improving the freeze-thaw durability of the material (Figure 5).

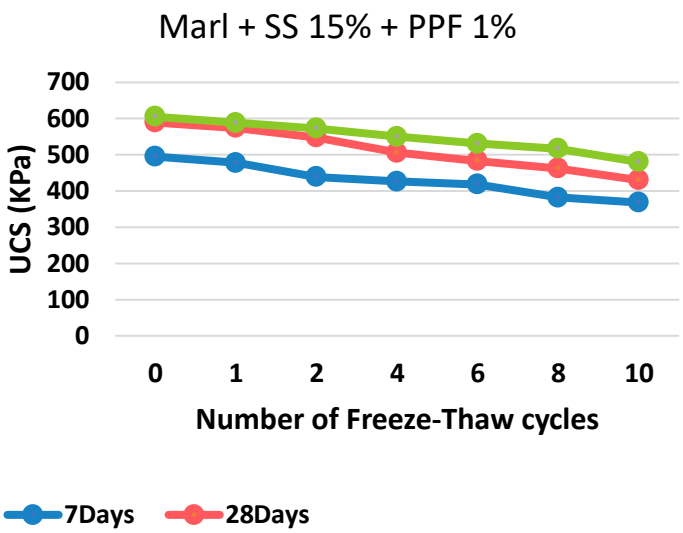

Figure 5. UCS of marl soil treated with the optimum combination of 15% sewage sludge (SS) and 1% polypropylene fiber (PPF) under different freeze-thaw cycles and curing periods.

CONCLUSION

This study focused on enhancing the freeze-thaw resistance of high-plasticity marl soil through the use of wastewater treatment sludge (SS) and polypropylene fibres (PPF). The results showed that treated samples with SS and PPF maintained structural integrity and exhibited minimal strength loss after multiple freeze-thaw cycles, whereas untreated marl experienced significant degradation.

The optimal combination of 15% SS and 1.00% PPF yielded the highest resistance to cracking and structural breakdown under freeze-thaw loading. Microstructural analyses confirmed that the additives improved internal bonding and reduced porosity, resulting in a denser soil matrix better equipped to withstand harsh environmental conditions.

These findings demonstrate the effectiveness of SS and PPF in reinforcing soil durability under repeated temperature fluctuations, offering a promising solution for soil stabilization in cold and seismically active regions.

Sustainable Pasture Management Through Community Engagement: Preserving Ecosystem Services in Korab-Koritnik Nature Park, Albania

Mihallaq Qirjo[1*] and Ani Ahmetaj[2]

[1]Faculty of Natural Sciences, Department of Biology, University of Tirana, Albania
[2]Resource Environmental Center Albania, Albania

Abstract
Across the Green Belt area of the Western Balkans, pastures are among the most vulnerable natural ecosystems, facing numerous challenges that lead to their degradation. Korab-Koritnik Nature Park, located in the cross-border region with North Macedonia, contains 22,578 hectares of pastures (or 40.6% of the whole protected area) classified as Alpine calcareous grasslands, lowland hay meadows (*Alopecurus pratensis, Sanguisorba officinalis*), and mountain hay meadows. These areas host valuable biodiversity and provide essential ecosystem services to local populations who have used them for thousands of years. The assessment offers data and insights into community practices related to pasture use. Emerging trends, such as early spring grazing—driven by rising temperatures and climate change at higher elevations—are negatively affecting pasture quality. Focus group discussions with shepherds and community representatives highlighted that pasture management practices should include rotational grazing, soil erosion control, and fire prevention and management.

Keywords pastures management, grazing, ecosystem services, community-based natural resource management, socio-ecological systems, climate change adaptation

INTRODUCTION

The Korab-Koritnik Nature Park is a significant part of the European Green Belt and is recognized as one of the important biodiversity hotspots on the Balkan Peninsula. This park spans approximately 22,578 hectares in the eastern Albanian Alps, featuring extensive subalpine and alpine grasslands that constitute a large portion of its total area. These grasslands provide ecological value and reflect human-environment interactions, which are vital for local communities' livelihoods and cultural identities [1] [2]. The unique geomorphology of the park, representing some of Albania's older geological formations, combined with various climatic influences, has resulted in a remarkable array of habitats and species, including many endemics that are rare or not found elsewhere [3] [4].

To analyze the multifaceted challenges posed to these critical ecosystems, this paper employs the Socio-Ecological Systems (SES) framework. This approach helps elucidate the intricate relationships between ecological components—such as grasslands, soils, and hydrology—and social factors including local communities, governance structures, and economic activities [2] [5]. The SES framework contrasts with traditional views that see humans primarily as threats to environmental integrity; instead, it emphasizes complex feedback loops and resilience, integrating social, economic, and political factors that impact ecological outcomes [6]. This framework supports a structured analysis that can lead to more nuanced insights into the interactions within the Korab-Koritnik ecosystems.

The primary challenge confronting the grasslands of Korab-Koritnik is their degradation, which threatens both biodiversity and human well-being. This degradation arises from various interrelated factors, including historical land-use practices, such as livestock grazing that began during the Medieval period, which have significantly altered treelines and shrub compositions [7]. Contemporary socio-economic changes, characterized by rural depopulation and emigration, further worsen these conditions. Additionally, climate change is a critical factor that impacts vegetation dynamics and ecosystem stability [2] [8]. Numerous studies illustrate how climate change interacts with local land management practices, producing profound effects on grassland ecosystems.

To address these pressing challenges, this paper advocates for a transition away from centralized, top-down conservation models that have historically failed to promote effective stewardship by local communities. A shift towards Community-Based Natural Resource Management (CBNRM) is proposed, wherein local communities are empowered through secure rights and active roles in managing their natural resources [1] [2]. This model integrates traditional ecological knowledge with scientific techniques, creating incentives for sustainable land use and stewardship [5] [6]. The effectiveness of CBNRM is linked to its potential to align conservation goals with local socio-economic conditions, ultimately enhancing both governance and ecological outcomes.

The study aims to achieve three objectives: (1) to characterize the current state of the Korab-Koritnik pasture socio-ecological system, including its key ecological elements and the dynamics of the local community; (2) to identify feedback mechanisms and systemic pressures driving ecological changes and threatening resilience; and (3) to propose a tailored co-management framework based on CBNRM principles to ensure the long-term sustainability of the park's grasslands and the communities that rely on them [4] [6].

MATERIALS AND METHOD

A. *Study Area: The Korab-Koritnik Socio-Ecological System*

Geographical and Ecological Context

The Korab-Koritnik Nature Park is located in the northeastern region of Albania, part of the broader Scardo-Pindhic Mountains system. This park features an ancient landscape, characterized by topographical diversity that includes high peaks such as Korabi i Math at 2,764 m, as well as deep gorges, canyons, and expansive plateaus like the Shishtavec plateau [9]. The rugged terrain has been shaped by geological processes over millennia, resulting in a complex mosaic of features, such as horst structures and steep slopes. The geology is varied, featuring siliceous rock formations in areas like the Shishtavec plateau and Kallabak Mt., limestone formations in the Koritnik and Gjallica Mts., and unique gypsum substrates located in Pelpeneku Mt. These geological features contribute to the park's rich floristic diversity and plant community variability [10].

The climate within the Korab-Koritnik area reflects a complex interplay of influences. The lower western slopes are influenced by a Mediterranean climate that penetrates through the Drini River valley, while much of the park experiences a modified continental climate [11]. At altitudes above 2,000 m, a mountainous climate prevails, with average annual temperatures ranging from 2 to 3°C, and annual precipitation ranging from 1,300 mm to over 2,000 mm on the higher western slopes [9]. This combination of geological diversity, topographical variation, and climatic differences gives rise to a wide array of ecological niches, contributing to the exceptionally high habitat heterogeneity observed within the park [12].

Socio-Economic and Governance Context

The socio-economic dimension of the Korab-Koritnik Socio-Ecological System (SES) is deeply rooted in a historical connection to the land, a relationship currently undergoing significant transformations. The communities situated within and around the park are primarily rural and have traditionally depended on pastures for their livelihoods. Key economic activities in the region include livestock herding, particularly sheep and goats, which utilize transhumance systems; beekeeping, producing honey derived from diverse alpine flora; and the collection of wild medicinal and aromatic plants [13]. A growing segment of nature-based tourism capitalizes on the park’s scenic and recreational appeal. However, these communities face considerable socio-economic challenges, including significant depopulation and demographic shifts due to high emigration rates. Many villages have experienced population declines, with remaining residents tending to be older, negatively impacting land management and diminishing the labour force available for traditional agricultural and pastoral activities [14] [15].

DRAFT

B. Data Collection and Analysis

Phytosociological and Habitat Assessment

Ecological data for this study were obtained from a series of field expeditions conducted during the spring, summer, and autumn of 2024. These expeditions aimed to assess the current state of herbaceous and shrub-land vegetation communities across the park's diverse geological substrates, including limestone, silicate, flysch, and gypsum formations [11]. Methodology was centred on identifying changes in floristic composition and structure while evaluating their relationships with habitat types and anthropogenic pressures. Detailed records were maintained on dominant and rare plant species, the composition of plant communities, and habitat conditions throughout the fieldwork period. The classification of vegetation units adhered to the hierarchical floristic system outlined in the EuroVegChecklist, while habitat types were identified according to the European Union's NATURA 2000 framework [16]. Plant identification utilized established botanical literature relevant to Albania and Europe [17] [18] [19] [20] [21] [22], ensuring scientific rigor.

Community-Based Participatory Assessment

To capture the social components of the SES, a qualitative, participatory research methodology was adopted, focusing on local stakeholder knowledge and experiences [23]. This process included focus group discussions in Peshkopi, engaging shepherds, beekeepers, farmers, and representatives from community organizations and the Dibër municipality. These sessions promoted dialogue and allowed participants to share insights related to pasture use and management [23] [24]. Additionally, comprehensive individual interviews were conducted with key informants, including an expert from AdZM Dibër, a transhumant shepherd, and five farmers from the Kala e Dodës administrative unit. The semi-structured nature of these interviews was designed to gather in-depth information on community demographics, livelihood strategies, pasture use practices, intra-community cooperation, perceived challenges, and future needs [25]. This community-based approach is critical for understanding local perspectives and socio-economic drivers that inform human-environment interactions within the park [24] [26].

RESULTS

The field assessments reveal that the Korab-Koritnik Nature Park harbors an exceptionally rich mosaic of grassland and heathland ecosystems, reflecting its complex environmental gradients. These ecosystems are of high conservation value, with several habitats listed as priorities under the EU Habitats Directive.

Grassland and Heathland Diversity

The grasslands of the park can be broadly categorized into several major phytosociological classes. The dry grasslands of the class Festuco−Brometea are widespread, occurring on both xerophilic sites, characterized by the alliance *Festucion valesiacae*, and xeromesophilic sites, represented by the alliance *Bromion erecti*. These communities are typically found along ridges and in the openings of forest zones, with dominant species including various fescues (*Festuca vallesiaca, F. rupicola, F. koritnicensis*), *Chrysopogon gryllus*, and *Bromus erectus*.

On high-altitude acidic and silicate substrates, such as those found on Kallabaku and Grama mountains, the acidophilous grasslands of the class *Juncetea trifidi* are prominent. These are represented by the alliances *Seslerion comosae* and *Poion violaceae*, which host a suite of Balkan endemic and alpine species like *Sesleria comosa, S. korabensis, Festuca panciciana*, and *Bellardiochloa violaceae*.

In stark contrast, the hygromesophilic meadows of the class Molinio−Arrhenatheretea occupy wet valleys, stream banks, and depressions, particularly in areas like Shishtavec. These meadows, vital for hay production and biodiversity, are characterized by alliances such as Calthion and *Agrostion albae* and support species like *Molinia caerulea, Sanguisorba officinalis, Polygonum bistorta*, and the rare *Gladiolus palustris*.

On calcareous and gypsum substrates, particularly on Koritnik and Gjallica mountains, the grasslands belong to the class Elyno−Seslerietea. These include communities of the alliance Seslerion juncifoliae on cold, north-facing slopes, and Onobrichido−Festucion on warmer, southern slopes. These habitats are rich in specialist and endemic species such as *Sesleria coerulans, Dryas octopetala, Onobrychis scardica*, and *Oxytropis korabensis*.

Finally, the landscape is punctuated by dwarf shrub communities. Formations of Alpine juniper (*Juniperus communis subsp. alpina*) are widespread on both calcareous and silicate slopes, representing an early colonizer of post-glacial landscapes. These are often interspersed with ericoid heaths of the class Loiseleurio procumbentis−Vaccinietea, including communities dominated by bilberry (*Vaccinium myrtillus*), bog bilberry (*V. uliginosum*), and Balkan heath (*Bruckenthalia spiculifolia*), which play a crucial role in soil protection and providing habitat.

Observed Ecological Pressures

The ecological integrity of these habitats is under considerable pressure from a combination of factors. Direct field observations have documented clear indicators of environmental stress and degradation:

• Climate Change Indicators: Tangible evidence of climate change is visible in the upward migration of vegetation belts. On the slopes above Shishtavec village, the treeline advanced by approximately 38 meters in altitude between 2002 and 2023. An even more pronounced shift was recorded on Gjallica Mountain, where the treeline moved upward by 60 meters between 2001 and 2023. This phenomenon, consistent with global trends of vegetation response to warming, signifies a long-term contraction of the alpine zone and its specialist habitats .

• Soil Degradation and Erosion: Soil erosion is a pervasive problem throughout the park, particularly on steep slopes. This process is accelerated in areas where vegetation cover has been removed, such as through the intentional burning of juniper shrubs, the creation of informal vehicle tracks that channel runoff, and along the historical "soft belt" (Brezi i bute)—a narrow strip of cleared land along the state border from the communist era that has now become a major source of erosion.

• Habitat Alteration and Fragmentation: The practice of burning Juniperus shrubs to "clear" pastures has led to significant habitat alteration. In these burned areas, there is a notable expansion of early successional, ruderal species like fireweed (Epilobium angustifolium), which alters community structure and ecosystem function. Furthermore, the proliferation of unofficial roads and tracks for vehicles and motorcycles is fragmenting contiguous pasture habitats, creating barriers for species movement and introducing new corridors for erosion and invasive species.

Community Management Practices and Perceived Challenges

The participatory assessments with local communities reveal a complex picture of traditional stewardship practices grappling with new and powerful socio-economic and environmental challenges.

1. *Traditional Use and Governance*

The use of the park's pastures is deeply rooted in a traditional transhumance system. During the summer months, herders move their livestock (primarily sheep and goats) to high-altitude pastures, where they establish temporary camps known as *stane*. Access to and use of these communal pastures are not arbitrary but are governed by a sophisticated set of unwritten, customary rules. These rules, which dictate grazing rights and resolve disputes, are adjudicated and enforced by village elders (*pleqësia*). This system of informal, community-level governance has historically been effective in managing resource use and minimizing conflicts among local users.

2. *Emerging Challenges from the Community Perspective*

Discussions with shepherds, farmers, and other community members highlighted a set of pressing challenges that are straining this traditional system and degrading the pasture resources upon which they depend:

• Climate-Driven Mismatches in Grazing: A key concern raised by shepherds is the trend of earlier spring grazing. Rising temperatures are causing snow to melt earlier in the season, prompting herders to move their flocks to high-altitude pastures sooner than in the past. This practice is detrimental to pasture health, as it subjects young, vulnerable plants to grazing pressure during their critical initial growth phase, reducing overall forage productivity for the rest of the season.

• The Paradox of Undergrazing: Contrary to the conventional focus on overgrazing, a more insidious problem has emerged in many areas: undergrazing. The significant decline in livestock numbers, a direct consequence of rural depopulation and emigration, has led to a reduction in grazing intensity. Without sufficient grazing pressure to control them, there has been a marked increase in the abundance of unpalatable shrubs and, more alarmingly, poisonous plant species. This shift in vegetation composition not only degrades the quality of the pasture but also poses a direct economic threat, causing illness and mortality in the remaining livestock.

• Governance Confusion: Community members expressed significant confusion and frustration over the current state of formal governance. The recent transfer of some management responsibilities to the local municipality, without clear delineation of roles with the existing authority of the Regional Administration of Protected Areas (RAPA), has created confusion both in the governing bodies, as well as the local population. This ambiguity led to a complete lack of oversight and enforcement in 2024, with no grazing fees being collected and no official body actively monitoring pasture use.

These challenges are not isolated issues but are deeply interconnected, creating a negative feedback loop that accelerates degradation. The process begins with a socio-economic driver—emigration—which reduces livestock numbers. This leads to an ecological consequence—undergrazing—which allows unpalatable and toxic plants to proliferate, an expected outcome when grazing pressure is removed. This ecological degradation, in turn, creates a negative economic feedback, making the traditional livelihood of herding less profitable and more challenging, which may further incentivize abandonment of the practice and emigration from the region. This entire cycle is amplified by the simultaneous failure of the formal governance system, which leaves no institution with the clear authority or capacity to intervene and break the cycle. The ecological crisis and the socio-governance crisis are thus mutually reinforcing, driving the entire system toward a less productive and less resilient state.

DISCUSSION

A. The Korab-Koritnik Pastures as a Shifting Socio-Ecological System

The findings of this study, when interpreted through the Socio-Ecological Systems (SES) framework, indicate that the Korab-Koritnik pastures are undergoing a fundamental regime shift. Historically, the dynamics of this SES were defined by interactions between a relatively stable rural population and the grassland ecosystem, with human management focused on optimizing forage and preventing overgrazing [27]. In contrast, the current state is characterized by a new set of drivers and feedback loops that reflect a transition from a regime managed for pastoral production to one marked by land abandonment and undergrazing [28]. This shift signifies not just a change in land use intensity but is fundamentally altering the core structure and function of the ecosystem. The reduction in grazing pressure is leading to compositional changes, with a clear shift away from graminoid-dominated communities, which have co-evolved with herbivory, towards communities increasingly dominated by woody shrubs and unpalatable forbs [29]. This transition, driven by socio-economic pressures of depopulation, constitutes a critical loss of ecological characteristics inherent to these high-value grasslands, thereby endangering the essential ecosystem services they provide [30].

B. Climate Change as a Systemic Stressor and Threat Multiplier

Empirical evidence of climate change impacts in Korab-Koritnik, such as documented upward migration of the treeline and altered seasonal patterns, aligns with broader scientific projections

for the Balkan mountain regions. However, in the context of this SES, climate change extends beyond being a simple, additive threat; it functions as a systemic stressor and a significant threat multiplier that exacerbates existing vulnerabilities and accelerates negative trends. For instance, observed earlier snowmelt—a direct consequence of regional warming—induces a temporal mismatch within the pastoral system [28]. This early period of snowmelt leads to premature grazing on pastures that have not yet recovered, amplifying vegetation degradation at critical phenological stages. Global projections of hotter, drier summers for the Balkans heighten the frequency and intensity of droughts and wildfires [31]. These conditions elevate the risk that localized, traditional practices, such as burning juniper shrubs for pasture management, could become uncontrolled and escalate into large-scale destructive fires, particularly on slopes already vulnerable to erosion. The progressive advance of the treeline represents a direct, potentially irreversible loss of finite alpine pasture habitat as it is diminished at higher elevations. Consequently, climate change manifests as a pervasive force that undermines the resilience of the entire socio-ecological system against additional pressures.

C. Bridging the Governance Gap: The Case for Community-Based Co-Management

The current institutional ambiguity surrounding pasture management represents a critical governance failure that undermines the potential for sustainable management [27]. This management vacuum, characterized by unclear authority among state and local actors, serves as a primary obstacle in addressing the intertwined crises of ecological degradation and socio-economic decline [30]. Following the principles of Community-Based Natural Resource Management (CBNRM), the most viable path forward involves establishing a formal co-management framework [28]. Such a framework would move beyond the constraints of purely top-down, centralized control, which often lacks local legitimacy and practical enforceability [30]. A successful co-management model for Korab-Koritnik would need to formally recognize, legitimize, and empower traditional governance structures. By integrating these community-level institutions into a multi-stakeholder governing body—including representatives from state agencies, municipalities, and key resource user groups such as herders' associations and beekeepers—a more adaptive and resilient governance framework can be constructed [30]. This approach directly addresses the imperative for local participation and benefit-sharing, crucial for securing community buy-in and ensuring compliance with management regulations. Although establishing such a system poses challenges, including the need for capacity building, delineation of responsibilities, and conflict resolution mechanisms, it represents the most promising strategy for overcoming the current governance paralysis [30].

Proposing Integrated and Adaptive Management Interventions

A co-management framework would facilitate the implementation of nuanced and adaptive management interventions specifically tailored to the Korab-Koritnik SES's challenges. Rather than imposing uniform, landscape-wide prescriptions, management could become targeted and responsive [27]. First, to confront the paradox of undergrazing and shrub encroachment, the adoption of adaptive rotational grazing techniques is advised. This practice uses livestock as an ecological restoration tool, concentrating herds for short periods in specific degraded paddocks. This targeted grazing can suppress dominant shrubs and unpalatable forbs, creating opportunities for the recovery of more desirable grass species [28]. Subsequent long rest periods will allow ecosystems to recover, thereby enhancing soil health, root depth, and water retention. This method shifts the problem of undergrazing into a restorative solution, leveraging pastoral practices to enhance pasture quality and productivity.

Second, to manage the increasing fire risk, a shift from simple fire suppression to participatory fire management is vital. This shift can involve developing a Community Wildfire Protection Plan that integrates local communities in fire management efforts [27]. Strategies could include training community members as local fire brigades for rapid responses, forming strategic fuel breaks to protect villages, and using prescribed burning under expert supervision to manage fuel loads and

control shrub encroachment. This approach capitalizes on local knowledge and presence, crafting a resilient fire management system.

Lastly, to address persistent soil erosion issues, management should prioritize community-led restoration projects. Empowering local communities to undertake bio-engineering measures—such as building small check dams with local materials or revegetating eroded gullies—can prove highly effective. These initiatives often yield more sustainable, culturally appropriate, and cost-effective solutions than large-scale, top-down engineering efforts, thereby further strengthening community ownership and stewardship of the landscape [27].

CONCLUSION

The subalpine and alpine grasslands of Korab-Koritnik Nature Park constitute a socio-ecological system of immense natural and cultural value. This system is currently in a state of critical transition, driven by the profound socio-economic shift of rural depopulation and amplified by the pervasive pressures of climate change. The historical management paradigm, focused on controlling overgrazing, is no longer adequate to address the emerging and paradoxical challenge of undergrazing, which is leading to shrub encroachment, loss of forage quality, and a negative feedback loop that further threatens the viability of traditional pastoral livelihoods.

The analysis clearly indicates that the current governance framework, marked by institutional ambiguity and a disconnect between state authority and local communities, is incapable of managing these complex and interacting dynamics. The resulting management vacuum is a primary obstacle to halting the degradation of these vital ecosystems.

The long-term sustainability of the Korab-Koritnik pastures and the communities that depend upon them hinges on a fundamental reform of the governance model. The establishment of a formal, legitimate, and empowered co-management system is paramount. Such a system must bridge the gap between state-level authority and traditional community governance, integrating local knowledge, ensuring equitable benefit-sharing, and fostering a sense of shared responsibility. Investing in community-based management and adaptive interventions like rotational grazing and participatory fire planning is not merely a conservation strategy; it is a critical investment in sustainable rural development, the preservation of cultural heritage, and the enhancement of climate change resilience for this unique and invaluable region of the European Green Belt.

Özet
Bu çalışmada, farklı döşeme tiplerinin değişken zemin koşulları altındaki yapı maliyetine etkisi, 2018 Türkiye Bina Deprem Yönetmeliği (TBDY 2018) doğrultusunda incelenmiştir. Yapı mühendisliğinde döşeme sistemlerinin seçimi yalnızca yapısal performansa değil, aynı zamanda ekonomik sürdürülebilirliğe de bağlıdır. Bu kapsamda, iki döşeme tipi (kirişli plak döşemeler ve asmolen döşemeler) ele alınmıştır. Farklı zemin sınıfları (ZB, ZC, ZD) için yapısal modeller ideCAD Statik yazılımı kullanılarak oluşturulmuştur. Her döşeme tipi için deprem etkileri altında yapısal tasarımlar yapılmış ve oluşan yapı maliyetleri karşılaştırılmıştır. Hesaplamalarda TBDY 2018'de belirtilen deprem tasarım sınıfları, yük katsayıları ve spektrum parametreleri dikkate alınmıştır. Modeller, yönetmelikte belirtilen minimum beton ve donatı gerekliliklerini sağlayacak şekilde tasarlanmıştır. Sonuç olarak, ZB, ZC ve ZD zemin sınıflarında kirişli ve asmolen döşemeler arasındaki maliyet farklarını ortaya koyan karşılaştırmalı bir analiz sunulmuştur.

An investigation into the impact of different slab types on structural costs under variable soil conditions according to TBDY 2018

Abstract
In this study, the impact of different slab types on structural costs under variable soil conditions was investigated in accordance with the Turkish Building Earthquake Code 2018 (TBDY 2018). In structural engineering, the selection of slab systems is influenced not only by structural performance but also by economic sustainability. Within this scope, two slab types—beam-supported slabs and hollow block (asmolen) slabs—were examined. Structural models were created for different soil classes (ZB, ZC, ZD) using the Sta4CAD Static software. For each slab type, structural designs were carried out under seismic effects, and the resulting construction costs were compared. The calculations considered the seismic design classes, load factors, and spectrum parameters specified in TBDY 2018. The models were designed to meet the minimum concrete and reinforcement requirements dictated by the code. As a result, a comparative analysis was presented, evaluating the cost differences between beam-supported and hollow block slabs across ZB, ZC, and ZD soil classes.

GİRİŞ

Türkiye, aktif tektonik kuşakların üstünde yer alması sebebiyle ciddi düzeyde deprem riski taşıyan bir ülkedir. Geçmişte yaşanan depremler, yapı stokunun önemli bir kısmının yetersiz olduğunu ve taşıyıcı sistem seçimlerinin sadece mühendislik değil, aynı zamanda ekonomik sonuçlar da doğurduğunu göstermektedir (Altun, 2022; Türkmen ve Tekeli, 2005). Bu bağlamda, taşıyıcı sistemlerin önemli bir bileşeni olan döşeme sistemlerinin seçimi hem yapısal güvenlik hem de maliyet açısından dikkatle ele alınmalıdır (Khalaf ve ark., 2022).

Bu çalışmada, farklı döşeme tiplerinin (kirişli plak ve asmolen döşeme) değişken zemin koşulları altındaki yapı maliyetine etkisi, Türkiye Bina Deprem Yönetmeliği 2018 (TBDY 2018) kapsamında analiz edilmiştir. Yapı mühendisliğinde döşeme sistemlerinin seçimi, sadece taşıyıcılık açısından değil; üretim kolaylığı,

işçilik süresi, kalıp karmaşıklığı ve maliyet gibi ekonomik parametrelerle de doğrudan ilişkilidir (Bikçe ve Akyol, 2017; Kara ve Akkaş, 2023). Çalışmada bu iki yaygın döşeme sistemi, zemin sınıfları ZB, ZC ve ZD için modellenmiş ve aralarındaki maliyet farkları irdelenmiştir.

Yapısal analizler, ideCAD Statik yazılımı kullanılarak gerçekleştirilmiş; TBDY 2018 kapsamında belirtilen deprem tasarım sınıfları, yük katsayıları ve spektral ivme değerleri hesaplamalara entegre edilmiştir. Tüm modeller, yönetmelikte tanımlanan minimum beton ve donatı koşullarını sağlayacak şekilde tasarlanmıştır. Her bir döşeme tipi için deprem etkileri altında yapısal çözümler oluşturulmuş ve oluşan taşıyıcı sistem maliyetleri karşılaştırılmıştır. Ayrıca, modelleme sürecinde düşey taşıyıcı sistem sabit tutulmuş ve yalnızca döşeme sistemindeki değişimlerin ekonomik etkileri analiz edilmiştir.

Literatürde yer alan birçok çalışma, döşeme sistemlerinin yapı rijitliği ve davranışı üzerindeki etkilerini farklı yöntemlerle ortaya koymuştur (Uzun, 2014; Sağılyan ve ark., 2012; Özpınar, 2006). Özellikle döşemelerin düzlem içi rijitlik katkısı, kolon ve perde elemanlarının zorlanmalarını artırarak genel yapı davranışını etkileyebilmektedir. Diğer yandan, farklı deprem senaryoları ve analiz yöntemleri ile yapılan çalışmalarda, döşeme sisteminin deprem etkisi altındaki davranışa olan katkısının değiştiği görülmüştür (Hanif ve ark., 2024).

Bu çalışmada elde edilen sonuçlar, kirişli plak ve asmolen döşeme sistemlerinin farklı zemin sınıfları altında benzer yapısal taleplere maruz kaldığında, yapı maliyetleri açısından anlamlı farklar doğurabileceğini ortaya koymuştur.

MATERYAL VE METOD

Asmolen ve kirişli plak döşemenin, ZB, ZC ve ZD zemin sınıflarındaki maliyet kıyaslanmasının incelendiği bu çalışmada, döşeme sistemleri, taşıyıcılık, rijitlik. Ve zeminle etkileşim açısından farklı davranışlar göstermesi nedeniyle tercih edilmiştir. Bu sayede farklı döşeme türlerinin yapı maliyetine etkisi karşılaştırılmalı olarak incelenebilmiştir.

Sayısal modeller ideCAD statik analiz programı kullanılarak yapılmış olup oluşturulan sayısal model isimlendirilmeleri Şekil 1'de gösterildiği şekilde oluşturulmuştur.

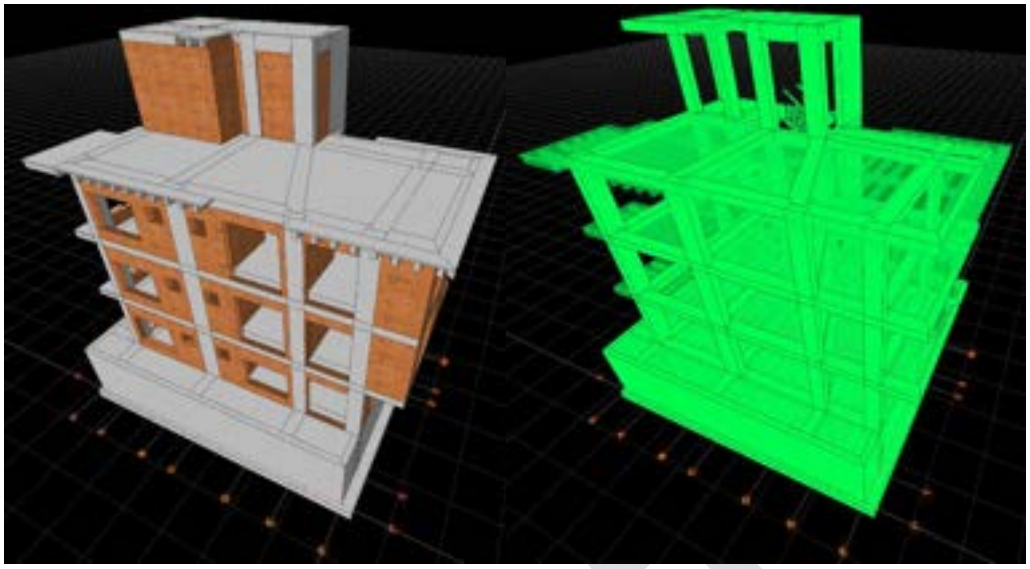
Şekil 1. Model isimlendirmesi

Toplamda altı farklı model oluşturularak bu modeller için maliyet analizleri yapılmıştır. Model numaraları ve özellikleri Tablo 1'de gösterilmiştir.

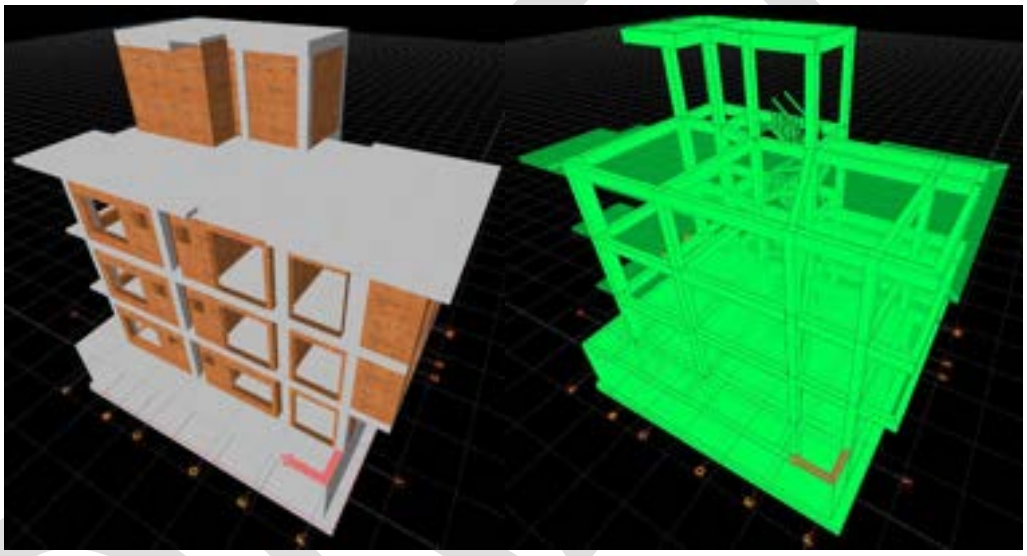
Tablo 1. Model İsimlendirmeleri

Model No	Döşeme Tipi	Zemin Sinifi
SM-A-ZB	Asmolen	ZB
SM-A-ZC	Asmolen	ZC
SM-A-ZD	Asmolen	ZD
SM-P-ZB	Plak	ZB
SM-P-ZC	Plak	ZC
SM-P-ZD	Plak	ZD

Asmolen döşemeye sahip olan sayısal modellerin genel görünümleri Şekil 2'de verilmiştir. Kirişli plak döşemeye sahip olan sayısal modellerin genel görünümleri ise Şekil 3'te verilmiştir. Yapı bodrum, zemin, iki normal kat olmak üzere dört kat ve kuleden oluşmaktadır.



Şekil 2. Asmolen döşemeli sayısal modellerin genel görünümleri



Şekil 3. Kirişli plak döşemeli sayısal modellerin genel görünümleri

Tüm sayısal modeller minimum yönetmelik şartlarını sağlayacak şekilde oluşturulmuş olup metraj listesi Şekil 4-9'da verilmiştir.

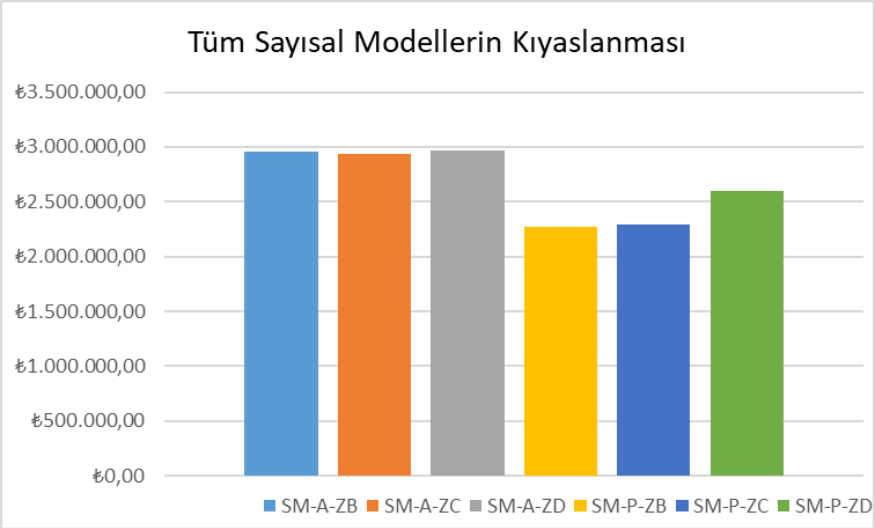
BULGULAR ve TARTIŞMA

Farklı zemin sınıfları (ZB, ZC, ZD) altında iki farklı döşeme sistemi olan kirişli plak döşeme ve asmolen döşeme sistemlerinin kaba inşaat maliyetleri karşılaştırmalı olarak incelenmiştir. Elde edilen bulgular, zemin koşullarının yalnızca yapı davranışı üzerinde değil, aynı zamanda döşeme tipine bağlı olarak maliyet

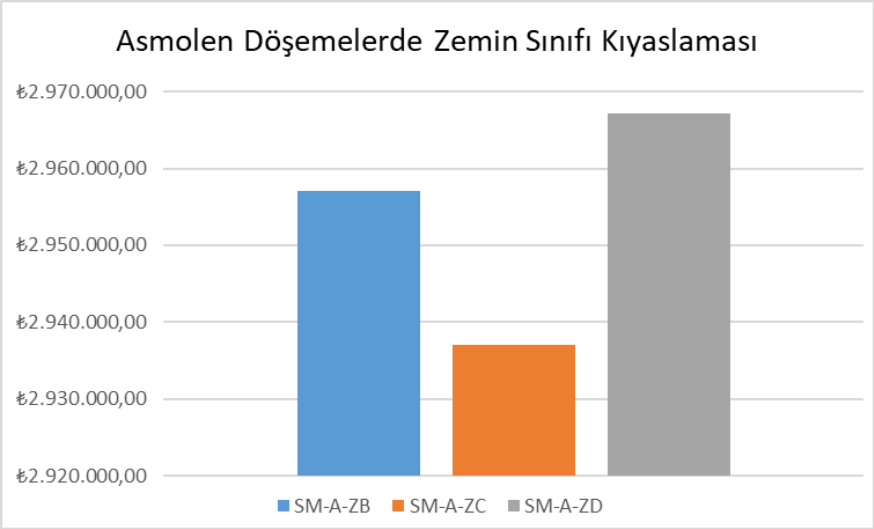
üzerinde de belirleyici bir rol oynadığını ortaya koymuştur. Farklı zemin koşullarında döşeme sistemlerinin yapıya uyguladığı yükler ve bu yüklerin yapı-zemin etkileşimi ile birleşerek oluşturduğu maliyet farklılıkları, seçim yapılırken yalnızca yapısal performansın değil, ekonomik faktörlerin de dikkate alınması gerektiğini ortaya koymaktadır. Şekil 10'da tüm sayısal modellerin maliyet kıyaslanması sunulmuştur.



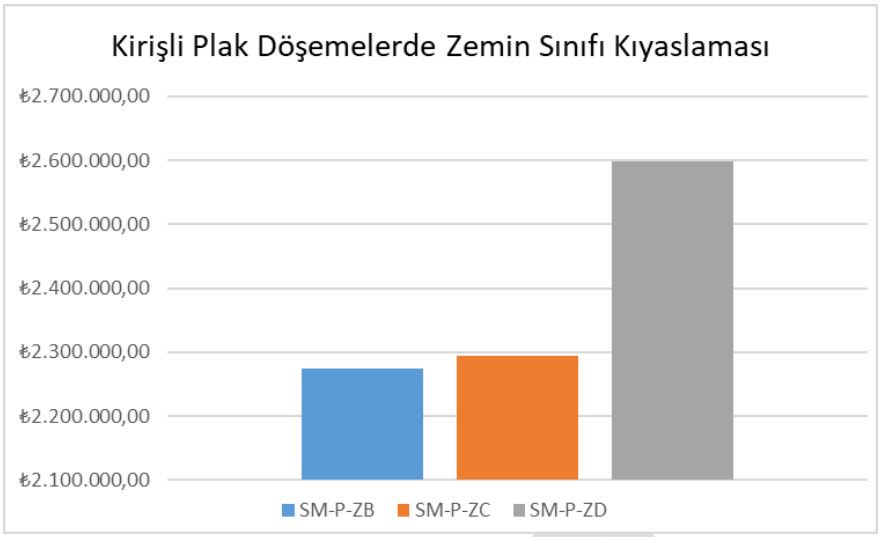
Şekil 10. Tüm sayısal modellerin kıyaslanması

SM-A-ZB modelinde kaba inşaat maliyeti ₺2.957.063,66, SM-A-ZC modelinde kaba inşaat maliyeti ₺2.937.012,72, SM-A-ZD modelinde kaba inşaat maliyeti ₺2.967.104,86, SM-P-ZB modelinde kaba inşaat maliyeti ₺2.273.830,91, SM-P-ZC modelinde kaba inşaat maliyeti ₺2.293.284,85, SM-P-ZD modelinde kaba inşaat maliyeti ₺2.598.011,12 olarak hesaplanmıştır.

Şekil 11'de asmolen tipi döşemeye sahip modellerin ZB-ZC-ZD zemin sınıfı maliyet kıyaslamaları verilmiştir. Şekil 12'de ise kirişli plak döşemeye sahip modellerin ZB-ZC-ZD zemin sınıfı maliyet kıyaslamaları verilmiştir.



Şekil 11. Asmolen döşemelerde zemin sınıfı kıyaslaması

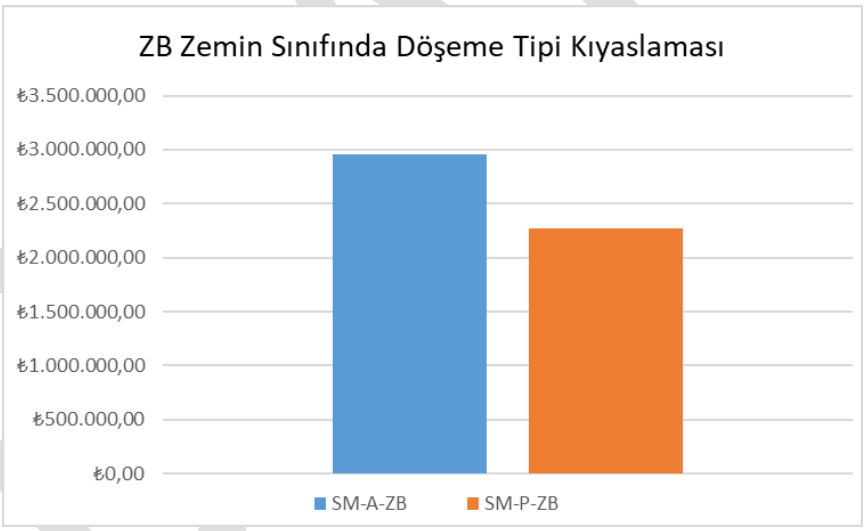


Şekil 12. Kirişli plak döşemelerde zemin sınıfı kıyaslaması

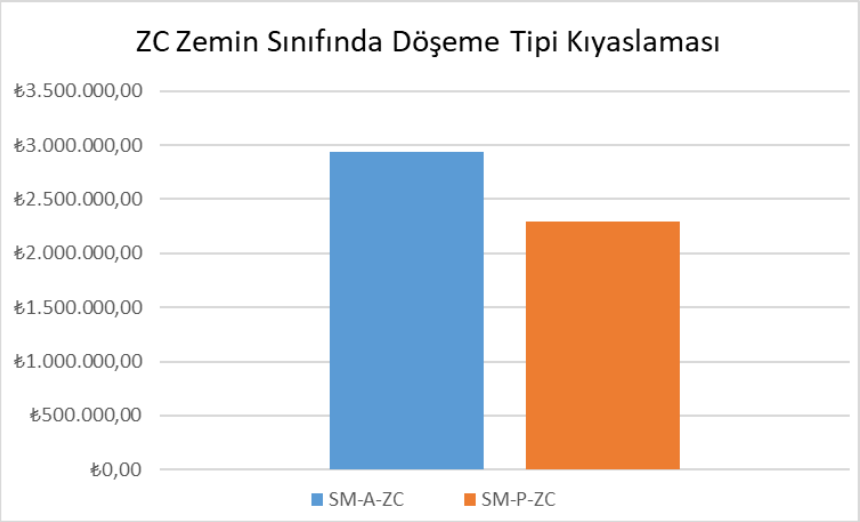
Şekil 11 incelendiğinde SM-A-ZB ile SM-A-ZC modelleri arasında %0,68, SM-A-ZB ile SM-A-ZD modelleri arasında %0,34 ve SM-A-ZC ile SM-A-ZD modelleri arasında %1,02 fark oluşmuştur.

Şekil 12 incelendiğinde SM-P-ZB ile SM-P-ZC modelleri arasında %0,85, SM-P-ZB ile SM-P-ZD modelleri arasında %14,26 ve SM-P-ZC ile SM-P-ZD modelleri arasında %13,29 fark oluşmuştur.

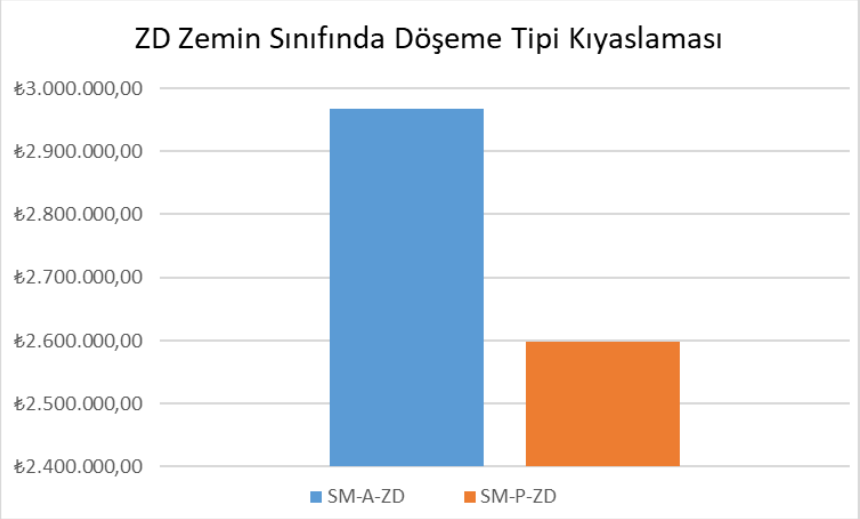
Şekil 13'te ZB zemin sınıfına sahip modellerin asmolen-plak döşemelerin maliyet kıyaslamaları verilmiştir. Şekil 14'te ZC zemin sınıfına sahip modellerin asmolen-plak döşemelerin maliyet kıyaslamaları verilmiştir. Şekil 15'te ZD zemin sınıfına sahip modellerin asmolen-plak döşemelerin maliyet kıyaslamaları verilmiştir.



Şekil 13. ZB zemin sınıfında döşeme tipi kıyaslaması



Şekil 14. ZC zemin sınıfında döşeme tipi kıyaslaması



Şekil 15. ZD zemin sınıfında döşeme tipi kıyaslaması

Şekil 13 incelendiğinde SM-A-ZB ile SM-P-ZB modelleri arasında %30,05 maliyet farkı oluşmuştur. Şekil 14 incelendiğinde SM-A-ZC ile SM-P-ZC modelleri arasında %28,07 maliyet farkı oluşmuştur. Şekil 15 incelendiğinde SM-A-ZD ile SM-P-ZD modelleri arasında %14,21 maliyet farkı oluşmuştur.

SONUÇ

Bu çalışmada farklı zemin sınıfları altında (ZB, ZC ve ZD) asmolen ve plak döşemelerin kaba inşaat maliyetleri kıyaslanmıştır. Elde edilen sonuçlara göre;

Asmolen ve plak döşemelerde ZB zemin sınıfında %30,05, ZC zemin sınıfında %28,07, ZD zemin sınıfında %14,21 fark oluşmuştur. Asmolen döşemelerde kirişli plak sistemlere göre daha fazla beton ve kalıp yüzeyi gerektirmektedir. Ayrıca daha fazla donatı da gerekebilmektedir. Bu sebeple daha yüksek maliyet oluşmuştur. Zemin sınıfı kötüleştikçe bu farkın azalma sebebinin ise asmolen döşemedeki güncel yönetmeliğin (TBDY2018) perde talebi olması ve bu talebin ZD zemin sınıfında kirişli plak döşemede de oluşmasıdır.

Asmolen döşemelerde farklı zemin sınıflarında maksimum %1 seviyelerinde maliyet farkı oluşmakla birlikte kirişli plak döşemelerde bu fark ZB-ZD ve ZC-ZD zemin sınıflarında sırasıyla %14,26 ve %13,29 ZB-ZC zemin sınıfları arasında %0,86 fark oluşmuştur. Bu durum yine kirişli plak döşemelerde ZD zemin sınıfındaki perde talebinin oluşturacağı yüksek maliyet ile açıklanabilir.

Son olarak kirişli plak döşemede en yüksek maliyet ZD, en düşük maliyet ZB zemin sınıfında oluşmasına rağmen asmolen döşemede en yüksek maliyet ZD, en düşük maliyet ZC zemin sınıfında oluşmuştur. Asmolen döşeme sistemi kütle açısından daha ağır olduğu için, zeminin rijitliği arttıkça yapıya gelen deprem kuvvetleri de artar. Ancak kirişli plak döşeme, asmolen döşemeye kıyasla daha hafif bir sistemdir.

Bu nedenle, rijit zemin üzerinde kütle artışı kaynaklı deprem kuvvetleri daha az artar ve yapısal elemanlar daha verimli çalışır. Ayrıca asmolen döşemeler daha ağır ve rijit sistemlerdir. Bu da yapıya büyük kesme kuvvetleri bindirerek taşıyıcı elemanlara yük bindirir. Kirişli plak döşemelerde periyot daha uzundur, dolayısıyla etki daha düşük olur. Bu farkın bu sebeple de olabileceği düşünülmektedir.

Sonraki çalışmalarda, kat sayısı ile değişen periyot ve deprem kuvvetlerinin etkisinin de incelenmesi için farklı kat yüksekliklerine sahip modeller incelenecektir.

Özet

Ülkemiz topraklarının çok büyük bir bölümü deprem tehlikesi ile karşı karşıyadır ve yakın geçmişte yaşanan, büyük ölçüde can ve mal kaybına neden olan depremler bunu çok açık bir şekilde göstermiştir. Bu gibi depremlerde ortaya çıkan kayıpların, ülkemizde, gelişmiş ülkelere göre çok daha büyük boyutlarda olması, üzerinde düşünülmesi gereken önemli bir konudur. Bu çalışmada, konut tipi betonarme binaların 2007 Deprem Bölgelerinde Yapılacak Binalar Hakkında Yönetmelik (DBYBHY-2007) ile 2018 Türkiye Bina Deprem Yönetmeliği (TBDY-2018) kapsamında performans ve kaba yapı maliyeti açısından karşılaştırmalı değerlendirilmesi amaçlanmıştır. Deprem yönetmeliklerindeki güncellemeler, yapı tasarımı ve maliyet üzerinde doğrudan etkili olmakta; mühendislik uygulamalarında önemli değişiklikler doğurmaktadır. Bu kapsamda 4 ve 8 katlı iki bina, her iki yönetmelik esas alınarak TBDY-2018' e göre ZA ve ZE, DBYBHY-2007'ye göre Z1 ve Z4 zemin sınıfları ile modellenmiş ve performans analizleri gerçekleştirilmiştir. Analizlerde deprem etkileri altındaki yapısal davranış değerlendirilmiş; taşıyıcı sistemin ihtiyaç duyduğu minimum beton ve donatı miktarları tespit edilmiştir. Elde edilen veriler doğrultusunda kaba yapı maliyetleri hesaplanmış ve her iki yönetmeliğin maliyetleri kıyaslanmıştır.

Anahtar Kelimeler: DBYBHY-2007, TBDY-2018, Betonarme Binalar, Yapı Maliyeti, Sta4CAD

Evaluation of residential reinforced concrete buildings in terms of performance and structural construction cost according to DBYBHY-2007 and TBDY-2018 codes

Abstract

A large portion of the land in our country is under significant earthquake risk, and recent devastating earthquakes that have caused substantial loss of life and property clearly demonstrate this reality. The fact that the damage and losses resulting from such earthquakes are significantly greater in our country compared to developed nations is an important issue that warrants serious consideration. This study aims to perform a comparative evaluation of residential reinforced concrete buildings in terms of structural performance and rough construction cost, based on the 2007 Earthquake Code for Buildings in Seismic Zones (DBYBHY-2007) and the 2018 Turkish Building Earthquake Code (TBDY-2018). Updates in seismic design codes directly affect both structural design and cost, leading to substantial changes in engineering practice. In this context, two buildings (one with 4 stories and the other with 8 stories) were modeled according to both codes. For TBDY-2018, soil classes ZA and ZE were used; for DBYBHY-2007, Z1 and Z4 soil classes were applied. Performance analyses were conducted, and structural behavior under seismic loads was assessed. The minimum required amount of concrete and reinforcement for the load-bearing system was determined for each case. Based on the obtained data, rough construction costs were calculated, and the results were compared to evaluate the economic impact of each code.

GİRİŞ

Türkiye, dünyanın en aktif deprem kuşaklarından biri üzerinde yer almakta olup, tarihsel süreç boyunca yaşanan yıkıcı depremler ciddi can ve mal kayıplarına neden olmuştur. Özellikle son yıllarda meydana gelen büyük depremler, yapı güvenliği ve deprem yönetmeliklerinin önemi konusunda kamuoyunda farkındalık oluşturmuştur. Deprem kaynaklı kayıpların gelişmiş ülkelere kıyasla çok daha yüksek olmasının nedenleri arasında yetersiz zemin etütleri, mühendislik uygulamalarındaki eksiklikler, denetim

yetersizlikleri ve yürürlükteki yapı yönetmeliklerinin güncel sismik riskleri yeterince yansıtamaması gibi unsurlar yer almaktadır (Bikçe ve Akyol, 2017; Kara ve Akkaş, 2023).

Bu bağlamda, ülkemizde deprem yönetmelikleri zaman içerisinde güncellenmiş; 1975, 1997, 2007 ve son olarak 2018 yıllarında yürürlüğe giren düzenlemelerle yapı tasarımı ve taşıyıcı sistemlerin performansı açısından önemli değişiklikler yapılmıştır. Bir diğer çalışmada (Şapçı, 1998), 1975 ve 1997 yönetmelikleri esas alınarak perde-çerçeve sistemli binalarda yapılan karşılaştırmalarda, birleşim kesme kuvveti sınırlarının ve güçlü kolon-zayıf kiriş koşullarının yapısal davranışa etkisi ortaya konmuştur. Aynı çalışmada, yönetmelik değişikliklerinin özellikle düşey taşıyıcı eleman metrajlarında artışa neden olduğu ve yaklaşık %20 oranında bir maliyet farkı oluşturduğu belirlenmiştir.

Benzer şekilde, (Tekeli, 2006) tarafından dört, altı ve sekiz katlı betonarme binalar üzerinde gerçekleştirilen analizlerde, farklı deprem bölgeleri ve zemin sınıfları için yapılan statik hesaplar sonucunda, bir yapının depreme dayanıklı şekilde inşa edilmesinin maliyet üzerinde %4–8 arasında bir artışa yol açtığı saptanmıştır. (Tunç ve Tanfener, 2016) tarafından yürütülen çalışmada ise 2007 ve 2018 deprem yönetmeliklerinin karşılaştırmalı analizi yapılmış; 2018 yönetmeliğinin tasarım iç kuvvetlerinde yaklaşık %20 oranında artışa neden olduğu sonucuna ulaşılmıştır. Kırklareli ili özelinde yürüttükleri araştırmada, 2007 ve 2018 yönetmelikleri kapsamında elde edilen elastik tasarım spektrumlarını karşılaştırarak, 2018 TBDY'nin deprem tehlikesini daha gerçekçi biçimde yansıttığını ortaya koymuşlardır (Keskin ve Bozdoğan, 2018).

Bu literatür çerçevesinde yürütülen bu çalışmanın amacı, konut tipi betonarme binaların 2007 Deprem Bölgelerinde Yapılacak Binalar Hakkında Yönetmelik (DBYBHY-2007) ile Türkiye Bina Deprem Yönetmeliği (TBDY-2018) kapsamında yapısal performans ve kaba yapı maliyeti açısından karşılaştırmalı değerlendirilmesidir. Bu amaç doğrultusunda, 4 ve 8 katlı iki farklı betonarme yapı modeli, her iki yönetmelik doğrultusunda belirlenen deprem yükleri ve zemin sınıfları (ZA–ZE, Z1–Z4) dikkate alınarak analiz edilmiştir. Analiz sonuçları doğrultusunda yapısal elemanlara ait beton ve donatı miktarları belirlenmiş; elde edilen veriler ışığında kaba yapı maliyetleri hesaplanarak yönetmeliklerin maliyet üzerindeki etkileri karşılaştırmalı olarak değerlendirilmiştir.

MATERYAL VE METOD

Konut tipi betonarme binaların 2007 Deprem Bölgelerinde Yapılacak Binalar Hakkında Yönetmelik (DBYBHY-2007) ile 2018 Türkiye Bina Deprem Yönetmeliği (TBDY-2018) kapsamında iyi kötü zemin sınıfları olan Z1, Z4, ZA, ZE zemin sınıflarındaki 4 ve 8 katlı binaların maliyet kıyaslamasının incelendiği bu çalışmada sayısal modeller Sta4CAD statik analiz programı kullanılarak yapılmış olup oluşturulan sayısal model isimlendirilmeleri Şekil 1'de gösterildiği şekilde oluşturulmuştur.

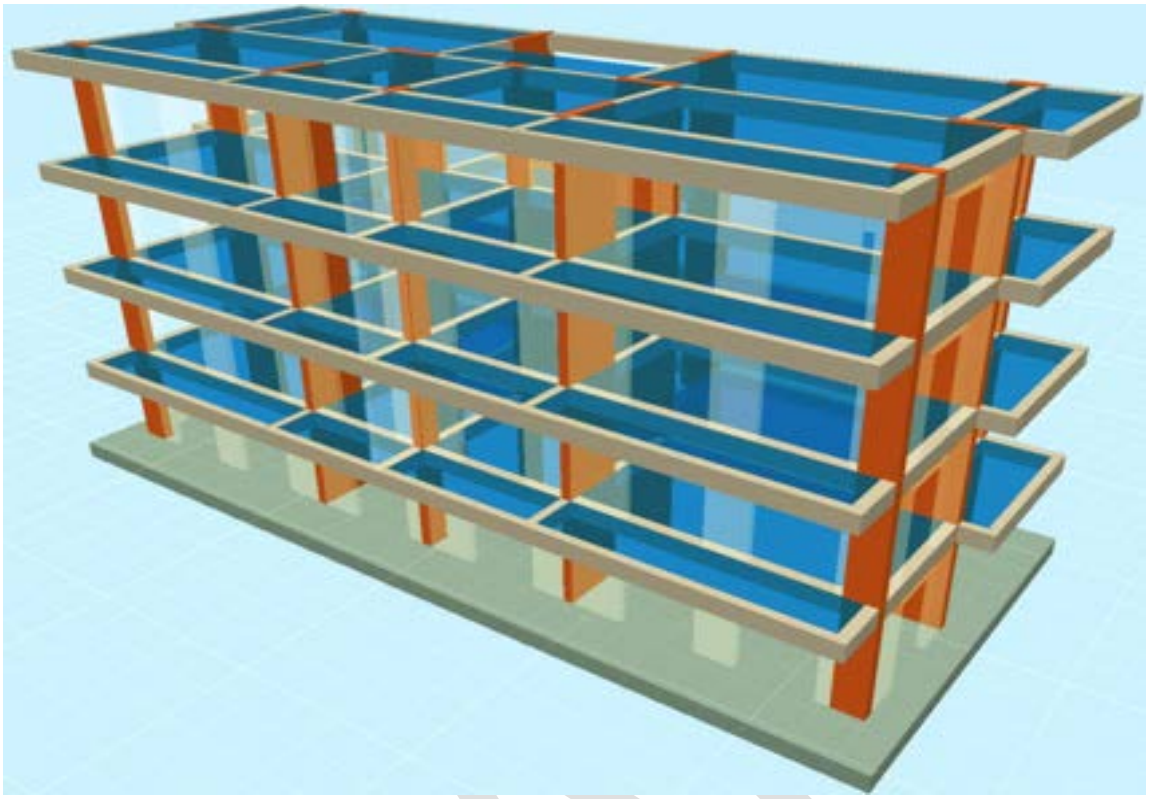
Şekil 1. Model isimlendirmesi

Toplamda sekiz farklı model oluşturularak bu modeller için maliyet analizleri yapılmıştır. Model numaraları ve özellikleri Tablo 1'de gösterilmiştir.

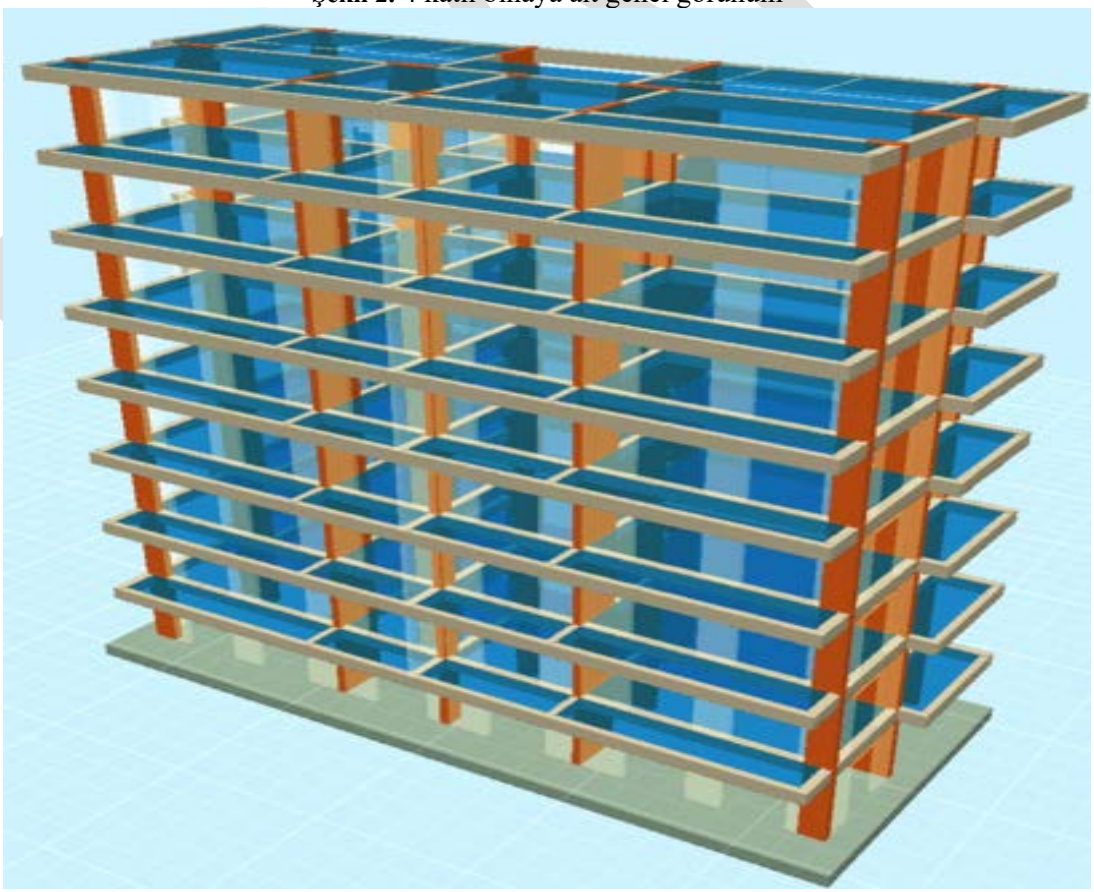
Tablo 1. Model İsimlendirmeleri

Model No	Yönetmelik	Zemin Sınıfı	Kat Sayısı
2007-Z1-4	DBYBHY-2007	Z1	4
2007-Z1-8	DBYBHY-2007	Z1	8
2007-Z4-4	DBYBHY-2007	Z4	4
2007-Z4-8	DBYBHY-2007	Z4	8
2018-ZA-4	TBDY-2018	ZA	4
2018-ZA-8	TBDY-2018	ZA	8
2018-ZE-4	TBDY-2018	ZE	4
2018-ZE-8	TBDY-2018	ZE	8

4 kata sahip olan sayısal modellerin genel görünümü Şekil 2'de verilmiştir. 8 katlı sayısal modellerin genel görünümü ise Şekil 3'te verilmiştir. Yapı bodrum, zemin, iki normal kat olmak üzere dört kat ve kuleden oluşmaktadır.



Şekil 2. 4 katlı binaya ait genel görünüm



Şekil 3. 8 katlı binaya ait genel görünüm

Tüm sayısal modeller minimum yönetmelik şartlarını sağlayacak şekilde oluşturulmuş olup metraj listesi Şekil 4-11'da verilmiştir. Birim fiyatlar eski pozlara ait olup buradaki değerler değil T.C. Çevre Şehircilik ve İklim Değişikliği Bakanlığı tarafından hazırlanan rayiç fiyat listesinde yer alan rayiç değerler kullanılmıştır.

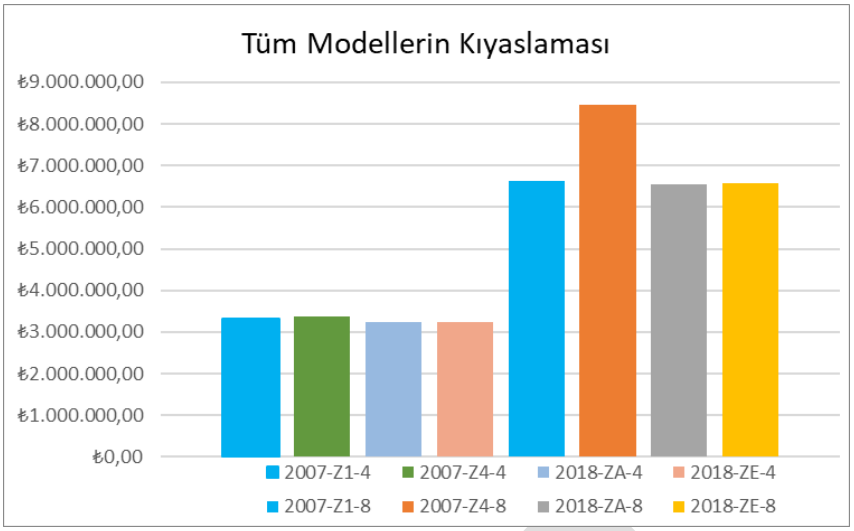
BULGULAR ve TARTIŞMA

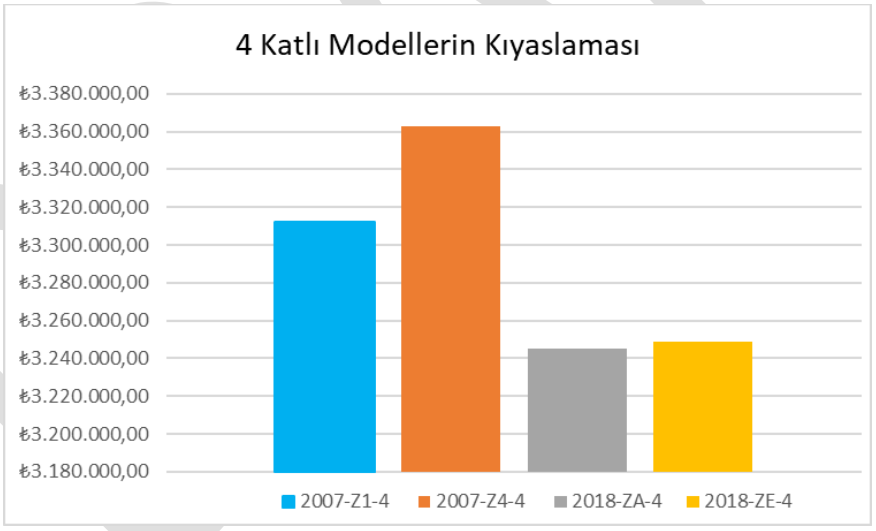
Konut tipi betonarme binaların 2007 Deprem Bölgelerinde Yapılacak Binalar Hakkında Yönetmelik (DBYBHY-2007) ile 2018 Türkiye Bina Deprem Yönetmeliği (TBDY-2018) kapsamında iyi kötü zemin sınıfları olan Z1, Z4, ZA, ZE zemin sınıflarındaki 4 ve 8 katlı binaların kaba inşaat maliyetleri karşılaştırmalı olarak incelenmiştir. Şekil 12'de tüm sayısal modellerin maliyet kıyaslanması sunulmuştur.



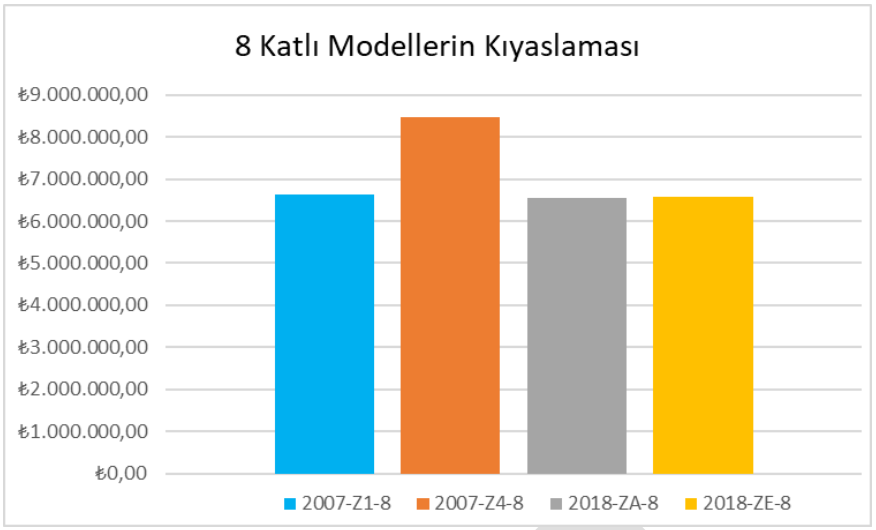
Şekil 12. Tüm sayısal modellerin kıyaslanması

2007-Z1-4 modelinde kaba inşaat maliyeti 3.312.202,86₺, 2007-Z4-4 modelinde kaba inşaat maliyeti 3.362.846,83₺, 2007-Z1-8 modelinde kaba inşaat maliyeti 6.631.758,44₺, 2007-Z4-8 modelinde kaba inşaat maliyeti 8.468.545,95₺, 2018-ZA-4 modelinde kaba inşaat maliyeti 3.245.110,78₺, 2018-ZE-4 modelinde kaba inşaat maliyeti 3.248.912,47₺, 2018-ZA-8 modelinde kaba inşaat maliyeti 6.559.885,33₺, 2018-ZE-8 modelinde kaba inşaat maliyeti 6.586.266,50₺ olarak hesaplanmıştır.

Şekil 13'te 4 katlı modellerin DBYBHY-2007 ve TBDY-2018 yönetmeliklerinde tanımlanan en iyi ve en kötü zemin sınıflarındaki maliyet kıyaslamaları verilmiştir. Şekil 14'te 8 katlı modellerin DBYBHY-2007 ve TBDY-2018 yönetmeliklerinde tanımlanan en iyi ve en kötü zemin sınıflarındaki maliyet kıyaslamaları verilmiştir.



Şekil 13. 4 katlı modellerin kıyaslaması

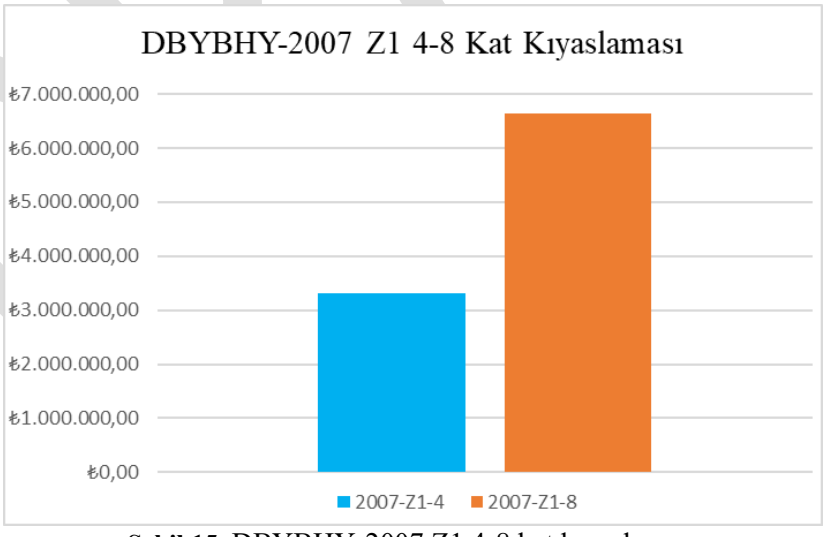


Şekil 14. 8 katlı modellerin kıyaslaması

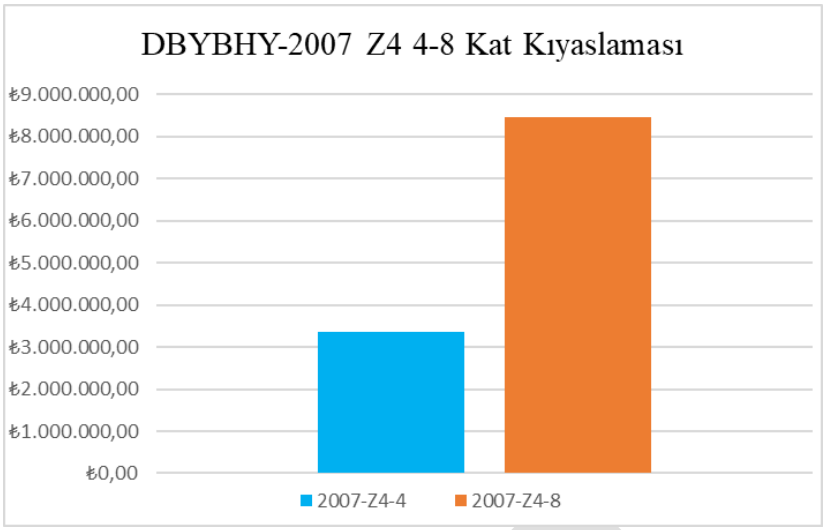
Şekil 13 incelendiğinde 2007-Z1-4 ile 2018-Z4-4 modelleri arasında %1,53, 2007-Z1-4 ile 2018-ZA-4 modelleri arasında %2,07, 2007-Z1-4 ile 2018-ZE-4 modelleri arasında %1,95, 2007-Z4-4 ile 2018-ZA-4 modelleri arasında %3,63, 2007-Z4-4 ile 2018-ZE-4 modelleri arasında %3,51 ve 2018-ZA-4 ile 2018-ZE-4 modelleri arasında %0,12 modelleri arasında fark oluşmuştur.

Şekil 14 incelendiğinde 2007-Z1-8 ile 2018-Z4-8 modelleri arasında %27,70, 2007-Z1-8 ile 2018-ZA-8 modelleri arasında %1,10, 2007-Z1-8 ile 2018-ZE-8 modelleri arasında %0,69, 2007-Z4-8 ile 2018-ZA-8 modelleri arasında %29,10, 2007-Z4-8 ile 2018-ZE-8 modelleri arasında %28,58 ve 2018-ZA-8 ile 2018-ZE-8 modelleri arasında %0,40 modelleri arasında fark oluşmuştur.

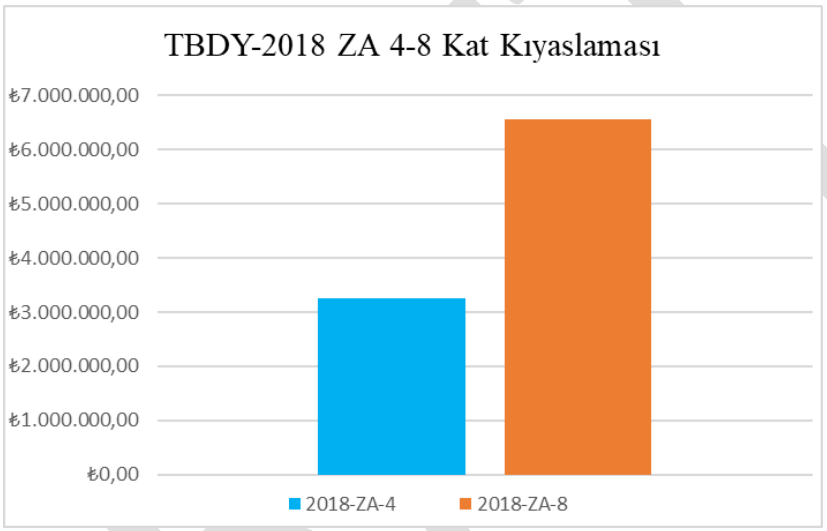
Şekil 15'te DBYBHY-2007 yönetmeliğine ve Z1 zemin sınıfına göre çözülmüş 4-8 kat kaba maliyet kıyaslaması verilmiştir. Şekil 16'da DBYBHY-2007 yönetmeliğine ve Z4 zemin sınıfına göre çözülmüş 4-8 kat kaba maliyet kıyaslaması verilmiştir. Şekil 17'de TBDY-2018 yönetmeliğine ve ZA zemin sınıfına göre çözülmüş 4-8 kat kaba maliyet kıyaslaması verilmiştir. Şekil 18'de TBDY-2018 yönetmeliğine ve ZE zemin sınıfına göre çözülmüş 4-8 kat kaba maliyet kıyaslaması verilmiştir.



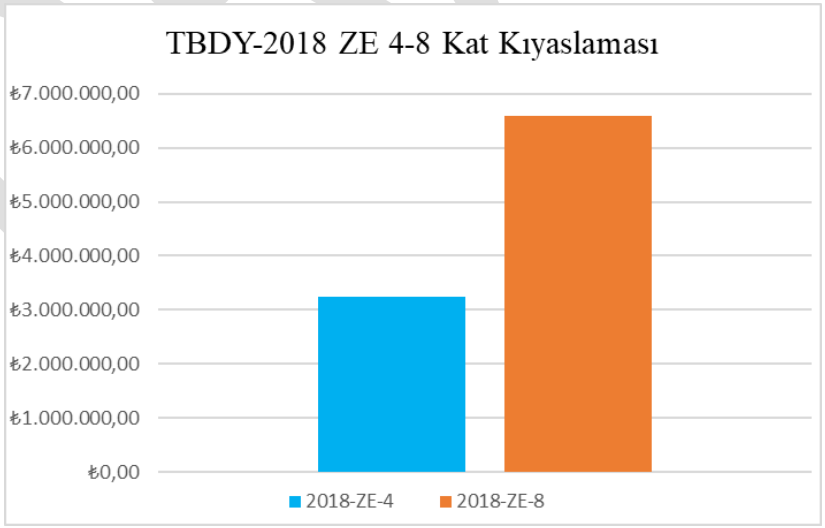
Şekil 15. DBYBHY-2007 Z1 4-8 kat kıyaslaması



Şekil 16. DBYBHY-2007 Z4 4-8 kat kıyaslaması



Şekil 17. TBDY-2018 ZA 4-8 kat kıyaslaması



Şekil 18. TBDY-2018 ZE 4-8 kat kıyaslaması

Şekil 15 incelendiğinde 2007-Z1-4 ile 2007-Z1-8 modelleri arasında %100,22 maliyet farkı oluşmuştur. Şekil 16 incelendiğinde 2007-Z4-4 ile 2007-Z4-8 modelleri arasında %151,83 maliyet farkı oluşmuştur. Şekil 17 incelendiğinde 2018-ZA-4 ile 2018-ZA-8 modelleri arasında %102,15 maliyet farkı oluşmuştur. Şekil 18 incelendiğinde 2018-ZE-4 ile 2018-ZE-8 modelleri arasında %102,72 maliyet farkı oluşmuştur.

SONUÇ

Bu çalışmada, DBYBHY-2007 ile TBDY-2018 yönetmelikleri kapsamında iyi kötü zemin sınıfları olan Z1, Z4, ZA, ZE zemin sınıflarındaki 4 ve 8 katlı binaların kaba inşaat maliyetleri kıyaslanmıştır. Elde edilen sonuçlara göre;

Zemin sınıfı kötüleştikçe maliyetin artması beklenen bir eğilimdir ve bu eğilim özellikle 2007 yönetmeliği altında daha keskin şekilde gözlemlenmiştir.

2018 yönetmeliği, zemin büyütme etkilerini daha kontrollü dağıttığı için, zemin sınıfı değişimlerine bağlı maliyet artışları daha sınırlı kalmıştır.

Kat sayısı arttıkça, zemin etkilerinin yapısal sistem üzerinde daha fazla belirleyici olduğu ve bu durumun maliyete yansıdığı tespit edilmiştir.

Ayrıca, 2007 yönetmeliği ile tasarlanmış yapılarda, gereksiz emniyet katsayıları ve belirsizliklerin etkisiyle maliyetler daha yüksek çıkabilmektedir.

Sonraki çalışmalarda, model sayı ve diğer zemin sınıfları da dahil edilerek daha kapsamlı bir araştırma yapılacaktır.

Özet

Bu çalışmada, küçük ölçekli toplu taşıma sistemleri için düşük maliyetli ve IoT (Nesnelerin İnterneti) tabanlı bir Elektronik Ücret Toplama Sistemi (EFCS) otomasyonu geliştirilmiş ve test edilmiştir. Sistem, NFC kart okuyucularını ve GPS modüllerini Raspberry Pi tabanlı bir donanım altyapısıyla entegre ederek kullanıcıların bakiye işlemlerini kolaylaştırırken, aynı zamanda otobüslerin gerçek zamanlı konum ve performans takibini de mümkün kılmaktadır. Geliştirilen yazılım altyapısı, Python dili kullanılarak oluşturulan özel algoritmalar ile kart doğrulama, bakiye kontrolü ve ödeme işlemlerini otomatikleştirmektedir. Önerilen sistem üç ana bileşenden oluşmaktadır. Otobüs cihaz arayüzü, kullanıcı arayüzü ve kurumsal yönetim arayüzü. Otobüs cihaz arayüzü, NFC okuyucular aracılığıyla kullanıcı kartlarını tanımlar ve ödeme işlemlerini gerçekleştirirken, GPS modülü araç konum verilerini toplar ve bunları merkezi bir veritabanına iletir. Kullanıcı arayüzü, bireylerin çevrimiçi bakiye sorgulama ve yükleme işlemleri yapmalarına olanak tanırken, kurumsal yönetim arayüzü otobüs cihazlarının, kullanıcı işlemlerinin ve finansal hareketlerin yönetimini sağlar. Sistem tasarımı maliyet etkinliği ön planda tutularak gerçekleştirilmiştir. Veritabanı altyapısı, kullanıcı ve operatör verilerini depolayacak şekilde yapılandırılmıştır. Ödeme işlemleri sırasında doğrulama anahtarları kullanılmaktadır. Ayrıca sistemin gerçek dünya performansı pratik testler aracılığıyla değerlendirildi. Bu çalışma, özellikle küçük ölçekli toplu taşıma şirketleri için maliyet etkin bir EFCS çözümü sunarak nakit işlemlerden dijital sistemlere geçişi kolaylaştırmayı amaçlamıştır. Sistem, gelecekte QR kod ödemesi veya mobil NFC entegrasyonu gibi özelliklerin kolayca eklenebileceği esnek bir altyapıya sahiptir. Bu yaklaşım, toplu taşıma süreçlerinin dijitalleştirilmesine ve yenilikçi IoT tabanlı çözümlerin yaygınlaştırılmasına önemli bir katkı sağlayacaktır.

Anahtar Kelimeler: IoT, Raspberry Pi, Elektronik Ücret Toplama Sistemi, NFC, Toplu Taşıma Otomasyonu

Effective and Economic Electronic Fee Collection System Design Using Raspberry Pi

Abstract

In this study, a low-cost and IoT (Internet of Things)-based Electronic Fare Collection System (EFCS) automation for small-scale public transportation systems has been developed and tested. The system integrates NFC card readers and GPS modules with a Raspberry Pi-based hardware infrastructure, facilitating users' balance transactions while also enabling real-time location and performance tracking of buses. The developed software infrastructure automates card verification, balance control, and payment transactions with special algorithms created using the Python language. The proposed system consists of three main components: bus device interface, user interface, and corporate management interface. The bus device interface identifies user cards via NFC readers and performs payment transactions, while the GPS module collects vehicle location data and transmits it to a central database. The user interface allows individuals to conduct online balance inquiries and loading transactions, while the corporate management interface provides management of bus devices, user transactions, and financial movements. The system design was carried out by prioritizing cost-effectiveness. The database infrastructure is structured to store user and operator data. Verification keys are used during payment transactions. In addition, the system's real-world performance was evaluated through practical tests. This study aimed to facilitate the transition from cash transactions to digital systems by offering a cost-effective EFCS solution, especially for small-

scale public transport companies. The system has a flexible infrastructure where features such as QR code payment or mobile NFC integration can be easily added in the future. This approach will make a significant contribution to the digitalization of public transport processes and the dissemination of innovative IoT-based solutions.

GİRİŞ

Artan şehirleşme oranına bağlı olarak yoğunlaşan toplu taşıma işlemleri kent hayatının en önemli sorunlarının başında gelmeye devam etmektedir. 20. Yüzyılın ilk zamanlarından itibaren uygulamaya sokulmaya çalışılan akıllı ulaşım sistemleri sürekli olarak gelişmiş, otomasyon sistemleri ve zamanla insan kaynaklı hataları minimize etmeye yönelik teknolojik desteklerle günümüzde başladığı noktanın çok ilerisine evirilmiştir. Akıllı ulaşım sistemlerinde (AUS) ilk otomasyon sistemlerine 1960-70'li yıllarda Japonya ve Amerika'da kartlı geçişlerle başlanılmış, takip eden yıllarda bilgisayarlı sistemlerin desteği ile otomasyon oranları çok daha iyileştirilmiştir (Taç, 2018). Günümüzde ise neredeyse insan unsuru tamamen devre dışı bırakılarak tüm sistemin otomatik olarak işletilmesi söz konusu olmuştur.

Akıllı ulaşım sistemlerinin ilk uygulamaları 1960'ların sonlarında görülmeye başlanmış, ABD'de 1969'da başlatılan ERGS (Electronic Route Guidance System - Elektronik Güzergâh Kılavuzluk Sistemi), Japonya'da 1973'te başlatılan CACS (Comprehensive Automobile traffic Control System - Kapsamlı Araç trafiği Kontrol Sistemi) ve Almanya'da 1974'te başlatılan ARI (Autofahrer-Rundfunk-Informations system - Sürücü Radyo Yayını Bilgi Sistemi), ilk uygulamaların en dikkat çekici uygulamalarını oluşturmuşlardır (Tiryaki, 2015).

Akıllı ulaşım sistemlerinin yayılması, farklı çözüm arayışlarını da beraberinde getirmiştir. Yolcuların daha ekonomik ve kolay seyahat edebilmeleri AUS sistemlerinin amaçlarından bir tanesidir. Otomatik ücretlendirme sistemleri de yolcu ile sürücü arasındaki fiziksel işlemlerin ortadan kaldırılmasını sağlayarak süreci hızlandırmakta ve farklı alternatifler sunarak da daha ekonomik ulaşım imkânları sağlamaktadır. Geleneksel sistemlerde ilk zamanlarda kullanılan manuel ücret toplama sistemelerinin birçok dezavantajı bulunmaktadır. Bunlar; zaman alıcı olmaları, trafik sıkışıklığına, çevre kirliliğine ve kaçak geçişlere neden olmaları şeklinde ifade edilebilir (Kumawat ve Chandramore, 2014). Bu nedenle akıllı ulaşım sistemlerinde elektronik olarak ücret toplama sistemleri devreye sokulmaya başlanmıştır. AUS'un en önemli bileşenlerinden biri olan elektronik ücret toplama sadece ücret toplamamnın ötesine geçerek kent yaşamında elektronik bilgi toplama sürecine evrilmiştir (Geçer, 2016). Eelktronik ücret toplama sistemlerinin yaygınlaşması ile birçok önemli avantajın eldesi hedeflenmiş ve başarılmıştır. Personelin nakitle temasının azaltılarak suistimallerin önlenmesi, kayıp kaçak oranının düşürülmesiyle mali kayıpların önüne geçilmesi, sıra bekleme ve zaman kayıplarının minimize edilmesi, kullanıcı dostu uygulamaların devreye alınması, farklı seçeneklerin devreye alınmasıyla daha ekonomik ve adil bir ücretlendirme yapısının sağlanması elde edilen kazanımlara örnek olarak verilebilir.

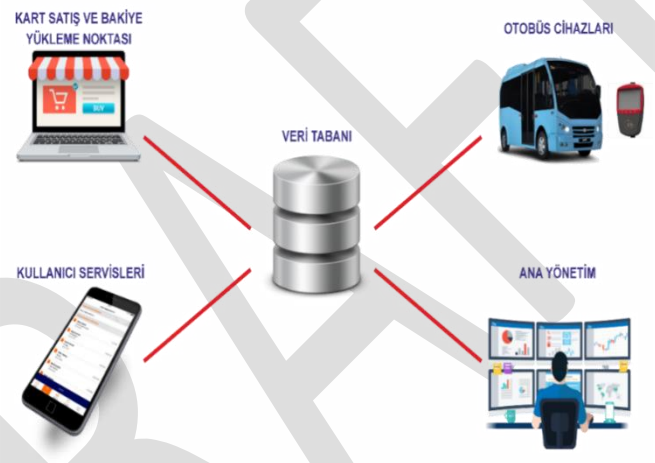
Bu amaçla elektronik ücret toplama sistemlerine yönelik bir çok çalışma yapılmış ve farklı noktalarda test edilmişlerdir. Ülkemizde de ilk olarak karayollarında başlatılan elektronik ücret toplama sistemleri genelde RFID etiketlerin kullanılması şeklinde başlamıştır (Katanalp vd., 2018). Ayrıca yapılan farklı çalışmalarda benzer şekilde RFID teknolojisi kullanılmış (Kumawat ve Chandramore, 2014), bu teknolojinin yanında Bluetooth teknolojisi de eelktronik ücret toplama amaçlı olarak etst edilmiştir (Türk ve Arslan, 2017). Benzer şekilde gene başka çalışmada, elektronik ücretlendirme sistemlerinin farklı fonksiyonları için gömülü sistemlerin desteği kullanılmıştır (Arslan vd., 2016).

Nüfus yoğunluğunun çok fazla olduğu kentlerde kullanılan elektronik ücretlendirme sistemlerinin benzer yapılarıyla küçük işletmelerde kullanımının maliyet noktası göz önüne alındığında işletmeleri zorladığı görülmektedir. Bu nedenle küçük işletmelere yönelik olarak daha düşük maliyetli sistemlerin efektif bir şekilde devreye sokulmasında yarar vardır. Özellikle ilçelerdeki toplu taşıma sistemlerinde kullanılabilecek maliyeti düşük çözümlerin üretilmesi ve test edilmesi gerekmektedir. Bu çalışmada tamamen bu amaca yönelik olarak daha düşük maliyetli ve sistemin gereksinimlerini karşılamaya yönelik bir çözüm üzerinde durulmuştur. Raspberry Pi tabanlı bir sistem önerilerek elektronik ücret toplama işleminin kolaylıkla gerçekleştirilebileceği, işletme ve kullanıcıların önerilen sistemi kolay ve güvenli bir şekilde kullanabilecekleri bir sistem tasarımı gerçekleştirilmiş ve test edilmiştir. Çalışmanın ikinci bölümünde

sistemin nasıl tasarlandığı ve kullanılan teknolojiler tanıtılmış, üçüncü bölümde ise bulgular verilmiştir. Dördüncü bölümde ise önerilen sistemin sonuçları tartışılmıştır.

MATERYAL VE METOD

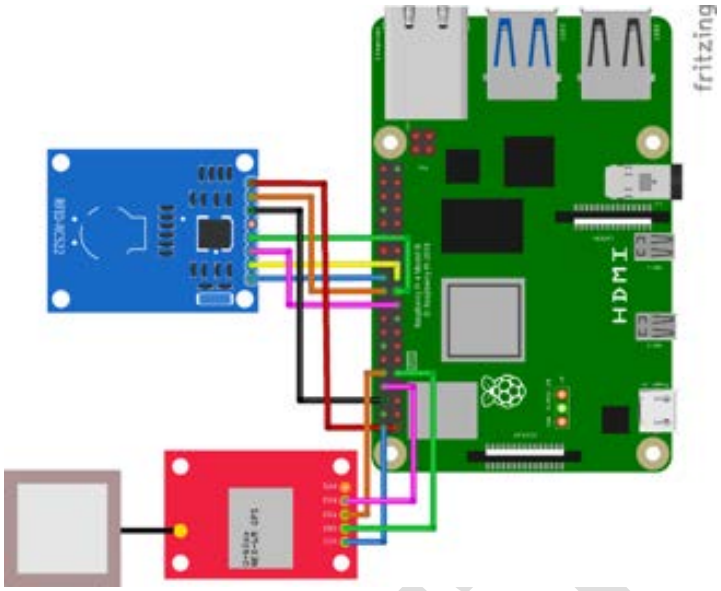
Tasarlanan ve Şekil 1'de çalışma diyagramı verilen bu sistemde, bileşenler arasındaki veri akışı ve haberleşme entegre bir yapı içinde kesintisiz olarak gerçekleşmektedir. Otobüs cihazı (Raspberry Pi), yolcuların kartlarını okumak için NFC kart okuyucusu ile doğrudan iletişim kurarak kart bilgilerini alır ve bu verileri işler. Alınan veriler, daha sonra merkezi sunucuya iletilir. Merkezi sunucu (MySQL veri tabanı), otobüs cihazlarından gelen ödeme ve kullanıcı bilgilerini toplayarak güvenli bir şekilde depolar. Bu veri aktarımı, web servisleri aracılığıyla sağlanır ve otobüs cihazları ile merkezi sunucu arasında anlık veri akışı oluşturur. Web sitesi kullanıcıların bakiye işlemlerini yönetebilmesi için merkezi veri tabanına bağlanır ve böylece kullanıcılar bakiye yükleme, hesap yönetimi gibi işlemlerini gerçekleştirebilir. Web ara yüzü, sistemin kullanıcıya yönelik hizmetlerini sağlarken, yönetim paneli ise sistemin genel yönetimi ve raporlanması için merkezi sunucu ile haberleşir. Böylece, sistemin tüm bileşenleri arasında sürekli bir veri akışı ve koordinasyon sağlanarak sistemin verimli ve kesintisiz bir şekilde çalışması mümkün hale gelir.



Şekil 1. Önerilen sistemin çalışma diyagramı

Şekil 2' de gösterilen Raspberry Pi, otobüslerde kullanılacak olan ana cihaz olarak işlev görecektir. Bu cihaz, entegre edilmiş NFC kart okuyucularla birlikte çalışarak, yolcuların kart bilgilerini okuma işlemlerini gerçekleştirecektir. NFC kart okuyucular, kullanıcıların biniş işlemi sırasında kartlarını okutarak, bu verileri Raspberry Pi cihazına iletecektir. Raspberry Pi, bu verileri anlık olarak gerekli Python kütüphaneleri kullanarak oluşturulan algoritmalar ile işleyerek kullanıcıların ödeme bilgilerini merkezi veri tabanına gönderecektir. GPS modülü ile ise otobüslerin anlık takibi kontrol edilmesi amaçlanmıştır.

,



Şekil 2: Raspberry Pi ve GPS modüllerinin bağlantı şemaları

BULGULAR

Bu proje, toplu taşıma sistemlerinde kullanılan kartlı ödeme yöntemlerinin daha güvenli, kullanıcı dostu ve işlevsel hale getirilmesini amaçlayan bir elektronik ücret toplama sistemi geliştirmeyi hedeflemektedir.

Sistem, kullanıcıların toplu taşıma araçlarında kartlarını kullanarak ödeme yapmasını, bakiye takibini ve online işlemlerle yönetimini sağlar.

Sistem, Şekil 3' de gösterildiği gibi öncelikli olarak okutulan kartın geçerliliğini kontrol eder. Kartlara önceden gömülen özel doğrulama anahtarları sayesinde, sahte veya kopyalanmış kartların kullanılmasının önüne geçilir. Kart orijinalliği doğrulandıktan sonra, kart ID'si ile veri tabanında sorgulama yapılır. Kullanıcı veri tabanında mevcut değilse işlem sonlandırılır ve kullanıcıya bilgi verilir. Mevcut kullanıcılar için kart bilgileri cihazlara aktarılır ve ilk olarak vize tarihi kontrol edilir. Vize tarihi geçmiş kartlar için işlem sonlandırılır ve kullanıcı bilgilendirilir.

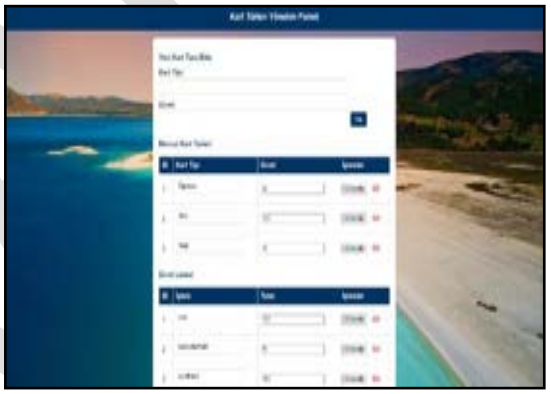
Vize tarihi uygun olan kartlarda, kart tipine göre belirlenmiş ücretlendirme üzerinden bakiye kontrolü yapılır. Yeterli bakiye yoksa işlem sonlandırılır ve kullanıcıya bilgi sağlanır. Yeterli bakiye mevcutsa, ödeme gerçekleştirilir ve kullanıcının işlem sonrası güncel bakiyesi ekranda görüntülenir. Sistem, özel kart tipleri (örneğin; engelli, yaşlı veya anne kartları) ve indirimli kart kullanıcıları için özel kurallar barındırır. Bu kartlardan ücret alınırken kötüye kullanımın önlenmesi amacıyla, aynı kartla belirli bir süre içinde birden fazla işlem yapılması sınırlandırılmıştır.

DRAFT

Şekil 3: Sistemin fiziksel olarak tasarlanmış hali

Firma yetkilileri için geliştirilen kurumsal ara yüz, Şekil 4 ve Şekil 5' deki gibi sistemin tüm yönlerini dinamik bir şekilde yönetmeyi mümkün kılar. Bu ara yüz üzerinden personel ekleme, kart tiplerini ve ücretlerini belirleme, otobüs cihazlarının konumlarını izleme ve finansal istatistikleri görüntüleme gibi işlemler yapılabilir. Firma personeli ise kullanıcıların kart bakiyelerini sorgulayabilir, bakiye yükleyebilir, vize güncellemeleri gerçekleştirebilir ve kaybolan kartlar için yeni kart tanımlayabilir.

Şekil 4: Firma çalışanı ara yüzü

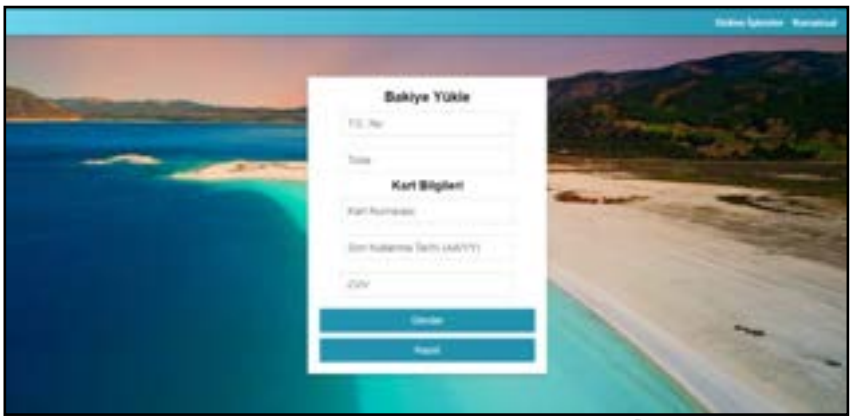


Şekil 5: İzlenen finansal istatistikler

Son kullanıcılar için geliştirilen kullanıcı dostu arayüz(Şekil 6), online işlemler üzerinden kart bakiyesi sorgulama ve bakiye yükleme gibi kolaylıklar sunar. Kullanıcılar, T.C. kimlik numaraları ile sisteme erişerek işlemlerini hızlı bir şekilde tamamlayabilir.

Bu sistem, kullanıcıların ve firma yetkililerinin tüm işlemlerini pratik ve güvenli bir şekilde gerçekleştirmesini sağlarken, toplu taşıma sektörüne yenilikçi bir çözüm sunmaktadır. Kapsamlı veri tabanı entegrasyonu, dinamik ücretlendirme ve kullanıcı dostu arayüzleriyle, sektörün dijitalleşmesine katkıda bulunmayı hedefler.

DRAFT



Şekil 6: Son kullanıcı ara yüzü

SONUÇ

Bu çalışmada özellikle küçük ölçekli işletmelerin mevcut elektronik ücret toplama sistemlerine mesafeli durmasını sağlayan yüksek maliyetli çözümlere alternatif bir sistem önerisi yapılmış, tasarlanmış ve test edilmiştir. Önerilen sistemin çalışması çok basit ve kolay olup, maliyeti diğerlerine göre minimum seviyededir. Tasarlanan ara yüzlerle kullanıcıların kartlarına bakiye yüklemeleri, bakiyelerini takip etmeleri, firmaların durum izleme sistemleri kolaylaştırılmıştır. Çalışma tamamen maliyet eksenine odaklanmış ve küçük firmalara alternatif bir çözüm üretmek hedeflenmiştir. Yapılan testler sistemin sorunsuz olarak çalıştırılabileceğini göstermiş olup, önerilen bu sistem ufak değişikliklerle efektif bir biçimde kullanılabilir.

Abstract
Water scarcity is a critical global issue, and solar steam generation (SSG) using photothermal materials offers a sustainable solution for desalination. However, high costs and complex fabrication often limit their practicality. In this study, a low-cost SSG system was developed by modifying a commercial cellulosic sponge with carbonized Turkish tea waste (CTW). The CTW, obtained via pyrolysis, provided strong light absorption and efficient photothermal conversion, while the sponge served as a lightweight, self-floating substrate with rapid water uptake. The resulting CTW-S composite achieved a water evaporation rate of 1.42 kg m^{-2} h^{-1} and a solar-to-vapor conversion efficiency of 83% under one sun illumination. This work demonstrates the potential of biomass-derived materials for scalable, eco-friendly water treatment applications.
Keywords: Turkish tea waste, carbonization, cost-effective evaporator solar desalination.

INTRODUCTION

Due to the increasing demand of the human population and the continuous pollution of limited clean water resources, the shortage of clean water has become an urgent problem for the sustainable development of society. Desalination of seawater and treatment of wastewater are two effective ways to alleviate the shortage of fresh water (Ibrahim et al., 2021; Tian et al., 2022).

It is estimated that the total amount of energy that the Sun provides to the Earth in 1 hour is more than the energy humans consume in a year. Utilizing solar energy to desalinate seawater and purify polluted water without consuming fossil energy and causing environmental pollution is an environmentally friendly and sustainable strategy (Toyoda & Inagaki, 2023).

Recently, a significant amount of research has been conducted focusing on achieving efficient evaporation results with solar energy (Chen et al., 2020). These researches are focused on producing advanced materials that can increase solar absorption, improve thermal management, and facilitate water transport and vapor diffusion to produce clean water vapor (Liu et al., 2017a).

To date, various materials capable of photothermal conversion have been reported for solar steam generation (SSG), including metallic plasmonic nanoparticles, polymers, and carbon-based materials. However, most of these materials are expensive and involve complex production processes. From the perspective of sustainable development, there is still a significant need for new materials that are low-cost, self-floating, and easy to produce to obtain clean water using solar energy (Liu et al., 2017b; Wang et al., 2016).

As well known, tea is one of the most consumed non-alcoholic beverages in the world. Global tea consumption, which reached 6.3 million tons in 2020, is estimated to increase to 7.4 million tons in the next five years (Debnath et al., 2022). In Turkey, per capita fresh tea consumption has been 14-15 kg in the last five years, while that of dry is 3.5-4.0 kg. However, this popularity of tea results in the generation of large quantities of tea waste (TW). Most of the TW is disposed of by landfills without proper treatment, causing a considerable environmental threat and polluting water and soil (Guclu et al., 2021).

Recently, biomass carbon materials have shown a broad application in SSG applications with their high specific surface area, unique microstructure, and environmentally friendly properties. TW, as biomass,

DRAFT

possesses a rich carbon source and can be pyrolyzed to yield low-cost and efficient TW biochar. This carbonized product can be used as a photothermal material to absorb sunlight and convert solar energy to heat (Nidheesh et al., 2021).

Herein, we describe the preparation of a carbonized Turkish tea waste-modified commercial sponge as an efficient evaporator for SSG. Firstly, a pyrolysis process was applied to Turkish TW after brewing to fabricate a highly porous carbonized structure. Subsequently, an inexpensive cellulosic sponge was coated with the resulting porous biomass-derived carbonaceous structure to obtain a novel solar steam generator. This sponge was used as a substrate in the preparation of solar steam generators due to its lightweight and self-floating feature thanks to its large pores. The easy and rapid water absorption ability of the sponge (S) combined with the strong light absorption and high solar-vapor conversion of the carbonized Turkish tea waste (CTW), our photothermal material (CTW-S) showed superior SSG performance. The findings exhibited that CTW-S with a water evaporation rate of 1.42 kg m^{-2} h^{-1} under one sun illumination and a solar-to-vapor conversion efficiency of 83%, is a promising low-cost solar evaporator for large-scale practical applications such as desalination and water purification. The development of such eco-friendly materials demonstrates the potential of waste utilization in alleviating global challenges.

MATERIALS AND METHODS

2.1. Materials

Tea is brewed several times daily at the tearoom of the Chemistry Department of Atatürk University (Figure S1). Tea waste (TW) was obtained from this tearoom. The commercial natural cellulosic bath sponge (Wee Baby) was supplied by local suppliers in Türkiye. NaCl, $MgCl_2$, KCl, $CaCl_2$, $Cr(NO_3)_3$, $Ni(NO_3)_2$, $Cu(NO_3)_2$, $Pb(NO_3)_2$, HCl, NaOH, and methylene blue (MB) were purchased from Sigma-Aldrich.

2.2. Preparation of CTW

TW was washed several times and dried at 60°C. Then it was loaded into a tube furnace and heated in an Argon atmosphere at different temperatures (200, 300, 400, and 500 °C) for 2 h. The carbonized TWs (CTWs) were named CTW-200, CTW-300, CTW-400, and CTW-400 and ground in a mortar for 20 min.

2.3. Preparation of solar evaporator: CTW-S

To prepare the photothermal evaporator, first, the commercial natural cellulosic sponge (S) was cut in a cylinder with about 4 cm diameter. Subsequently, a polyvinyl alcohol (PVA) solution was prepared and the circular surface of the sponge was dipped into this solution. This surface of S was homogeneously coated with the optimized amount of CTW. At the surface, the PVA solution and CTW were mixed and thus, fixed on the sponge surface.

RESULTS and DISCUSSION

The morphology of the bare S and the CTW-S was characterized through FESEM. Figures 1.a and b show that the sponge has a network consisting of different-sized pores. These disordered pores are beneficial for water absorption and evaporation. CTW is coated homogenously inside the sponge in Figures 1.c and d, and the roughness of the surface increased due to the stacked CTW, which contributes to a higher solar absorption for evaporation. The SSG performance of CTW-S was evaluated with the measurement system in Figure 1.e. This system consists of a solar simulator, an electronic analytical balance to measure the mass change through water evaporation, and a computer to determine the time-dependent evaporation rate. The temperature changes were monitored and recorded with a thermal camera. The experiments were carried out with an insulated double-walled container to prevent environmental heat conduction and including floating CTW-S on water (Figure 1.f).

DRAFT

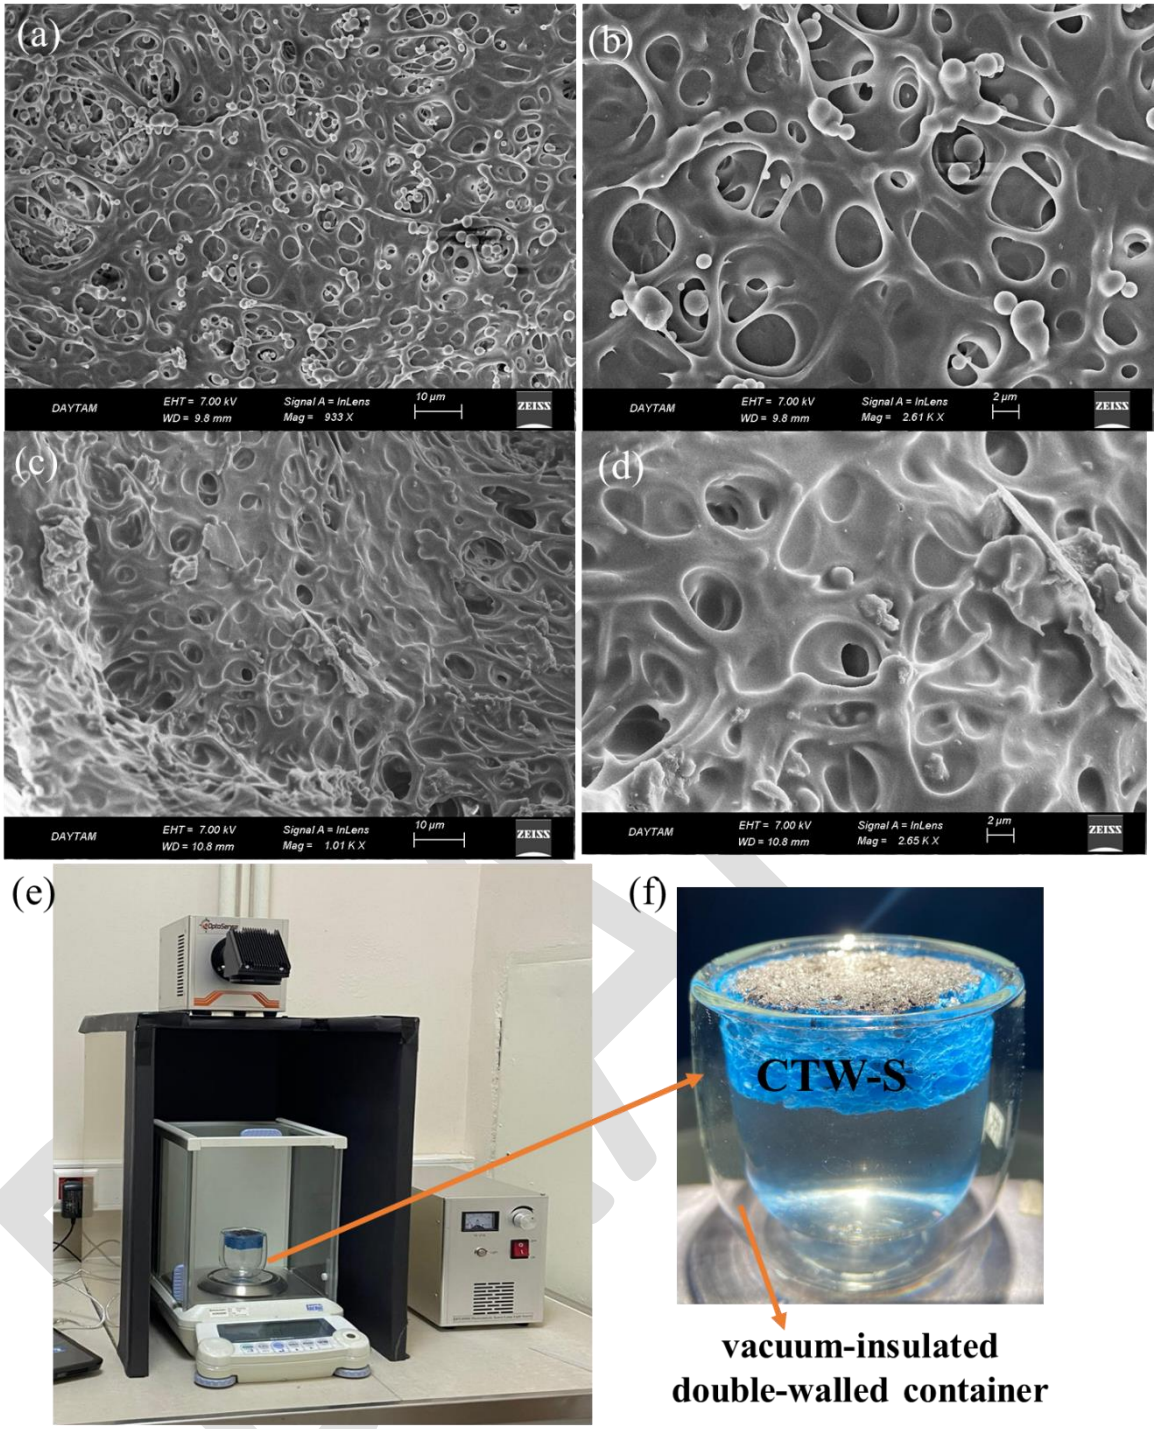

Figure 1. FESEM image of bare S (a-b) and CTW-s (c-d) at different magnifications. Digital photograph of SSG device (a) and solar evaporator in double-walled glass container (b).

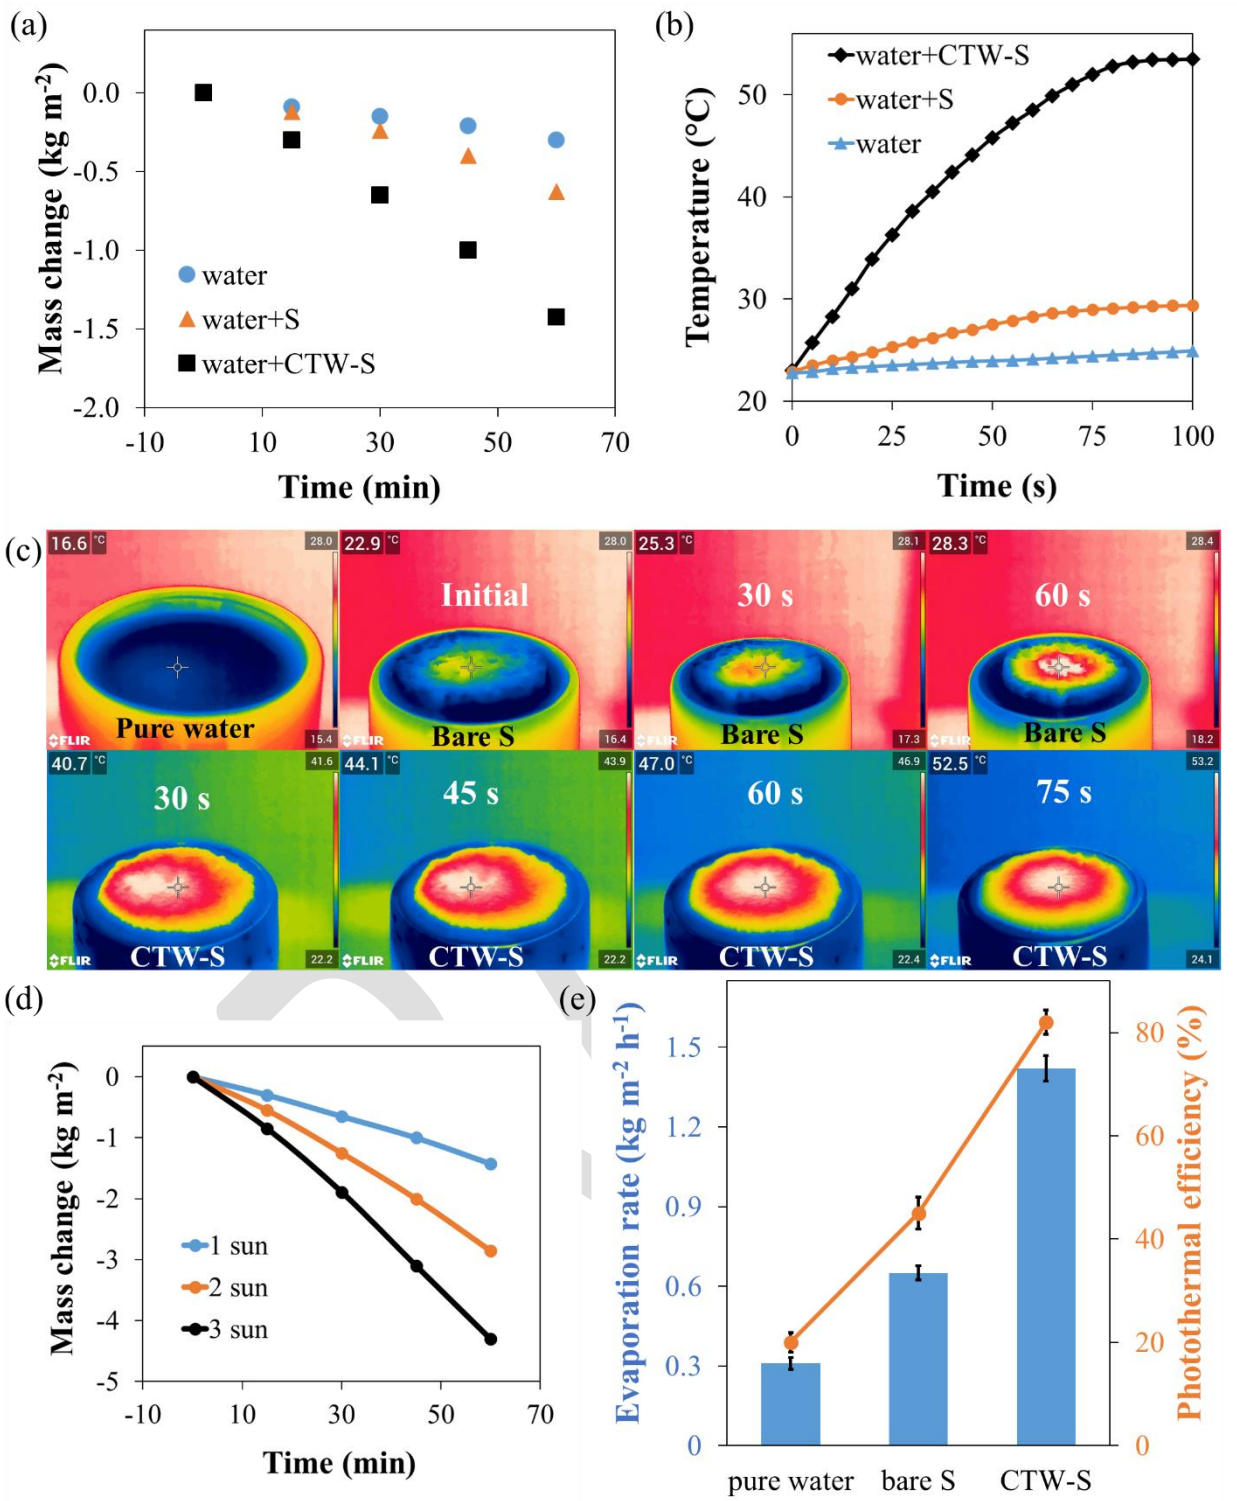

Figure 2. Time-dependent mass change (a) and surface temperature (b) of CTW-S, bare S, and pure water under 1 sun irradiation. (c) Infrared images of pure water, bare S, and CTW-S at different times. (d) Time-dependent mass change of CTW-S under different solar irradiation. (e) Evaporation rate and photothermal efficiency of pure water, bare S, and CTW-S under 1 sun irradiation.

The mass change of water under 1 sun irradiation for 60 min was determined to investigate the evaporation performance of CTW-S in Figure 2.a. The evaporation rate over time for CTW-S was calculated as 1.42 kg m^{-2} h^{-1}, which is about 4.6 times that of pure water (0.31 kg m^{-2} h^{-1}) and about 2.2 times that of bare S (0.65 kg m^{-2} h^{-1}). In Figure 2.b, the temperature increases of the samples (pure water, bare S, and CTW-S) over time were examined during 100 s of irradiation. After 100 s, the surface temperature of pure water and bare S reached 24.9 °C and 29.4 °C, respectively, while that of CTW-S rapidly increased during the first 85 s and stabilized at 53.4 °C. The maximum surface temperature of CTW-S was higher than that of the bare S,

indicating the strong photothermal conversion effect of the carbonized structure (CTW). In Figure 2.c, the surface temperature of pure water, bare S, and CTW-S were monitored with an infrared camera over time under 1 solar irradiation. The initial temperature of pure water was 16.6 °C. Noticeably, the surface temperature of CTW-S sharply increased in the first 30 s and was recorded as 40.7, 44.1, 47.0, and 52.5 °C after 30, 45, 60, and 75 s; in contrast, that of bare S exhibited low temperatures with less increment from 25.3 °C to 28.3 °C after 30 and 60 s, respectively. Figure 2.d exhibits that the amount of water evaporated increased with increasing solar radiation.

The evaporation rate of the CTW-S was recorded as 2.86 and 4.34 kg m^{-2} h^{-1} for 2 and 3 sun lights, respectively. The pure water, bare S, and CTW-S demonstrated a photothermal efficiency of 20%, 45%, and 83%, respectively (Figure 2.e). CTW-S exhibited higher energy efficiency and water evaporation rate, indicating the superior photothermal conversion performance of CTW. Furthermore, CTW laid on the S surface acts as a barrier to prevent heat loss and thus increases the photothermal efficiency.

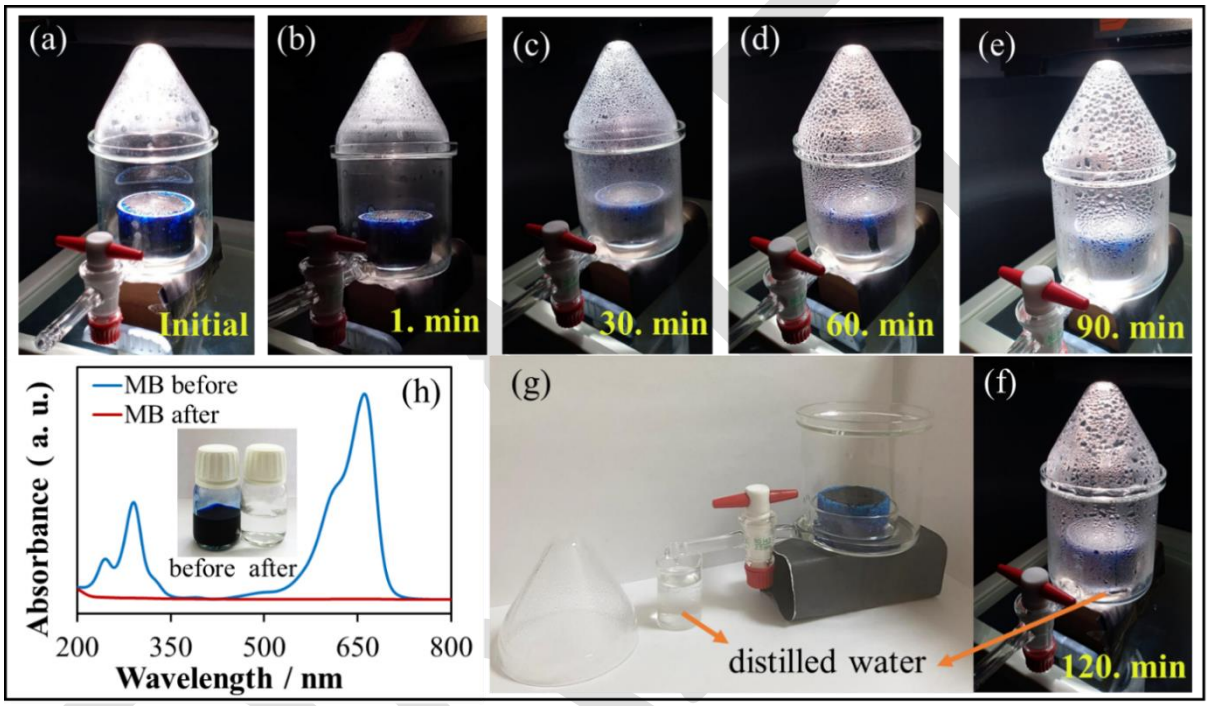

Figure 3. Digital photographs of solar purification with CTW-S at different times (a-f) and distillate (g). (h) UV−vis spectra of MB before and after solar purification.

To test the solar purification of the dye-containing solution with CTW-S, an MB solution with a concentration of 1.0 g L^{-1} was placed in the prepared SSG setup, and the distillation process was applied. After irradiation for 2 h, the distillate water was examined through UV-visible absorption spectroscopy. Photographs of solar evaporation from initial to 1, 30, 60, 90, and 120 min are shown in Figure 3 a-f. The distillate collected through the tap of the container (Figure 3.g) was transparent (inset of Figure 3.h), and its UV−vis spectrum showed the disappearance of the MB absorption peaks, demonstrating successful solar purification and, thus, the potential effect of CTW-S in sewage treatment.

CONCLUSION

In this study, a cost-effective and eco-friendly solar steam generator was developed using a commercial cellulosic sponge modified with carbonized Turkish tea waste. The CTW, produced through the pyrolysis of spent tea leaves, exhibited a highly carbonaceous structure with excellent photothermal properties. After coating the sponge, the CTW-S showed strong solar steam generation performance. Specifically, under one sun illumination, CTW-S achieved a water evaporation rate of 1.42 kg m^{-2} h^{-1} and a solar-to-vapor conversion efficiency of 83%. These results underscore the potential of utilizing biomass-derived waste materials in the development of sustainable, low-cost SSG systems. The successful integration of tea waste into a functional photothermal material highlights the value of waste valorization in addressing global water scarcity through scalable and environmentally responsible technologies.

Abstract
Water scarcity remains one of the most pressing global challenges, with solar steam generation (SSG) emerging as a promising method for sustainable desalination. Nevertheless, the widespread application of SSG technologies is often hindered by high production costs and complicated fabrication methods. In this study, an affordable and efficient SSG device was developed using a commercial cellulose-based sponge enhanced with carbonized Turkish coffee waste (CTCW). Produced through pyrolysis, CTCW offered excellent photothermal properties due to its strong solar absorption and effective light-to-heat conversion. The sponge matrix contributed additional advantages, including buoyancy and rapid water absorption. The resulting CTCW-S composite achieved a water evaporation rate of 1.63 kg m^{-2} h^{-1} and a solar-to-vapor conversion efficiency of 81% under standard sunlight conditions. These findings highlight the promise of repurposed biomass materials in developing scalable, eco-conscious water purification technologies.
Keywords: Biomass-derived carbon, Turkish coffee byproduct, cost-efficient evaporation, sunlight-assisted desalination.

INTRODUCTION

The decreasing availability of clean water poses a significant challenge to human survival and sustainable progress. Currently, purification of brackish water and municipal wastewater and desalination of seawater are considered the primary methods to reduce stress on water resources (Chen et al., 2020). There has been a rapid growth in the installation of seawater desalination plants in water-stressed regions as a way to increase water supply (Elimelech & Phillip, 2011). Multi-stage distillation and reverse osmosis are the two dominant technologies for thermal distillation and membrane-based desalination plants. These two methods account for the majority of the desalination market (Asghar et al., 2023; Hailemariam et al., 2020). However, the energy-intensive use of thermal/electric power and the extensive infrastructure required limits their widespread adoption to provide safe and sustainable drinking water. (Zhang vd., 2021; Li vd., 2020). At this point, solar energy emerges as an inexhaustible renewable green energy source owning an environmentally friendly and sustainable alternative compared to other energy sources. Thus, solar steam generation (SSG) using photothermal materials is a green, low-cost, and efficient method of solving the global water crisis with sustainable energy. From an energy efficiency perspective, the design of a water evaporation material should include the following components: 1) Photothermal materials that can efficiently convert sunlight into heat; 2) Structures that can simultaneously expand the evaporation surface and provide water to the heated space; 3) Thermal insulators that reduce heat loss from the available water and ambient air.

To date, great progress has been made in the development of various photothermal materials and hydrophilic supporting substrates for SSG. Photothermal materials consist of carbon-based materials, plasmonic metal nanoparticles, semiconductor materials, and organic polymers. Hydrophilic substrate materials include hydrogels or hydrophilic sponges. Significant advances in photothermal material research have enabled the use of solar-absorbing materials such as Au/Ag/Pd nanoparticles. (Toyoda & Inagaki, 2023; Wen et al., 2023). However, high-cost raw material requirement, complex production processes, and low stability prevent their use in practical applications. Therefore, the need for the development of low-cost and more environmentally friendly materials for water treatment persists.

Biochar is a solid product consisting of carbon and mineral elements produced by thermochemical processes such as combustion, gasification, hydrothermal carbonization, roasting, and pyrolysis in the

absence or limitation of an oxidizing agent, using biomass materials. Although wood has been used as biomass since ancient times, biochar can be produced from corn cobs, rice husks, peanuts, tree shells, processed paper waste, etc. (Nidheesh et al., 2021). Among these, coffee waste is a low-cost and abundant biomass source.

There is a large coffee consumption volume in Turkey as in the world. Turkish coffee (TC) is regarded as part of Turkish cultural heritage and this element was inscribed in 2013 on the UNESCO Intangible Cultural Heritage of Humanity. TC, among others, is the most consumed and liked coffee by Turkish society. Thus, TC waste, a biomass source, is formed through this huge consumption.

The negative impacts of waste materials on the environment and, consequently, on humans have led to an increased interest in research on the conversion of waste materials into value-added materials. The preparation of biochar for environmental remediation is a kind of "waste to wealth" strategy as it helps in the management and utilization of waste (Tripathi et al., 2016). For an ideal solution to purify polluted water, raw material cost and environmental impact should be taken into consideration. Therefore, carbonized natural materials, especially biomass waste, are extremely important in solar water purification due to providing the opportunity for recycling. Nevertheless, studies on the preparation of photothermal material for the SSG through the utilization of waste biomass are limited.

In this work, we fabricated photothermal material (CTCW-S) by modifying a hydrophilic self-floating commercial sponge (S) with carbonized TC waste (CTCW) for SSG. Firstly, a pyrolysis process was applied to TC waste collected to prepare a photothermal carbonized structure. Subsequently, an inexpensive cellulosic sponge was modified with the resulting porous biomass-derived carbonaceous structure to obtain a novel solar steam generator. The easy and rapid water absorption ability of the S combined with the strong light absorption and high solar-vapor conversion of the CTCW, our photothermal material showed superior solar steam generation performance. The findings exhibited that CTCW-S with a water evaporation rate of 1.63 kg m^{-2} h^{-1} under one sun illumination and a solar-to-vapor conversion efficiency of 81%, is a promising low-cost solar evaporator for large-scale practical applications such as water purification and desalination. CTCW-S will bring a new perspective to the development of waste-based materials for SSG and provide a viable alternative to address freshwater scarcity.

MATERIALS AND METHODS

Materials

TC is drunk at home and office daily. TCW was obtained by collecting the coffee grounds left at the bottom of the coffee cups (Figure S1). The commercial natural cellulosic bath sponge (Wee Baby) was supplied by local suppliers in Türkiye. NaCl, $MgCl_2$, KCl, $CaCl_2$, $Cr(NO_3)_3$, $Ni(NO_3)_2$, $Cu(NO_3)_2$, $Pb(NO_3)_2$, HCl, NaOH, polyvinyl alcohol (PVA) and methylene blue (MB) were purchased from Sigma-Aldrich.

Preparation of CTCW

TCW was washed several times and dried at 60 °C. Then it was loaded into a tube furnace and heated in an Argon atmosphere at different temperatures (300, 400, 500, and 600 °C) for 2 h. The CTCWs were named CTCW-300, CTCW-400, CTCW-500, and CTCW-600.

Preparation of solar evaporator: CTCW-S

To prepare the photothermal material, first, the commercial natural cellulosic sponge (S) was cut in a cylinder with about 4 cm diameter. Subsequently, a polyvinyl alcohol (PVA) solution was prepared and the circular surface of the sponge was dipped into this solution. This surface of S was homogeneously coated with the optimized amount of CTCW. At the surface, the PVA solution and CTCW were mixed and thus, fixed on the sponge surface.

DRAFT

RESULTS and DISCUSSION

The morphology of the bare S and the CTCW-S was characterized through FESEM. Figures 1.a shows that the sponge has a network consisting of different-sized pores. These disordered pores are beneficial for water absorption and evaporation. CTCW is coated homogenously inside the sponge in Figures 1.b and d, and the roughness of the surface increased due to the stacked CTCW, which contributes to a higher solar absorption for evaporation. The SSG performance of CTCW-S was evaluated with the measurement system in Figure 1.c. This system consists of a solar simulator, an electronic analytical balance to measure the mass change through water evaporation, and a computer to determine the time-dependent evaporation rate. The temperature changes were monitored and recorded with a thermal camera. The experiments were carried out with an insulated double-walled container to prevent environmental heat conduction and including floating CTCW-S on water (inset of Figure 1.c).

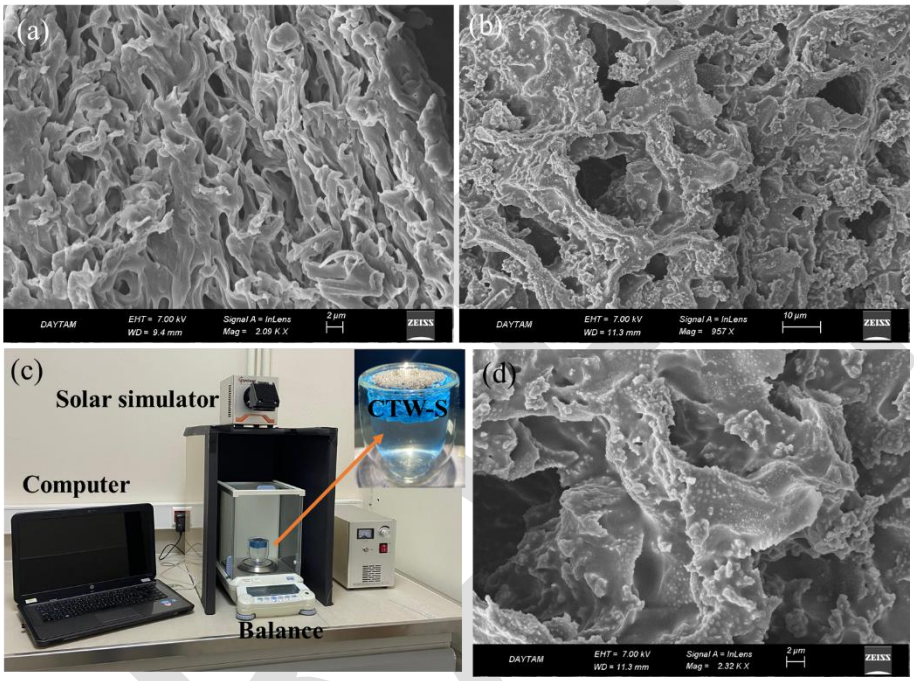

Figure 1. FESEM image of bare S (a) and CTCW-S (b and d) at different magnifications. Digital photograph of SSG device (c).

The mass change of water under 1 sun irradiation for 60 min was determined to investigate the evaporation performance of CTCW-S in Figure 2.a. The evaporation rate over time for CTCW-S was calculated as 1.63 kg m^{-2} h^{-1}, which is about 5.2 times that of pure water (0.31 kg m^{-2} h^{-1}) and about 2.5 times that of bare S (0.65 kg m^{-2} h^{-1}). In Figure 2.b, the temperature increases of the samples (pure water, bare S, and CTCW-S) over time were examined during 100 s of irradiation. After 100 s, the surface temperature of pure water and bare S reached 24.9 °C and 29.4 °C, respectively, while that of CTCW-S rapidly increased during the first 85 s and stabilized at 55.2 °C. The maximum surface temperature of CTCW-S was higher than that of the bare S, indicating the strong photothermal conversion effect of the carbonized structure (CTCW). In Figure 2.c, the surface temperature of pure water, bare S, and CTCW-S were monitored with an infrared camera over time under 1 solar irradiation. The initial temperature of pure water was 15.8 °C.

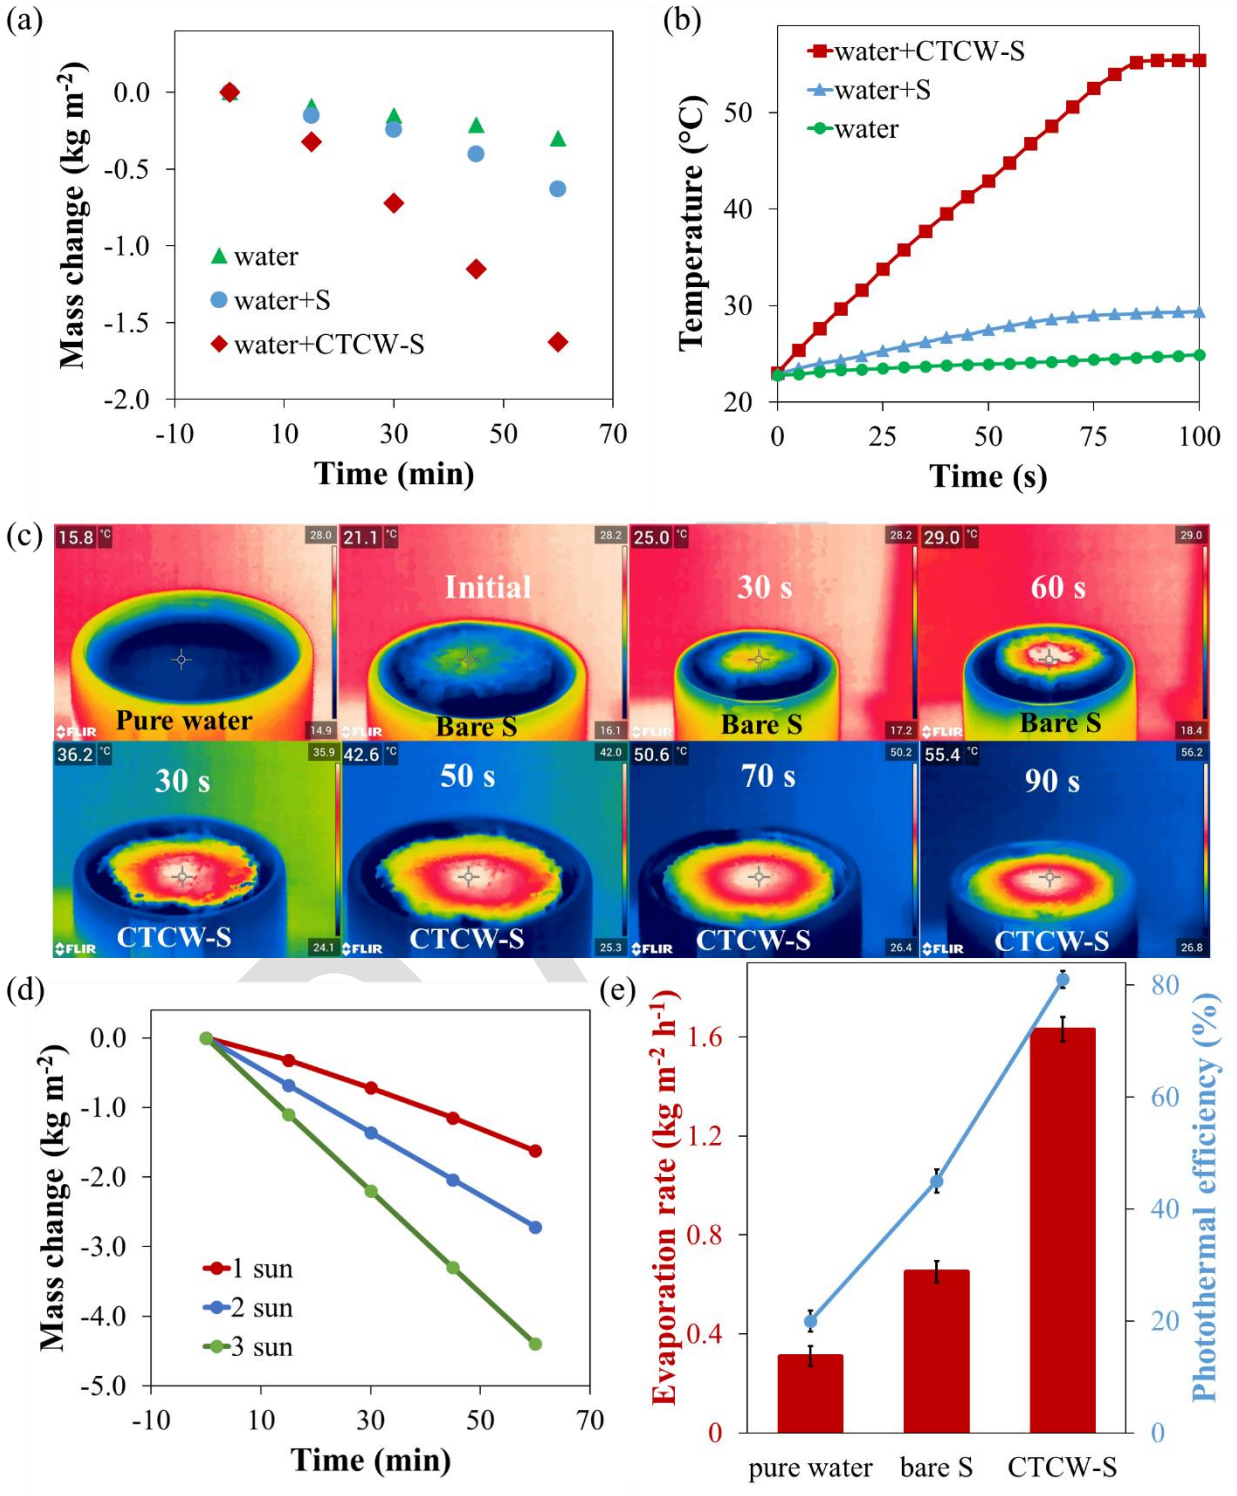

Figure 2. Time-dependent mass change (a) and surface temperature (b) of CTCW-S, bare S, and pure water under 1 sun irradiation. (c) Infrared images of pure water, bare S, and CTCW-S at different times. (d) Time-dependent mass change of CTCW-S under different solar irradiation. (e) Evaporation rate and photothermal efficiency of pure water, bare S, and CTCW-S under 1 sun irradiation.

Noticeably, the surface temperature of CTCW-S sharply increased in the first 30 s and was recorded as 36.2, 42.6, 50.6, 47.0, and 55.4 °C after 30, 50, 70, and 90 s; in contrast, that of bare S exhibited low temperatures with less increment from 25.0 °C to 29.0 °C after 30 and 60 s, respectively. When the light intensity was increased to 2 and 3 sun lights, the evaporation rate of the CTCW-S photothermal material was also increased to 2.72 and 4.40 kg m^{-2} h^{-1}, respectively (Figure 2.d). The photothermal efficiency for samples was calculated using equations 1 and 2, shown in detail in the supporting information. The pure water, bare S, and CTCW-S demonstrated a photothermal efficiency of 20%, 45%, and 83%, respectively

(Figure 2.e). CTCW-S exhibited higher energy efficiency and water evaporation rate, indicating the superior photothermal conversion performance of CTCW. Furthermore, CTCW laid on the S surface acts as a barrier to prevent heat loss and thus increases the photothermal efficiency.

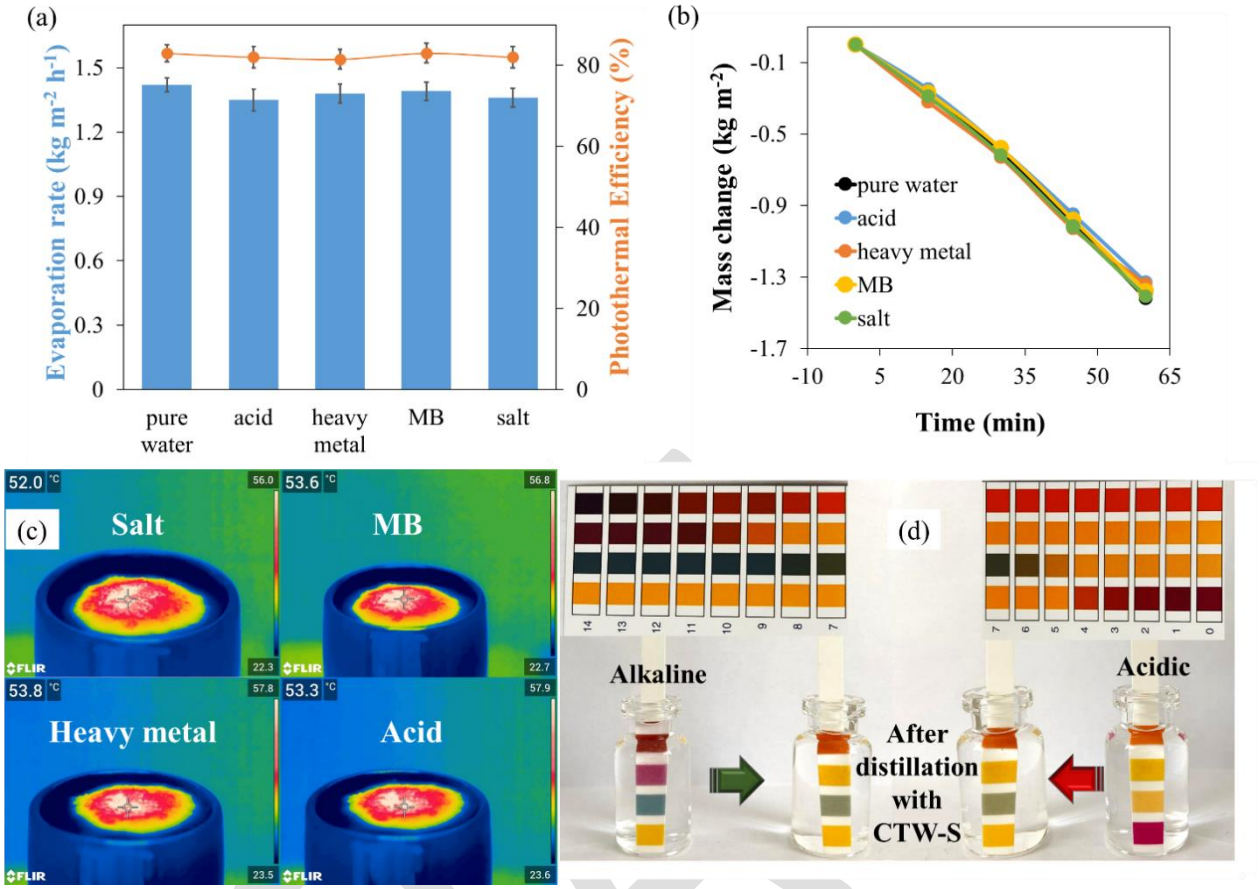

Figure 3. Photothermal efficiency and evaporation rate (a) and time-dependent mass change (b) of CTCW-S for pure water and solutions containing acid, alkaline, salt, heavy metal, and MB under 1 sun irradiation. (c) Infrared images of CTCW-S floating on solutions containing heavy metal, salt, acid, and MB. (d) Digital photographs of pH values before and after solar purification of the acidic (pH 2) and alkaline (pH 12) solutions with CTCW-S.

The evaporation performance of CTCW-S was further investigated for different solutions containing heavy metal (200 mg/L), acid (pH 2), alkaline (pH 12), and dye (MB-1.0 g/L), salt (NaCl-3.5 wt %) solutions. Figure 3 displays the photothermal efficiency, evaporation rate (Figure 3.a), and mass change (Figure 3.b) of CTCW-S in different solutions, and the results are very close to that of pure water, demonstrating that our material has a comparable SSG performance in various solutions. Meanwhile, the surface temperature of CTCW-S on different solutions exhibited the range of 52-54 °C (Figure 3.c), which is consistent with mass change. All these findings revealed that CTCW-S is a potential photothermal material in desalination and water purification applications. On the other hand, the distilled water generated from acidic and alkaline solutions showed a pH value close to 7 (Figure 3.d). All these results further confirm that CTCW-S photothermal material has excellent solar desalination and purification performance.

CONCLUSION

This study presents a sustainable and cost-effective approach to solar steam generation by utilizing carbonized Turkish coffee waste (CTCW) integrated with a commercial cellulose sponge. The CTCW enhanced solar absorption and photothermal efficiency, while the sponge provided structural support, buoyancy, and rapid water transport. The resulting CTCW-S composite demonstrated a high evaporation rate and energy conversion efficiency under standard sunlight conditions. These results confirm the potential of biomass-derived materials for scalable and environmentally friendly water treatment technologies. Future work may further explore other types of biomass waste to optimize performance and broaden practical applications.

Abstract
This paper presents a fuzzy backstepping controller of a quarter vehicle suspension system for a comfortable and safe ride with a high road holding feature. Active suspension systems are essential for autonomous and electric vehicles as well as classical vehicles. These nonlinear systems require a nonlinear controller for ride comfort, road holding, and low power consumption. Backstepping controller provides a globally asymptotic stability with Lyapunov design for nonlinear and systems with uncertain parameters. Additionally, it integrates control law into the controller structure through the virtual control variables at each step. The practical implementation of the backstepping controller requires constant closed-loop gains for the chosen Lyapunov function at each step. The system's dynamic response depends on these values at a high rate. In this study, the fuzzy logic controller determines these values. This approach also reduces the steady-state error occurring in the natural behavior of the classical backstepping algorithm. The results show that the fuzzy backstepping approach reduces the sprung mass displacement, acceleration, RMS values of dynamic tire load, and suspension deflection according to the classical control approach.
Keywords: Quarter vehicle model, Fuzzy backstepping, Ride comfort, Suspension deflection

INTRODUCTION

Improving ride comfort for passenger convenience and road holding for safe riding are the primary purposes of the automotive suspension system. The performance of the suspension has been improved by adding active elements to the passive suspension systems.

Road holding is obtained by supplying the contact of the road and the tire as much as possible. Additionally, ride comfort is supplied by isolating the road disturbances from the body of the vehicle. The road handling is improved with an active suspension system, too.

The system parameters have constant values for passive suspension systems, so the suspension stroke is limited (Ahmed 2021). Semi-active suspension systems usually have adjustable damping ratios through magnetorheological (MR), electrorheological, or variable orifice-type damping elements (Ergin and Yatak 2023). The active suspension system is the most enhanced suspension system among the other types of suspension systems. With an active suspension system, ride comfort and road holding can be improved concurrently (Yatak and Şahin 2021). The controllable part of the suspension system is the force actuator for arranging the ride comfort and suspension deviations.

The performance of the active suspension system strongly depends on the control technique. However, the complexity of the control technique, the cost, and the power consumption are the negative features of active suspension systems; the dynamic performance improvement on ride comfort and road holding makes it the most advanced suspension type.

Researchers have conducted many studies on the variety of control techniques for various vehicles, such as quarter, half-, or full-vehicle suspension systems. Linear quadratic regulator and static output feedback were compared in (Yim 2025). In (Tang and Ahmad 2025), enhanced fuzzy logic and two types of optimization methods were analyzed for active suspension systems. An adaptive integral terminal sliding mode active suspension system was implemented in (Liang, Gao et al. 2025). Passive suspension system, backstepping control, and sliding mode backstepping control were analyzed in (Li, Du et al. 2025). These control techniques are for improving the performance of the suspension systems. Nonlinear control algorithms are more appropriate for nonlinear systems. Zhang and Chen improved the body lateral vibration of high-speed trains with a backstepping semi-active control (Zhang and Chen 2025). They controlled the MR damper for this reason. In (Feng, Zhou et al. 2025), adaptive backstepping control was improved for

MR damper-based seat suspension. They reduced the frequency-weighted root mean square of acceleration, the vibration dose, and the root mean square of relative displacement effectively.

In this paper, the quarter vehicle suspension system has been controlled with a fuzzy backstepping controller (FBC). The controller performance has been compared with a passive suspension system (PSS) and a classical controller, a PID controller. The nonlinear structure of the backstepping control is acceptable for the nonlinear suspension system. The actuator force is determined with the FBC. The performance parameters of the controller are chosen as the acceleration of the sprung mass for ride comfort, tire deflection for road holding, suspension deflection for ride comfort, road holding, and the structural characteristics of the suspension system.

The organization of the paper is as follows: The second section, Materials and Methods, contains the mathematical model of the quarter vehicle suspension system as a subsection. The other subsection is for the backstepping controller with fuzzy logic adaptation. The third section is for comparison of the controller simulations. The last section covers the results and the discussions of the work.

MATERIALS AND METHODS

Quarter Vehicle Suspension System

A quarter vehicle active suspension system, as seen in Figure 1, was used to reveal the superiority of FBC. The sprung mass (m_s) for representing the quarter of the vehicle body, unsprung mass (m_u) for representing one tire, k_s for suspension spring, b_s for suspension damping, f for actuator force, b_u for tire damping, and k_u for tire spring are the basic components of a quarter vehicle active suspension system. Table 1 shows the parameters for the steady-state model of the system.

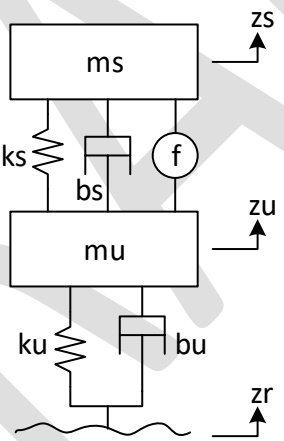

Figure 1. Quarter vehicle active suspension system model

The motion equations are derived from Newton's laws of motion, and they can be written as follows:

$$m_s\ddot{z}_s = k_s(z_u - z_s) + b_s(\dot{z}_u - \dot{z}_s) + f \quad (1)$$

$$m_u\ddot{z}_u = k_u(z_r - z_u) + b_u(\dot{z}_r - \dot{z}_u) - k_s(z_u - z_s) - b_s(\dot{z}_u - \dot{z}_s) - f \quad (2)$$

Table 1. Parameters and values of the quarter car suspension system

System	Parameter	Definition
Inputs	$(u_1 = f)$	Force actuator
	$(u_2 = z_r)$.	Road input
Outputs	$(y_1 = x_1)$	Position of the sprung mass
	$(y_2 = x_3)$	Position of the unsprung mass
State Variables	$(x_1 = z_s)$	Position of the sprung mass
	$(x_2 = \dot{z}_s = \dot{x}_1)$	Velocity of the sprung mass
	$(x_3 = z_u)$	Position of the unsprung mass
	$\left(x_4 = \dot{x}_3 - \frac{b_u}{m_u} u_2\right)$	

The steady state model and the coefficient matrices are given in (3) and (4).

$$\dot{x} = Ax + Bu \quad y = Cx + Du \tag{3}$$

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ -\frac{k_s}{m_s} & -\frac{b_s}{m_s} & \frac{k_s}{m_s} & \frac{b_s}{m_s} \\ 0 & 0 & 0 & 1 \\ \frac{k_s}{m_u} & \frac{b_s}{m_u} & -\frac{k_u+k_s}{m_u} & -\frac{b_u+b_s}{m_u} \end{bmatrix}, \quad B = \begin{bmatrix} 0 & 0 \\ \frac{1}{m_s} & \frac{b_s b_u}{m_s m_u} \\ 0 & \frac{b_u}{m_u} \\ -\frac{1}{m_u} & \frac{k_u}{m_u} - \frac{b_s b_u + b_u^2}{m_u^2} \end{bmatrix},$$

$$C = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix}, \quad D = 0 \tag{4}$$

Backstepping Control

The backstepping approach is a systematic control structure for nonlinear systems (Kumar, Rana et al. 2021, Şahin and Yatak 2024). It derives stable control laws with a step-by-step approach without the knowledge of all model states. This method is especially effective for the strict-feedback formed nonlinear systems. This controller scheme is based on an iterative design in which the system states are accepted as virtual control inputs. In each step, a Lyapunov function candidate is selected, and a virtual control law is derived for the current sub-dynamics of the system. This virtual control law is treated as a real state variable for the following step.

The control aim in this study is to find such a control law $u_1 = f$ for the suspension system using the backstepping method that the suspension deflection of the quarter vehicle system follows the zero-reference trajectory. The suspension deflection is given as follows:

$$z_{sref} = z_s - z_u = 0 \tag{5}$$

Suspension deflection is a vital performance parameter that is related to nearly all aspects of the performance of the suspension system, as ride comfort, road holding, and handling. If it is not kept in control, an increase in suspension system wear and fatigue occurs (Ergin and Yatak 2023). So, this parameter is chosen as the reference parameter for FBC.

The control aim is to provide the suspension deflection to be zero. The system state variables in accordance with the backstepping approach are determined as follows:

The reference input, suspension deflection $z_{sref} = 0$:

$$x_1 = z_s - z_u \tag{6}$$

The design for the first sub-system (x_1):

The error variable: $e_1 = x_1 - z_{sref} = x_1$ (7)

The Lyapunov function candidate: $V_1 = \frac{1}{2}e_1^2$ (8)

Time derivative: $\dot{V}_1 = e_1.\dot{e_1} = e_1.x_2$ (9)

x_2 is virtual control input.

If $x_2 = -c_1 e_1$, $(c_1 > 0)$, $\dot{V}_1 = -c_1\, e_1^2 < 0$ and $e_1 \to 0$ can be obtained. This control law is determined as $\alpha_1 = -c_1 e_1$.

The design for the second sub-system (x_2):

The second error variable is described as the difference between x_2 and the virtual control α_1:

$e_2 = x_2 - \alpha_1 = x_2 + c_1 e_1$ (10)

The expanded Lyapunov function candidate:

$V_2 = V_1 + \frac{1}{2}e_2^2 = \frac{1}{2}e_1^2 + \frac{1}{2}e_2^2$ (11)

Time derivative: $\dot{V}_2 = \dot{V}_1 + e_2\dot{e}_2 = e_1(e_2 - c_1 e_1) + e_2\left(\dot{x}_2 + c_1(e_2 - c_1 e_1)\right)$

$\dot{V}_2 = -c_1 e_1^2 + e_1 e_2 + e_2(\dot{x}_2 + c_1 e_2 - c_1^2\, e_1)$ (12)

A control law u is chosen that makes e_2 term to zero and provides error damping to make the Lyapunov derivative negative semi-definite:

$e_1 - c_1^2 e_1 + \dot{x}_2 + c_1 e_2 = -c_2 e_2$ (13)

Here c_2 is a positive design gain.

Fuzzy Backstepping Control

The backstepping approach is a strong controller for nonlinear systems. In spite of this, it is insufficient for competing with the steady-state error. The reason for this, it generally provides asymptotic stability. When the state is reached, that place is not the exact point; it is balanced at the nearest point to the target point. To overcome this disadvantage, a robust control strategy can be provided by utilizing fuzzy logic (Şahin and Yatak 2024).

In this study, c_2, a positive design gain is determined with fuzzy logic. It is the most effective gain to make the error zero. The first input is $e_1 = x_1 - z_{sref} = x_1$ and the membership functions for this input is seen in Figure 2a. The second input is a derivative of e_1, and the membership functions are as in Figure 2b. The output is c_2 gain. The singleton membership functions for this output is seen in Figure 2c.

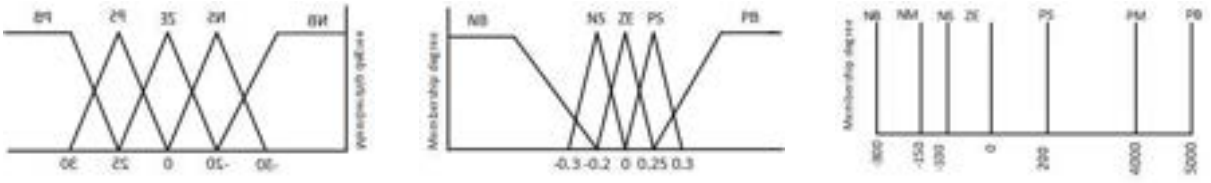

Figure 2. Membership functions for the FBC **a.** Input e_1 **b.** Input $\dot{e_1}$ **c.** Output

RESULTS and DISCUSSION

Vehicle suspension systems are evaluated over various performance parameters. These parameters are improved by various controllers. In this study, a nonlinear and iterative controller, the fuzzy backstepping controller, was analyzed to put forward its superiority over the classical PID controller and passive suspension system.

The system was tested for two different road types. The results were evaluated from three critical parameters. The first parameter is suspension deflection as shown in Eq. 14. This is the relative vertical displacement between the sprung and unsprung masses and is related to ride comfort and road handling.

$$s_d = z_s - z_u \tag{14}$$

The second parameter is tire deflection as shown in Eq. 15. Tire deflection is the displacement between the unsprung mass and the road input. It indicates whether the tire contacts the road surface and determines the road holding feature.

$$t_d = z_u - z_r \tag{15}$$

The last parameter is the acceleration of the unsprung mass. It is an important ride comfort parameter that shows how much road disturbances are transmitted to the vehicle.

The first road input is shown in Figure 3. The suspension deflections for the three types of controllers are shown in Figure 4 for this road input.

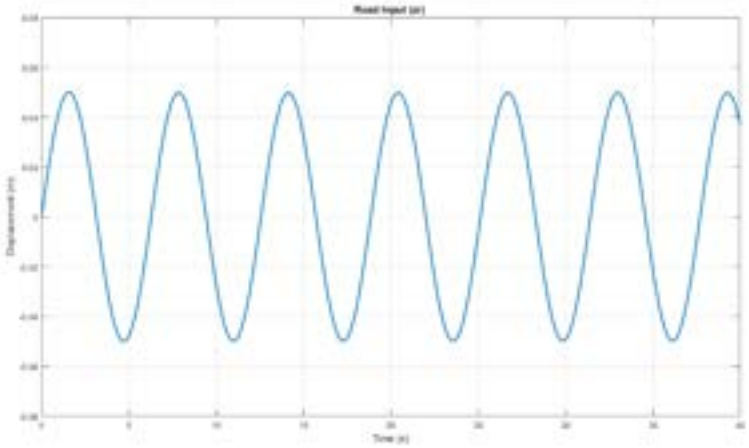

Figure 3. The first road input profile

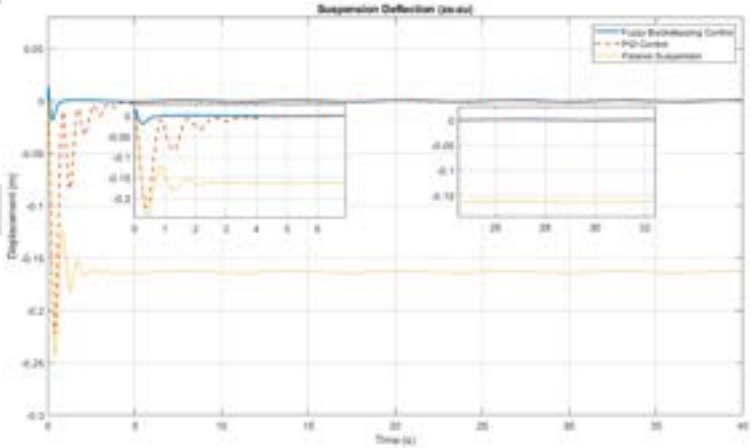

Figure 4. Suspension deflections for three types of suspension systems

Figure 5 is the tire deflection for three types of suspension systems, showing the road holding and handling. The acceleration of sprung mass is related to ride comfort, and it can be seen from Figure 6 for the sinus road input type.

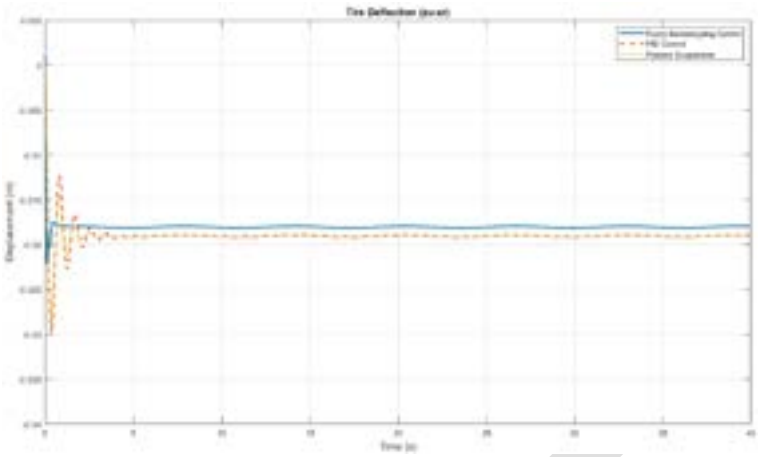

Figure 5. Tire deflection three types of suspension systems

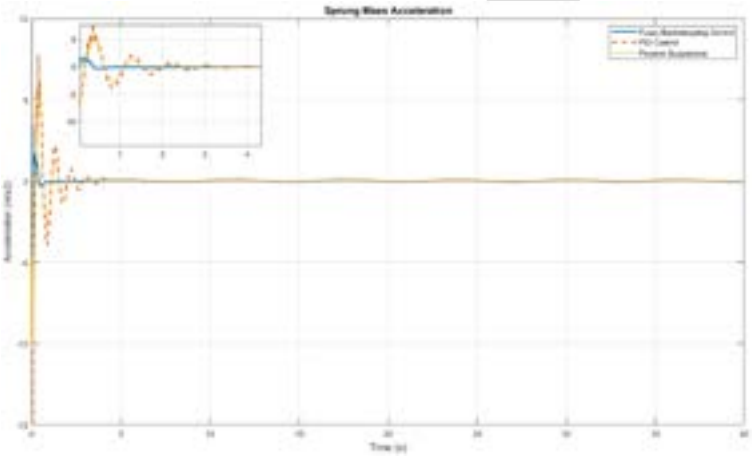

Figure 6. Sprung mass accelerations

The displacements of sprung mass and unsprung mass are shown in Figures 7 and 8, respectively.

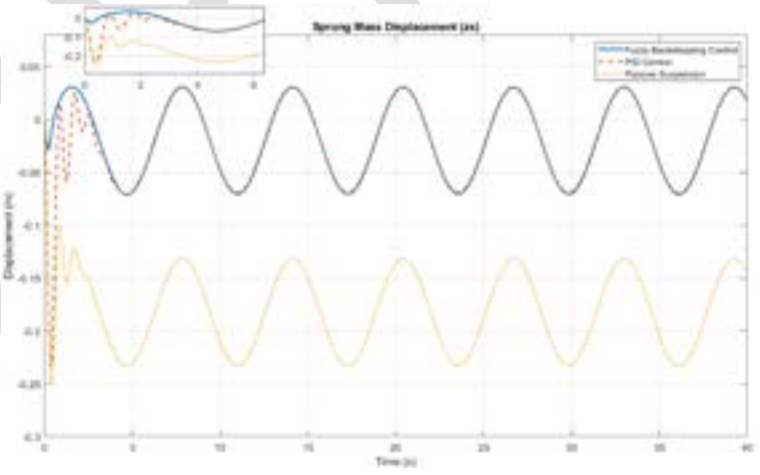

Figure 7. Sprung mass displacements

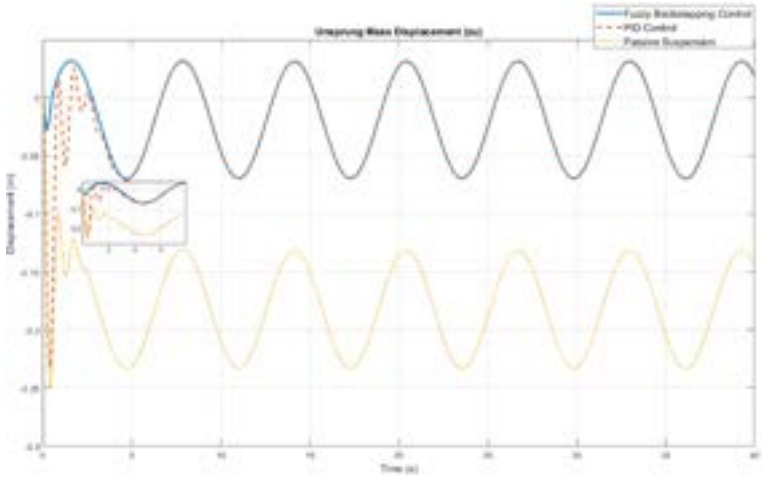

Figure 8. Unsprung mass displacements

The quarter car suspension system model was evaluated for a bump input as a different type of road disturbance, as seen in Figure 9.

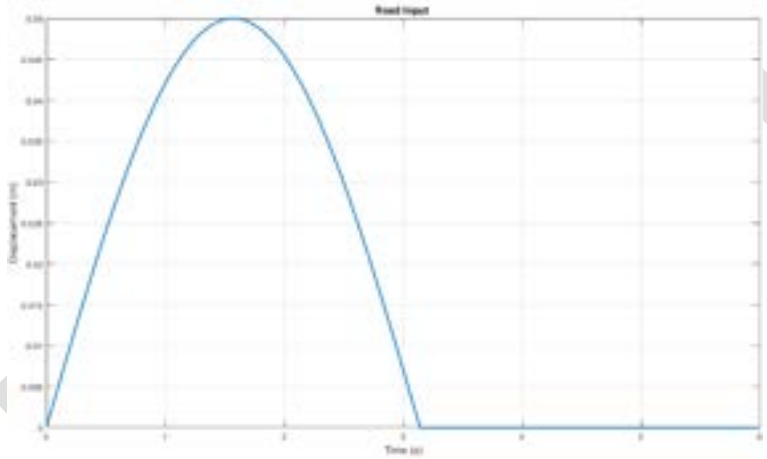

Figure 9. Bump road input

The suspension deflections and tire deflections for bump input are shown in Figures 10 and 11, respectively.

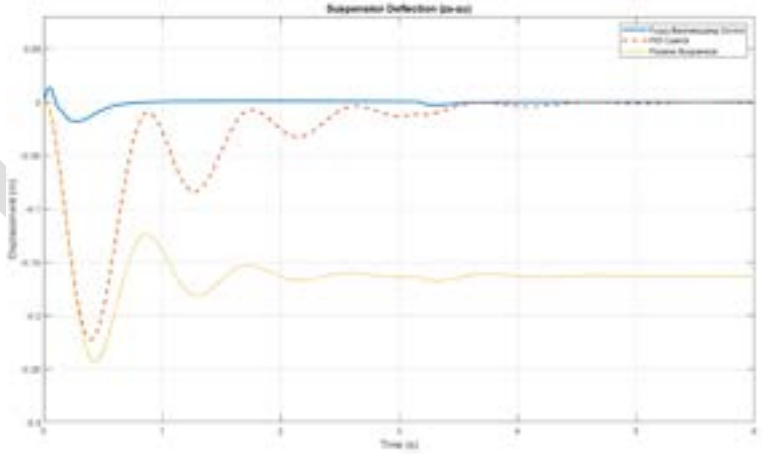

Figure 10. Suspension deflections

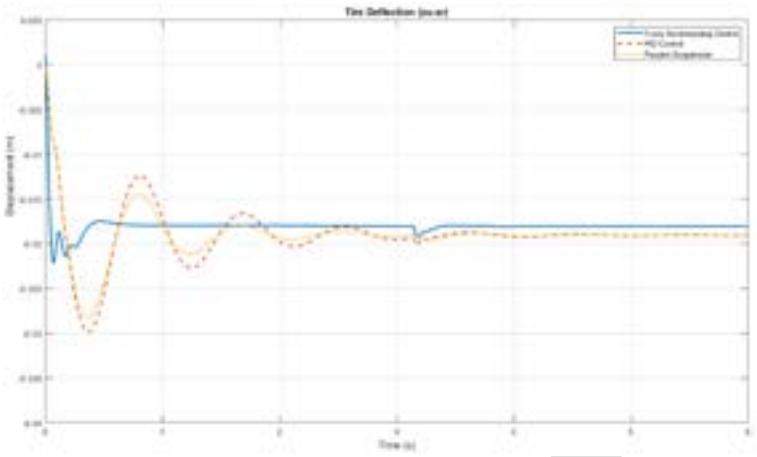

Figure 11. Tire deflections

The acceleration of sprung mass is shown in Figure 12.

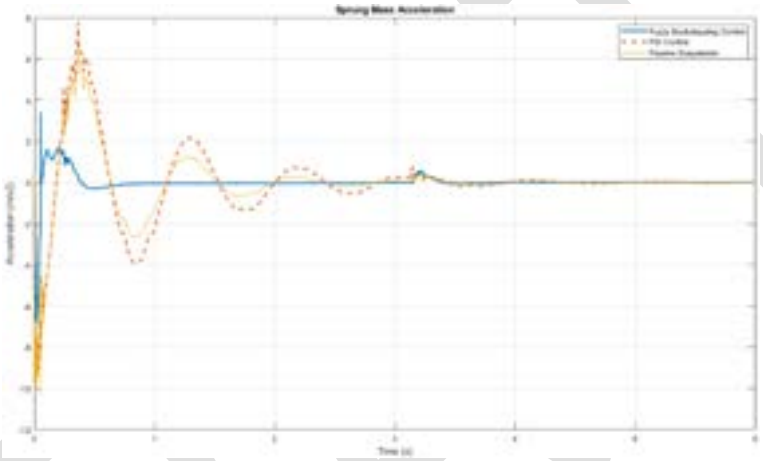

Figure 12. Sprung mass accelerations

The displacements of sprung mass and unsprung mass are shown in Figures 13 and 14, respectively.

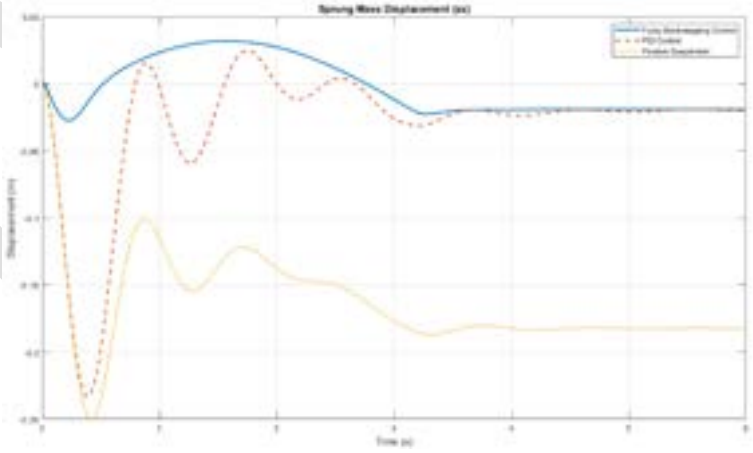

Figure 13. Sprung mass displacement

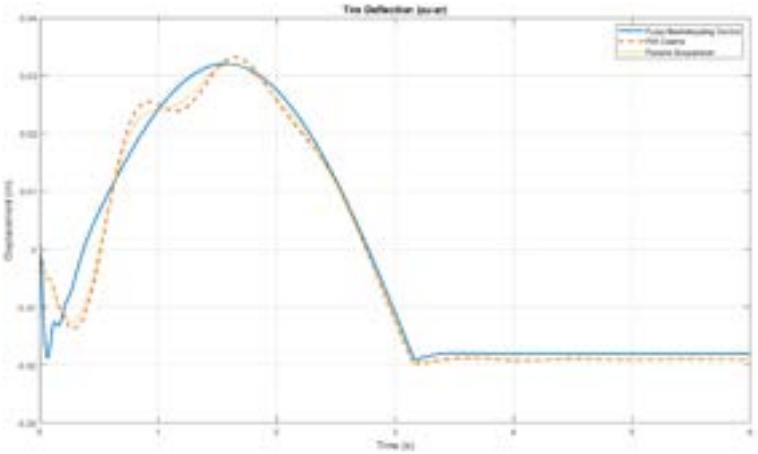

Figure 14. Unsprung mass displacement

The performance results of the passive suspension system and the active suspension systems with PID and FBC on the RMS values are seen Table 2. While ↑ shows the improvement of the value according to the passive system, ↓ indicates the decrease in the value. It can be seen from the table that FBC has superiority in all the parameters over the passive suspension system. These analytical results are consistent with the figures of the parameters. Especially the control variable, suspension deflection, has been made better with the controller, nearly 100%. Additionally, ride comfort is improved with FBC according to the acceleration improvement of nearly 100%.

Table 2. RMS values of the performance parameters for passive and active suspension systems

Parameter	Passive	PID	FBC
Suspension Deflection	0.1635	0.0008298 (↑99.49%)	0.0009724 (↑99.41%)
Tire Deflection	0.01907	0.0191 (↓1.6%)	0.01906 (↑0.5%)
Sprung Mass Acceleration	0.007385	0.02337 (↓2.2%)	0.0001465 (↑98%)

CONCLUSION

This paper presents a nonlinear controller for a nonlinear system. Backstepping controller uses Lyapunov functions for determining the control law for asymptotic stability. As a result of this natural structure, there is a bit of steady-state error in the dynamic response. To overcome this, fuzzy logic was used in this study. Sprung mass acceleration, suspension deflection, and tire deflection are chosen as performance parameters. Nearly 100 % optimization was obtained on the ride comfort with the proposed controller. Although the calculation and programming cost and the complexity of the controller are factors, the improvement in ride holding and a bit of road holding make the FBC an appropriate controller for a suspension system.

Abstract

Plastics are an important group of materials, especially due to their high resistance to environmental impacts and low prices. The usage areas of recycled PET(polyethyleneterephthalate) bottles are developing rapidly. In this study, during the recycling of waste PET bottles for recycling, the mechanical properties of the material are lost at high rates due to shear stresses, temperature, thermal and oxidative degradation. This causes the material to become brittle, its gloss and stability to decrease, and its surface properties to deteriorate. It is seen in many studies that the problems caused by the use of commercial chemical additives are prevented by the use of nucleating additives. The additives used here are generally in the form of macromolecules. Alpha (α) type nucleating additives positively affect the crystallization behavior of PET. It is also expected to show a synergistic effect as a process optimizer.
In this study, a new generation of macromolecular Schiff bases were synthesized as alpha-type nucleators for the treatment of recycled PET wastes and characterized by analytical and spectroscopic techniques. As a result of FTIR analysis, υ(C=N) stretching was observed at 1500-1675cm^{-1}. This can be attributed to the imine group of the Schiff base formed. As a result of the new 1H-NMR, the proton connected to the azomethine group resonates in the δ=8-9 ppm range. The mechanical, thermal and morphological properties of the masterbatches obtained as a result of the process will be investigated for their suitability for use instead of the original raw material. At the same time, the characterization of the synthesized nucleating agents will be examined and the results in recycled PET will be investigated.

Introductıon

Recycling of plastic materials is of great importance for environmental sustainability today. Especially polyethylene terephthalate (PET) is a type of plastic with a high recycling potential as well as having a wide range of uses. One of the ways to reduce the amount of accumulated PET waste is to recycle and reuse it in industry (Kale et. al., 2007). The higher the quality of recycling, the higher the chance of reuse in bottle production and the higher the circularity, while the lower the quality, the lower the conversion to lower level products (Scheirs et. al., 2006). Although the reuse of PET bottles instead of being mixed with nature reveals the importance and diversity of PET bottle recycling, the main thing here should be the use of recycled raw materials in PET bottle production for at least 7-8 cycles by recycling from bottle to bottle (Guclu et. al., 2002). Microplastics can harm marine life in various ways. First of all, they can cause blockages in the digestive systems of sea creatures. They can also be ingested by fish. Microplastics can also absorb toxins, which can be passed on to animals that eat them (Rochman, 2020).
The use of recycled PET (rPET) brings with it the necessity to improve the mechanical and thermal properties of the material. At this point, nucleating agents play a critical role in improving material performance by accelerating the crystallization processes of polymers. Conventional nucleating agents usually have certain limitations and may have undesirable effects on recycling processes. Therefore, the development of next generation nucleating agents has become an important research area to improve the performance of recycled PET masterbatches. These new agents have the potential to both reduce environmental impacts and improve material properties. In this study, the synthesis and characterization of

next generation nucleating agents for use in recycling PET masterbatches will be discussed. The synthesis process will be optimized by combinations of different chemical components to increase the nucleation efficiency. Furthermore, the interactions of the obtained nucleating agents with rPET and their effects on material properties will be studied in detail. The results of this research aim to provide more efficient and sustainable solutions in recycling processes.

Crystallization of polymers has been studied for a long time. Crystallization of polyolefins occurs when cooled below the melting temperature. This state consists of two main parts. The first is crystallization and the second is the growth phase. Nucleation can be defined as the phenomenon where a new crystalline phase begins to form in places called cells. Nucleation processes are very important for the crystallization kinetics of polymers. In the macromolecular crystallization in the structure, nucleation is initiated first and then nucleation takes shape depending on the growth rate. In this process, whether the nucleation is in homogeneous or heterogeneous phase depends on this situation (Libster et al., 2007).

When homogeneous nucleation is achieved, the distribution of polymer chains in the melt blend is more uniform. This is due to the homogeneous distribution of nucleation and the constant velocity of the melt. Heterogeneous nucleation, on the other hand, is characterized by a variable rate and relatively low supercooling due to the presence of foreign bodies in the polymer melt, which increase the crystallization rate, act as heterogeneous nuclei and reduce the free energy required for the formation of a critical nucleus (Thierry et. al., 2006). Polypropylene (PP), the most widely used commercially, is a widely used thermoplastic material that combines unique mechanical properties and low cost. Depending on the crystallization conditions, the most widely used type is isotactic polypropylene (iPP). Some polypropylene nucleating agents found in the literature have used the α-phase or the less stable hexagonal β-phase or rarely the γ-phase (Thomann et. al., 1996, Marco et. al., 2002, Vy´chopnˇova´ et. al., 2006). The α-phase produces a thermodynamically highly stable crystal form and is therefore widely used in the crystallization of iPP. β-iPP exhibits lower melting temperature and density and is therefore used in limited areas. It exhibits higher toughness and drawability properties in this crystallization. Therefore, iPP containing β-phase is currently considered a suitable alternative to α-iPP for certain applications (Obadal et. al., 2005).

Polypropylene is used in many materials used in industry. There are many potential materials as polypropylene nucleating agents. Aromatic carboxylic acid salts such as sodium benzoate have been extensively studied. Inorganic additives such as talc and feldspar have also been used as suitable nucleators. Their intended use is determined by their cost and mechanism of action. An important disadvantage is the limited nucleation efficiency of these materials. To overcome this disadvantage, high concentrations of loading are required (Alamo et. al., 1999).

There are fewer studies on the modification of rPET by the addition of a nucleating agent, which should be adapted from PET modification studies. Modification methods of PET include copolymerization, blending and various synergistic effects. Among them, blending modification has been widely used in the field of PET modification due to its advantages of simple operation and high cost effectiveness (Babaei et. al., 2024). In a study, the role of crystalline, mobile amorphous and rigid amorphous fractions on the performance of recycled polyethylene terephthalate (PET) polymer was investigated. The crystalline regions of PET polymers are the regions where molecular chains are ordered in a regular manner. These regions can affect the mechanical strength and stiffness of the polymer. The mobile amorphous regions of PET polymers are regions where the molecular chains are arranged in a more random way, but can still move. These regions can affect the flexibility and ductility of the polymer. The rigid amorphous regions of PET polymers are regions where the molecular chains are arranged in a more disordered and fixed manner. These regions can affect the thermal behavior and chemical resistance of the polymer (Badia et. al., 2012).

MATERIALS AND METHODS

In this study, firstly, pre-treatments were applied to plastic wastes coming to Kahramanmaraş Paper Mill for the recovery of waste polyethyleneterephthalates. PET samples separated from plastic wastes were subjected to washing, drying and pulper shredding stages. The shredded PET wastes were granulated in the extruder for blending. This stage was carried out in the plastic recovery facility established within the facility. Percent dry matter content (K_m) of the obtained wastes was calculated by subtracting the first weighing from the last weighing. Combustion values were measured with a calorimeter.

PET nucleating agent synthesis was carried out by condensation reaction. The nucleation agent synthesis is denoted by the code (N_1). The nucleating agent synthesized here promotes the nucleation of the resin by crystallization and regulates the melt flow. Another important effect is to bring the crystallization cells homogeneously to the same size. As a result, it improves the hardness, heat distortion temperature, dimensional stability, transparency and gloss of the products. The reaction conditions were as follows. The

aldehyde compound was dissolved in 200 ml of methanol in a flask and stirred under a magnetic stirrer heater. The resulting solution was reafluxed at 80°C for about 48 hours under a recooler system. The reaction result was checked with TLC paper and completed. The resulting solvent was removed from the evaporator. It was separated and left to dry at room temperature. The dried sample was subjected to purification by crystallization from ethyl alcohol. The reaction scheme is given in Figure 1.

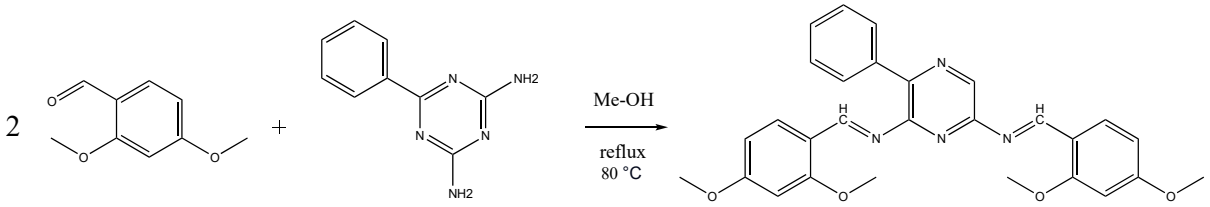

Figure 1. Synthesis mechanism of 1E,1'E)-N,N'-(3-phenylpyrazine-2,6-diyl)bis(1-(2,4-dimethoxyphenyl)methanimine (N_1)

N_1: 1E,1'E)-N,N'-(3-phenylpyrazine-2,6-diyl)bis(1-(2,4-dimethoxyphenyl)methanimine, Color: white, Melting Point: 185°C, Chemical Form: $C_{28}H_{26}N_4O_4$, Bulk Mass: 482.20, Molecular Weight: 482.54, m/z: 482.20 (100.0%), 483.20 (30.7%), 484.20 (5.7%), 483.19 (1.5%), Elemental Analysis: C, 69.70; H, 5.43; N, 11.61; O, 13.26, FTIR (υ, cm^{-1}, N_1): υ(O-C) stretching at 1085-1310 cm^{-1}, aliphatic in-plane υ(C-H) stretching at 2700-3000 cm^{-1}, aromatic in-plane υ(C-H) stretching at 3000-3300 cm^{-1}, 1500-1675 υ(C=N) stretching.

RESULTS AND DISCUSSION

In this study, a new generation of Schiff bases was synthesized for the nucleation of PET waste for the first time. Refluxing of 2,4-dimethoxybenzaldehyde and 2,6-diamino-4-phenyl-1,3,5-triazine compounds in methylated spirits yielded the pure compound 1E,1'E)-N,N'-(3-phenylpyrazine-2,6-diyl)bis(1-(2,4-dimethoxyphenyl)methanimine. For single crystal studies, it was recrystallized in ethyl alcohol medium and the obtained single crystal was sent to x-ray analysis for characterization.

For this purpose, first of all, FTIR spectra of the Schiff base compound (N_1) were carried out in the Schimadzu IRXross brand FTIR device in the laboratory of Kahramanmaraş Sütçü İmam University, ÜSKİM. The spectrum obtained is presented in Figure 2.

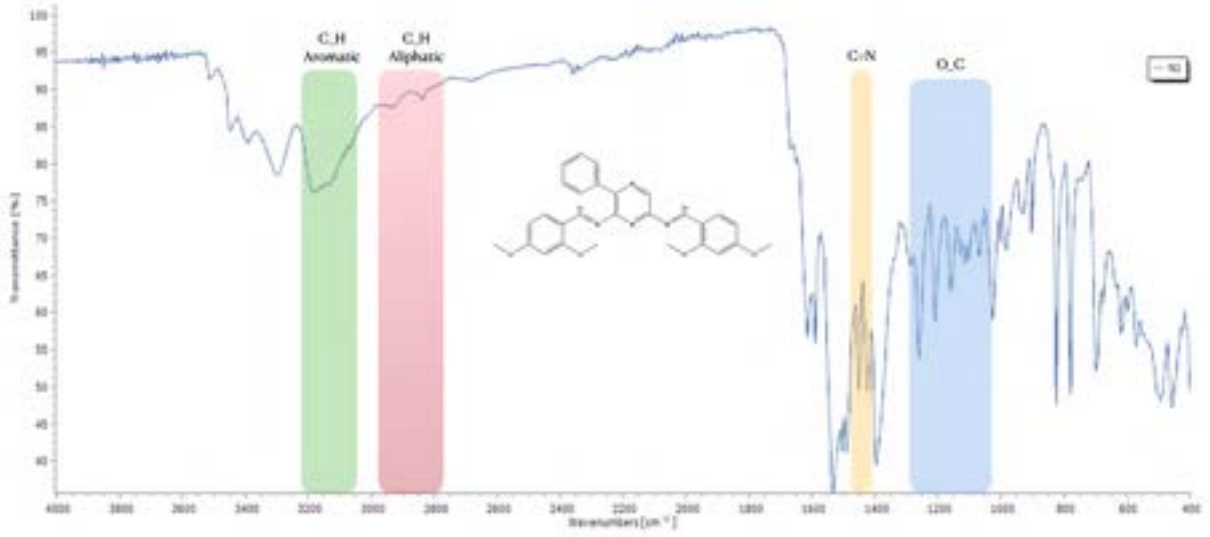

Figure 2. FTIR Spectrum of compound N_1

Looking at the FTIR spectrum, the bands observed at 3600 cm^{-1} are υ(O-H) due to the crystalline water present in the structure. The aromatic in-plane υ(C-H) stretches at 3000-3300 cm^{-1} are attributed to the aramotic rings present in the Schiff base structure. The aliphatic in-plane υ(C-H) stretching observed at 2700-3000 cm^{-1} refers to methoxy groups. The most important situation is that the band belonging to the

carbonyl group observed at 1480 cm^{-1} is converted to 1500-1675 υ(C=N) imine group. This shows that the reaction took place (Ceyhan et. al., 2012).

^{1}H-NMR spectra were taken in TMS solvent. The samples were analyzed in the Agilent 400 Mhz NMR device in the spectroscopy laboratory of Harran University, HUBTAM. According to the results obtained (Figure 3); peaks belonging to methoxy groups were observed as singlets in the range of 3.7-3.9 ppm. Singlets in the 8.0-8.5 ppm range belong to imine protons (-CH=N-). The imine protons in the Schiff base structure were determined as characteristic singlet signals in the range of 8.3-8.5 ppm due to their resonance with the conjugated system. Due to the symmetric structure of the molecule, these signals appear as a single signal, not as a pair. The protons of the 1,3,5-triazine ring are sharper due to the electronegativity of the nitrogen atoms and show signals in the range of 8.5-9.0 ppm. At 6.50-8.20 ppm, aromatic protons are observed. Protons at positions 3, 5 and 6 of the 2,4-dimethoxyphenyl rings form multiplets, especially in the range 6.50-7.00 ppm. The aromatic protons in the pyrazine ring are sharper due to the electronegative effect of nitrogen atoms and are observed in the range of 8.00-8.20 ppm. The protons belonging to the phenyl group typically appeared as multiplets in the range of 7.20-7.50 ppm.

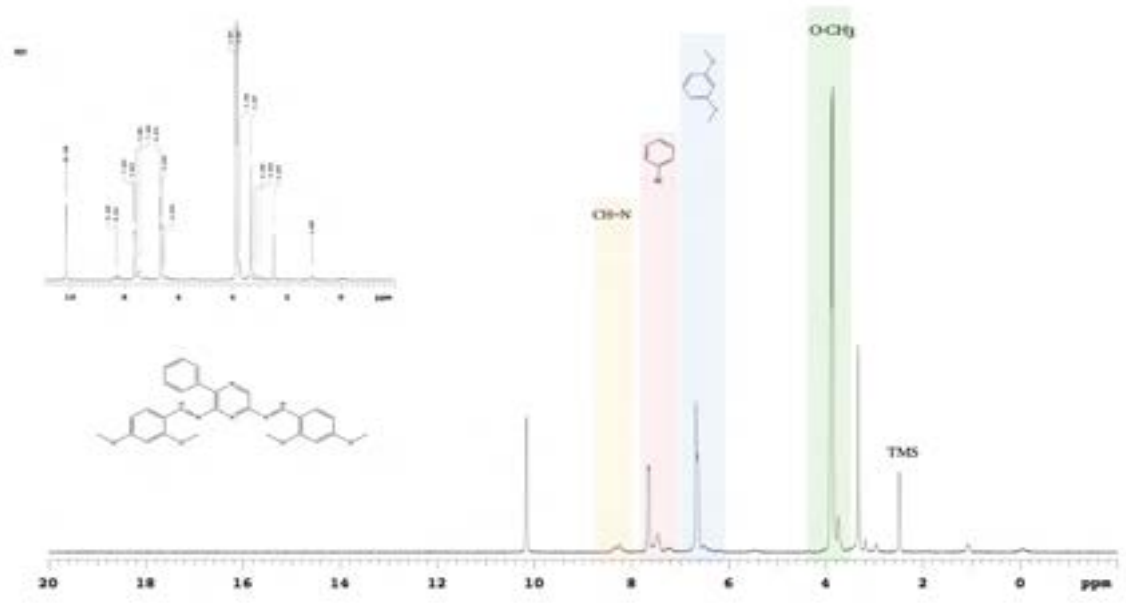

Figure 3. ^{1}H-NMR of compound N_1

^{13}C-NMR spectra were also taken in TMS solution. Looking at the spectrum (Figure 4); methoxy carbons are around 55-60 ppm; imine carbons are 160-165 ppm; aromatic carbons are between 110-150 ppm. The carbons belonging to the pyrazine ring are blocked by the effect of nitrogen. These NMR data are consistent with the expected chemical structure of the compound and support both the Schiff base formation and the symmetry of the aromatic structures (Ceyhan et. al., 2012).

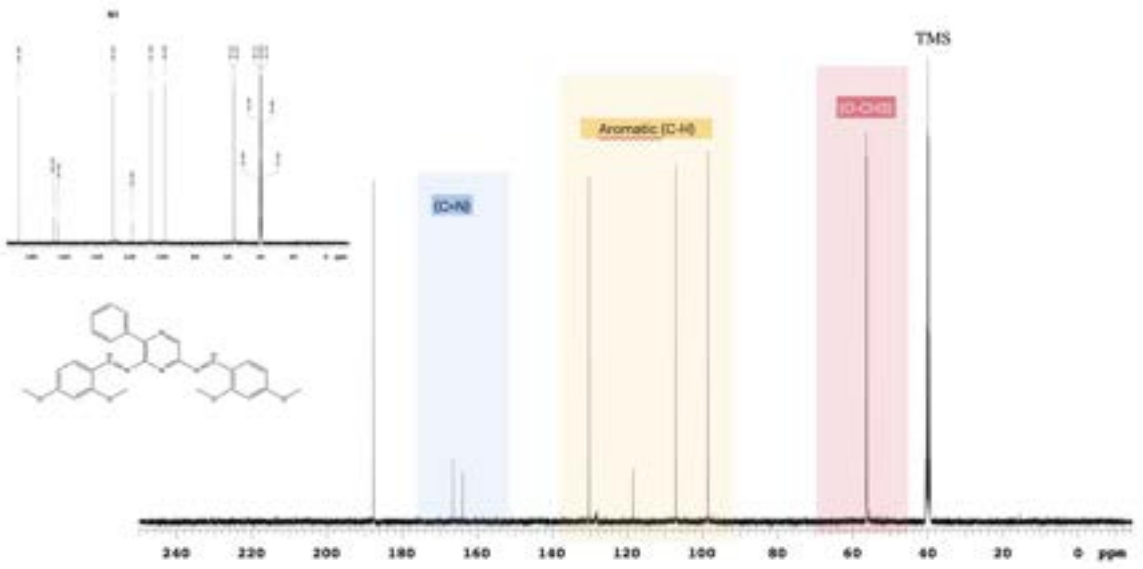

Figure 4. ^{13}C NMR Spectrum of compound N_1

CONCLUSION

In this study, a new generation Schiff base compound (N_1) synthesized to be integrated into the PET recycling process was successfully obtained and its efficiency as a nucleating agent was supported by characterization data. In FTIR analysis, characteristic peaks belonging to the imine (C=N) group were clearly observed, indicating that the target compound was successfully synthesized. Furthermore, ^{1}H-NMR and ^{13}C-NMR spectra confirmed the structural integrity and molecular symmetry of the Schiff base.

This synthesized macromolecular nucleating agent, when integrated into the PET matrix, promotes crystallization processes, resulting in more uniform and homogeneous nucleation. This led to significant improvements in product properties such as hardness, heat distortion temperature, dimensional stability, transparency and gloss. Furthermore, due to the more controlled development of crystal morphology, the performance of recycled PET has approached and in some aspects even surpassed that of the original raw materials.

The results obtained show that macromolecular Schiff bases can be used as nucleating agents in recycled PET masterbatches and contribute to sustainable materials engineering. The use of such additives is promising for more sustainable polymer production in both economic and environmental terms. In future studies, it is recommended to synthesize and comparatively analyze different Schiff base derivatives and test similar applications in other thermoplastics other than PET.

ACKNOWLEDGEMENTS

This research was supported by the Scientific and Technological Research Council of Turkey (TÜBİTAK Grant no: 118C060) and Kahramanmaraş Sütçü İmam University Scientific Research Projects Commission (KSU/BAP Project No. 2024/3-17 D6) within the scope of TÜBİTAK 2244- Kahramanmaraş Sütçü İmam University and Kahramanmaraş Kâğıt Sanayi Ticaret ve Anonim Sirketi Cooperation Industrial Doctorate Project. We would like to thank Kahramanmaraş Paper Mill R&D Center and ÜSKİM laboratories for the use of the laboratory and KOREN Chemical Company for supporting this study.

Özet

Mancozeb (MNC), sucul organizmalar üzerinde önemli etkilere sahip olan ve çok miktarda, çeşitlilikte kullanılan fungusitlerden biridir. MNC'nin toksikolojik etkilerini araştırmak için dünya genelinde iyi bir model organizma olarak Nil tilapyasını (*Oreochromis niloticus*) kullanarak MNC'nin su canlıları üzerindeki olumsuz etkilerini göstermek büyük öneme sahiptir. Deney canlısı *Oreochromis niloticus*'un kontrol grubuyla birlikte MNC maruziyet konsantrasyonlarında 0.1 ppm ve 0.5 ppm etkisinde 48 saat boyunca toksisite etkileri belirlenmiştir. Çalışmada *Oreochromis niloticus*'un solungaç dokusunda oksidatif hasara karşı ilk enzimatik koruma elemanları olan süperoksit dismutaz (SOD) enzim aktivitelerinde olan değişimler araştırılmıştır. Mancozeb maruziyeti sonucu 48 saat etkide *Oreochromis niloticus*'un solungaç dokusunda 0.1 ppm ve 0.5 ppm konsantrasyonlarda kontrol grubuna göre SOD enzim aktivitesinde sırasıyla %24 ve %56 azalma belirlenmiştir. Bu çalışmanın sonuçları, Nil tilapyasını MNC toksisitesinin kısa süreli maruziyette sucul organizmalar üzerindeki etkilerinin biyomarkırlar ile belirlenmesini de amaçlamıştır.

Anahtar Kelimeler: Mancozeb, Solungaç, Süperoksit dismutaz

Effect of Mancozeb Toxicity on SOD Enzyme Activity in Gills of Nile Tilapia *Oreochromis niloticus*

Abstract

Mancozeb (MNC) is one of the fungicides that have significant effects on aquatic organisms and are used in large quantities and in a variety of ways. It is of great importance to show the adverse effects of MNC on aquatic organisms by using Nile tilapia (*Oreochromis niloticus*) as a good model organism worldwide to investigate the toxicological effects of MNC. The toxicity effects of the experimental organism Oreochromis niloticus were determined with the control group at MNC exposure concentrations of 0.1 ppm and 0.5 ppm for 48 hours. In the study, changes in the superoxide dismutase (SOD) enzyme activities, which are the first enzymatic protection elements against oxidative damage in the gill tissue of Oreochromis niloticus, were investigated. As a result of exposure to Mancozeb, a decrease of 24% and 56% in SOD enzyme activity was determined in the gill tissue of Oreochromis niloticus at 0.1 ppm and 0.5 ppm concentrations, respectively, compared to the control group within 48 hours. The results of this study also aimed to determine the effects of MNC toxicity on aquatic organisms with biomarkers in short-term exposure of Nile tilapia.

Key Words: Mancozeb, Gill, Superoxide dismutase

GİRİŞ

Pestisitler, tarımda mahsullerinin zararlı etkisinden korunması için geniş çeşitlilik ve miktarda kullanılır. Bu kullanımın tarım ürünleri üzerinde insanlara bunun yanında sulama ve yağış nedeniyle de doğaya salınarak ekoloji üzerinde geri dönüşü olmayan ekosistemin bozulmasına sebep olur (Soare ve ark., 2014). Günümüzde bir çok kirleticinin yüzey sularıyla sucul ortama ulaşması da su kaynaklarının ve sucul ekosistemin üzerinde olumsuz etkileri önemli endişe kaynağı oluşturmaktadır.

Fungisitler, su ortamında önemli kirliliğe sebep olan ve mantar hastalıkları için yaygın olarak kullanımı olan pestisid türlerinden biridir (Temiz, 2019). Fungisit mancozeb tarım ve diğer sektörlerde geniş uygulamalara sahip olan bis-ditiyokarbamat alt grubuna ait carbamate grubu fungusittir (Srivastava ve Ajay Singh, 2014). Birçok çalışmada MNC'nin sucul organizmaların üzerinde olan toksikolojik etkisinin

DRAFT

kan parametreleri ve antioksidan toksisitesi dahil olmak üzere rapaorladılar (Lutnicka ve ark., 2016; Kanu ve ark., 2023; Chijioke ve ark., 2024).

Sucul organizmalar içerisinde balıklar, yüksek kirletici duyarlılığı, metabolize etme yetenekleri ve biyolojik birikiminin belirlenmesi nedeniyle su ortamlarında oluşan pestisit toksisitesini değerlendirilmesi için iyi bir biyoindikatör modeldir (Fazio ve ark., 2013). Nil tilapisi, *Oreochromis niloticus*, su ürünleri olarak dünya üzerinde tüketilen, dayanıklı bir tür olması nedeniyle araştırmalar için önemli bir balık türüdür.

Pestisitlerin kirliliğinin hedef dışı organizmalar üzerindeki etkileri, organizmalardaki fizyolojik, biyokimyasal veya moleküler düzeylerdeki değişiklikleri tespit ederek incelenebilir ve çevre kalitesinin izlenmesinde erken uyarı araçları sağlar (Khan ve ark., 2025). Erken uyarı biyobelirteçleri, çevresel kirleticilerin ve biyolojik canlılar arasındaki etkileşimin gösterilmesini sağlar. Bu biyobelirteçlerin inhibisyonu ya da indüklenmesi, kirleticilerin çevresel organizmalar üzerindeki potansiyel toksik etkilerini göstermek açısından önem arz eder (Sharma ve ark., 2016).

Bu çalışmada Mancozeb maruziyeti 48 saat etkisinde *O. niloticus*'un solungaç dokusunda SOD enzim aktivitesinde olan değişimler araştırılmıştır.

MATERYAL VE METOD

Mancozeb, ticari olarak satılan Syngenta Abic (Mancozeb 75 % WP) isimli ürünü alınmıştır. Daha önceki çalışmada belirlenen *O. niloticus* canlısı Mancozeb 96 saat LC_{50} değerine (11,5 ppm) göre çalışmamızda kullanılan konsantrasyonlar belirlendi (Rahman ve ark., 3023).

Oreochromis niloticus deney canlısında 3 grup ile yapılan deneyde kontrol grubu ile beraber 0.1 ppm ve 0.5 ppm konsantrasyonlarında deney süreci 48 saat boyunca devam edilmiştir.

Deneylerde kullanılan *O. niloticus* türünün ortalama boyu 10,98±0,54 cm, ağırlığı ise 22,43±1,07 gr olarak ölçülmüştür. 40x40x40 cm boyutta cam akvaryumlara dinlendirilmiş musluk suyu ile 40 L doldurulmuştur. Akvaryumlarda merkezi sistem ile havalandırma yapılmıştır. Laboratuvar ortamında 12/12 saat fotoperiyodik periyodu uygulanmıştır.

Cam akvaryumlarda yapılan deneylerde su kalitesi ölçülerek planlanmış bir canlı hayvan deneyi gerçekleştirilmiştir. Toksisisite çalışmalarında toksik kimyasal miktarında toksik deney kimyasal miktarını su içerisinde sabit tutmak amacıyla 24 saat aralıklarla su değişimi ve toksik madde eklemesi yapılmıştır. Deney sonu 48 saat etkiden sonra dekapitasyon yöntemiyle öldürülen balıklardan solungaç dokuları disekte edilerek çıkarılmıştır. Solungaç dokusu fizyolojik tuz çözeltisi (%0.59 NaCl) ile yıkandıktan sonra biyokimyasal analizler yapılana kadar -80 ^{o}C'ye kaldırılmıştır. Solungaç dokusu %1,17 KCl içeren pH 7.4, 0,1M sodyum-fosfat tamponunda, 1/10 oranında seyreltilerek 3 dk homojenize edilmiştir.

Homojenatların +4 ^{o}C'de 16000 rpm'de 20 dakika santrifüjden sonra elde edilen süpernatantlar süperoksit dismutaz (McCord & Fridovich, 1969) enzim aktivitelerinde olan değişimler belirlenmiştir.Ayrıca Bradford (1976) yöntemiyle protein miktarı belirlenerek istatiksel olarak hesaplamalar yapılarak deneysel süreçte olan enzimatik değişimler karşılaştırılmıştır. İstatiksel analizler SPSS 16 programında One-way Anova Duncan testi kullanılmıştır.

BULGULAR ve TARTIŞMA

Tarım alanında, mahsullerin verimini arttırmak için pestisitler çeşitli planlamalar ile kullanılır (Mansour ve ark., 2023). Ekolojik ve insan üzerindeki tehlikeli etkileri nedeniyle, artan pestisit kirliliği ciddi bir sağlık riskini oluşturmaktadır (Hamed vd., 2021). Mancozeb bir Fungisit grubu pestisittir, mantarların kötücül etkilerinin ve mantar hastalıklarının önlemek amacıyla geniş bir çeşitlilikte mahsuller üzerinde uygulanan pestisitlerdir (Brody ve ark., 2013). Canlıda hücresel düzeyde metabolik faaliyetler sonucu sürekli üretilen serbest radikaller çeşitleri hücrede savunma sistemi olarak bulunan antioksidan savunma sistemleri tarafından yok edilmektedir (Li ve ark., 2010). Canlıda antioksidan savunma sistemleri enzimler aracılığıyla ya da enzim olmadan olan sistemler bulunmaktadır. Süperoksit dismutaz (SOD), katalaz (CAT) gibi enzim yapıları hücrede serbest radikallere karşı ilk savunma sistemini oluşturur (Rahman ve ark., 3023).

Çalışmamızda Mancozeb maruziyeti 48 saat etkisinde 0.1 ppm ve 0.5 ppm konsantrasyonlarında *Oreochromis niloticus* solungaç dokusunda SOD enzim aktivitesinde kontrol grubuna göre %24 ve %56 azalma olduğu belirlendi. Benzer bir araştırmada Rahman ve ark., (2023) çalışmasında 1.15 ppm MNC maruziyetinde *O. niloticus* karaciğer dokusunda SOD enzim aktivitesi control grubuna göre önemli azalma olduğu bildirildi. Oksidatif stresin tetiklenmesine sebep olan pestisitler bu çalışmada kullanılan mancozeb,

ROS'un aşırı üretimine sebep olduğunu göstermektedir. Aşırı ROS ise hücrenin antioksidan savunma sistemi dengesini bozarak oksidatif stres sonucu SOD enzim aktivitelerinde hızlı aktivite kaybına sebep olduğu düşünülmektedir. Araştırmamıza benzer sonuçları olan İbrahim ve ark., (2023) çalışmalarında *O. niloticus*'un karaciğer dokusunda mancozeb maruziyetinin 4, 8, 12, 16 ve 20 ppm düzeylerinde etkilerinde kontrol grubuna göre doza bağlı artış oldukça SOD enzim aktivitesinde önemli bir azalma olduğu raporlandı.

Sonuç olarak çalışmamızda 48 saat etkide mancozeb maruziyetinin *O. niloticus* solungaç dokusunda antioksidan system üzerinde önemli etki gösterdiği, SOD enzim aktivitesinin pestisit toksisitesine karşı önemli hassasiyet göstererek toksikoloji araştırmalarında biyomarkır olarak değerlendirilmesinin önemi çalışmalarda önemli katkı sağlayacağını göstermiştir.

Özet

Neonikotinoid İmidacloprid'in (IMI) toksisite çalışmasında *Oreochromis niloticus*'un kontrol grubuyla birlikte 0,5 ppm ve 1 ppm sublethal konsantrasyonları etkisinde 24 ve 48 saat boyunca toksisitesi araştırıldı. *Oreochromis niloticus*'un beyin dokusunda asetilkolinesteraz (AChE) enzim aktivitesinde olan değişimler araştırılmıştır. *Oreochromis niloticus*'un beyin dokusunda 24 ve 48 saat maruziyetinde imidacloprid etkisinde AChE enzim aktivitelerinde kontrol grubuna göre önemli bir azalma olduğu belirlendi. 24 saat etkide 0,5 ppm ve 1 ppm sublethal konsantrasyonlarda kontrol grubuna göre sırasıyla %11 ve %28 azalma belirlendi. 48 saat etkide 0,5 ppm ve 1 ppm sublethal konsantrasyonlarda kontrol grubuna göre sırasıyla %43 ve %61 azalma belirlendi. İmidacloprid toksisitesi sonucunda *Oreochromis niloticus*'un beyin dokusunda olan nörotoksik etkileri kısa sürede gösterebildiği ve önemli değişimlere neden olduğu belirlenmiştir.
Anahtar Kelimeler: İmidacloprid, Beyin, Asetilkolinesteraz

Responses of Imidacloprid Toxicity to Acetylcholinesterase Activities in *Oreochromis niloticus* Brain Tissue

Abstract

In the toxicity study of the neonicotinoid Imidacloprid (IMI), toxicity was investigated for 24 and 48 hours under the effect of 0.5 ppm and 1 ppm sublethal concentrations of *Oreochromis niloticus* with the control group. Changes in acetylcholinesterase (AChE) enzyme activity in the brain tissue of *Oreochromis niloticus* were investigated. It was determined that there was a significant decrease in AChE enzyme activities under the effect of imidacloprid in the brain tissue of *Oreochromis niloticus* under the effect of 24 and 48 hours of exposure compared to the control group. In the 24-hour effect, 11% and 28% decreases were determined compared to the control group at 0.5 ppm and 1 ppm sublethal concentrations, respectively. In the 48-hour effect, 43% and 61% decreases were determined compared to the control group at 0.5 ppm and 1 ppm sublethal concentrations, respectively. As a result of imidacloprid toxicity, it was determined that *Oreochromis niloticus* can show neurotoxic effects on brain tissue in a short time and cause significant changes.
Keywords: Imidacloprid, Brain, Acetylcholinesterase

GİRİŞ

Neonikotinoidler sinir sistemi üzerinde etkisi olan tarımsal ürünlerin eldesinde verimi arttırmak için kullanılan bir pestisit sınıfıdır. Neonikotinoidlerin ilk çıkışı 1991 senesinde İmidaclporid ticari formülasyonu ilk olarak kullanıma çıkarılmıştır (Bass ve ark., 2015). Neonikotinoid sınıfı pestisitler de dahil olmak üzere tarımsal amaçlı kullanımı dünya çapında aynı zamanda çevre ve halk sağlığı üzerinde de zararlı etkilere sahiptir (Cimino ve ark., 2017).

Pestisitler çok çeşitli ve büyük miktarda kullanımı besin zincirinde ve su kütlelerinde birikerek ekolojik zincirde balık gibi su canlılarında birikebilir. Pestisitler kısa vadeli fayda sağladığı fakat uzun süre kullanımları zararlı maddelerin birikmesine yol açabilir ve sonuç olarak su ekosistemlerine ve insan sağlığına zarar verir (Chang ve ark., 2020). İmidaclporid, ilaçlama anında püskürtme sırasında yada sonrasında yüzeyden ve tarım çiftliklerinden gelen su drenajıyla akan su ortamına geçer (Miraglia ve ark., 2009; Jeschke ve ark., 2011; Amenyogbe ve ark., 2021).

Neonikotinoidler, zararlıların merkezi sinir sisteminin post sinaptik merkezde olan nikotin asetilkolin reseptörüne (nAChR) affinite gösterir ve sinir sistemini sekteye uğratarak toksik mekanizmasını gösterir (Tomizawa & Casida, 2005). Ayrıca sinir uyarısında iletimi kolinerjik sinapslarda asetil (ACh) ve

bütirilkolinin (BCh) parçalanmasını sağlayan asetilkolinesterazların ve bütirilkolinesterazların (AChE ve BChE) aktivitesini etkiler (Somogyvári ve ark., 2022).

Nil tilapisi (*Oreochromis niloticus*) dünya üzerinde yaygın olarak dağılım gösteren, omnivor beslenen tropikal bir balık türüdür. Ticari olarak önemi yüksek olan özellikle yaygın dağılımı ile alan ve laboratuvar araştırmaları için su kirleticilerinin etkilerinin incelemesi ve değerlendirilmesi açısından değerli bir model organizmadır. Tilapia türleri, çok çeşitli çevre koşullarına dayanıklılık sağlamaları, hızlı büyümeleri ve erken üremeleriyle su ürünleri yetiştiriciliğinde içinde elverişli bir tür olarak bilinmektedir (FAO, 2018; FAO, 2022).

Çalışmada kontrol grubuyla birlikte imidacloprid maruziyet konsantrasyonları olan 0,5 ppm ve 1 ppm etkisinde 24 ve 48 saat etki süresinde toksisite etkileri *Oreochromis niloticus*'un beyin dokusunda AChE enzim aktivitelerinde olan değişimler araştırılmıştır.

MATERYAL VE METOD

İmidaclporid'in ticari olarak Hekdivor 600 FS isimli ürünü alınmıştır. *Oreochromis niloticus* deney canlısında kontrol grubu ile beraber 0,5 ppm ve 1 ppm sublethal konsantrasyonları deney süreci etkisinde 24 ve 48 saat uygulanmıştır. Deneylerde kullanılan *O. niloticus* türünün ortalama boyu 12,4±0,34 cm, ağırlığı ise 22,11±0,34 gr olarak ölçülmüştür. Kontrol grubu ve toksisite denemelerinde akvaryumlarda her grupta 3 balık olacak şekilde tekrarlı olarak çalışıldı. Boyutları 40x40x40 cm olan cam akvaryumlarda dinlendirilmiş musluk suyu ile 50 L doldurulmuş ve akvaryumlar havalandırmaları merkezi sistem ile planlı bir şekilde havalandırılmaktadır.

Laboratuvar ortamında 12/12 saat fotoperiyodik period sistemi ile düzenli gece/gündüz uygulaması yapılmaktadır.

Deneyde kullanılan akvaryum su kalitesi parametreleri:

sıcaklık 23 ± 0.6 °C,

pH 7,54 ± 0,32,

çözünmüş oksijen 6,34±0,24 mg/L,

alkalinite 236 mg/L $CaCO_3$,

sertlik 264 mg/L $CaCO_3$ olarak hesaplanmıştır.

Toksik deneylerde kimyasal miktarında azalmayı önlemek amacıyla 24 saat aralıklarla su değişimi ve toksik madde eklemesi yapılmıştır. 24 ve 48 saat sonunda dekapitasyon yöntemiyle öldürülen balıklardan Beyin dokuları disekte edilerek çıkarılmıştır.Araştırma yapılmak üzere beyin dokusu fizyolojik tuz çözeltisi (%0.59 NaCl) ile yıkandıktan sonra biyokimyasal analizler için -20°C sıcaklıkta saklanmıştır. Beyin dokusu %1,17 KCl içeren pH 7.4, 0,1M sodyum-fosfat tamponunda, 1/20 oranında seyreltilerek 2 dk homojenize edilmiştir.

Homojenatların 16000 rpm'de +4 °C'de 20 dakika sürede santrifüj edildikten sonra elde edilen süpernatantlar AChE enzim aktivitelerinde Ellman (1961) yöntemiyle olan aktivasyonda olan değişimler belirlenmiştir. Ek olarak toplam protein miktarı Bradford (1976) yöntemiyle belirlendi. Çıkan sonuçlar hesaplamalar yapılarak deneysel süreçte olan enzimatik değişimlerde istatistik olarak kontrol grubuna karşı karşılaşma yapılmıştır. İstatiksel analizler SPSS 16 programında One-way Anova Duncan testi kullanılmıştır.

DRAFT

BULGULAR ve TARTIŞMA

IMI'nin suda kimyasal yapısı gereği uzun süre sabit kaldığını ve ekosistem içersinde dağılarak kimyasal yapısını bozmadan gösterildi, IMI'nin kimyasal yapısının bertaraf edilmemesi durumu, daha sonradan çevre yoluyla ulaştığı organizmalar üzerinde önemli toksik etkilerine sebep olur (Tišler ve ark., 2009).

Çalışmamızda *O. niloticus*'un beyin dokusunda 24 ve 48 saat maruziyetinde imidacloprid etkisinde AChE enzim aktivitelerinde kontrol grubuna göre önemli bir azalma olduğu belirlendi. 24 saat etkide 0,5 ppm ve 1 ppm sublethal konsantrasyonlarda kontrol grubuna göre sırasıyla %11 ve %28 azalma belirlendi. 48 saat etkide 0,5 ppm ve 1 ppm sublethal konsantrasyonlarda kontrol grubuna göre sırasıyla %43 ve %61 azalma belirlendi. Gajula ve ark., (2023) çalışmasında imidacloprid etkisinde 66.6 mg/lt maruziyetinde Labeo rohita balığında beyin ve kas dokularında 28 ve 42 gün etkilerinde AChE enzim aktivitelerinde kontrol grubuna göre önemli azalma olduğu belirlendi. Neonikotinoid türü pestisitlerin ve metabolitlerinin, nikotine benzer olan ve kan-beyin bariyerini kolayca geçen ChE aktivitelerini değiştirmeye yönelik daha yüksek bir afinite gösterir ve hayvan çalışmalarında görüldüğü gibi potansiyel olarak nörolojik etkilere neden olduğu raporlanmıştır (Özdemir ve ark., 2014). Önceki çalışmalarda genel olarak pestisitlerin balık dokularında AChE inhibisyonuna neden olabileceğini gösterilmiştir (Xing ver ark., 2013; Zouaoui ve ark., 2024). Toksik pestisitlerin kullanımının azaltılması ya da kullanılmaması birçok alanda tarım faaliyetleri, gıda paketleme, hayvancılık gibi alanlarda daha az zararlı bir ilaçlama ya da koruyucu programların oluşmasa ayrıca daha fazla araştırma ve evrensel bilinç programları ile toksik etkilerin bertarafı sağlanmalıdır.

Abstract

Perlite and vermiculite are materials of volcanic origin with abundant reserves in Turkey and worldwide. These materials are used in the production of natural lightweight aggregates, which are of strategic importance as construction materials. The advantages of these materials, which include low density, high thermal insulation capacity and environmental sustainability, have led to their widespread use in many sectors, particularly in the construction industry. However, due to their high water absorption capacity and suboptimal mechanical properties, these aggregates show limited effectiveness in structural concrete and mortar applications. In this study, the surfaces of expanded perlite and expanded vermiculite aggregates were strengthened by a coating method consisting of cement and silica fume, and their physical and mechanical performance was improved. In this study, the aggregates were subjected to three different coating thicknesses and used in mortar production by replacing raw uncoated aggregates in varying proportions (0-50%). Unit weight and water absorption tests were carried out on the mortar samples. The experimental results show that the coating significantly reduces the water absorption properties of the expanded lightweight aggregates, making them more suitable as building materials. Specifically, the mixture containing 50% coated perlite and 50% coated vermiculite showed a reduction in water absorption of up to 60% compared to the control sample. The results indicate that lightweight aggregates strengthened by coating processes can be transformed into a novel structural aggregate material with reduced permeability, improved durability and performance orientation.

Keywords: Lightweight aggregate, Lightweight mortar, Perlite, Vermiculite, Surface treatment

INTRODUCTION

With the developments in modern construction materials, lightweight aggregates such as pumice, perlite and vermiculite have gained great importance in the global sector. This is particularly evident in countries located in active seismic zones, where the design of lightweight structures has become mandatory to reduce seismic loads. Population growth and accelerated urbanisation have led to an increased demand for lightweight construction materials (Öztürk et al., 2022). The porous nature of lightweight aggregates leads to a low density, thereby enabling the production of concrete that is up to 30% lighter than that produced using conventional aggregates. It has been demonstrated that this configuration has the capacity to mitigate the adverse effects of seismic activity on the structural integrity of the building, thereby reducing the dead loads to which the structural system is subjected (Tunç, 2013).

Studies in the literature indicate that energy savings of up to 50% in heating and cooling costs can be achieved in buildings constructed with lightweight materials (Öztürk et al., 2022). This phenomenon is particularly pronounced in the Scandinavian countries, which are located in the cold climate zone, where the use of imported lightweight building materials has been shown to result in lower heating costs compared to Turkey. The results underline the importance of lightweight construction materials in improving energy efficiency.

The low density of lightweight concrete is primarily due to the lightweight aggregates used in its composition, whether these aggregates are natural or artificially derived. It has been shown that the porosity of these aggregates can be increased by various processes. Research has shown that lightweight concrete has superior performance in terms of fire resistance compared to conventional concrete (Tunç, 2013).

However, the high water absorption capacity of these aggregates can lead to undesirable effects such as the formation of shrinkage cracks during the curing process.

Turkey has abundant natural reserves of expanded perlite and vermiculite. These aggregates are widely used in the construction industry as lightweight construction materials to reduce the overall weight of the structure while improving its performance characteristics, including thermal and acoustic insulation. Vermiculite is characterised by its ability to withstand high temperatures and its sound insulation properties, while perlite is favoured for its low density and high thermal insulation capacity. It is indeed possible to produce low density mortars using expanded vermiculite and expanded perlite as natural materials. However, studies have shown that the use of these materials as aggregates in mortar and concrete production can have a detrimental effect on the properties of concrete, including a reduction in compressive strength and an increase in water absorption (Koksal et al., 2015; Mo et al., 2018; Tie et al., 2022; Cojocaru, 2023). The effective utilisation of expanded perlite and expanded vermiculite aggregates, in construction materials is contingent on the resolution of these challenges. This strategic approach is critical for optimising the mechanical and physical performance of building materials, as well as increasing their sustainability. The objective of this study is to enhance the physical and mechanical properties of expanded perlite and expanded vermiculite aggregates through the application of a cement-silica fume slurry onto their surfaces.

MATERIALS AND METHODS

In this study, CEM II/A-M (P-LL) 42.5 N type cement, which conforms to TS EN 197-1 standard, was utilised as the binder material. The cement has a specific gravity of 3.06 g/cm³ and a Blaine fineness of 4085 cm²/g. Furthermore, silica fume with a specific gravity of 2.2 g/cm³ and Blaine fineness of 200000 cm²/g, supplied from Antalya Eti Elektrometalurji A.Ş., was used as a fine pozzolanic materials. The chemical properties of cement and silica fume are presented in Table 1. Natıral sand, exhibiting a specific gravity of 2.63 g/cm³, was identified as the optimal fine aggregate. Furthermore, a polycarboxylate-based super plasticiser (SP) with a specific gravity of 1.10 g/cm³ was utilised to enhance the fluidity of the mixture.

Table 1. Chemical composition of cement and silica fume

Chemical analysis(%)	Cement	Silica fume
CaO	57.38	2.06
SiO_2	23.38	91.92
Al_2O_3	4.60	0.42
Fe_2O_3	3.24	0.20
MgO	2.18	3.28
SO_3	2.79	0.83
K_2O	-	0.85
Na_2O	-	0.25
Loss	4.86	1.50

The aggregates, composed of expanded perlite and expanded vermiculite, were coated in a multilayer structure using a cement-silica fume slurry by cold bonding method. The coating process was conducted within a pelletising apparatus that operated at a constant velocity and inclination. Subsequent to this, the aggregates underwent a curing phase spanning a duration of 28 days. The gradation test of coated perlite (CP) and coated vermiculite (CV) aggregates, which have three different coating thicknesses (Ct), was performed in accordance with the ASTM C136 standard. The results obtained are presented in Figure 1. In order to ascertain the loose bulk density values for the aggregates produced, the ASTM C29 method was employed. Furthermore, the water absorption and specific gravity values were determined in accordance with the ASTM C128 standard.

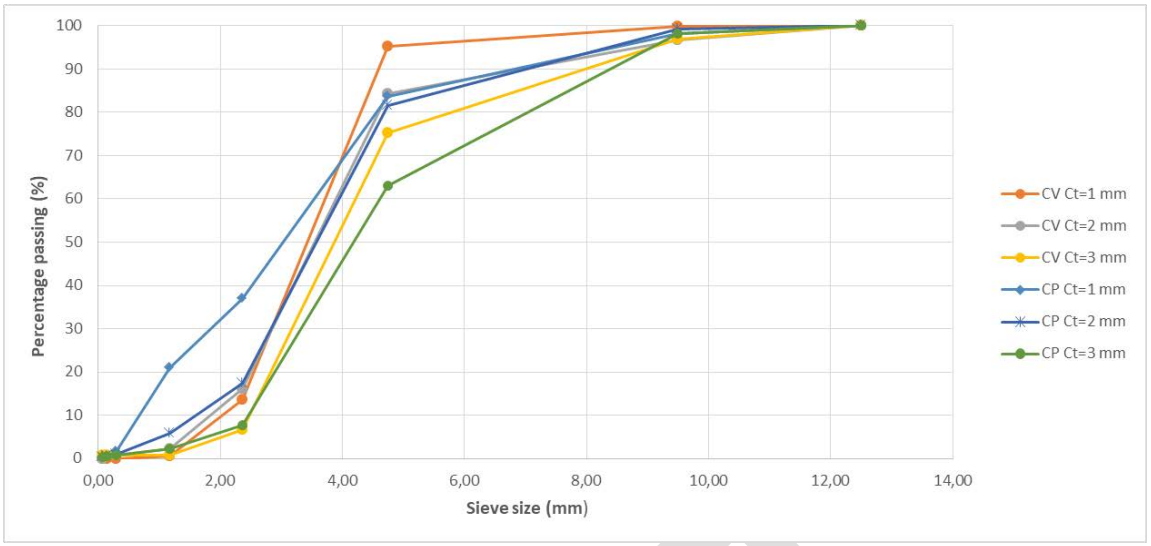

Figure 1. Gradation curves of CP and CV aggregates

The water-to-cement ratio was maintained at a constant value of 0.45, while the cement dosage was set at 550 kilograms per cubic metre for all mortar mixtures. In this study, the replacement of aggregates of varying thicknesses of CP and CV, coated in multiple layers, with uncoated perlite (UP) and uncoated vermiculite (UV) aggregates was investigated at 0%, 25% and 50% by volume. It has been demonstrated that the higher water absorption capacity of porous lightweight aggregate, in comparison with normal weight aggregate, results in a reduction in workability. A common technique employed in practice to overcome this problem is to estimate the water content by considering the water absorption properties or wetting the lightweight aggregates before mixing (Domagała, 2015; Nguyen et al., 2018; Adhikary et al., 2022). Consequently, in the present study, perlite and vermiculite aggregates were subjected to water curing for a duration of 24 hours prior to their incorporation into the mortar mixture. Subsequently, the aggregates were dried to a state of saturated dry surface.

The same mixing methodology was used for all fresh mortar mixes prepared. The initial step in the process involved the introduction of cement, natural sand, and saturated surface-dry aggregates into a 15-litre capacity mixer. The mixture was then subjected to a one-minute period of normal-speed mixing, followed by a subsequent one-minute period of high-speed mixing. Subsequently, water and superplasticiser were incorporated into the mixture, and the mixing process was terminated after a further two minutes of high-speed mixing. In the course of the experimental studies, 25 distinct mortar mixtures were prepared. Subsequently, specimens measuring 50x50x50 mm were produced from these mixtures, which were then water cured until the commencement of the test. The oven dry density and water absorption tests were conducted in accordance with the provisions of the ASTM C642 (2013) standard. The experiment was conducted on three 50 mm cube specimens on the 28th day. The final value was obtained by averaging the values obtained.

RESULTS AND DISCUSSION

The loose bulk density, water absorption and specific gravity values of CV and CP aggregates produced in this study are given in Table 2. As demonstrated in Table 2, the CV aggregate demonstrates a specific gravity of 1.75-1.81, a loose bulk density of 360-379 kg/m³, and a water absorption rate of 18-24%. In contrast, the CP aggregate exhibits a specific gravity of 1.89-2.10, a loose bulk density of 995-1129 kg/m³, and a water absorption rate of 15-22%. The water absorption values of expanded vermiculite and expanded perlite aggregates are 300% and 169% respectively. Table 2 indicates a substantial increase in the specific gravity and loose bulk density values, accompanied by a notable decrease in the water absorption rates of both CV and CP type coated aggregates, in comparison to the uncoated aggregate (Ct=0). The coating method employed in this study resulted in a significant decrease of approximately 90% in the water absorption values of CV and CP aggregates in comparison with uncoated aggregate. It is evident that the grain density and bulk density of CV aggregates are less than 2000 kg/m³ and 1200 kg/m³, respectively. This stipulation renders them as suitable for categorisation as lightweight aggregates, as outlined in EN-13055. It is noteworthy that the grain density and bulk density of CP aggregates are less than 2000 kg/m3 (with the exception of those exhibiting an average pavement thickness of 2 and 3 mm) and 1200 kg/m3,

respectively. This stipulation renders them as suitable for categorisation as lightweight aggregates, as outlined in EN-13055.

Table 2. Physical properties of CV and CP aggregates

		Average coating thickness (mm)			
		0	**1**	**2**	**3**
Vermiculite	Loose bulk density (kg/m^3)	78	379	373	360
	Specific gravity	0.22	1.75	1.78	1.81
	Water absorption (%)	300	18	21	24
Perlite	Loose bulk density (kg/m^3)	120	995	1107	1129
	Specific gravity	0.58	1.89	2.07	2.10
	Water absorption (%)	169	22	15	15

As demonstrated in Figure 2, the substitution ratios of CP and CV aggregates, in conjunction with coating thicknesses, exert a significant influence on the oven dry density values. As demonstrated in Figure 2, the vertical axis signifies the oven dry density (δ_{od}), the lower horizontal axis denotes the replacement ratio of coated perlite aggregate ($CPAR_R$), and the upper horizontal axis indicates the replacement ratio of uncoated perlite aggregate ($UPAR_R$). The lowest oven dry density value of 1.26 g/cm³ was obtained from the mortar sample with 100% uncoated vermiculite (UV) and uncoated perlite (UP) aggregates. As demonstrated in Figure 2, the oven dry density values of the specimens with CV and CP aggregates range from 1.31 to 1.88 g/cm³. The study established that the density of the lightweight mortar increased in proportion to the increase in the substitution ratios of both CV and CP aggregates. It is evident that, irrespective of the substitution ratio, an augmentation in coating thickness in mortar samples produced using CV and CP aggregates results in elevated oven dry density values in comparison to uncoated aggregates. This phenomenon can be attributed to the higher specific gravity exhibited by CV and CP aggregates in comparison to UV and UP aggregates. In the instance of complete substitution of the CV aggregate for the UV aggregate, an increase in oven dry density was observed, ranging from approximately 13% to 17%, contingent upon the coating thickness. In the experiment, the CP aggregate was substituted in its entirety for the UP aggregate. This resulted in an increase in the oven dry density value, ranging from approximately 18% to 24%, depending on the coating thickness. The enhanced increase in the oven dry density of mortar samples produced with CP aggregate is attributable to the elevated specific gravity of these aggregates in comparison to CV aggregates. An increase between 38% and 49% in the oven dry density values of the samples was obtained in which both 50% CV aggregate and 50% CP aggregate were utilised.

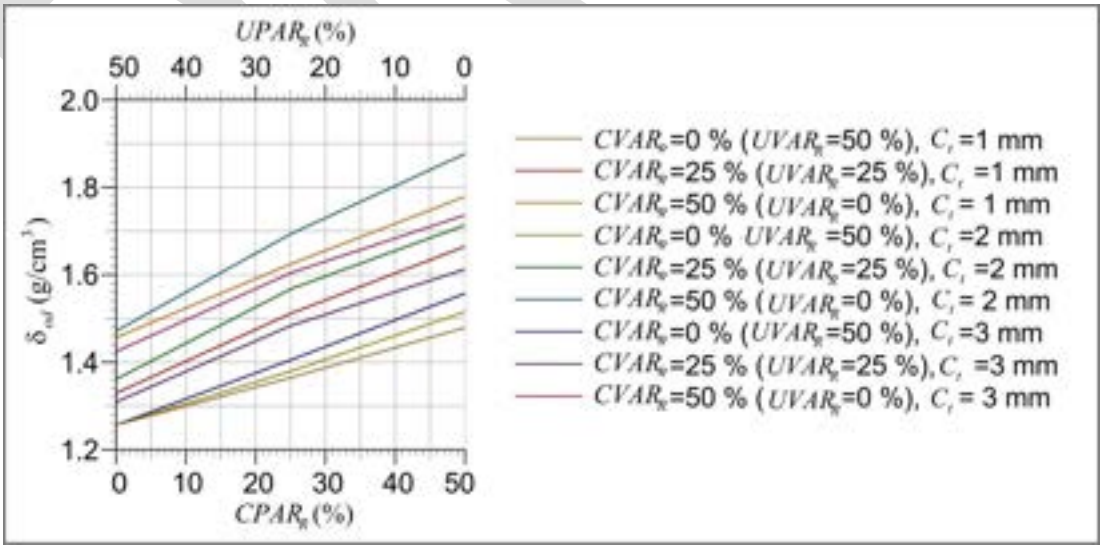

Figure 2. Relationship between the substitution ratios and average coating thicknesses of CV and CP aggregates and oven dry density

In mortar samples produced with CV and CP aggregates, an observation was made that the increase in the coating thickness of the aggregates directly affected the oven dry density values of the samples. The findings of the study indicated that an augmentation in coating thickness yielded elevated oven dry density values for the samples prepared with coated aggregates in comparison to those prepared with uncoated aggregates. The highest oven dry density was obtained in mortar samples produced with CV and CP aggregates, with an average coating thickness of 2 mm. However, as the mean coating thickness reached 3 mm, a decrease in the density of the specimens was generally observed. The underlying principle for this phenomenon is predicated on the observation that an augmentation in coating thickness results in an increase in aggregate grain diameter, consequently leading to a deterioration in aggregate gradation. The increased grain size resulted in an increase in the void volume between the aggregates. This had a detrimental effect on the compactness of the mixture, consequently resulting in lower density values. The maximum oven dry density recorded was approximately 1.88 g/cm³, which was obtained for the sample with an average coating thickness of 2 mm and containing 100% coated aggregates (50% CV and 50% CP). Subsequent to the ascertainment that the dry density values of all samples were below 2 g/cm³, it was determined that the production of lightweight mortar with CV and CP aggregates was a viable prospect.

As demonstrated in Figure 3, the impact of varying replacement ratios of CV and CP aggregates, along with average pavement thicknesses, on water absorption is illustrated. As demonstrated in Figure 3, a substantial decline in water absorption values was observed with an increase in the substitution ratio of CV and CP aggregates. The maximum water absorption value of approximately 27.4% was obtained in the sample containing 50% UV and %50 UP. The water absorption values of the specimens with CV and CP aggregates ranged between 25.9% and 10.5%. It was determined that the water absorption values of the lightweight mortar decreased with the increase in the substitution ratios of both CV and CP aggregates. It is evident that, irrespective of the substitution ratio, the augmentation in coating thickness in mortar samples produced using CV and CP aggregates results in diminished water absorption values when compared to uncoated aggregates. In the instance of complete substitution of the CV aggregate for the UV aggregate, a decline in water absorption was observed, with values ranging from approximately 28 to 30%, contingent on the coating thickness. In the instance of complete substitution of the CP aggregate for the UP aggregate, a decline in water absorption value was observed, ranging from approximately 13% to 22%, contingent on the coating thickness. The water absorption values of the specimens with both 50% CV aggregate and 50% CP aggregate were reduced in the range of 41% to 62%, depending on the coating thickness. The lowest water absorption value recorded, with a value of approximately 10.5%, was obtained from the samples produced with 50% CP and 50% CV aggregates with an average coating thickness of 2 mm. A decline of approximately 62% was documented in comparison to the water absorption value of the mortar produced with uncoated aggregate.

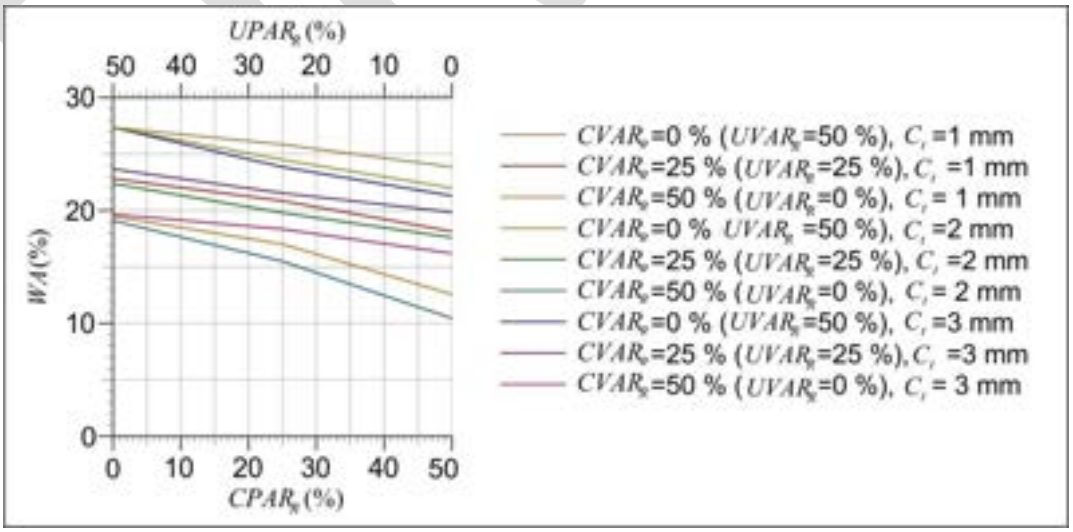

Figure 3. Relationship between the substitution ratios and average coating thicknesses of CV and CP aggregates and water absorption

CONCLUSION

The present study investigates the physical properties of coated perlite (CP) and coated vermiculite (CV) aggregates, which are obtained by progressive coating of expanded perlite (UP) and expanded vermiculite (UV) aggregates with cement-silica fume slurry. Furthermore, the density and water absorption performances of mortar samples produced using these aggregates are evaluated. The following conclusions were reached on the basis of the results obtained:

- In comparison with uncoated aggregates, CP and CV aggregates demonstrated an increase in specific gravity and loose bulk density values, and a significant decrease in water absorption rates. The applied coating method reduced the porosity and water contact surface of the aggregates, resulting in a decrease in water absorption values by approximately 90%.
- It is evident that the grain density and loose bulk density values of CV aggregates are lower than 2000 kg/m³ and 1200 kg/m³, respectively. This classification indicates that they are considered to be lightweight aggregates, as defined in the EN 13055 standard. It is evident that the CP aggregates satisfied these criteria, with the exception of the average coating thickness, which ranged from 2 to 3 millimetres.
- The findings of the study demonstrated that mortar specimens comprising CV and CP aggregates exhibited higher oven dry density values in comparison with uncoated aggregates.
- The oven dry density values of the mortars exhibited an increase of 13-17% when CV aggregate was substituted entirely for UV, 18-24% when CP aggregate was substituted entirely for UP, and 38-49% for mortar samples containing 50% CV and 50% CP. In all samples, the oven dry density value was found to be less than 2 g/cm³, thereby meeting the lightweight mortar criterion.
- The highest density values were obtained in the specimens prepared with CV and CP aggregates, with an average coating thickness of 2 mm.
- The water absorption rate of the specimens with CV and CP aggregates exhibited variation, ranging from 25.9% to 10.5%. The water absorption rates of mortars decreased by 28-30% when CV aggregate was completely replaced by UV, by 13-22% when CP aggregate was completely replaced by UP, and by 41-62% when 50% CV and 50% CP were used.
- The lowest water absorption value was recorded in the specimen containing 50% CV and 50% CP aggregates with a coating thickness of 2 mm.
- In conclusion, the physical properties of expanded perlite and expanded vermiculite aggregates were significantly improved by the multiple coating application proposed in this study. The utilisation of the obtained CV and CP aggregates in lightweight structural elements has been enhanced, yielding favourable outcomes with regard to strength and durability. In addition, enhancements have been identified in the water absorption and density parameters.

Abstract
This paper studies the detection of pedestrian in complex urban environments using Frequency Modulated Continuous Wave (FMCW) automotive radar, addressing the challenges posed by environmental obstacles like trees and vehicles. Unlike studies employing idealized radar targets, this research incorporates realistic 3D models to simulate radar scenarios. Radar Cross Section (RCS) analysis is conducted over relevant angles to study the wind effects on a 3D tree model in detail. By including dynamic effects such as the movement of tree branches in the wind, we analyze the undesired impacts on pedestrian classification accuracy. Convolutional neural networks (CNN) enhance pedestrian detection and classification with the extraction of micro-Doppler features from radar spectrograms. The findings demonstrate that the utilized CNN model improves detection reliability under unpredictable environmental interference, highlighting the practical implications for radar-based pedestrian detection in real-world settings.
Keywords: FMCW, CNN, micro-doppler signatures, target classification

INTRODUCTION

In recent years, both industry and academia have focused on advancing autonomous driving systems, particularly emphasizing the role of artificial intelligence (AI) in achieving full autonomy. The rapid evolution of AI-powered technologies and techniques, including machine learning and deep learning, has significantly contributed to the development of autonomous vehicles (AVs) capable of navigating in complex environments. However, Perception systems in AVs face significant technical challenges when operating in diverse environmental conditions including windy, foggy, rainy, and snowy weather. (Pandharipande et al., 2023). To ensure operational safety, potential risks arising from these challenges must be carefully analyzed. One approach to improve AV perception is to incorporate AI-based techniques to enhance pedestrian detection algorithms in adverse scenarios (Tumas et al., 2020). These techniques in AI systems must focus on enhancing safety and efficiency by improving key functionalities such as pedestrian detection and obstacle recognition. While AI integration improves perception, it also raises concerns regarding reliability, interpretability, and explainability (ISO/IEC TR 5469, 2024). One suggested method for addressing these challenges in AI systems is to provide redundancy combined with diversity, ensuring multiple AI approaches are implemented to achieve reliable detection (ISO/IEC TR 5469, 2024).

Micro-Doppler feature extraction methods in target detection systems vary in effectiveness across applications. Parashar highlights that techniques such as short-time Fourier transform (STFT) and Wigner-Ville decomposition must be selected based on factors like target type, latency requirements, accuracy expectations, computational complexity, and scalability (Parashar et al., 2017). Chen further studies micro-Doppler modulation, emphasizing that an ideal feature extraction method should provide high resolution in both time and frequency domains while minimizing cross-term interference (Chen et al., 2006). Radar cross section (RCS) is another important factor affecting micro-Doppler signatures. Shi demonstrates that targets with micro-Doppler dynamics and smaller RCS values can be distinguished even when located near larger objects with higher RCS if observed from an optimal angle (Shi et al., 2022).

On the other hand, in terms of perception sensors, FMCW automotive radars - particularly at 77GHz - have become widely used in AVs for pedestrian detection due to their cost-effectiveness and reliability. Belgiovane explores their application in detecting pedestrians and cyclists based on micro-Doppler signatures (Belgiovane and Chen, 2017). Traditional classification methods from machine learning such as support vector machines (SVM), k-nearest neighbor (kNN), and Gaussian mixture models have been widely used for target classification (Villeval et al., 2014). However, recent studies indicate that deep learning

DRAFT

techniques, particularly convolutional neural networks (CNN), achieve superior results in complex scenarios. Palffy demonstrates improved multi-class detection and classification accuracy with CNN compared to other techniques (Palffy et al., 2020). Integrating FMCW radar hardware with a well-developed CNN-based classification scheme can achieve accuracy rates of 90% and higher with low latency (Elbeialy et al., 2022). However, in highly complex scenarios, the accuracy rate declines, necessitating further research to improve classification performance (Parashar et al., 2017).

Despite advancements, AV safety remains a concern, particularly in environments with dynamic obstacles. A challenging scenario involves AV operation in woodland areas on windy days, where moving tree leaves create significant noise in radar signals, affecting pedestrian detection and micro-Doppler feature extraction. This paper investigates a scenario, analyzing the environmental impact on target classification and evaluating the effectiveness of CNN-based classification techniques in mitigating its effects.

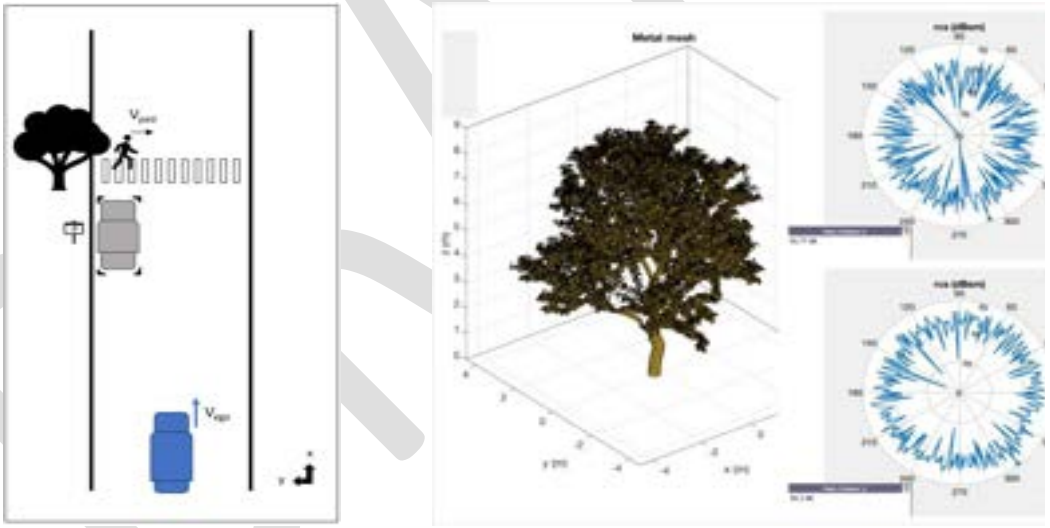
This paper is structured as follows: First, the scenario design and data generation process are explained in detail. Second, the CNN architecture is described. After discussing the simulation performance and presenting the simulation results, we summarize the study and outline future research directions.

SCENARIO AND DATA GENERATION

Designing the Scenario

The scenario considered in this study as shown in Figure 1a includes a moving ego vehicle with an FMCW automotive radar which works at 77GHz, a stationary car which is parked on the side of the road, a pedestrian who is crossing the street and a tree on the side of the road.

It is assumed that the speed of the ego vehicle is in the slow range, the height of the pedestrian changes between certain values while the pedestrian walks in a random direction towards the road. The weather in the scenario is windy and the wind speed is strong enough to move the branches of the tree. We assume that the tree has many branches and there are many leaves on the branches as visualized in Figure 1b.



(a) Driving scenario (b) 3D model of a tree with its RCS calculation

Figure 1. Driving scenario and target RCS

The idea behind the scenario is to analyze if the FMCW radar and CNN system would be able to detect the walking pedestrian among the other targets (tree and parked car) and classify them.

The sub-scenarios are generated based on the limitations of the main scenario and are composed of the targets as stated in Table 1.

Table 1. The Sub-scenarios

No.	Sub-Scenario
1st	only 'parked car' exists
2nd	only 'pedestrian' exists
3rd	only 'tree' exists
4th	'pedestrian' + 'parked car' exist
5th	'pedestrian' + 'tree' exist
6th	'pedestrian' + 'parked car' + 'tree' exist

Generation of Test and Training Data

After designing the main scenario, the simulation environment has been created in Matlab to generate output spectrograms to have a visual representation of the radar signal data to observe the frequency shifts changing over time. In applications like pedestrian detection, spectrograms capture subtle movement patterns called micro-Doppler signatures which can indicate specific types of motion such as walking, running, sitting, bending, falling, etc. (Shah and Fioranelli, 2019). These spectrograms are valuable for identifying pedestrians within complex environments, since they help differentiate human movement from other objects. CNN often analyzes these spectrograms to classify detected objects, providing essential data for autonomous vehicle safety systems.

In order to generate the test and the training spectrogram data, we compose the simulation in four parts as below.

Determination of Target Specifications

As a beginning, the target specifications have been identified and their objects have been created individually as tree, pedestrian and parked car while designing the driving scenario as stated below:

- Parked vehicle: It is positioned on the roadside and acts as a static target.
- Pedestrian: The pedestrian's height varies between 1.5 m and 2 m, and they walk in a random direction (towards the road where the ego vehicle is moving) at a speed of 8–10 km/h.
- Tree: It is modeled as a realistic 3D model to simulate an urban landscape environment.

While the pedestrian and parked vehicle parameters are available as pre-built objects in Matlab, we need to create the tree target from scratch. In Kiliç's study (Kilic et al., 2015), a forest scattering model was designed using cylindrical perfect electric conductors (PEC) randomly distributed in different sizes and orientations to represent tree trunks and branches. This allowed for the examination and analysis of back-scattering from the trunk and branches. However, one missing detail for our case is the signal noise caused by the movement of tree leaves.

To integrate the selected 3D tree model, as shown in Figure 1b, into the simulation, the radar cross-section (RCS) must be calculated. As the exact numerical solution like the method of moments (MoM) requires very high computational power, we chose using the method of Physical Optics (PO) which is still applicable for the high frequency approximations (Treml et al., 2009). The PO approximation assumes that the observed surface patch is ideally smooth, flat, and an electrically perfect conductor. As a result, Treml defines the scattered electric field as (Treml et al., 2009):

$$E_{scat} = jk\psi_0 \int_S s \times [n \times E - \eta s \times (n \times H)] e^{jkr(i-s)}\, dS \qquad (1)$$

where k represents the wavenumber, s and i are unit vectors indicating the propagation direction of the scattered and incident waves, respectively. r denotes the position vector from the origin of the local coordinate system to the surface patch dS, and η represents the free-space impedance. $\psi_0 = \frac{e^{jkr}}{j\pi R}$ which is the far field Green's function, where R is the distance between the observation point and the surface patch. The mathematical equation of the RCS, denoted as σ, is expressed as follows (Hess, 2008).

$$\sigma = 4\pi R^2 \frac{|E_{scat}|^2}{|E_{inc}|^2} \quad (2)$$

where E_{scat} is the electromagnetic power scattered by the target and received by the radar, E_{inc} is the electromagnetic power transmitted by the transmitter and R is the distance between the radar and the target. Based on the calculated electric fields at the observation point resulting from PO by using Eq. (1), the total RCS of the radar target is calculated with the RCS Eq. (2), where R will be canceled due to the far field Green's function (Treml et al., 2009).

Following the PO approximation approach for the RCS, the electromagnetic scattering model of the tree model must be developed. In Rao's study (Rao et al., 1982), a simple and effective numerical procedure was developed for calculating electromagnetic scattering from the surfaces of arbitrarily shaped objects. In this context, Rao uses planar triangular surface patches when modeling objects for numerical computations (Rao et al., 1982).

Building on this approach, the 3D tree object used in this study was modeled using 99,120 triangular surface patches, as shown in Figure 1b.

As RCS varies with the frequency, our RCS model is based on 77GHz. The azimuth angle was selected to cover the entire perimeter of the tree [-180° to 180°], while the elevation angle was considered as [0° and 45°] for the calculations.

Before integrating the generated tree model into the simulation, the micro-noise effects caused by tree leaves must be incorporated into the model. In this context, Swerling's study provides four different fluctuating target models for targets with varying cross-section areas (Swerling, 1960).

Swerling 3 & Swerling 4 models (Swerling, 1960) are both applicable to our tree model as the total RCS includes one large scatterer along with several independent, small, and approximately equal scatterers. In Swerling 3, the total RCS remains constant throughout the scan, while the total RCS varies from one radar pulse to another in Swerling 4. In both models, the density function becomes a Chi-square distribution and the RCS fluctuation can be shown as follows for $\sigma > 0$.

$$w(\sigma, \hat{x}) = \frac{4\sigma}{\hat{x}^2} e^{-2\frac{\sigma}{\hat{x}}} \quad (3)$$

Due to the integration of both large and small scattering surfaces and the fact that the total RCS varies with each radar pulse, the Swerling 4 fluctuating target model was selected for integrating the 3D tree model into the simulation. This model not only accounts for the main scattering effects from the tree trunk but also incorporates the micro-noise variations caused by leaf movement, which fluctuates with each radar pulse.

Validation of the Target Model

When constructing the tree model, three key aspects are considered:

- Treating the tree trunk as a single, unified structure.
- Incorporating the scattering effects of branches and leaves.
- Simulating the influence of wind, which causes leaf movement.

In order to compare our target model with the theoretical prediction, we calculated a mean RCS value, σ_{mean}, over three equal signals which are reflected from the target at three different aspect angles. The angles are used as [azimuth elevation] respectively as [0 0], [45 0] and [45 45]. The result gives us σ_{mean} for the theoretical prediction for a nonfluctuating RCS. Figure 2 shows that the generated Swerling 4 model follows the distribution as expected from the Eq. (3) as $w(\sigma, \sigma_{mean})$.

The spectrogram outputs obtained from the simulation were also compared with the study published by Kilic (Kilic et al., 2015). Kilic analyzes the effects of turbulent air under different wind speeds in a forest environment on human micro-Doppler signatures. The findings indicates that branch movements, depending on the relationship between radar direction, wind direction, and turbulence levels, can mask

micro-Doppler signatures (Kilic et al., 2015). According to Kilic, the noise is strong enough to block the human signature with the wind speed of 15 m/s for all turbulence levels.

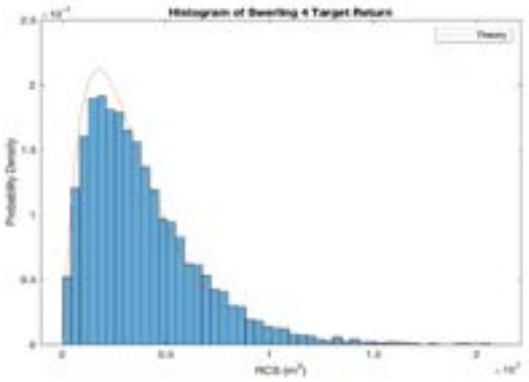


Figure 2. Distribution of the returns vs Theoretical prediction

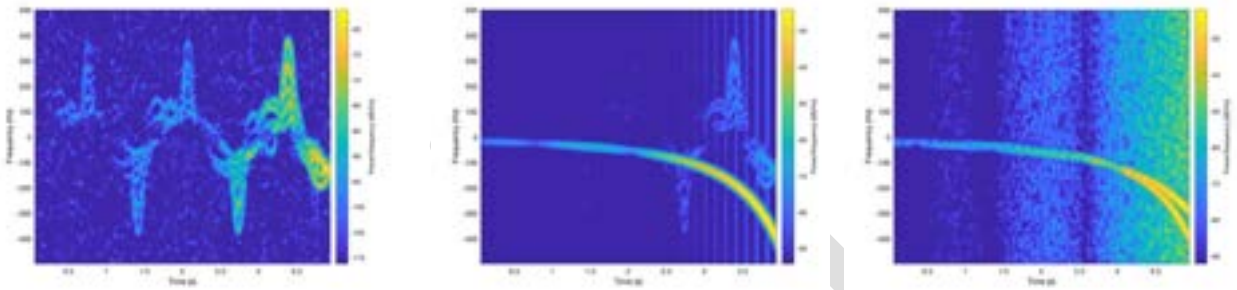
While Figure 3a and Figure 3b clearly show the micro-Doppler signature of a pedestrian, the impact of integrating our 3D tree model is highly visible and makes it almost impossible to distinguish human micro-Doppler signatures with a naked eye in the spectrogram as seen in Figure 3c.



(a) Human model

(b) Human and parked car models

(c) Human, tree and parked car models.

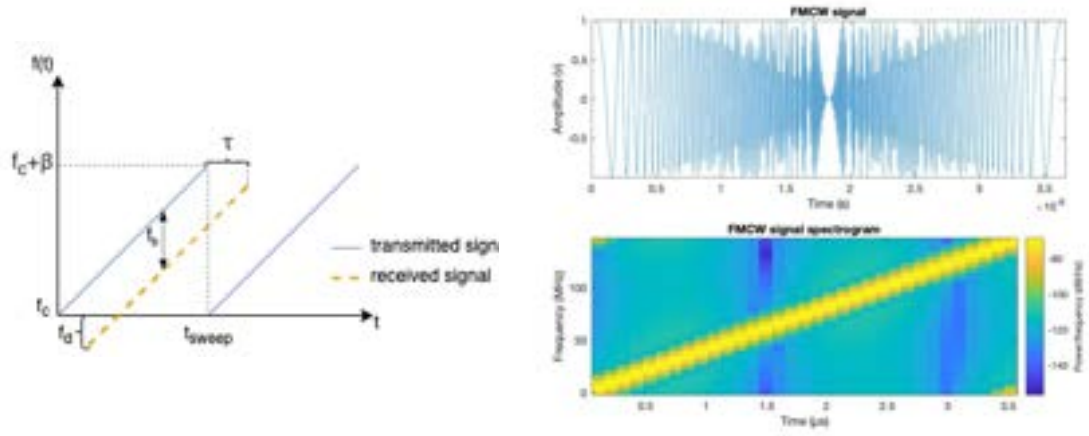
Figure 3. Spectrograms of the radar signals from the simulation

Determination of FMCW Radar Parameters

In parallel with defining the characteristics of the targets in the simulated environment, the parameters of the FMCW radar mounted on the ego vehicle must also be specified and integrated into the simulation.

Karnfelt developed a system simulation platform for a 77GHz adaptive cruise control (ACC) radar and tested various radar architectures, modulation formats, and detection algorithms (Karnfelt et al., 2009). He concluded that although Frequency Shift Keying (FSK) modulation provides excellent velocity resolution, its range resolution is insufficient. Therefore, Linear Frequency Modulation (LFM) is better suited for handling more complex scenarios (Karnfelt et al., 2009).

A basic LFM waveform is shown in Figure 4a while Figure 4b shows the FMCW signal used in our simulation. The up-sweep signal can be simply expressed in Eq. (4) where the signal bandwidth is β, the carrier frequency is f_c and the sweep time is t_{sweep}.



(a) FMCW modulation waveform with up-sweep

(b) FMCW signal used in the simulation and its spectrogram

Figure 4. FMCW signal

$$f(t) = f_c + \frac{\beta}{t_{sweep}} t \tag{4}$$

Wegner provided a general assessment of automotive radars and discussed future applications, describing a 77 GHz long-range radar (LRR) with a 9-degree beamwidth capable of detecting objects up to 150 meters, and a 24 GHz short-range radar (SRR) with an 80-degree beamwidth and a 30-meter detection range (Wegner, 2005). Considering the scenario in this study, where the ego vehicle must detect pedestrians at a safe and sufficient distance, the simulation utilizes a 77 GHz LRR with a maximum detection range set to 100 meters. This type of radar, commonly used in modern vehicles and ACC systems, aligns with the study's objectives and employs FMCW radar parameters.

The FMCW radar parameters which are used in our simulation are given in Table 2. According to Rohling (Rohling and Meinecke, 2001), a typical value of the signal bandwidth of an LFM waveform, β, is 150MHz which gives us the range resolution $\Delta R = \frac{c}{2\beta} = 1m$. By using the Eq. (5) (Karnfelt et al., 2009), Doppler frequency shift, f_d, frequency shift due to time delay, f_τ, and the beat frequency, f_b, are calculated where c is the speed of light where $f_d = \frac{2v_r f_c}{c}$ and $f_\tau = \frac{2\beta R}{ct_{sweep}}$. R and the relative speed, v_r, are determined according to the sub-scenario variation which is explained in the next part.

$$f_b = \frac{2v_r f_c}{c} - \frac{2\beta R}{ct_{sweep}} \tag{5}$$

Table 2. FMCW radar parameters

Symbol	System Parameters	Value
f_c	Carrier frequency (GHz)	77
f_s	Sample frequency (MHz)	150
R_{max}	Maximum target range (m)	100
ΔR	Range resolution (m)	1
v_{max}	Maximum target speed (km/h)	30
t_{sweep}	Sweep time (microseconds)	3.67
β	Sweep bandwidth (MHz)	150
f_b	Beat frequency (MHz)	27.27

Data Generation from Sub-scenarios

To introduce complexity and diversity into the collected data, multiple sub-scenarios were generated for training the CNN. This involved assigning random velocity values to the ego vehicle, varying the initial

positioning of the parked car, tree, and pedestrian on the x-axis, and randomizing pedestrian height, speed and heading. These variations were implemented while ensuring that the overall framework of the designed scenario in Figure 1a remained intact.

The collected data from each simulation run with the randomized sub-scenario was used to generate individual spectrograms for each category. These spectrograms were obtained using the Short-Time Fourier Transform (STFT) (Belgiovane and Chen, 2017), as described in Eq. (6), where $\omega(t)$ represents the window function and $x(t)$ is the signal undergoing transformation.

$$\chi(\tau,\omega) = \int_{-\infty}^{\infty} x(t)w(t-\tau)e^{-j\omega t}\,dt \tag{6}$$

The data have been organized into six data sets and labeled as "Pedestrian, Parked Car, Tree, Pedestrian + Parked Car, Pedestrian + Tree, Pedestrian + Parked Car + Tree". A total of 21,000 spectrograms were generated, with an equal distribution across all datasets, resulting in 3,500 spectrograms per category. Of the generated data, 80% was allocated for training, while the remaining 20% was designated for validation within each category. They later become inputs to the CNN architecture as training and validation data.

CLASSIFICATION ARCHITECTURE

There are a variety of different possible approaches that can be used while creating the CNN architecture specific to the target classification systems. The proposed CNN architecture whose CNN methodology is adopted from Angelov's multi-target classification system (Angelov et al., 2018) is specifically designed to handle challenging complex situations such as suppressed pedestrian micro-Doppler signatures due to wind-induced noise from trees in urban forestry environments.

The CNN architecture proposed in Figure 5 processes high resolution RGB spectrogram images with the vector size of 717×908×3, starting with a 2D convolutional layer that utilizes 16 filters, 10×10 kernel to extract basic patterns like edges and textures. It is followed by a max pooling layer with a pool size of 10×10 for dimensionality reduction and preserving key features. The next stages consist of three consecutive 2D convolutional layers (each with 32 filters, 5×5 kernel size) including max pooling layer 10×10, 10×10, and 5×5, respectively. The last 2D convolutional layer (32 filters, 5×5 kernel size) is followed by an average pooling layer to refine and smooth the feature map. These features are then passed through a fully connected layer with 6 neural units and a SoftMax layer to transform these outputs into probability scores for classification. Finally, the decision is made through classification layer.

To obtain the desired CNN architecture for noise handling and classification, the proposed architecture went through extensive training with various configurations, as it provided the best balance between computational efficiency and classification accuracy for micro-Doppler feature extraction. The optimal results were achieved through hyperparameter tuning, utilizing an Adaptive Moment Estimation (ADAM) optimizer with a learning rate of 0.001, a batch size of 64, and ReLU activation functions in the hidden layers.

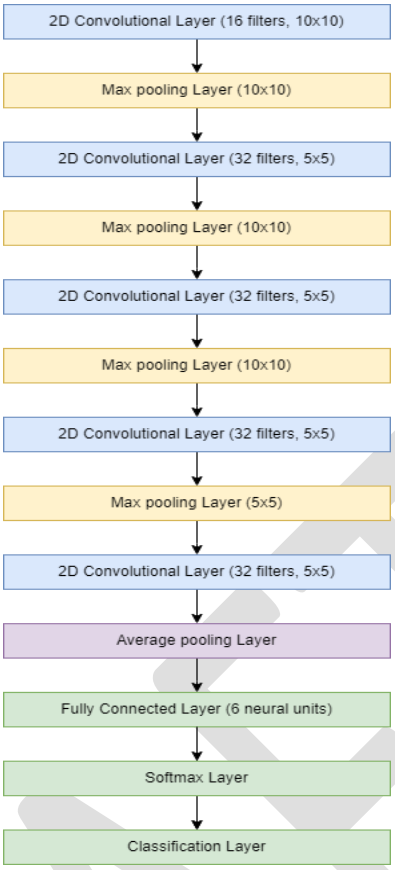

Figure 5. Representation of CNN architecture

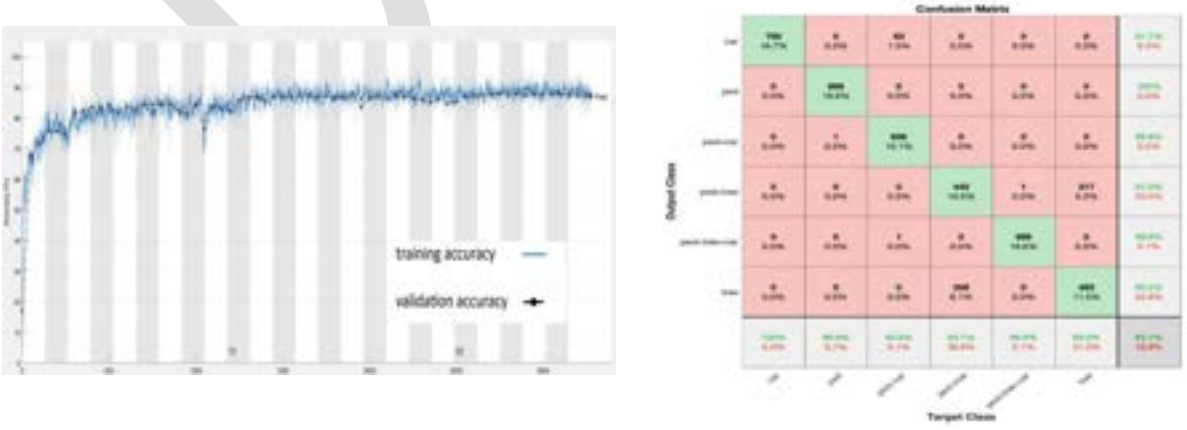
PERFORMANCE ANALYSIS AND RESULTS

The findings show that our main scenario and the sub-scenarios have worked well with the integration of 3D tree model and Swerling 4 target model to generate a dominant signal noise simulating the movement of the branches and the leaves of the tree to suppress the pedestrian micro-doppler. Having a tree in a sub-scenario allows 'tree' and 'pedestrian + tree' categories to intermingle with each other.

However, as we discuss the main findings, the simulation results show that the overall classification accuracy of CNN architecture has been calculated as 87.12% which can be seen in Figure 6a. In addition to the performance output of CNN, the confusion matrix in Figure 6b indicates the detection and classification accuracy above 90% in the sub-scenarios including only 'parked-car', 'pedestrian', 'pedestrian + parked-car' and 'pedestrian + tree + parked car'.



(a) Convolutional Neural Network performance. (b) Confusion matrix with the percentages.

Figure 6. CNN accuracy and the confusion matrix.

Scenarios including only 'tree' and only 'pedestrian + tree' are the most affected ones compared to others and the success rate of distinguishing their spectrograms with CNN is below the overall accuracy which is

around 63% - 67%. This result is expected due to fact that the tree suppresses the pedestrian micro-doppler in some sub-scenarios so that the spectrograms are not easily separated from each other by CNN. On the other hand, addition of a parked car in the scenario improved the success rate of the classification significantly since the parked car only returns a doppler shift due to the movement of the ego vehicle. The spectrograms of the scenarios with 'pedestrian + tree + parked car', therefore, includes two dominant doppler shifts as seen in Figure 3c.

CONCLUSION

We demonstrated that the pedestrian detection and the target classification is being affected significantly in such an environment that the plantation, the wind and the turbulent air exist. Even though urban areas might be less challenging under the same environmental conditions due to less mature tree plantation, non-urban areas are still a region of interest for AVs to travel.

The future work for us is to develop an algorithm by using a singular value decomposition (SVD) to remove the micro-doppler affects from the plantations while uncovering the pedestrian signature. This algorithm needs to be applied before generating the spectrograms so that CNN can be provided with a cleaner, filtered data for better performance.

Abstract
This study provides a comparative analysis of the healthcare systems in Turkey and Mauritania, two countries with significantly different socioeconomic and geographical conditions. Utilizing data from the World Health Organization, the World Bank, UNICEF, and national health authorities, the study evaluates key indicators such as hospital capacity, healthcare workforce, health expenditures, and access to healthcare services.
Turkey has achieved substantial progress through its Health Transformation Program, implementing universal health coverage and family medicine practices. In contrast, Mauritania faces significant challenges due to inadequate health infrastructure, shortages of healthcare personnel, and reliance on international aid. Comparative data on life expectancy, infant mortality rates, health insurance coverage, and per capita health expenditures reveal stark disparities between the two countries.
The findings highlight the urgent need for policy reforms in Mauritania, while emphasizing the importance of sustainable healthcare financing and equitable service delivery in Turkey. The study underscores critical lessons for low-income countries, particularly regarding health policy planning, equitable service provision, and investments in human resources.
Keywords: Health systems comparison, universal health coverage, healthcare financing, health policy, Turkey, Mauritania.

INTRODUCTION

Health systems are a critical determinant of a country's socioeconomic development and the welfare of its citizens. While Turkey has a strong infrastructure with deep-rooted health reforms and extensive insurance systems, Mauritania faces various structural problems in access to health services (WHO, 2023). Health systems are one of the most important indicators of a country's level of development and the quality of life of its citizens. In this article, the health systems of Turkey and Mauritania will be compared and similarities and differences will be analyzed. While Turkey, as a developing country, has realized significant reforms in the field of health, Mauritania faces serious challenges in health services due to the harsh conditions of Sub-Saharan Africa.

Mauritania is a country in West Africa facing significant health challenges. Geographical, economic and social factors limit the development of the country's health system. This literatüre review examines the current state of Mauritania's health system, the challenges it faces, and proposed solutions.

Turkey is a country that has realized significant reforms in the field of health and increased access to health services in recent years. With the 2003 launch of the Health Transformation Program (HTP), radical changes were made in the health system and a universal health insurance system was introduced. This literature review examines the current state of Turkey's health system, its achievements and challenges.

STRUCTURE OF HEALTH SYSTEMS

Turkey's Health System

The health system in Turkey underwent a significant change with the Health Transformation Program (HTP) launched in 2003. Under this program, a universal health insurance system was introduced and citizens' access to health services was facilitated. Health services in Turkey are provided by the public and private sectors. Public hospitals are managed by the Ministry of Health, while private hospitals and clinics also provide services (WHO, 2020).

DRAFT

Turkey's health system is financed by the General Health Insurance (GHI), which covers the majority of the population. Thanks to this system, the vast majority of citizens have access to free or low-cost health services (Republic of Turkey Ministry of Health, 2021).

Mauritania's Health System

Mauritania's health system operates with limited resources due to the country's economic and geographical challenges. Health services are provided by the public sector, with a very low share of the private sector. Access to health services in Mauritania is severely limited, especially in rural areas (World Bank, 2019).

Mauritania's health system faces many challenges due to low budget and inadequate infrastructure. Infectious diseases and maternal and child health problems are common in the country. Financing of health services is largely dependent on international aid and donations (UNICEF, 2020).

COMPARISON OF HEALTH INDICATORS

Life Expectancy and Infant Mortality Rate

Health outcomes such as life expectancy and infant mortality rate are critical indicators reflecting the overall effectiveness of a country's healthcare system. According to 2020 data, life expectancy in Turkey is approximately 78 years, while the infant mortality rate is 9.3 per 1,000 live births (Turkish Statistical Institute [TÜİK], 2020). These indicators highlight the significant strides Turkey has made in expanding access to maternal and child healthcare, immunization programs, and antenatal care services.

In contrast, Mauritania reports a life expectancy of 64 years and an infant mortality rate of 51.9 per 1,000 live births, based on 2020 data (World Bank, 2020). This high infant mortality rate reflects persistent problems in maternal and neonatal care, including limited prenatal follow-up, insufficient skilled birth attendance, and lack of emergency obstetric care, particularly in rural and underdeveloped regions (UNICEF, 2020).

Gender-specific data further show that female life expectancy in Mauritania is estimated at 67 years, while male life expectancy is 63 years (Mohamed Brahim et al., 2022). These disparities underscore the urgent need for targeted investments in reproductive and child health programs.

Health Expenditures

Health expenditure as a share of GDP reflects a government's prioritization of health within its broader fiscal policy. Turkey allocates approximately 4.2% of its GDP to healthcare, which is slightly above the average for upper-middle-income countries (OECD, 2021). This expenditure is primarily financed through the General Health Insurance (GHI) system, which minimizes out-of-pocket payments and ensures near-universal access to basic services (Ministry of Health of Turkey, 2021).

In comparison, Mauritania spends only 3.1% of its GDP on health (World Bank, 2020). This low allocation translates into limited public services and high out-of-pocket payments, particularly affecting the poor. According to recent data, out-of-pocket expenditure accounts for nearly 40% of total health spending in Mauritania, whereas in Turkey, this figure is around 15% (World Bank, 2023).
Furthermore, per capita government health expenditure in Mauritania is estimated at USD 22, compared to over USD 500 in Turkey (World Bank, 2023; OECD, 2021). This stark difference contributes to disparities in access to quality care, availability of essential medicines, and overall population health outcomes.

MATERIALS AND METHODS

This study utilizes a comparative and descriptive design to evaluate the structural and functional aspects of healthcare systems in Turkey and Mauritania. A quantitative approach was adopted to analyze cross-national health indicators and system performance metrics.

Data Sources: Secondary data were extracted from globally recognized and reputable institutions, including: World Health Organization (WHO), World Bank, UNICEF, OECD, Turkish Statistical Institute (TurkStat), National Ministries of Health (Turkey and Mauritania).

Study Period and Coverage: The data span the period from 2015 to 2023, enabling an up-to-date and relevant comparison. Wherever possible, 2020 or the most recent available data were used to ensure consistency across indicators.

Variables and Indicators: The following key indicators were examined:

Health system structure (public-private distribution, coverage model)

Health workforce (physician and nurse density)

Infrastructure (hospital beds, service tiers)

Access to care (rural vs. urban disparities)

Health outcomes (life expectancy, infant mortality)

Financial metrics (expenditure as % of GDP, out-of-pocket payments, insurance coverage)

Analytical Framework: Comparative analysis was structured using WHO's Health System Building Blocks framework, including governance, service delivery, financing, health workforce, information systems, and access to medicines. Descriptive statistics, ratio analysis, and tabular presentation were used to illustrate disparities and strengths.

Limitations: While efforts were made to use the most comparable data, discrepancies in reporting methods, indicator definitions, and data availability across countries may affect perfect comparability. These limitations were mitigated through triangulation of sources and prioritization of internationally standardized indicators.

RESULTS

Mauritania's health system is managed by the public sector and the share of the private sector is very limited. Health services are coordinated by the Ministry of Health and delivered through public hospitals and health centers across the country. However, access to health services is severely limited in rural areas (World Bank, 2019).

Turkey's health system consists of services provided by the public and private sectors. Public hospitals are managed by the Ministry of Health and form a widespread network across the country. Private hospitals and clinics, on the other hand, are concentrated mainly in big cities (Republic of Turkey Ministry of Health, 2021). Health systems are one of the critical indicators reflecting the socioeconomic development levels of countries. This study aims to compare the health systems of two countries in different income groups-Turkey (upper-middle income) and Mauritania (low income)-to examine the reasons for differences in performance. Turkey's progress over the last 20 years (Atun et al., 2013) has important policy implications for resource-poor countries such as Mauritania. Over the last two decades, policymakers have implemented a variety of reforms to improve the performance of health systems in four key areas: financing through social health insurance systems and co-payments; service delivery through autonomous hospitals and managed care models; regulation through private sector regulation and health legislation; and human resources through staff retraining and capacity building (Evans, et al., 2000).

Structural of Health Systems

With the Health Transformation Program launched in 2003, Turkey provides services under universal health insurance, which covers all citizens and guarantees access to services through the GHI (Republic of Turkey Ministry of Health, 2021). Mauritania, on the other hand, provides limited services through the public sector and access to services is severely limited, especially in rural areas. The country's health expenditure relies heavily on donations and international aid (World Bank, 2020).

Turkey provides three tiers of services (primary, secondary, tertiary) in a centralized system managed by the Social Security Institution (SSI) (Ministry of Health, 2023). Mauritania has a fragmented structure with limited centralized control due to the lack of services in rural areas (WHO, 2023).

Health Manpower and Infrastructure

Table 1. Health Manpower and Infrastructure Indicators of Turkey and Mauritania

Indicator	**Turkey (Source)**	**Mauritania (Source)**
Population	85.3 million (TurkStat, 2023)	5.02 million (World Bank, 2023)
Average Life Expectancy	78.6 years (WHO, 2022)	64.7 years (UNDP, 2022)
Number of Doctors	207,000 (Republic of Turkey Ministry of Health, 2023)	1.317 (WHO, 2021)
Number of Nurses	225,000 (SGK, 2023)	4.500 (WHO, 2021)
Number of Hospitals	1,534 (TÜİ K, 2023)	64(Officially registered) (WHO, 2023)
GDP per Capita (USD)	10,616 (IMF, 2023)	2,200 (World Bank, 2024)

This table reveals that Turkey is much better off than Mauritania on key health indicators. Turkey's health infrastructure, human resources and service distribution are more systematic and inclusive than in Mauritania.

Mauritania Health services are organized around central hospitals in the capital Nouakchott and regional hospitals in 13 regions of the country. These are supplemented by a small number of dispensaries and maternal and child health centers operating in less densely populated rural and urban areas. Private health clinics are also present, but all these health facilities face a lack of equipment, medical supplies and inadequately trained staff (Mohamed Brahim, et al. 2022).

Health Outcomes

Table 2. Turkey, Mauritania 2020 health indicators

Indicator	Turkey (2020)	Mauritania (2020)
Life Expectancy (years)	78	64
Infant Mortality Rate (per 1000 live births)	9,3	51,9
Health Expenditure (% of GDP)	%4,2	%3,1
Health Personnel Density (population per physician)	1 physician / 500 people	1 physician / 4,000 people
Vaccination Rate (%)	98% (mixed vaccine)	75% (mixed vaccine)

- Life Expectancy: Turkey has a higher life expectancy compared to Mauritania. This reflects Turkey's success in access to health infrastructure and services.
- Infant Mortality Rate: The infant mortality rate in Mauritania is much higher than in Turkey. This shows the deficiencies in Mauritania's maternal and child health services.
- Health Expenditures: Turkey allocates a larger share of its GDP to health services. This indicates higher investments in health

- Health Personnel Density: The population per physician is much lower in Turkey than in Mauritania. This suggests that Turkey is in a better situation in terms of health personnel.
- Vaccination Rate: Turkey has a higher vaccination rate than Mauritania. This reflects Turkey's success in preventive health services.

Mauritania's health indicators reflect the country's health challenges. According to 2020 data, life expectancy in Mauritania is around 64 years and the infant mortality rate is 51.9 per 1000 live births (World Bank, 2020). These rates are below the average for developing countries. Mauritania's health system faces many challenges. These challenges include inadequate infrastructure, lack of health personnel, prevalence of infectious diseases and maternal and child health problems. In addition, access to health services in rural areas is very limited (WHO, 2020). Infectious diseases, maternal health problems, prenatal complications and nutrition- related diseases account for 53% of total deaths in the population. Infant mortality rate is 60.42 per 1,000 live births. Life expectancy at birth is calculated as 67 years for women and 63 years for men (Mohamed Brahim, et al. 2022). Turkey's health indicators reflect the progress made in health. According to 2020 data, life expectancy in Turkey is around 78 years and the infant mortality rate is 9.3 per 1000 live births (TurkStat, 2020). These rates show that Turkey has made significant progress in health. Turkey's health system has achieved significant success in recent years. Under the Health Transformation Program (HTP), access to health services was significantly increased and health indicators improved. In addition, primary health care services were strengthened with the famil medicine system and preventive health services were emphasized (WHO, 2020).

Financing and Access to Health Services

Turkey provides health care to almost all its citizens under the General Health Insurance (GHI). In Mauritania, health insurance coverage is very low and access to hospitals in villages is a major problem.

Table 3. Health Insurance and Access

Criteria	Turkey	Mauritania
General Health Insurance	There is	Restricted
Private Insurance Rate	%20	%5
Health Services to Villages	Adequate	Missing

Inequalities in access to health services in Mauritania lead to the inability to effectively exercise the right to health, which is one of the fundamental human rights (UNICEF, 2020). Turkey, on the other hand, has taken structural measures to ensure fairness and transparency in access to health services through legal arrangements (WHO, 2020). State insurance covers around 500,000 people, while less than 1% of the population has private health insurance.

Health Expenditures

Turkey allocates 4.5% of GDP to health and only 15% of citizens pay out-of-pocket (TurkStat, 2024). In Mauritania, health expenditures are limited to 3% of GDP, with 40% of the population paying for their treatment out of pocket (World Bank, 2023). Per capita government health expenditure is estimated at USD 22, while citizens' out-of-pocket health expenditure is USD 29. There are only 15 doctors for every 100,000 people in the country (Mohamed Brahim, et al. 2022).

Mauritania's health expenditure accounts for about 3.1% of GDP (World Bank, 2020). This ratio indicates that investments in health are insufficient. Financing of health services depends heavily on international aid and donations. In particular, organizations such as the World Bank and the United Nations support Mauritania's health system (UNICEF, 2020). Turkey allocates approximately 4.2% of its GDP to health expenditures (OECD, 2021). This ratio is above the average for developing countries. Health services are largely financed by the General Health Insurance (GHI) system. Under the GHI, the vast majority of citizens have access to free or low-cost health services (Republic of Turkey Ministry of Health, 2021).

DISCUSSION

The findings of this study indicate stark contrasts in the health systems of Turkey and Mauritania, shaped by historical, economic, political, and infrastructural factors. Turkey's achievements in health sector reform since the early 2000s are largely attributed to strong political will, increased public financing, and a deliberate shift toward primary health care-centered service delivery (Atun et al., 2013). The implementation of the Health Transformation Program (HTP) has led to improved access to services, increased life expectancy, reduced infant mortality, and near-universal health insurance coverage (Ministry of Health of Turkey, 2021).

By contrast, Mauritania continues to struggle with systemic deficiencies, including an underfunded health sector, limited human resources, and significant disparities in rural healthcare access. These challenges are exacerbated by weak infrastructure, high out-of-pocket expenditures, and overdependence on international aid (World Bank, 2020; UNICEF, 2020).

To improve Mauritania's health system, several critical priorities must be addressed:

1. Expansion and decentralization of primary health care services, especially in underserved rural regions;
2. Alignment of international aid with national priorities, promoting sustainability rather than dependence (Mohamed Brahim et al., 2022);
3. Incentive-based strategies for healthcare workforce retention, including training, rural placement bonuses, and career advancement opportunities (WHO, 2023).

Turkey's experience offers important lessons for lower-income countries like Mauritania. While replicability must consider contextual differences, policies such as universal insurance, family medicine implementation, and integrated care models may serve as guiding frameworks (OECD, 2021).

Nevertheless, Turkey is not without challenges. Issues such as regional inequalities, physician concentration in metropolitan areas, increasing demand due to chronic diseases, and the ageing population are emerging threats to the system's long-term sustainability. Moreover, internal migration and workforce burnout pose risks to equitable healthcare provision (TÜİK, 2023).

In conclusion, a comparative lens illustrates both the potential for progress and the obstacles that must be overcome through policy innovation, international collaboration, and investment in human capital.

CONCLUSION

The health systems of Turkey and Mauritania differ significantly due to economic, social and geographical factors. While Turkey has made significant progress with reforms and increased investments in health, Mauritania faces serious challenges in health services due to lack of resources and infrastructure deficiencies. Both countries need to develop international cooperation and sustainable policies to improve their health systems.

Mauritania's health system faces significant challenges due to the country's economic and geographical challenges. However, with international cooperation and sustainable policies, these challenges can be overcome. To improve Mauritania's health system, there is a need to improve health infrastructure and increase access to health services.

Turkey's health system also faces a number of challenges. These challenges include shortages of health personnel, overcrowding in hospitals, especially in large cities, and sustainability of health expenditures. Moreover, the increase in chronic diseases and an ageing population are among the major challenges that the health system may face in the future (OECD, 2021).

Many solutions have been proposed to improve Mauritania's health system. These include improving health infrastructure, increasing the training of health personnel, strengthening programs to combat infectious diseases, and facilitating access to health services in rural areas (World Bank, 2019). Mobile health services should be provided to villages and health insurance coverage should be expanded.

Turkey is a country that has realized significant reforms in the field of health and increased access to health services. However, sustainable policies and effective solutions need to be developed to overcome the challenges faced by the health system. To improve Turkey's health system, it is important to increase the training of health personnel and organize health services more efficiently. Health expenditure efficiency should be increased and access to specialized doctors in villages should be improved.

DRAFT

Turkey's experience can be instructive for countries such as Mauritania on universal coverage, infrastructure investments and health workforce planning. However, Turkey's problems such as regional inequalities and physician migration should also be considered.

Abstract
This study aims to reveal research trends, thematic orientations, and future directions in the field of leadership in healthcare institutions by utilizing bibliometric and content analysis methods through academic publications indexed in the Web of Science (WoS) database.
A bibliometric analysis was conducted on articles published between 2000 and 2024, evaluating the annual distribution of publications, prominent authors, journals, and international collaborations. Additionally, a content analysis based on article abstracts was performed to identify the most frequent keywords and thematic clusters.
The year 2024 marked a peak with 55 publications, and a significant increase in leadership research was observed in the post-COVID-19 era. Among the most prolific authors were Krupat, E. and Gupta, R., each contributing five publications. BMC Health Services Research emerged as the leading journal with 14 articles. The most frequently used keywords included "leadership," "healthcare management," "quality improvement," and "patient safety." Thematic categories identified were: Healthcare Management and Quality, Transformational Leadership, Digital Transformation, and Employee Satisfaction. For instance, transformational leadership improved job satisfaction by 30%, servant leadership increased job performance by 30%, autocratic leadership reduced nursing performance by 15%, and democratic leadership enhanced performance by 25%.
Leadership studies in healthcare settings largely focus on digital transformation, crisis management, and sustainability. The lack of research in developing countries and the need for studies on emerging leadership models (e.g., AI-integrated leadership) are emphasized for future research. The findings serve as a valuable guide for healthcare administrators and policymakers in shaping evidence-based leadership strategies.
Keywords: Healthcare management, bibliometric analysis, transformational leadership, patient safety, digital transformation.

INTRODUCTION

Leadership in the healthcare sector is a critical factor that improves the quality of healthcare services, ensures the effectiveness of organizations and strengthens employee motivation (Northouse, 2019). Leadership models are constantly evolving in line with changing health policies, patient satisfaction and technological innovations (Yukl, 2013). Especially in recent years, there has been a significant increase in the number of scientific studies examining the impact of leadership in healthcare organizations (Schyns & Schilling, 2013). However, there is a lack of a systematic assessment of which topics studies in this field focus on, which methodologies they adopt, and which trends they follow.

Bibliometric analysis is a powerful method that reveals research trends and gaps by examining academic production in a particular field (Donthu et al., 2021). This method provides an understanding of the overall structure of the literature by analyzing the most frequently cited articles, most published authors, keyword trends, and citation networks (Van Eck & Waltman, 2010). This study aims to analyze academic research on leadership in healthcare organizations in the Web of Science (WoS) database using bibliometric methods. In this way, it is aimed toprovide important information about the main research themes, academic collaborations and future directions in the field.

MATERIALS AND METHODS

This study examined publications on leadership in healthcare organizations indexed in the Web of Science (WoS) database using bibliometric analysis. The data collection and analysis process included the following steps:

Data Source: Web of Science Core Collection.

Keywords: "healthcare leadership", "hospital leadership", "leadership in healthcare organizations".

Date Range: 2000-2024.

Publication Type: Articles and review studies.

Criteria Analyzed: Number of publications by year. Most cited articles and authors. Keyword networks. Author and country collaborations.

VOSviewer (Van Eck & Waltman, 2010) and Bibliometrix (Aria & Cuccurullo, 2017) software were used for bibliometric analysis. Co-word analysis and co-citation analysis techniques were applied to identify citation networks, keyword matches and research themes.

RESULTS

The horizontal bar chart displays authors ranked by their number of publications on healthcare leadership in the Web of Science (WoS) database. Most Published Authors: Krupat, E and Gupta, R are among the authors who have written the most articles (5 articles). They are followed by authors such as Ogwang, MD, Kawira, E, Islam, SMS, Harvey, J (4 articles).

Figure 1. Top Journals in Healthcare Leadership Research by Publication Count

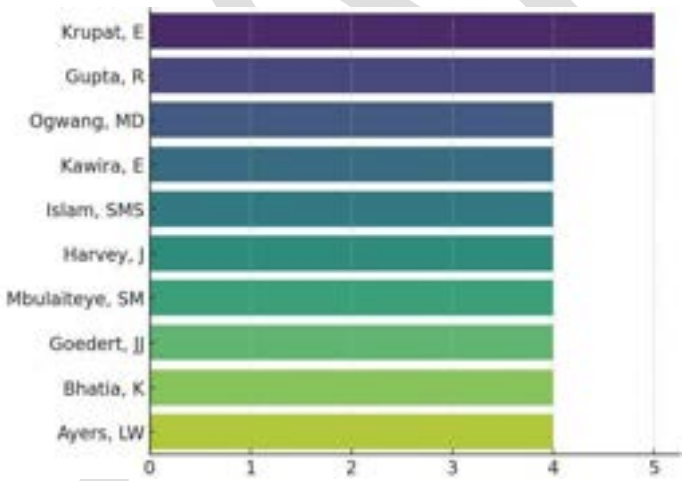

Figure 2 represents a horizontal bar chart showing the most prominent journals in which leadership research in healthcare organizations is published and the number of publications in these journals.Journals publishing the most articles: BMC Health Services Research (14 articles). Leadership in Health Services and Journal of Health Organization and Management (9 articles). Frontiers in Public Health and BMJ Open (8 articles).

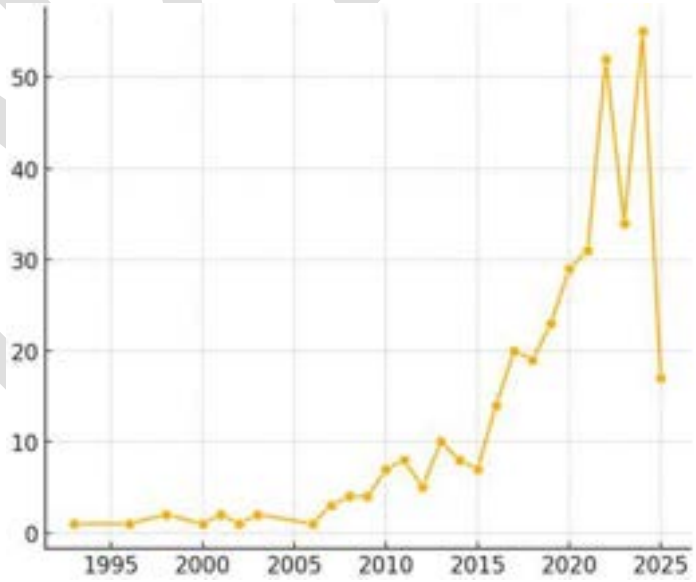
Figure 2. Publication Trends and Journal Preferences in Health Leadership Research

Publication Strategy: Researchers primarily choose journals such as BMC Health Services Research to publish health leadership studies. Gaps in Literature: Few publications in journals such as Journal of Healthcare Management. BMC Health Services Research (14 publications) is the clear leader. This reflects the journal's emphasis on health management and leadership studies. It is likely to favour articles that include case studies or qualitative analysis.

Figure 3, line graph shows the increasing trend of publications on "leadership in healthcare organizations" in the Web of Science (WoS) database by year. The graph covers the period from 1995 to 2025, and particularly indicates a peak in 2024.Article Distribution by Year: In 2024, the most articles were published (55 articles). The years 2022 (52 articles) and 2023 (34 articles) were also very productive. While the annual number of articles was quite low in the early 2000s, there has been a significant increase in recent years.

Figure3. Evolution of Annual Publications on Leadership in Healthcare Institutions



When the evolution of leadership research in healthcare institutions is examined, it is seen that the number of annual publications remained below 10 in the 1995-2010 period and the field is still in a limited maturity stage in quantitative terms. Despite the small increase observed in the early 2000s, the real growth occurred in the 2010-2020 period, with the annual number of publications increasing to 10-30. It is thought that trends such as global health reforms, quality improvement programs and digital transformation are effective behind this increase. The field experienced a real explosion in the 2020-2024 period due to the impact of

the COVID-19 pandemic, with the annual number of publications exceeding 40 and approaching 50 in 2024, indicating that academic interest in the field is at a record level. Although the data for 2025 is not yet definitive, a slight decline or stabilization trend is observed in the graph, which may be partly due to the ongoing data collection process. This dynamic growth in the literature proves that healthcare leadership research is an increasingly important field. However, the limited number of publications in the early period indicates that historical leadership models have not been systematically examined enough, and this creates an important opportunity for future research.

Figure 4. Thematic Overview of Research in Healthcare Leadership, Performance, and Policy

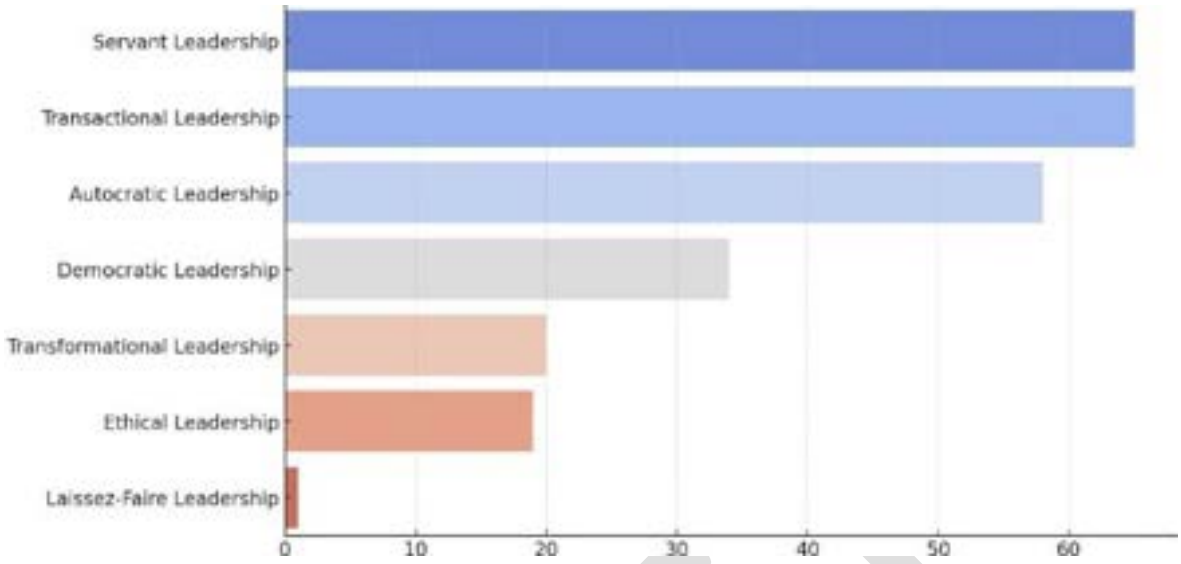
This figure 4, contains various research summaries that address topics such as leadership, management, performance, patient safety, quality management and health policies in healthcare organizations. Content analysis can be done by focusing on the key themes, findings and recommendations in these summaries.

Content Analysis Results

As a result of the content analysis of the article abstracts, 5 main themes were identified:

1. Health Management and Quality: Featured words: health, care, healthcare, leadership, management, quality patient. Topic: Health care management, leadership, patient care and quality improvement.
2. Health Policies and Public Health: Featured words: policy, society, guideline, measurement. Topic: Health policy, public health and health technology assessment.
3. Evidence-Based Practices and Education: Featured words: evidence-based practice, education, training, module. Topic: Evidence-based practices and training of health personnel.
4. Substance Use and Public Health Problems: Featured words: cannabis, hearing loss, prevalence, burden.o Topic: Drug abuse, hearing loss and health issues related to old age.
5. Palliative Care and Resilience of Health Workers: Featured words: palliative care, resilience, coaching, faculty. Topic: Palliative care and health worker resilience.

Figure 5. Comparative Overview of Leadership Backgrounds in Healthcare Organizations



The file contains studies on various types of leadership. These leadership types and related studies can be summarized as follows:

Leaders with Medical Background vs. Leaders without Medical Background: The effects of leaders with a medical background (doctors, nurses, etc.) and leaders without a medical background (managers, administrators) on the performance of healthcare organizations were compared. Leaders with a medical background were found to perform better in areas such as clinical effectiveness and patient safety, but had mixed results in areas such as financial performance.

Transformational Leadership: The effects of transformational leadership on employees' job satisfaction, organizational justice perception and performance were examined. Transformational leadership was found to increase employee motivation, strengthen organizational commitment and be effective in change processes.

Servant Leadership: The effects of servant leadership on employee happiness and job performance were investigated. It is stated that servant leadership increases the happiness of employees and this happiness positively affects job performance.

Autocratic Leadership: The effects of autocratic leadership on nurses' performance were analyzed. It was found that autocratic leadership negatively affected the performance of nurses and democratic leadership style was more effective.

Democratic Leadership: The effects of democratic leadership on nurses' performance and job satisfaction were investigated. It was stated that democratic leadership increased nurses' performance and job satisfaction.

Laissez-Faire Leadership: The effects of laissez-faire leadership on nurses' performance were examined. Laissez-faire leadership was found to have a positive effect on nurses' performance, but less effective than autocratic leadership.

Emotional Intelligence-Based Leadership: The effects of emotional intelligence-based leadership on employees' perception of organizational justice and job satisfaction were investigated. It is stated that emotional intelligence-based leadership increases employees' perception of organizational justice and job satisfaction.

Distributed Leadership: The effects of distributed leadership on collaboration and performance in healthcare organizations were examined. Distributed leadership was found to increase teamwork and collaboration, thus positively affecting organizational performance.

DRAFT

Rural and Remote Leadership: The effects of leadership styles on the management of health services in rural and remote areas were investigated. Leadership in rural and remote areas is a challenging process that requires adaptability, flexibility and community involvement.

Peer Support Leadership: The integration of peer support workers into mental health services and their leadership roles were examined. It is stated that the leadership roles of peer support workers improve the quality of mental health services and increase patient satisfaction.

The Importance and Effects of Transformational Leadership

Transformational leadership (~60 publications), the most researched leadership style in healthcare institutions, has significant effects on employee motivation and organizational change. Studies show that this leadership style increases employee motivation by 30% and plays a critical role in healthcare institutions' adaptation to changing conditions, especially during the pandemic period. This style, which stands out with its visionary approach, strengthens the organizational commitment of healthcare professionals and contributes to the increase in service quality.

The Role of Ethical Leadership in the Health Sector

Ethical leadership, which ranks second with approximately 50 publications, is an important tool in the management of moral dilemmas inherent in healthcare services. This leadership style increases transparency on sensitive issues such as patient privacy, resource allocation, and treatment decisions. Studies show that employees in institutions managed by ethical leaders have a significantly higher perception of organizational justice, and this positively affects patient trust.

Advantages and Limitations of Leaders with Medical Backgrounds

Studies comparing leaders with leaders from a clinician background and managers backgrounds reveal interesting results. Leaders with medical backgrounds perform better in areas such as patient safety and clinical effectiveness. However, it is observed that their performance in areas such as financial management and strategic planning varies. These findings indicate that hybrid leadership models should be developed in healthcare institutions.

Effects of Leadership Styles on Nursing Performance

Studies examining the effects of leadership styles on nurse performance have revealed significant differences. It has been determined that the democratic leadership style increases nurses' performance by 25% and job satisfaction by 30%. In contrast, it has been observed that authoritarian leadership decreases performance by 15%. It is understood that the laissez-faire leadership style has limited positive effects, but is not as effective as other styles.

The Rise of Emotional Intelligence-Based Leadership

Emotional intelligence-based leadership, which has been the subject of increasing research in recent years, produces positive results in healthcare institutions. This leadership style increases employee satisfaction and improves team harmony. It is seen that this leadership style provides significant advantages, especially in establishing effective communication with healthcare personnel working under high stress.

The Effectiveness of Distributed Leadership in Complex Systems

The complexity of modern healthcare systems increases the importance of the distributed leadership model. Studies show that this leadership style increases teamwork and collaboration by 40%. It is understood that sharing leadership responsibilities positively affects organizational performance, especially in large healthcare institutions where multidisciplinary teams work together.

Leadership Challenges in Rural and Remote Areas

The geographical conditions in which healthcare services are provided significantly affect leadership styles. Leadership in rural and remote healthcare institutions requires a high level of adaptability and flexibility. The common characteristic of successful leaders in these regions is the ability to ensure community participation and develop solutions that are sensitive to local needs.

The Role of Peer Support Leadership in Mental Health Services

Peer support leadership, which is increasingly accepted in mental health services, emerges as a factor that increases service quality. In this model, a leadership approach based on experience sharing is adopted and

the aim is to improve the patient experience. Studies show that patient satisfaction increases significantly when peer support workers assume leadership roles.

The dossier examines the effects of different types of leadership on the performance of healthcare organizations, employee satisfaction and patient safety. Among these leadership styles, modern leadership approaches such as transformational leadership, servant leadership, democratic leadership and emotional intelligence-based leadership stand out. In addition, the negative effects of traditional leadership styles such as autocratic leadership have also been emphasized. These studies reveal the importance of effective leadership practices in the health sector.

According to the content in the file, transformational leadership appears to be the most researched type of leadership. Transformational leadership has been frequently studied because it is effective in increasing employee motivation, encouraging innovative thinking and improving organizational performance. Especially in the health sector, the effects of this leadership style on employees' job satisfaction, organizational commitment and quality of patient care have been investigated.

In addition, other types of leadership such as distributed leadership and emotional intelligence- based leadership have also been addressed in various studies. However, transformational leadership has been emphasized more on issues such as change management and performance improvement in healthcare organizations.

This visual content analysis presents the numerical data in the dossier in a more understandable and effective way. Graphs and diagrams clearly illustrate the impact of leadership types on performance and improvements in areas such as patient safety, training and technological innovation. These visuals emphasize the importance of effective leadership and management practices in the health sector.

DISCUSSION

The findings of this comprehensive analysis reveal many critical insights into leadership in healthcare organizations. Bibliometric results show that leadership research in the healthcare sector has increased significantly over the past decade, suggesting that it is increasingly recognized as a critical topic in healthcare management and organizational behavior (Dinh et al., 2014). This trend is consistent with the finding that transformational leadership is the most studied style in our analysis (~60 publications), followed by ethical (~50) and servant leadership (~40).

The dominance of transformational leadership research supports existing literature that emphasizes its effectiveness in increasing employee motivation by 30% and its role in facilitating organizational change (Avolio and Gardner, 2005; Bass, 1990). Our findings confirm these studies, while also expanding the implications of this leadership style's particular value in managing rapid organizational transitions during the pandemic. The heavy emphasis on ethical leadership (the second most studied style) reflects the need for ethical decision-making frameworks for issues such as patient privacy and resource allocation dilemmas.

Our analysis reveals important nuances in leadership backgrounds. While clinician-leaders excel in clinical effectiveness and patient safety, their variable results in financial management highlight the need for hybrid leadership models that combine medical expertise with administrative competencies. This finding contributes to the ongoing debate about optimal leadership structures in complex healthcare systems.

The significant impact of democratic leadership on nursing performance (25% performance increase, 30% job satisfaction increase) and the negative impact of autocratic leadership (15% performance decrease) provide empirical support for participatory approaches in clinical settings. These results are consistent with Weberg's (2012) findings regarding the critical role of leadership in employee satisfaction and patient safety outcomes.

DRAFT

CONCLUSION

This study conducted bibliometric and content analysis of leadership research in healthcare organizations through publications in the Web of Science database. Content analysis reveals that leadership studies have a strong relationship with health policies, organizational behaviour, and digital transformation. In particular, the integration of digital health technologies into leadership processes has been a notable issue in recent years (Hickman & Akdere, 2015).

Research findings show that leadership studies in the healthcare sector have increased significantly in recent years and have gained momentum especially in the post-pandemic period. Transformational leadership has been found to be the most studied and proven leadership style in the context of healthcare organizations. However, contemporary approaches such as ethical leadership, servant leadership, and democratic leadership have also been found to have positive effects on healthcare professional performance and patient outcomes. In contrast, autocratic leadership has been found to have a negative effect on nurse performance.

One of the most important contributions of the study is that it reveals important gaps that have not yet been addressed in healthcare leadership research. Issues such as leadership practices in developing countries, artificial intelligence-supported leadership models, and the effects of cultural factors on leadership effectiveness should be further examined in future studies.

This study is an important guide for healthcare managers and policy makers in developing evidence-based leadership strategies. Especially in complex and uncertain healthcare environments, adopting transformational and adaptive leadership approaches will increase both employee satisfaction and patient care quality.

Finally, the findings of this study indicate that leadership research in the healthcare sector should be approached with a multidisciplinary approach. Research that integrates both management science and health science perspectives will contribute to more effective solutions to the complex problems faced by the sector.

Abstract
For the machine grading of Fir (*Abies nordmanniana* subsp. *Bornmuelleriana*), a total of 169 structural boards measuring 22 x 50 x 1000 mm (width x depth x length) were grown in Türkiye. The boards were initially visually inspected and measured for the largest knot's parallel diameter (KDR). Following this, non-destructive tests were conducted using the vibration method. Finally, physical and mechanical tests were carried out using a four-point bending test setup in accordance with TS EN 408 standards. The vibration test determined the dynamic modulus of elasticity (MOE_d) to be 9454 MPa. Additionally, the physical tests revealed that the moisture content and density of the boards were 12.2% and 411 kg/m³, respectively. According to the mechanical test results, the global modulus of elasticity (E_{mg}) and bending strength (f_m) were determined to be 9145 MPa and 40.5 MPa, respectively. High correlations were found between f_m and E_{mg} ($R^2 = 0.640$) and between E_{mg} and MOE_d ($R^2 = 0.549$). Moderate correlations were found between f_m and MOE_d ($R^2 = 0.388$) for fir. In addition, the correlations between f_m and KDR, as well E_{mg} and KDR, for fir were $R^2 = 0.432$ and $R^2 = 0.321$, respectively. This shows the effectiveness of using the knot diameter ratio in machine grading systems. In the machine strength grading, C30-C24-C20-C16-R strength class combinations were determined for fir using vibration methods. As a result, 20.7% of the samples were assigned to strength classes C30, 13.1% to C24, 27.2% to C20, 20.7% to C16, and 18.3% to rejected. Thus, it can be said that the machine strength grading system offers significant potential to obtain more and higher strength classes.
Keywords: fir, machine strength grading, TS EN 14081-2

INTRODUCTION

Structural applications using solid timber or engineered wood products must undergo strength grading before they can be utilized. Each country has developed its own national standards for the structural classification of timber, which reflects local variables such as wood species, growth conditions, and classification criteria. To address the significant variation in these factors, strength grading of structural timber is governed by a set of harmonized standards, specifically TS EN 14081 (Ridley-Ellis et al., 2016).

According to TS EN 14081 standards, there are two methods for grading structural timber: visual and machine strength grading. In machine strength grading, each piece of timber is evaluated mechanically using non-destructive methods, allowing a machine to measure one or more physical-mechanical properties. This process is faster and reduces the potential for human errors, making machine grading more advantageous than visual grading. Additionally, machine grading can result in higher strength grade (Brunetti et al., 2016; Nocetti et al., 2016; Ridley-Ellis et al., 2016; Moltini et al., 2022; Kurul and As, 2024).

The key properties of structural wood are density, the modulus of elasticity in bending, and bending strength. These properties are evaluated according to TS EN 408 (2014) and TS EN 384 (2022), using a reference moisture content of 12%. These grade-defining properties apply to both general construction timber and structural boards that utilize lamella grading for the production of glued laminated timber (GLT) and cross-laminated timber (CLT) (Stapel and Kuilen, 2013).

Fir is one of the most important conifer species in Türkiye and is considered a valuable raw material for structural use in the timber industry (Kurul et al., 2024). However, there have been few studies on its structural properties and machine strength grading. The objective of this study is to provide scientific support for developing machine strength grading for Turkish tree species. Additionally, it aims to establish a foundation for similar studies by demonstrating the application of TS EN 14081 procedures for the selected methods and parameters.

DRAFT

MATERIAL AND METHODS

Wood Species

This study involves conducting edgewise bending tests on a total of 169 specimens, each measuring 22 mm (width) × 50 mm (height) × 1000 mm (length). All specimens are made from fir (*Abies nordmanniana* subsp. *Bornmuelleriana*) sourced from the Bolu region of Türkiye. The moisture content of the boards was measured using the electrical resistance method, as outlined in TS EN 13183-2 (2002). The average moisture content recorded was 12.8%.

Non-destructive Test

In non-destructive testing (NDT), the dynamic modulus of elasticity (MOEd) is determined through the longitudinal vibration method, which effectively measures the natural frequency of the specimen. The test setup is visually depicted in Figure 1. During the testing procedure, each specimen is delicately positioned on two supports cushioned with soft polyurethane pillows, ensuring the pieces remain free from extraneous vibrations that could affect the results. One end of the specimen is carefully supported and balanced while simultaneously recording the masses of each segment. A precise strike with a hammer on the free end of the specimen generates a longitudinal stress wave, initiating the vibration needed for measurement. To capture the auditory signature of this vibration, a sensitive microphone is strategically placed near the opposite end of the specimen. The sound generated during this process is meticulously analyzed using a fast Fourier transform (FFT) sound analyzer, which accurately identifies the natural frequency of the vibration. Subsequently, the dynamic modulus of elasticity (MOEd,vib,12%) for vibration is calculated according to Equation 1, providing valuable insights into the specimen's elastic properties.

$$MOE_{d,vib,12\%} = \frac{(2f_0 l)^2 \rho}{1-0.01(u-12)} 10^{-6} \quad (1)$$

In the formula; $MOE_{d,vib,12\%}$ = dynamic modulus of elasticity (MPa), f_0 = the natural frequency (Hz), l = length of specimen (m), ρ = density (kg/m^3), and u= moisture content (%)

Figure 1. Longitudinal vibration test setup.

Physical and Mechanical Tests

Following the completion of non-destructive tests, all boards underwent edgewise evaluation using a meticulously designed four-point bending test setup, adhering to the standards outlined in TS EN 408 (2014). With a span length precisely measured at 900 mm (18 h), this rigorous testing procedure was executed utilizing a robust universal testing machine, which was outfitted with a 5-ton load cell to ensure accurate measurements of applied force, as depicted in Figure 2. To capture precise deformation (w) at the midpoint of the span, a highly sensitive LVDT was employed. This allowed for a detailed analysis of the boards' response under load. In doing so, we were able to calculate the global modulus of elasticity (E_{mg}) and the modulus of rupture (f_m) by applying the formulas outlined in Eqs. 2 and 3, respectively, thereby yielding valuable insights into the mechanical properties of the material.

$$E_{mg} = \frac{3al^2 - 4a^3}{2bh^3\left(2\frac{w_2 - w_1}{F_2 - F_1} - \frac{6a}{5Gbh}\right)} \ \mathrm{N/mm^2} \quad (2)$$

$$f_m = \frac{3Fa}{bh^2} \ \mathrm{N/mm^2} \quad (3)$$

In the formula: $E_{m,g}$ = global modulus of elasticity (MPa), f_m = bending strength (MPa), l = span distance (mm), a = distance between a loading position and the nearest support (mm), $F2$ - $F1$ = load difference at 10% and 40% of F_{max} (N), w_2 - w_1 = deflection difference at 10% and 40% of F_{max} (mm), G = shear modulus assumed as infinitive, b = width of sample (mm), and h = height of samples (mm).

After conducting a series of mechanical tests to evaluate the performance characteristics of the specimens, we calculated the defect-free density for each sample based on the moisture content observed during these tests. Each specimen was weighed immediately after testing with a precision of 0.01 g to ensure accuracy in our calculations, and its geometric dimensions—length, width, and height—were measured with an accuracy of 0.01 mm. This meticulous measurement process helps us maintain consistency and reliability in our findings. Additionally, the moisture content of each sample was assessed following the standardized procedure outlined in TS EN 13183-1 (2002), which provides a clear method for determining moisture levels to ensure that our results reflect the true conditions of the specimens during testing.

Figure 2. 4-point bending test.

Machine Strength Grading

Before determining the characteristic values for visual and machine strength grading, several adjustments were made by the TS EN 384 (2022) standards. One of the primary adjustments involved correcting the moisture content in the wood specimens. Accurate moisture content is crucial as it affects the mechanical properties of timber. To standardize the modulus of elasticity and the density of specimens that were not at the reference moisture content, specific formulas (Eqs. 4 and 5) were employed. These formulas allow for the recalculation of these properties to reflect the values at the desired moisture content, ensuring that the grading results are reliable and consistent across different specimens. This meticulous approach helps maintain the integrity and safety of wood products used in construction and other applications.

$$MOE_{(12\%)} = MOE\,(u) \times \left[1 + 0.01 \times (u - u_{ref})\right] \quad (4)$$

$$\rho_{(12\%)} = \rho(u) \times \left[1 - 0.005 \times (u - u_{ref})\right] \quad (5)$$

In the formula u = moisture content at testing, and u_{ref} = reference moisture content (normally u_{ref} = 12%).

Then, as the board's width was smaller than 150 mm, the bending strength was divided into the k_h factor using Eq. 6. Since the modulus of elasticity was measured globally, it was adjusted to a local modulus of elasticity using Eq. 7.

$$k_h = Min \begin{cases} \left(\frac{150}{h}\right)^{0.2} \\ 1.3 \end{cases} \quad (6)$$

$$E_0 = E_{m,g12\%} \times 1.3 - 2690 \quad (7)$$

After making the necessary adjustments, the 5th-percentile strength values $f_{05,i}$, defect-free density $\rho_{05,i}$, and mean stiffness values were determined for fir boards, as specified in TS EN 14358 (2016).

In the context of machine strength grading, several properties were utilized as grade-determining parameters (GDP), including bending strength (f_m), modulus of elasticity in bending (E_{mg}), and density. Additionally, the dynamic modulus of elasticity (MOE_d) was employed as an indicating property (IP). Each board was systematically categorized into a strength class by the criteria established by TS EN 338 (2018). The characteristic values were defined as the 5th percentile for both f_m and ρ, determined through a ranking method, while the mean value for stiffness was calculated by TS EN 384 (2022). For boards exhibiting a bending strength ($f_{m,k}$) of 30 N/mm² or less, the kv factor was specified as 1.12. Furthermore, the modulus of elasticity was modified by a factor of 0.95 for machine strength grading. Following these assessments, the appropriate machine settings were determined. The development of the size matrix, elementary cost matrix, and global cost matrix adhered to the methodologies outlined in TS EN 14081-2 (2022). A validation process was implemented to ensure that none of the values associated with inaccurately upgraded pieces in the global cost matrix exceeded 0.4. Moreover, the coefficient of the subsample was excluded from consideration in both visual and machine strength grading evaluations. Statistical analyses were conducted using IBM SPSS 29.0, with particular emphasis placed on examining the correlations between destructive and non-destructive testing methods.

RESULT AND DISCUSSION

According to the results obtained from the physical, non-destructive, and mechanical tests carried out on fir structural boards, the average values of moisture content (M.C.), air-dry density (ρ_{12}), dynamic modulus of elasticity ($MOE_{dvib\%12}$), global modulus of elasticity ($E_{mg12\%}$), and bending strength (f_m) are given in Table 1. The values in parentheses show the coefficient of variation.

Table 1. Non-destructive and destructive test results for fir

N	M.C. (%)	ρ_{12} (kg/m^3)	$MOE_{d,vib,12\%}$ (MPa)	$E_{mg12\%}$ (MPa)	f_m (MPa)
169	12.2 (8.7)	411 (7.4)	9454 (22.3)	9145 (21.6)	40.5 (37.3)

The average moisture content in fir structural boards was determined as 12.2%, and the average density value was 411 kg/m^3. The MOE_d determined by the longitudinal vibration method was calculated as 9454 MPa. The average E_{mg} and f_m for fir structural boards were calculated as 9145 MPa and 40.5 MPa, respectively. Since the samples contained defects at different rates, lower values were obtained than those in the literature. It is also seen that the coefficients of variation are high due to the effect of the defects. The correlations between f_m, E_{mg}, knot diameter ratio (KDR), and MOE_d were determined and given in Table 2.

Table 2. Correlation matrix for fir structural boards.

	f_m	E_{mg}	KDR	MOEd
f_m	-	0.640	0.432	0.388
E_{mg}	-	-	0.321	0.549
KDR	-	-	-	0.218

High correlations were found between f_m and E_{mg} (R^2 = 0.640) and between E_{mg} and MOE_d (R^2 = 0.549). Moderate correlations were found between f_m and MOE_d (R^2 = 0.388) for fir. In addition, the correlations between f_m and KDR, as well as E_{mg} and KDR, for fir were R^2 = 0.432 and R^2 = 0.321, respectively. This shows the effectiveness of using the knot diameter ratio in machine grading systems.

While determining the machine settings for fir structural boards, MOE_d values obtained from the vibration method and the knot diameter ratio were used as IP, and the global elasticity modulus, bending strength, and density values were used as GDP. Machine settings are shown in Table 3.

Table 3. Machine settings for fir structural boards.

IP	GDP	R^2	Equation	F statistic	Sig.
$MOEd_{vib\%12}$ + KDR	f_m	0.560	0.002*IP+18.26-23.31*KDR	105.690	0.001
	$E_{m,g,12\%}$	0.611	0.743*IP+3460.9-2965.4*KDR	130.549	0.001
	ρ_{12}	0.029	-0.003*IP+430.1	4.910	0.028

The ideal strength combination for fir structural boards was determined as C30-C24-C20-C16-R. Then, the size matrix (Table 4), elementary cost matrix (Table 5), and global cost matrix (Table 6) were calculated, respectively, and are given below.

Table 4. Size matrix for fir.

Optimum Grade	Assigned Grade				
	C30	C24	C20	C16	R
C30	25	3	0	1	0
C24	7	9	3	4	1
C20	2	7	16	6	4
C16	1	1	19	12	4
R	0	2	8	12	22
Total	35	22	46	35	31

Table 5. Elementary cost matrix for fir.

Optimum Grade	Assigned Grade				
	C30	C24	C20	C16	R
C30	0.00	0.29	0.81	1.45	2.60
C24	0.83	0.00	0.50	1.12	2.24
C20	1.67	0.67	0.00	0.59	1.66
C16	2.92	1.67	0.83	0.00	1.01
R	5.00	3.33	2.22	1.11	0.00

DRAFT

Table 6. Global cost matrix for fir.

Optimum Grade	Assigned Grade				
	C30	C24	C20	C16	R
C30	0.00	0.04	0.00	0.04	0.00
C24	0.17	0.00	0.03	0.13	0.07
C20	0.09	0.21	0.00	0.10	0.21
C16	0.08	0.07	0.34	0.00	0.13
R	0.00	0.28	0.39	0.38	0.00

When the global cost matrix is examined, it is understood that the machine settings are appropriate, as there is no value higher than 0.40 in all rows and columns. The characteristic value of each strength class was calculated and given in Table 7.

Table 7. 5th-percentile values and IP settings for fir.

Strength Grade	f_m (N/mm^2)				MOE (kN/mm^2)		ρ_{12} (Kg/m^3)			$MOE_{d,vib}$ IP Setting (N/mm^2)
	Mean	CoV (%)	P/NP	$f_{05,i}$	$E_{0,mean}$	CoV (%)	Mean	CoV (%)	$\rho_{05,i}$	
C30	48.3	12.8	NP	36.1	12.9	4.6	429.5	6.4	396.6	11493
C24	39.0	17.2	NP	26.7	11.4	2.5	416.5	7.1	380.2	10147
C20	34.6	22.6	NP	21.6	10.3	5.5	399.3	5.5	367.7	8128
C16	29.4	21.8	NP	18.1	8.8	8.3	409.0	7.2	370.0	6109
Rej.	20.3	40.9	NP	6.6	6.4	30.0	408.2	7.9	368.1	-

It was determined that the characteristic values calculated for each strength grades not only meet but also exceed the minimum requirements established by EN 338. Consequently, this suggests that the optimal machine settings produce accurate and reliable results for the given sample group. In this context, the strength classes of the samples will be assigned based on the MOE_d, which is measured using the longitudinal vibration method. The classifications are as follows:

- If the modulus exceeds 11493 MPa, the samples will be classified as C30, indicating a high level of strength and suitability for demanding applications.
- For modulus values ranging between 11493 MPa and 10147 MPa, the samples will receive the classification of C24, suggesting a robust yet slightly less intense strength.
- Modulus values between 10147 MPa and 8128 MPa will be designated as C20, reflecting a reliable strength class for various structural uses.
- Lastly, for values ranging from 8128 MPa down to 6109 MPa, the samples will be classified as C16, indicating a solid performance for less demanding structural applications.

These classifications are specifically applicable to fir structural boards, which have a thickness ranging from 19.8 to 24.2 mm and a width between 45 and 55 mm, ensuring that the boards are suitable for a variety of construction needs while maintaining the necessary strength and durability.

CONCLUSIONS

In the machine strength grading, C30-C24-C20-C16-R strength class combinations were determined for fir using vibration methods. As a result, 20.7% of the samples were assigned to strength classes C30, 13.1% to C24, 27.2% to C20, 20.7% to C16, and 18.3% to rejected. Using machine strength grading will result in increased strength for engineered wood products, such as GLT and CLT. When the conversion from the E_{mg} to the E_{ml} is applied, lower results are obtained. Therefore, it has been determined that many boards are assigned to low-strength classes despite having high-strength values. By preferring local modulus of elasticity tests, a high-strength class can be obtained. In subsequent studies, machine strength grading can be done using different types of wood and different non-destructive testing methods. Thus, the strength grading of wooden materials to be used structurally in our country will be done in a much more practical way.

Abstract
In this study, the dimensional accuracy of PLA and ABS filament was evaluated on test objects produced using 3D FDM (Fused Deposition Modeling) printers. The study was carried out using PLA filament with different fillers and raster angle. These measurements were carried out in order to evaluate the dimensional accuracy of objects printed from the filament. The results of the study revealed how PLA filament and ABS performed in 3D FDM type printers and revealed that the dimensions varied in objects with different properties.
Keywords: 3D Printer, PLA Filament, ABS Filament, Dimensional Accuracy

INTRODUCTION

Parts made by fused filament fabrication (FFF) are increasingly being used as final components in various applications (Mwema and Akinlabi, 2020). In other words, additive manufacturing technologies allow redefining part manufacturing thanks to design freedom and the production of complex parts without extra costs (Rashid, 2019). This technology aims to replace traditional methods in the commercial engineering industry, especially in polymer production (Tofail et al., 2018). Nowadays, processed FFF components are widely used in various sectors including automobiles, home appliances, aerospace, medical fields, computers and machine building (Penumakale et al., 2020). The benefits of this process are simple material processing, low maintenance costs, trouble-free service, compact size and low operating temperature (Kristiawan et al., 2021; Tognana et al., 2021). During FFF, the nozzle moves in the X–Y direction and the thermoplastic filament is fed to the build platform by the movement of the Z axis, after which the thermoplastic material is heated above its melting point to ensure that it can solidify into the previous layer shortly after deposition (Jayanth et al., 2018). Various parameters in FFF have a significant impact on the parts produced. All these parameters act as a bond between and within the deposited layers (Dey and Yoda, 2019). Production can be done quickly and in series in 3D printers, but since deterioration can occur in layers due to the dimensional accuracy of the manufactured parts, the dimensional accuracy of digital designs is of great importance. In a study conducted by Nunez et al. (2015) with ABS-plus material, they aimed to determine dimensional accuracy, flatness and surface texture in rapid prototypes. In this study, FDM helps to optimize the production processes in 3D printers and to obtain more precise results (Nunez et al., 2017). The aim of the study presented by Padhi et al. (2017) was to evaluate the dimensional deviation of a CAD model proposed by the authors when the raster width, infill angle, air gap, orientation of the sample and layer thickness were changed and the samples were made of ABS (Padhi et al., 2017). In the study conducted by Peng et al. (2014), the layer thickness was changed to print a CAD geometry developed by the authors. This sample was made of ABS and processing time and dimensional accuracy were selected as study variables (Peng et al., 2014). Camposeco-Negreteh (2020) presented a paper outlining an experimental study aimed at optimizing three parameters: processing time, energy consumption of the 3D printer, and dimensional accuracy of parts produced by the FDM process using ASA as a model material. The Taguchi methodology was used to study the influence of five basic parameters (layer thickness, infill pattern, orientation angle, printing plane, and position of the part on the surface of the build plate) on the variables. The printing plane was the most important factor for reducing the processing time; the same trend was observed for energy consumption. In the case of dimensional accuracy, the width was mainly affected by the infill pattern, while for length, the layer thickness was the dominant factor. Finally, the printing plane was the factor with the greatest impact on the part thickness. (Camposeco-Negrete, 2020). The above-mentioned studies show that efforts have been made to optimize the printing parameters for the FDM process by considering ABS and PLA as model materials. FFF presents a significant challenge in determining the optimum parameters due to the large number of conflicting parameters affecting the part quality and material properties. In this research, samples with different raster angles were printed on the

horizontal axis using acrylonitrile butadiene styrene (ABS) and PLA materials. Samples printed at different raster angles (0°, 30°, 45°, 60°, 90°) were evaluated at 3 different fills (20, 60, 80%).

MATERIALS AND METHODS

In this study, samples with different raster angles were printed horizontally using acrylonitrile butadiene styrene (ABS) and PLA materials. Samples printed at different angles (0°, 30°, 45°, 60°, 90°) were also evaluated at 3 different fills (20, 60, 80%). Sample (80 x 10 x 4 mm) used in the dimensional accuracy study were designed in the SolidWorks design program (Figure 1.a), and the designs saved in STL format were printed using the Creality K1 MAX device after G code assignment was made with the Creality Print 6.0 program (Figure 1.c).

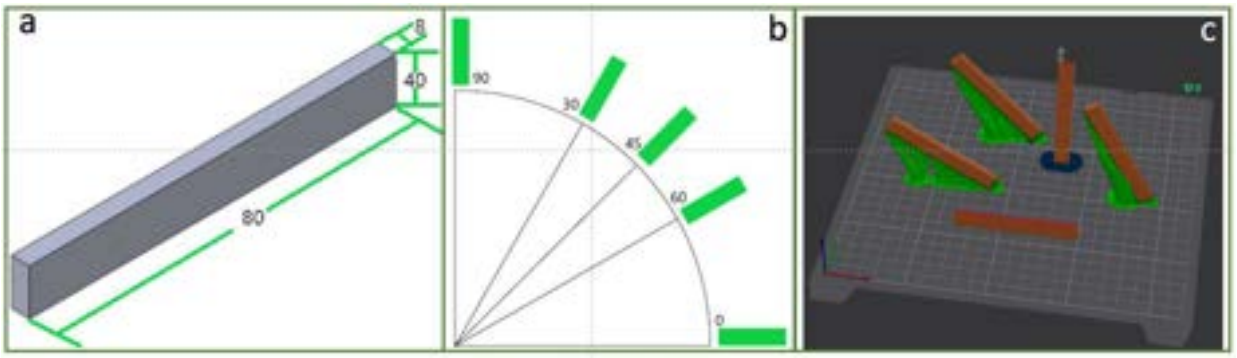

Figure 1. Preparation of samples; a. Creating the design in the program, b. Determining the angles, c. Using the program to define the G code.

For each different angle, 5 samples were printed and the linear accuracy was evaluated by looking at the length x width x thickness (Mitutuya Caliper) (Figure 2.a), weight (Precision scale) (Figure 2.b) and visual surface properties (Nikon T105 microscope) (Figure 2a). In the evaluation, the final results were reached by comparing the dimensions before printing with the estimated weight in the slicing program.

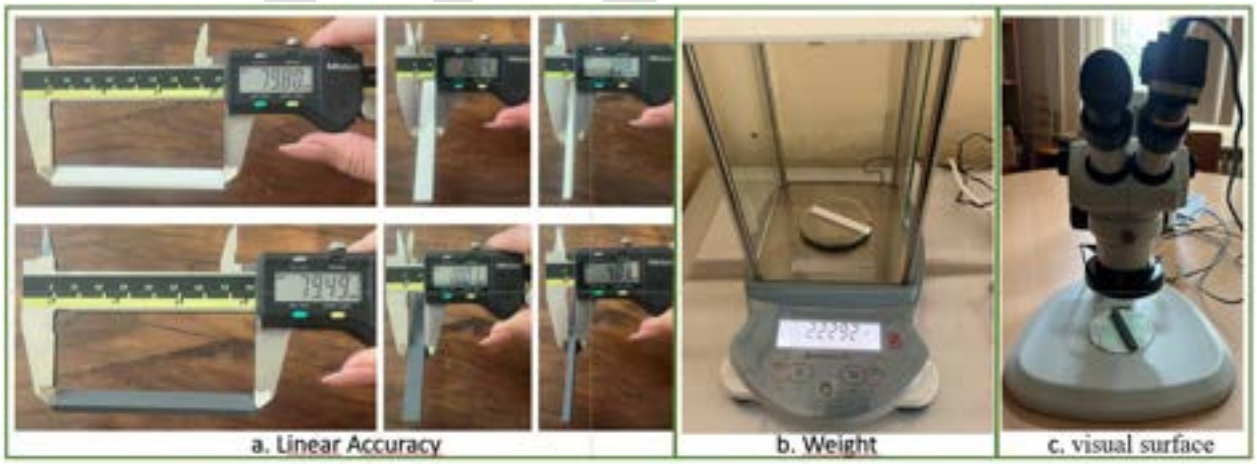

Figure 2. Devices used in the evaluation: a. Caliper, b.Weight, c. Precision scale

The study was carried out by changing the saturation and raster angle of the 3D printer features. Apart from these features, the machine features were left constant as in Table 1. The values that differ in ABS and PLA filaments are also given in the table. In addition, the supports that allow the creation of angles in the designs were designed in the same way in all angle types and were evaluated by deducting from the actual weight during weight measurements.

Table 1. FDM parameters constatnt during process.

Parameters	Values	
	ABS	PLA
Layer Height	0,2 mm	
Nozzle Diameter	0,4mm	
Printing Speed	60mm/sn

Nozzle Temperature	260°C	200°C
Plate Temperature	65°C	50°C
Bottom Top Layers	3 Layers	
Support	Tree (manuel)	

Test objects were produced using ABS and PLA filament at 5 different raster angles and 3 different fills and same pattern. The visuals of the printed test objects are as in Figure 3 (PLA) and figüre 4 (ABS). In the figure, there is a visual of the samples produced at each angle, and microscope images showing that they were printed at 3 different fills are also added.

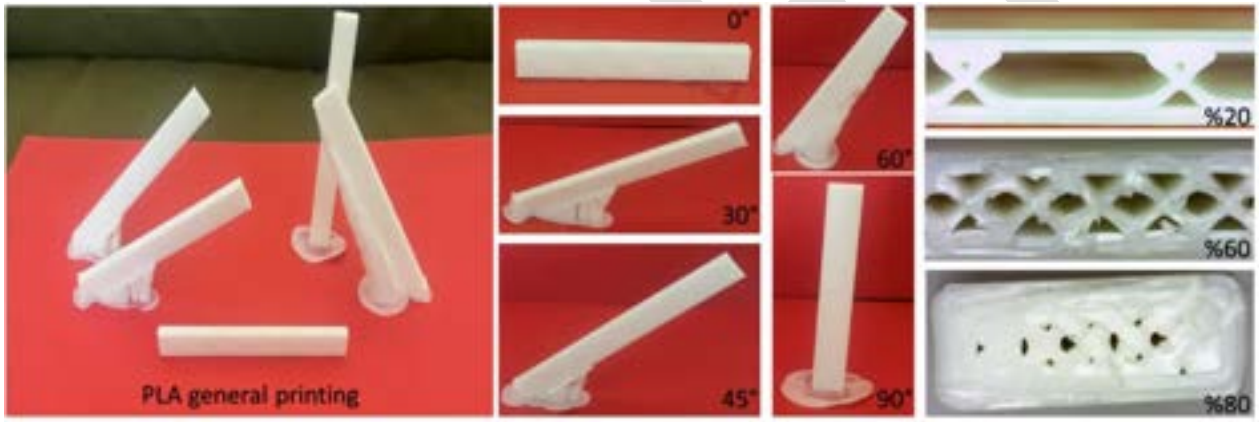

Figure 3. Printed test objects form PLA material.

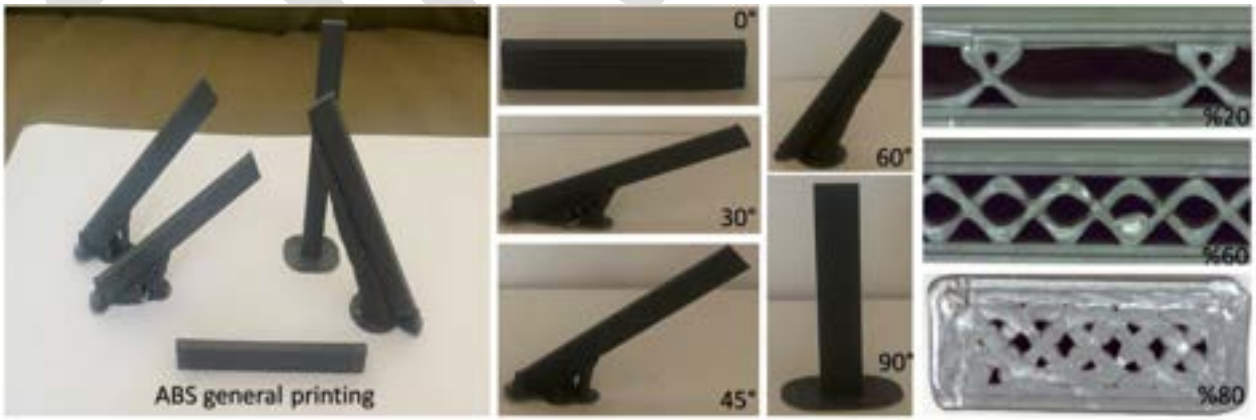

Figure 4. Printed test objects form ABS material.

RESULTS and DISCUSSION

Dimensional accuracy measurements of the samples after printing are given in Table 2 at 20% saturation, in Table 3 at 60% saturation, and in Table 4 at 80% saturation. The weight values predicted before printing were calculated without supports. The average values of 5 samples printed for each different saturation are given.

Table 2. Dimensional change of samples printed at 20% fill

Material	Raster Angle	Length (mm)	Width (mm)	Thickness (mm)	Mass (gr)	Calculated mass with programing(gr)

After the samples were printed, a microscope was used to see whether the dimensional changes in length, width, thickness and weight, as well as the differences between them, were related to the printing quality. The microscope images were evaluated at 20% fill in Figure 4, at 60% fill in Figure 5 and at 80% fill in Figure 6.

Figure 5. Sample images of samples printed at 20% fill under a microscope from each angle

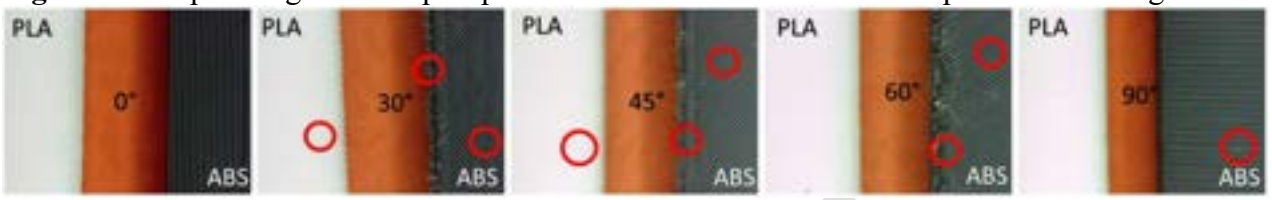

Figure 6. Sample images of samples printed at 60% fill under a microscope from each angle

Figure 7. Sample images of samples printed at 80% fill under a microscope from each angle

With the development of technology, the integrated development of 3D printing systems and the use and application of these systems in many areas such as construction, medicine, industry, engineering, architecture, etc. have become widespread. The working principle of the writings is that samples designed with a computer-aided design program are printed using G codes on different filament types. When the literature is examined in the system, it is seen that there is an area where many parameters are changed from design to G coding, from machine features to filament features, and different studies yield the same or opposite results.

In this study, samples with different fills printed from ABS and PLA filament were printed with different raster angles. The dimensional accuracy and surface properties of the printed parts were revealed. The results;

1. When the average of the samples printed with ABS and PLA filaments in the horizontal direction at 20% fill is examined; it was determined that the sample average printed at 0° angle was closest to the design dimensions and calculation of mass, while this angle was 60° for PLA.
2. When the average of the samples printed with 60% fill in the horizontal direction with ABS and PLA filaments is examined; it was determined that the closest value in length was reached at 60° angle, the closest width and thickness value was reached at 30° angle, and the sample printed with 0° angle was calculated as the weight closest to the mass predicted in the machine parameters; it was determined that the samples printed with 90° angle in PLA material met all the values.
3. When the average of the samples printed horizontally with 80% fill with ABS filaments is examined; it was determined that the closest value in length was reached at 60° angle, the closest width and thickness value was reached at 30° angle, and the weight closest to the mass predicted in the machine parameters. In PLA material, it was determined that the samples printed at 90° angles met all the values.
4. The surface defects of the printed samples printed horizontally were examined with a microscope. According to the results, no defects were detected in the samples printed at 0°, 45° and 90° angles at 20% and 60% fill, while defects were observed at 45° in those printed at 80% fill. Burrs and printing defects were also detected on the surfaces at 30° and 60° angles in all prints. In all results, it was determined that samples made of PLA material had cleaner prints than those made of ABS material.
5. When all the results were evaluated, it was determined that dimensional accuracy could be achieved by using different filament types, different angles, different saturations and changing the machine parameters, and that mandatory supports weakened the surface properties in angled prints.

DRAFT

CONCLUSION

Production can be done quickly and in series with 3D printers, but since the dimensional accuracy of the parts produced can cause deterioration in the layers, the dimensional accuracy of digital designs is of great importance. There are many studies on this subject in the literature. These studies are supported by this study.

Abstract
This study investigates the impact of high horizontal and vertical ground accelerations recorded during the first of the 2023 Kahramanmaraş earthquakes (Pazarcık event) on structural damage in Antakya, Türkiye. Ground motion records from local strong-motion stations revealed that both horizontal and vertical acceleration values significantly exceeded the TBEC-2018 DD2 and DD1 design spectra across most period ranges, primarily due to near-fault and site-specific effects. Notably, phenomena such as supershear rupture, forward directivity, fling, and basin effects were identified as contributing factors to the observed high spectral accelerations, especially at longer periods. A ten-story reinforced concrete building located near the 3124 station was selected for a detailed case study. Nonlinear time history analyses were conducted using three different ground motion input scenarios: (1) direct use of recorded horizontal and vertical components (Case-1), (2) station records scaled to match the TBEC-2018 design spectrum (Case-2), and (3) application of only the horizontal components to evaluate the effect of vertical motion (Case-3). The results demonstrated that the number of elements reaching extensive damage and collapse states, as well as story drift and second-order effects, were substantially higher in Case-1 compared to Case-2. The vertical component was found to play a secondary role, with the collapse mechanism predominantly governed by horizontal ground motions. These findings highlight the inadequacy of code-based design spectra in capturing the real seismic demand in regions affected by near-fault and basin effects. The study underscores the necessity of site-specific analyses and the incorporation of advanced ground motion characteristics into seismic design procedures to ensure more realistic and resilient structural performance in future earthquakes.
Keywords: 2023 Türkiye earthquakes, Antakya district, Seismic analysis, Strong ground motion.

INTRODUCTION

Two major earthquakes, with magnitudes of Mw 7.7 and Mw 7.6, occurred in Kahramanmaraş Province on February 6, 2023. The first shock originated in the Pazarcık district at a depth of 7.6 km, while the second occurred in the Elbistan district at a depth of 8 km. The Antakya region of Hatay was particularly affected by the first earthquake. Analysis of seismic ground motion data collected by strong-motion recording stations located in the Antakya district revealed that both horizontal and vertical acceleration values were exceptionally high. Notably, acceleration spectra derived from the original records have been reported by various researchers to exceed, across many period ranges, the elastic design spectrum values for both DD2 (10% probability of exceedance in 50 years) and even DD1 (2% probability of exceedance in 50 years) levels as specified by the 2018 Turkish Building Earthquake Code (TBEC-2018) (Baltzopoulos et al., 2023; Altunsu et al., 2024; Yaghmaei-Sabegh et al., 2024).

The high ground accelerations observed indicate a significant inelastic displacement demand on Antakya's buildings during the Pazarcık earthquake, which is one of the key factors explaining the severe damage and destruction in the region. Near-fault effects and site amplification played major roles in the generation of these high ground motions in the Antakya area. Analyses of ground motion velocity time histories have revealed pulse-like signals, which have been interpreted by various researchers as indicative of near-fault effects such as forward directivity and fling (Baltzopoulos et al., 2023; Wu et al., 2023; Chang et al., 2024).

Another possible cause of high ground accelerations is the supershear rupture mechanism. Supershear rupture velocities were clearly identified during the second earthquake (Mw 7.6) (Melgar et al., 2023). For the first event, the Pazarcık earthquake, strong signatures of supershear rupture have also been observed; however, a complex wave propagation pattern involving both supershear and subshear rupture velocities has been reported (Abdelmeguid et al., 2023; Rosakis et al., 2023).

Another important factor contributing to the high accelerations is site amplification. The Antakya region is located on the Hatay Graben, a rift valley. The central part of the region is characterized by relatively soft alluvial soils situated on the valley, while the outer parts are composed of harder soils associated with mountainous terrain and higher elevations. These features make the Antakya region particularly susceptible to ground motion amplification and basin effects commonly observed in soft soil conditions. Karray et al. (2024) emphasized the role of basin effects, suggesting that the sedimentary basin in Antakya is thick and stiff, and that basin effects contributed to the observed high accelerations. Similarly, Işık et al. (2024) pointed to basin effects based on analyses of velocity and displacement time histories.

A further significant factor exacerbating the damage and destruction in Antakya was the exceptionally large vertical acceleration components recorded during the earthquake. These extraordinary vertical accelerations have been explained by Duan et al. (2023) through the so-called trampoline effect. First introduced following the 2008 Iwate-Miyagi Inland (Japan) earthquake, the trampoline phenomenon suggests that the positive and negative values of vertical accelerations are asymmetrically amplified due to the nonlinear behavior of the soil (Aoi et al., 2008). One of the key indicators of the trampoline effect is that the positive accelerations are greater than the negative ones.

This study investigates the role of the high horizontal and vertical ground accelerations observed in Antakya in relation to structural damage. Nonlinear time history analyses were conducted for a ten-story reinforced concrete (RC) residential building representative of the region. Two different approaches were employed in the analyses. In the first approach, the recorded ground motion data from local stations were used directly. In the second approach, the station records were scaled to match the TBEC-2018 design acceleration spectra corresponding to the building's location. The aim here is to compare the effects of ground motions at the levels anticipated by the design code with those of the actual recorded motions on building response. Following the analyses, section-level damage states, second-order (P-Δ) effects, story drift values, and seismic performance levels were comparatively evaluated. The observed differences in these comparisons highlight the amplifying role of the high accelerations recorded during the Pazarcık earthquake on structural damage. However, it should be noted that attributing the severe destruction and damage in the region solely to high ground accelerations would be an incomplete approach. Field investigations have revealed that several other factors—such as inadequate engineering design, construction and workmanship deficiencies, insufficient inspection, and the use of substandard materials (e.g., low concrete strength or lack of transverse reinforcement)—also contributed significantly to the extent of the damage.

MATERIALS AND METHODS

The Antakya district of Hatay was particularly severely affected by the initial Mw 7.7 Pazarcık earthquake. Aftershocks and the subsequent Elbistan earthquake also contributed significantly to the extent of destruction observed in the region. In the post-earthquake damage assessment studies conducted by the Ministry of Environment, Urbanization and Climate Change, building damage and collapse states were classified into six categories (Table 1). The results, together with building location information, were made publicly available via the website "hasartespit.csb.gov.tr". Although the data provided on the website are intended for informational purposes only, systematic compilation and analysis of these results can yield valuable insights. Comparative graphs illustrating the proportions of buildings classified as 'Immediate Demolition + Collapsed' and 'Severely Damaged' (as defined in Table 1) are presented in Figure 1. The findings clearly indicate that Antakya experienced the highest relative rates of severe damage and collapse among the affected districts. The extremely high ground accelerations recorded in the area are among the primary factors underlying these outcomes, and this relationship can be further investigated through numerical analyses.

Table 1. Damage assessments provided by the Ministry for Hatay Province (hasartespit.csb.gov.tr)

Damage state	Definition
Undamaged (A)	Buildings with no damage
Slightly damaged (B)	Buildings with minor cracks in paint, plaster, or walls, and plaster detachment
Moderately damaged (C)	Buildings with wall cracks and minor cracks in load-bearing elements
Severely damaged (D)	Buildings with extensive and widespread shear cracks or separations in load-bearing elements
Immediate demolition (E)	Buildings where load-bearing elements have undergone significant residual displacement, leading to partial or complete collapse
Collapsed (F)	Situations involving total collapse beyond the state of immediate demolition

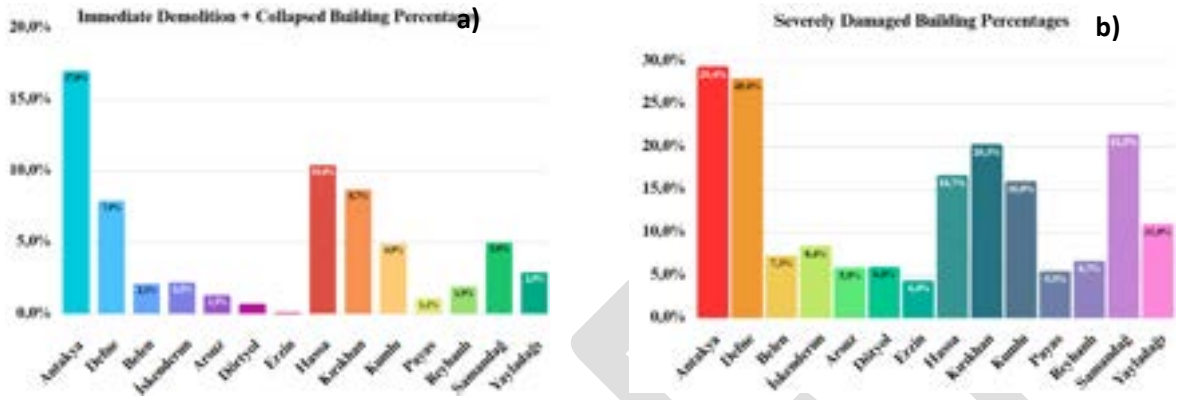

Figure 1. Percentages of building damage levels in Hatay a) levels E+F, b) level D

Strong Ground Motion Analysis

There are seven recording stations located in the Antakya region. When the acceleration spectra derived from the horizontal and vertical components recorded at these stations are compared with the elastic design acceleration spectra specified by TBEC-2018, it is observed that, for most period ranges, even the DD1 levels are exceeded (Figure 2). The 3131 station is distinguished from the other stations due to its unique geological and topographical characteristics, as the recorded values at this site generally fall between the DD2 and DD1 design spectrum levels. For this reason, the 3131 station has been excluded from the figures presented in the subsequent sections. Figure 2 presents horizontal (first six graphs) and vertical (subsequent six graphs) spectral comparisons.

As shown in Figure 2, the horizontal spectral accelerations recorded at stations 3126 and 3129 significantly exceed the DD1 levels for short periods up to 0.6 seconds. At stations 3123, 3124, 3125, and 3132, short-period accelerations are above the DD2 levels but generally remain below DD1. For longer periods, all stations exhibit ranges where the DD1 values are notably exceeded. When the predominant periods of the ground and the building coincide with these high spectral acceleration periods, the inelastic displacement demands on structures increase. Therefore, it is evident that such high accelerations, depending on site and building characteristics, contribute to increased damage and collapse. Here, building characteristics refer to both the fundamental period and the ductility capacity of the structure. Factors such as the number of stories, slab type, amount of shear walls, concrete and reinforcement quality, transverse reinforcement ratio, and structural system configuration play a critical role in determining both the fundamental period and the post-yield deformation capacity (inelastic behavior) and thus have a significant impact on the extent of damage and collapse.

DRAFT

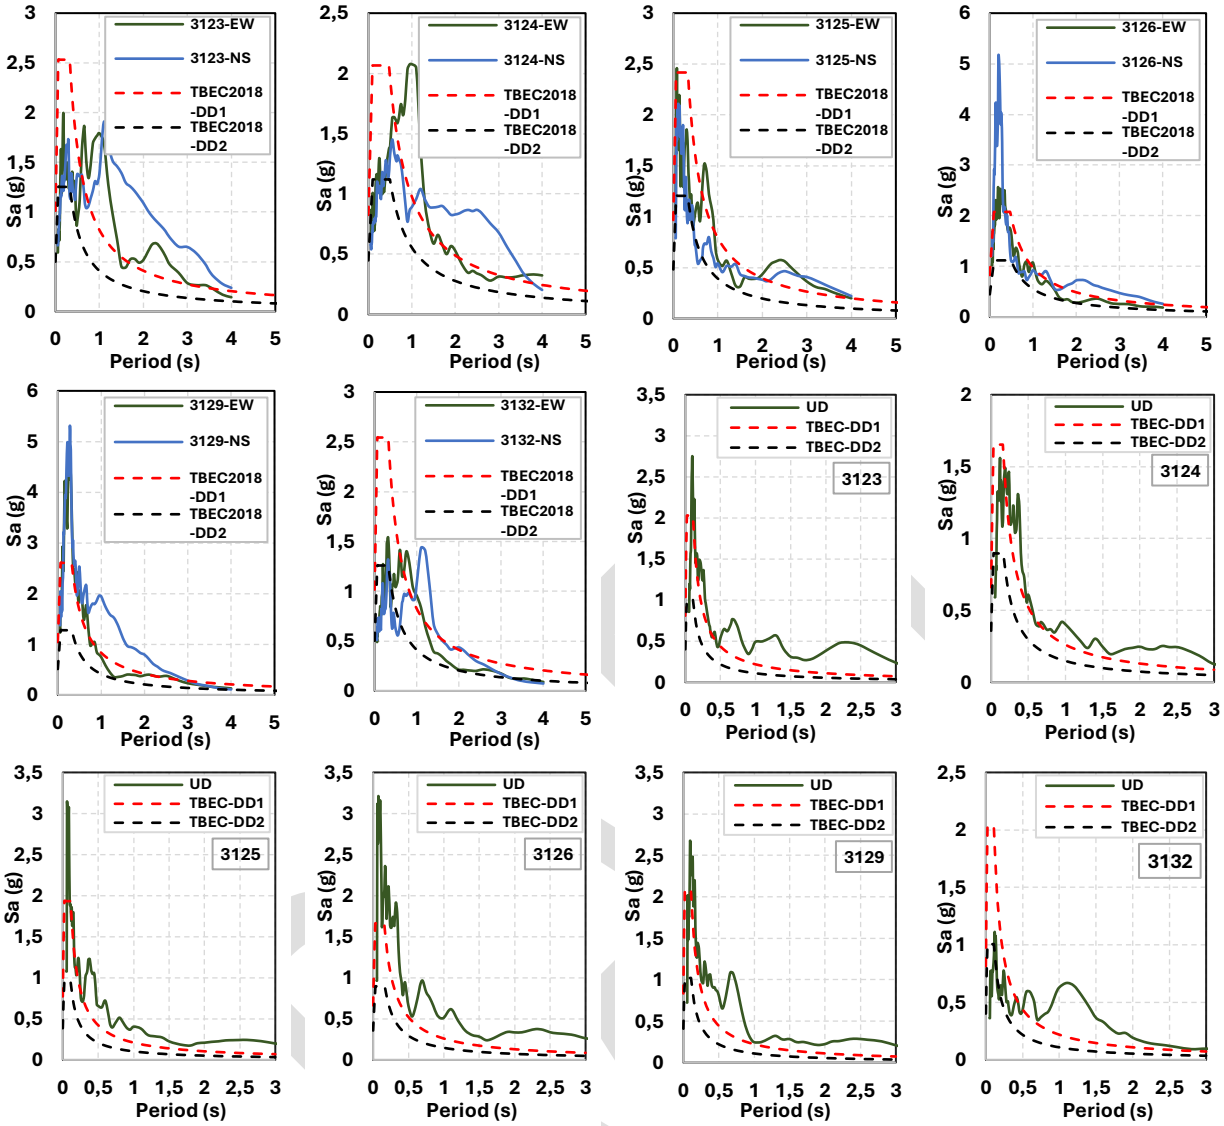

Figure 2. Comparison of the horizontal and vertical acceleration spectra proposed by the TBEC-2018 and Antakya stations.

The second set of six graphs in Figure 2 presents a comparison between the vertical acceleration spectra recorded at the stations and those specified by TBEC-2018. These elevated vertical accelerations have induced substantial compressive and tensile forces in vertical load-bearing elements. High compressive forces in older structural members—characterized by poor concrete and reinforcement quality and lacking adequate transverse confinement—have led to severe damage, and in some cases, complete loss of stability. The significant tensile forces generated can further contribute to damage by reducing the flexural moment capacity of vertical elements, exceeding the yield or ultimate strength of the reinforcement, causing inadequate anchorage and lap splice performance, loss of bond, and diminishing both section and joint shear capacities. The effects of vertical ground motions should be considered not only at the member level but also at the global building scale. Buildings with structural configurations that result in dominant torsional modes or insufficient lateral stiffness have been particularly susceptible to second-order (P-Δ) effects induced by vertical ground motions. Similarly, following stiffness degradation due to inelastic deformations, increased lateral displacements combined with high vertical accelerations have imposed substantial inelastic displacement demands on these structures. In such scenarios, buildings capable of redistributing internal forces and exhibiting ductile behavior after the formation of plastic hinges have demonstrated superior seismic performance, whereas those with relatively limited ductility capacity have been much more adversely affected.

Numerical Analysis

To investigate the effects of the high horizontal and vertical accelerations observed during the Pazarcık earthquake, a RC building located near the 3124-recording station was selected as a case study. Constructed after 2016, the building is a ten-story (basement + ground floor + eight typical floors) RC shear wall-frame structure with a beam-and-slab floor system. The concrete and reinforcement classes used are C30/37 (TS500) and S420 (TS708:2010), respectively. The thicknesses of the shear walls and slabs are 25–30 cm and 12–15 cm, respectively. Beams have dimensions of 25×60 cm, and columns are sized at C80×35, C45×45, C30×80, C30×95, and C35×95 cm. The typical story height is 290 cm. The typical floor plan of the building is shown in Figure 3a. To assess the impact of the high accelerations experienced by the building, two different analysis procedures were implemented. In the first procedure, referred to as Case-1, the building was analyzed using the simultaneous application of the recorded horizontal and vertical accelerations from the 3124 station. In the second procedure, Case-2, the 3124 station records were scaled to match the TBEC-2018 design spectrum for the relevant site conditions. To ensure compatibility with the building's orientation, the original EW-NS record set was rotated by 71°, and the rotated records were used in the analyses. After rotation, the EW component acts in the X direction (see Figure 3a). As illustrated in Figure 3b, there are significant differences between the acceleration spectra of the 3124 records and the TBEC-2018 design spectra (for ZD soil conditions). Consequently, the differing results obtained from these two-analysis series highlight the role of the high accelerations generated during the Pazarcık earthquake in the collapse of the building. The Case-1 analysis results represent the actual horizontal and vertical accelerations experienced by the building and thus are expected to be consistent with the observed collapse modes. In Case-2, spectral matching was performed using a software (Seismosoft, 2020) (Figure 3c), so this case represents the seismic demand corresponding to the design-level spectral accelerations for which the building was originally designed.

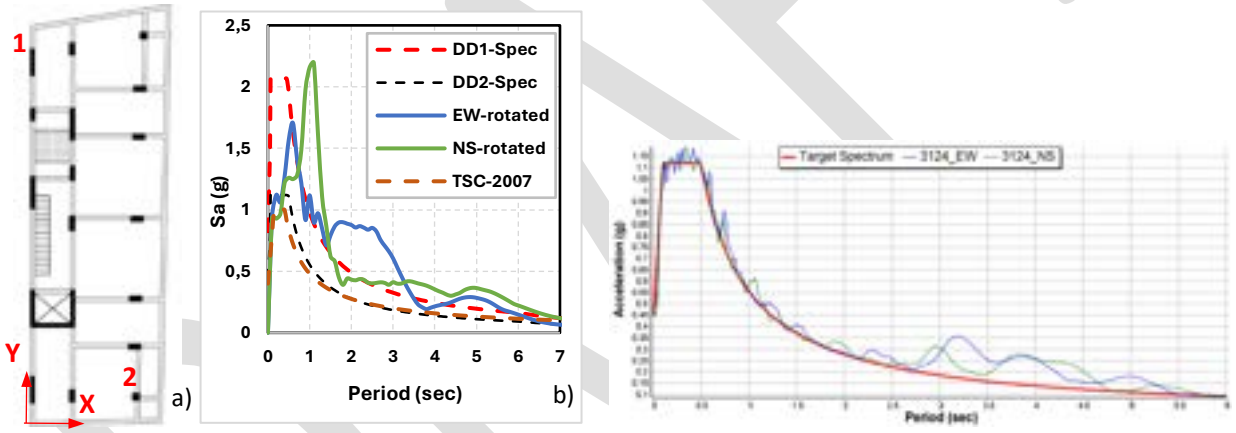

Figure 3. a) Typical floor plan of building, b) comparison of acceleration spectra from TSC-2007, TBEC-2018, and the 3124 station, c) scaling procedure.

As highlighted in the Introduction, the literature indicates that various phenomena—including near-fault ground motions, site amplification effects, and supershear rupture mechanisms—have contributed to the exceptionally high accelerations recorded in this region. The combined influence of these factors has led to a substantial increase in seismic demand on buildings in Antakya. The subject building was originally designed according to TSC-2007; however, since the elastic design acceleration spectra of TBEC-2018 and TSC-2007 are quite similar, the TBEC-2018 spectrum was adopted in Case-2 due to its status as the current code. It should also be noted that the TSC-2007 code, which was in effect at the time of the building's design, did not consider the effects of vertical ground motions. In contrast, TBEC-2018 explicitly accounts for vertical earthquake effects through Equation (1). Therefore, in the analyses, the vertical component was incorporated directly using the recorded vertical ground motion in Case-1, while in Case-2, it was considered in accordance with Eq. (1) of TBEC-2018. In this context, G refers to the effect of dead load, and S_{DS} denotes the design spectral acceleration coefficient at short periods.

$$E_d^{(z)} \approx (2/3)\, S_{DS}\, G \tag{1}$$

To further isolate and evaluate the influence of vertical ground motion on the results, an additional analysis was conducted, referred to as Case-3. In this analysis, only the horizontal components of the station records were applied, with the vertical component entirely neglected, to specifically assess the effect of vertical earthquake action. This approach enabled a clear identification of the impact of vertical ground motion on the comparison parameters. The numerical modeling was performed using the Perform3D (2023) software, and nonlinear time history analyses were carried out. Columns and beams were modeled as frame elements, while shear walls were represented by two-dimensional shell elements. Inelastic behavior was simulated using a lumped plastic hinge approach for beams, whereas columns and walls were modeled with a fiber-based distributed plasticity method. Basement walls and slabs were assumed to behave purely elastically. The material properties for confined concrete were defined according to the Mander model, as detailed in Annex-5A of TBEC-2018. For cyclic degradation, the model proposed by Lowes et al. (2016) was adopted for concrete, while the behavior of reinforcement bars was characterized using the Menegotto and Pinto (1973) model.

RESULTS and DISCUSSION

Figure 4a illustrates the element damage states resulting from the Case-1 analysis, while Figure 4b presents the lateral displacement profile of the building. Elements shown in red have exceeded the collapse deformation limit as defined in Section 15 of TBEC-2018. Elements in yellow have surpassed 75% of the collapse limit. In Figure 4, only the damage states of columns and shear walls are presented to better highlight the extent of plastic deformations. As observed, a significant number of vertical load-bearing elements have exceeded the 'Collapse State' damage threshold. In reality, the building collapsed by overturning in the +X direction (Figure 4c). The analysis results are consistent with the observed collapse mode, both in terms of the number of failed elements and the overall global behavior of the structure.

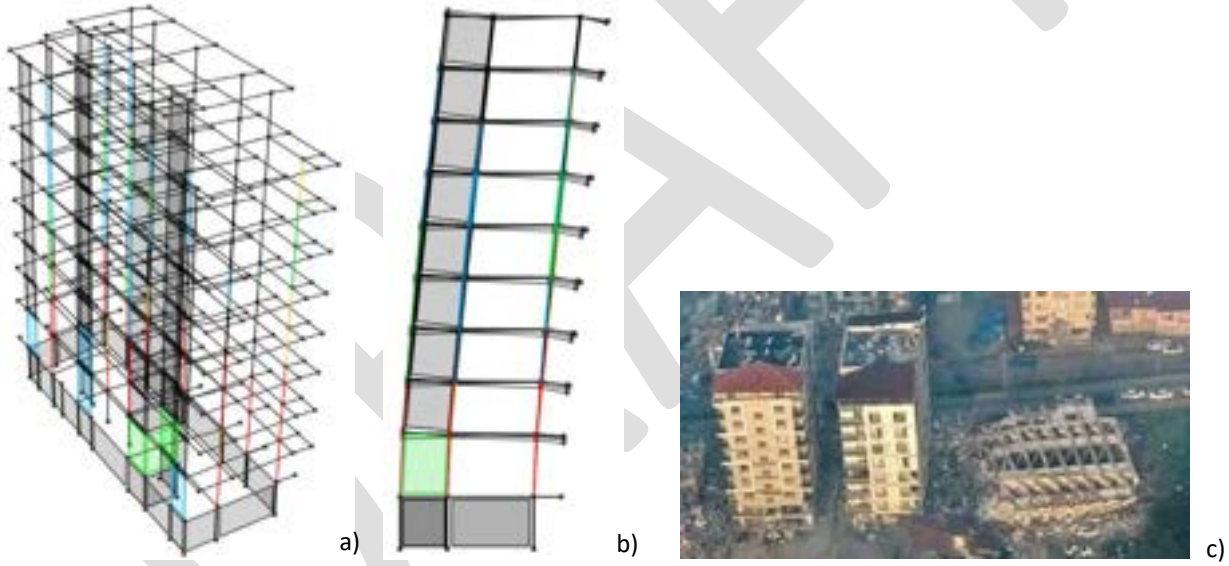

Figure 4. Case-1 Structural damages (a), Case-1 deformed shape (b) and a view of collapsed building

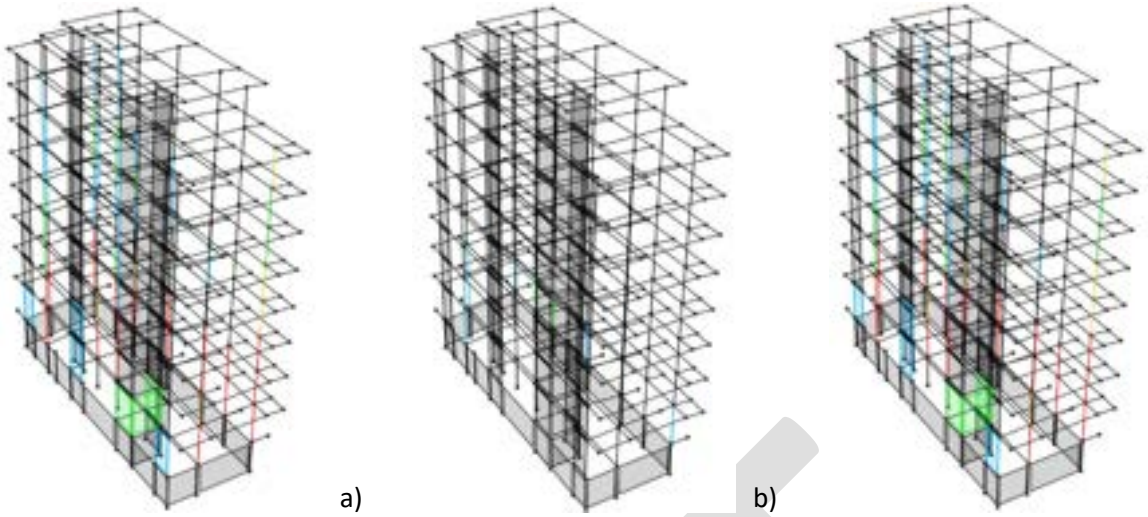
Figure 5 presents a comparative summary of the results for all three cases. As can be seen, there are substantial differences between Case-1 and Case-2, with significantly fewer elements exceeding the collapse limit in Case-2. This outcome is attributed to the higher acceleration levels present in Case-1. When comparing Case-3 and Case-1, the element damage levels are found to be quite similar. This comparison indicates that the damage and collapse mechanism of the building under consideration is predominantly governed by the horizontal components of ground motion.



a) b) c)

Figure 5. Structural damage in Case-1 (a), Case-2 (b), and Case-3 (c)

Story drift comparisons based on the values obtained from Points 1 and 2, as indicated in Figure 3a, are presented in Figure 6. Since the results of Case-1 and Case-3 are of nearly the same magnitude, Case-3 is not included in the graphs. According to the results, the effect of vertical ground motion on story drifts is negligible. The story drift values in Case-1 are significantly higher than those in Case-2. In Case-2, the commonly accepted drift limit of 2% is generally not exceeded, whereas the values observed in Case-1 are well above this threshold. This finding indicates that the actual ground accelerations experienced during the event were substantially greater than those anticipated by the design spectrum.

The evaluation of second-order (P-Δ) effects for Case-1 and Case-2 is presented in Table 2. Table 2 presents the data for each story. Since the results obtained in the X direction were more critical than those in the Y direction, only the values for the X direction are reported. The TBEC-2018 limit for the second-order (P-Δ) indicator is provided in the rightmost column of the table; values exceeding this limit are highlighted in red, while those below the limit are shown in green. In the table, Δ denotes the average displacement values, V_i represents the story shears, where the subscript indicates the analysis case and the superscript represents the direction of the measured value, W_i denotes the story mass. The formula for the second-order indicator is given in Equation 2. *R* and *D* denote the response modification factor and the overstrength factor for the structural system, respectively, while C_h represents a coefficient defined based on the nonlinear hysteretic behavior of the structural system. The results indicate that, in Case-2, the second-order effects remain within the permissible limits. However, in Case-1, these limits are significantly exceeded in the X direction, which corresponds to the direction of building overturning. These findings highlight the critical role of the extremely high acceleration recorded at the station in contributing to the collapse of the building.

CONCLUSION

In this study, the role of the first of the February 6 Kahramanmaraş earthquakes—the Pazarcık event—in the observed destruction was investigated through a numerical case study utilizing ground motion records from Antakya stations. Based on the evaluation of acceleration spectra derived from the station records and the results of nonlinear time history analyses, the following findings were obtained.

- The horizontal and vertical acceleration values recorded at the Antakya stations exceed the TBEC-2018 DD2 and DD1 design spectra across most period ranges. These high acceleration values are attributed to the combined effects of near-fault and site-specific conditions. One of the reasons for the elevated spectral accelerations at longer periods is the presence of velocity pulses with periods of 2.5–3.5 seconds, as identified by Wu et al. (2023) and Chang et al. (2024). Additionally, the high long-period accelerations have been associated with basin effects by Karray et al. (2024), indicating that this phenomenon also plays a significant role in the observed destruction.
- Numerous studies in the literature have provided significant evidence for the presence of phenomena such as supershear rupture, forward directivity, fling, and basin effects during the Pazarcık earthquake. The high inelastic displacement demands resulting from these phenomena,

which led to exceedance of the design spectrum predictions, have played a critical role in increasing the extent of damage and collapse in buildings.

- According to the numerical analysis results, the number of elements reaching the 'Extensive Damage' and 'Collapse State' levels in Case-1 is significantly higher than in Case-2. Similarly, the story drift values in Case-1 are much greater than those in Case-2. For second-order effects, Case-1 values substantially exceed the permissible limits, whereas Case-2 results remain within acceptable boundaries.
- The results of Case-2 suggest a high probability that the building would not collapse; however, the same cannot be concluded for Case-1. In summary, the high horizontal accelerations generated during the Pazarcık earthquake played a critical role in the collapse of the building, as the spectral accelerations corresponding to the predominant mode periods (1–2 seconds) were exceptionally high (see Figure 5a).
- The high vertical accelerations observed in the station records played a secondary role in the collapse mechanism. When comparing the element damage and story drift results of Case-1 and Case-3, the outcomes are found to be very similar. Therefore, it can be concluded that the collapse mechanism was predominantly governed by the horizontal ground motion components.
- In cases involving near-fault and basin effects, the recorded acceleration values can significantly exceed the predictions of the TBEC-2018 design spectrum. In such scenarios, site-specific studies are clearly necessary to obtain more realistic results. Furthermore, incorporating these phenomena—which contribute to the generation of high accelerations—into the design procedures through probabilistic approaches, when appropriate, would enable more realistic structural design and assessment.

The Oral Microbiota and Its Relation to Oral Health and Systemic Diseases: A comprehensive Review

Abdulridha Taha Sarhan (https://orcid.org/0000-0002-6612-612X)

University of Hilla, Faculty of Dentistry, Department of Basic Sciences, Babylon, Iraq

Abstract

Aim: This review article is to give an idea about the role of human oral microbiota on oral and body health. A wide range of microorganisms inhabit the human oral cavity, including bacteria, fungi, viruses, archaea and protozoa. These microorganisms form a complex ecological community that influences oral and systemic health. There is evidence that oral microbiota is also closely related to systemic diseases. Methods: A comprehensive understanding of the oral microbiota and its influence on oral health and diseases require a holistic view that emphasizes interactions among different residents within the oral community, as well as their interaction with the host. Notably, a large number of oral microorganisms enter the downstream digestive tract from the oral cavity through saliva, and they present a particularly close relationship with body diseases. Results: In the oral cavity, indigenous microorganisms are often associated with two major oral diseases, caries and periodontal diseases. These diseases seem to appear following an imbalance in the oral resident microbiota, leading to the emergence of potentially pathogenic microbiota. Discussion: To know well the process involved in caries and periodontal diseases, it is necessary to understand the ecology of oral cavity and to identify the factors responsible for the transition of the oral microbiota from a commensally to a pathogenic relationship with the host. The regulatory forces influencing the oral ecosystem can be divided into three major categories, host related, microbe related, and external factors. Conclusions: The indigenous microbiota play an important role in health and diseases of humans oral cavity. Also, it contributes to the development of the immune system and provides resistance to colonization by all native or pathogenic microorganisms. This suggests that oral microbiota may provide potential biomarkers in the diagnosis of some systemic diseases.

Keywords: Oral microbiota, Oral diseases, Systemic diseases, Oral ecology, Oral health.

INTRODUCTION

The mouth is one of the most heavily colonized parts of human body. Several distinct habitats within the oral cavity support heterogeneous microbial communities that constitute an important link between oral and general health (Gao, et al., 2018). The establishment of the oral microbiota occurs in a dynamic process over various stages and involve continuous interactions with the host and its environment (He, et al., 2015). The human oral microbiota is an important part of the body microbiome. The human oral cavity contains several significantly different ports with distinct microbial communities (Diaz and Valm, 2020). A wide range of microorganisms inhabit the human oral cavity, including bacteria, fungi, viruses, archaea and protozoa (Lamont, , et al., 2018).These microorganisms form a complex ecological community that influences oral and systemic health (Baker, et al., 2017). The most prevalent oral diseases, dental caries and periodontal diseases, are microbiota-associated diseases (Chen, et al. ,2018). Moreover, increasing evidences have supported that many systemic diseases are associated with disturbances in the oral ecosystem, such as diabetes, cardiovascular diseases and tumors (Gao, et al., 2022). The oral cavity is a complex environment that includes premium microbial habitats of soft and hard tissues which form a rich heterogeneous ecological system (Segata, et al., 2012). Oral and general health influence each other (Graves, 2019).). Recent scientific work shows that oral diseases can impact general health, and vice-versa (Gm, et al., 2021). A microbiota is composed of bacteria, fungi, archaea, protists, and other microorganisms , whose compositions are dependent upon environmental conditions (Jonathon et al, 2024). The oral cavity contains one of the most diverse and unique communities of microbes in the human body.

A milliliter of saliva contains a high microbial cells (Jo, et al, 2019), with a typical healthy microbiome comprised of a range of about 100 to 200 distinct microbial organisms (Lee, , et al, 2022). The aim and purpose of this article are to update oral healthcare practitioners on our current knowledge of the oral microbiome in health and disease, to review how molecular methods of microbial characterization have advanced our understanding, and to discuss potential implications for clinical practice that used as targets to treat oral and systemic diseases..

MATERIALS AND METHODS

A comprehensive understanding of the oral microbiota and its influence on host health and diseases will require a holistic review that emphasizes interactions among different residents within the oral community, as well as their interaction with the body systems. The hypothesis is that the oral microbiome could be a missing link that can partially explain the influences of oral diseases on general health. A general literature search was conducted in the electronic databases using the keywords: oral microbiota, oral diseases, systemic diseases and oral ecology. The details of the instances of oral microbiota and its relations to oral and systemic diseases were also evaluated. In addition, the present review describes the oral ecosystems, the major factors that might control the oral microbiota, the basic aspects of the secretory immune system, and the biological role and functions of IgA in the microbial ecology of the oral cavity (Jeong, J., et al. (2022).

RESULTS and DISCUSSION

All selected publications about oral microbiota and its relation to oral and body health were further scrutinized for adherence to the following topics:

1. Oral and human body microbiota.

Humans have evolved in the continuous presence and in the symbiosis with microbiome. The human body hosts approximately as many microbial cells as human. The human body lacks the specialized enzymes required for numerous chemical reactions (e.g. nutrient breakdown) and therefore has to rely on its microbial symbionts to carry out these functions. The human oral microbiota is an important part of the body microbiome. The human oral cavity contains several significantly different ports with distinct microbial communities (John , et al, 2024). A wide range of microorganisms inhabit the human oral cavity, including bacteria, fungi, viruses, archaea and protozoa (Baker and Edlund , 2018). Bacteria are the main inhabitants of the mouth, they primarily comprise bacteria of the Proteobacteria and Actinomycetes **(Table 1)**. Unlike gut microbiota, these types of bacteria do not change significantly. Diet and the environment have a great impact on gut microbiota but exert minimal effect on the composition of oral bacteria (Rooney, et al, 2020). The oral cavity contains one of the most diverse and unique communities of microbes in the human body, yet this port is relatively understudied as compared to the gut **(Fig. 1).** The oral cavity is a complex environment that encompasses distinct, different small microbial habitats, such as teeth, buccal mucosa, soft and hard palate, and tongue, which form a species-rich heterogeneous ecological system (Chiara , et al, 2024). Healthy people from different countries have similar compositions of oral microbiota. In the human mouth, 85 species of fungi can be found. Among these fungi, the most important one is *Candida* (Daniel, et al, 2018). *Candida* is neutral when the oral microbiota is normal; however, when the oral microbiota balance is broken, *Candida* will seek the opportunity to attack oral tissue *Candida* forms a biofilm with *Streptococcus* to play a pathogenic role (Lu, et al., 2019). Oral bacteria are the main components of the oral microbiota. Common oral bacteria include *Streptococcus mutans*, *Porphyromonas gingivalis*, *Staphylococcus aureus*, and *Lactobacillus plantarum* . The *S. mutans* is the main component of the oral microbiota, and it is one of the main components of dental plaque (Cai, Z. et al., 2021). It is also the main pathogen of caries, which is a bacterial infectious disease that occurs in hard tissues of the teeth and has the highest incidence among oral diseases (Baker, J. et al., 2021).*P. gingivalis* is a non-glycolytic Gram-negative anaerobic bacterium that is a periodontal pathogen. *Lactobacillus* refers to a bacterium that can ferment sugar to produce lactic acid. It is a group of microorganisms that live in the body and benefit

the health of the host. Yogurt contains lactobacilli. *Lactobacillus* ferments sugar and produces a large amount of lactic acid, which can easily cause caries.

2. Oral microbiota and oral diseases.

Oral microbiota may produce metabolites in the mouth, which can affect the development of a range of oral diseases, such as:

A. Caries:

Dental caries is the most common chronic infectious diseases in the oral cavity (Baker, J. et al., 2021). Bacteria are the main pathogens, and symptoms include hard tissue destruction of the teeth. The incidence rate of dental caries is high, and the disease range is wide, occurring at any age period of humans. Dental caries has a higher incidence in children than in adults, and it is closely related to oral microbiota. The latest information determined that *Lactobacillus* spp., *Prevotella* spp., *Dialister* spp., and *Filifactor* spp. may be involved in the pathogenesis and progression of dental caries. Compared with healthy individuals, the oral microbiota on the surface of dental caries presents increased complexity and decreased diversity, possibly due to the acidic environment (Christina J. et al., 2017). These characteristics are manifested in the salivary microbiota, which display an increase in *L. acidophilus in* dental caries. When people do not eat, the bacteria obtain nutrients from our saliva and gingival crevicular fluid, which are rich in glycoproteins. These glycoproteins are broken down by bacteria into sugars and proteins, which during metabolism, are broken down by bacteria into acidic or basic small molecules. Weak acid production will begin to affect and corrode the teeth (Anne and Daniel, 2019).

Table 1 . The Six Major Phyla and Genera in the Oral Microbiota with Some Examples of Less Frequent Genera.

Major phyla	Major genera	Minor genera
Firmicutes	***Streptococcus , Veillonella, Selenomonas , Gemella , Oribacterium***	***Granulicatella , Lactobacillus, Peptostreptococcus , Staphylococcus , Eubacterium***
Actinobacteria	***Actinomyces , Corynebacterium , Rothia***	***Propionibacterium***
Bacteroidetes	***Prevotella , Capnocytophaga , Porphyromonas***	***Bacteroides***
Proteobacteria	***Neisseria , Campylobacter , Haemophilus , Lautropia***	***Eikenella***
Fusobacteria	***Fusobacterium , Leptotrichia***	***Sneathia***
Spirochaetes	***Treponema***	**---**

B. Periodontitis:

Periodontitis is a common type of chronic periodontal disease with a wide age range, and it spreads from gingivitis to deep periodontal tissues. Dental plaque bacteria are the main factors of periodontal disease (Plachokova, A.S., et al., 2021). Plaque includes plaque and sub-gingival plaque, which is a micro-ecological system with bacteria on the tooth surface or periodontal pocket. The interactions between host and microbiota determine the manner, severity, and rate of progression of the disease (Abusleme L. et al., 2021). Therefore, the pathogen characteristics and microbiota distribution of periodontal disease are critical. Periodontal disease causes destruction of periodontal tissues (dental support tissues such as gums and alveolar bone) and constitutes a potential risk factor for certain systemic diseases. The relative abundance of the genera *Clostridium*, *Porphyromonas*, *Helicobacter*, *Actinomycetes*, *Micromonas*, and *Streptococcus pneumoniae* in oral microbiota of patients with periodontitis is significantly higher than that of healthy people. By contrast, *Neisseria*, *Corynebacterium*, *Carbonophilic*, and *Actinomycetes* in oral microbiota of patients with periodontitis is lower than that in healthy people (Curtis, M. et al., 2020).

C. Oral cancer:

Oral cancer is one of the most common malignant tumors of the head and neck. It is a general term for malignant tumors that occur in the mouth, and most of them belong to squamous cells (tissue) carcinoma, the so-called mucosal variation, that includes gingival cancer, tongue cancer, soft and hard sputum cancer, jaw cancer, oral cancer, oropharyngeal cancer, salivary gland cancer, lip cancer, maxillary sinus cancer, and cancer occurring in the facial mucosa (Sun, J. et al., 2020). Genetic background, bacteria, and living habits all affect the development of oral cancer. Recent research indicated a correlation between oral microbiota and oral cancer. Gingival carbon dioxide phagocytic bacteria, prednisone and *S. mutans* in the saliva of patients with oral squamous cell carcinoma significantly increase. These bacteria have potential value as diagnostic indicators for oral squamous cell carcinoma (Graves, D.T, et al., 2019).

3. Oral microbiota and systematic diseases.

Oral microbiota can regulate systemic diseases. Thus, oral microbiota will be a new target for treating **systematic** and **metabolic** diseases and improving the body's physical state: **(Fig. 2)**

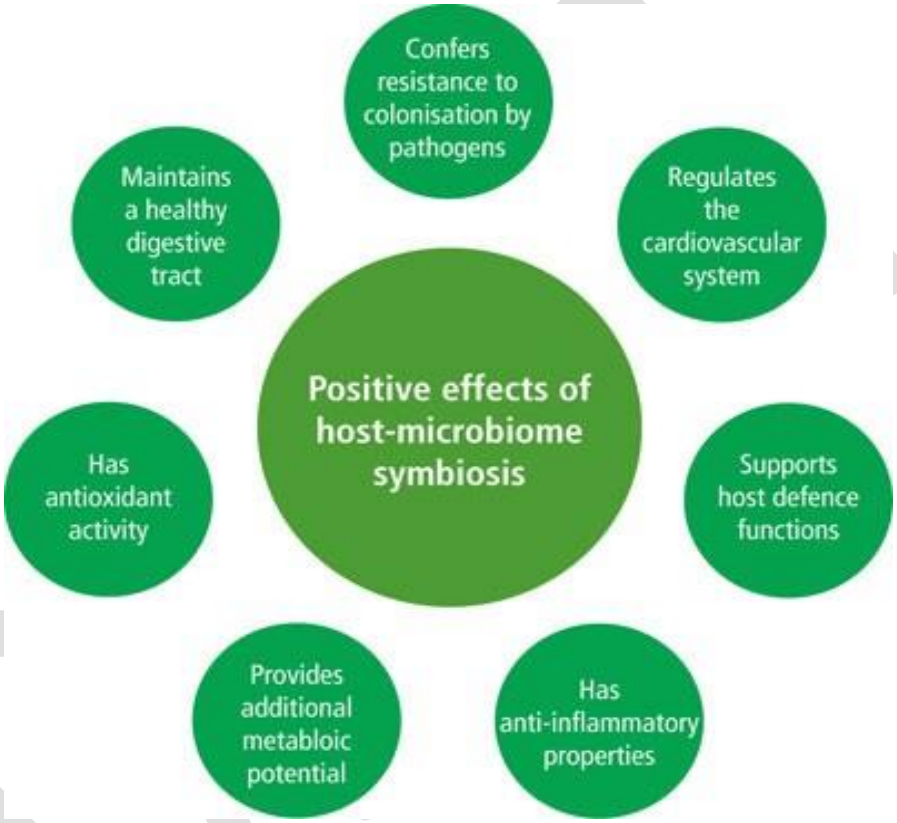

Fig. 1: The Most Diverse and Unique Positive Effects of Microbiota in the Human Body.

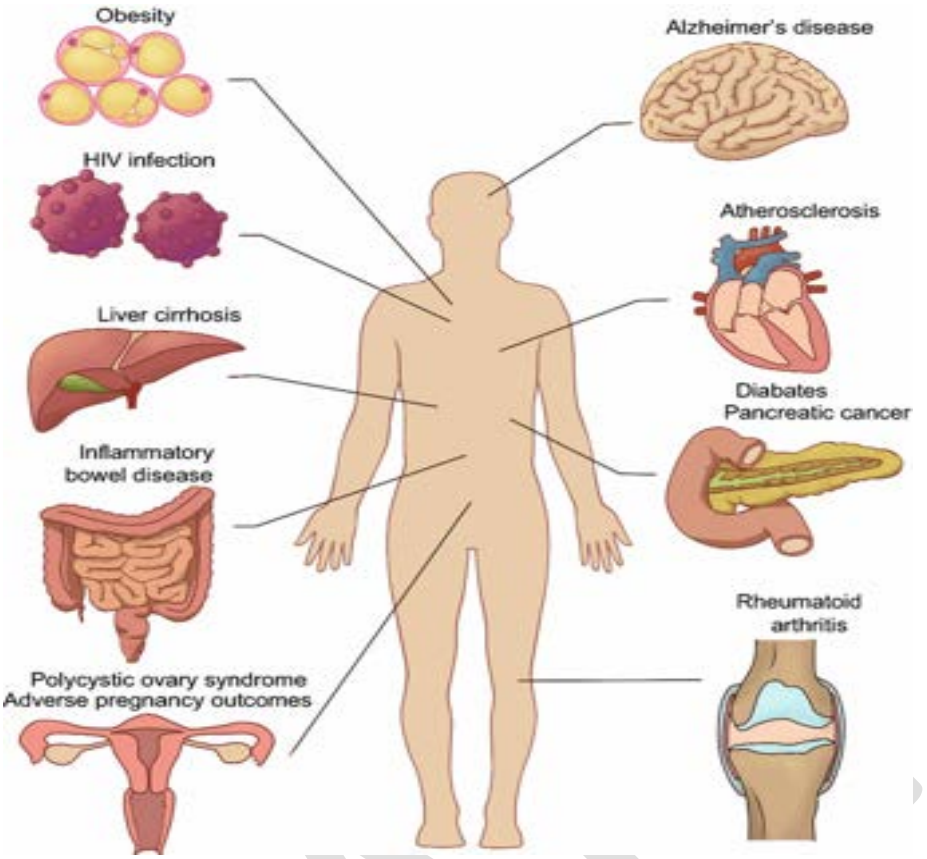

Figure 2. Oral and Systemic Diseases Associated with the Oral Microbiota.

3 -1. Diabetes:

The type 2 diabetes has become one of the most common chronic systemic diseases. It is mainly characterized by persistent hyperglycemia and disordered glucose, fat, and protein metabolism. Many studies have confirmed that the oral diseases (e.g., caries, periodontal disease, mucosa diseases) and type 2 diabetes is closely related. They play a role as mutual feedback. In the process of their interaction, oral microbiota is closely related to oral and systemic health and disease. In addition to its own symptoms, oral symptoms, such as loss of alveolar bone and loss of teeth, have become a complication of diabetes. Researchers conducted an in-depth study of the oral microbiota in the diabetic environment and its effects on the oral cavity by Illumina2 generation sequencing technology. The study revealed that oral microbiota is an important way for diabetes to cause complications. Researchers have observed significant differences in oral microbiota between patients with type 2 diabetes and non-diabetic patients, such as *Neisseria*, *Mycobacterium*, and moreover, the percentage *Fusobacterium*, *Veillon*, and *Streptococcus* have highly increased. Recently, researchers provided a mechanism for the improved understanding of how diabetes increases the risk and severity of tooth loss (Santonocito, S. et al., 2022).

3 -2. Obesity:

Obesity is a health problem that plagues the world. Many reports have described the relationship between gut microbiota and obesity, but whether oral microbiota and obesity are related remains unclear. Recently, 33 adult obese people and 29 healthy adults with normal weight were selected to identify the composition of oral microbiota. It was found that oral microbiota in the obese group was significantly different from that in the normal group, and the bacterial diversity and abundance of oral microbiota in the periodontal healthy obese people were significantly reduced . In the oral microbiota of obese people, the abundance of *Plasmodium*, *S. genus*, and *S.mutans* significantly increased, whereas the abundance of *Corynebacterium*, carbonophilic and *Staphylococcus* significantly decreased. The environmental adaptability of the oral microbiota of obese people and the biodegradability of exogenous substances were low, and they exhibited

notable immune disease characteristics. To date, researchers have only found that the oral microbiota of obese people has changed, but the mechanism underlying such a change needs further research in the future (Gasmi B. A. et al., 2021).

3 -3. Liver diseases:

The imbalance of gut microbiota is one of the important factors that promote the development of liver disease. However, recent studies have found that both gut microbiota and the imbalance of oral microbiota are closely related to liver disease. Previous work found a significant difference in the oral (lingual) microbiota of patients with liver cancer and healthy people. The diversity of oral microbiota in patients with liver cancer was higher than that of healthy people, and the composition of the microbiota in patients with liver cancer was also significantly different from that of healthy people (Acharya, C. et al., 2017). Among them, *Clostridium*, *Oribacterium*, *Ciliate*, *Actinomyces*, and *Campylobacter* have high abundance, whereas *Haemophilus*, *Streptococcus*, and *Pseudomonas* have low abundance. *Clostridium* and *Oribacterium* are biomarkers that can distinguish between patients with liver cancer and healthy people, as well as assist in the diagnosis of liver cancer without operation. (Marsh, P.D. 2000). Similar to patients with liver cancer, patients with cirrhosis exhibit an imbalance of oral microbiota, reduced abundance of oral symbiotic bacteria, and increased abundance of potential pathogenic bacteria (e.g., *Enterococcus*). Researchers compared the gut microbiota of patients with cirrhosis and healthy people, and they found that the intestinal microbiota of patients with cirrhosis is enriched with a large number of oral-derived microorganisms, including *Streptococcus*, *Haemophilus*, *Lactobacillus*, and *Clostridium* (. Zarco, M., et al, 2012). These researchers speculated that oral microbes invade gut microbiota of patients with cirrhosis.

3 -4. Cancers:

Previous reports have shown that gut microbiota and colorectal cancer are closely related, and the oral microbiota has been demonstrated to be closely related to colorectal cancer as well. *F. nucleatum* in the oral cavity can transfer to other parts of the body through blood cycling as the whole body's immunity declines, leading to local inflammation and indirectly promoting tumor formation (Xiu-Li Wang, 2023). The bacterium can be isolated from colorectal cancer tissues, and the risk of colorectal cancer is high in patients with the bacterium. *F. nucleatum* is a Gram-negative obligate anaerobic bacterium, and several studies have isolated *F. nucleatum* from colorectal cancer tissues. Patients with high abundance of *F. nucleatum* have a high risk for colorectal cancer (Malla, M.A., et al, 2019). Therefore, the number of this bacteria can be used as a potential marker for colorectal cancer. Studies have found that *F. nucleatum* can be transferred from the mother's mouth to fetal tissue and cause fetal death. Thus, *F. nucleatum* in the mouth can be transferred to other parts of the body. Also, it may involve transient bacteremia in the bloodstream and then transfer to the colorectal tumor (Lee, Y.-H., et al, 2021).

4. Oral Microbial Ecology

The habitat oral cavity is suitable for these organisms because of favorable physiochemical environment inside the oral cavity. An ecosystem consists of the microbial community living in a defined habitat and the abiotic surroundings composed of physical and chemical elements. In its simplest expression, the oral ecosystem is thus composed of the oral microorganisms and their surroundings, the oral cavity (Kaan, A. M. M., et al, 2021)**.** The oral cavity is a moist environment which is kept at a relatively constant temperature (34 to 36°C) and a pH close to neutrality in most areas and thus supports the growth of a wide variety of microorganisms (Kilian, M,. et al, 2016). However, the mouth must not be considered a uniform environment. There are several habitats in the oral cavity, each being characterized by different physicochemical factors and thus supporting the growth of a different microbial community. In the oral cavity, indigenous bacteria are often associated with two major oral diseases, caries and periodontal diseases (Diaz, P.I., 2021). These diseases seem to appear following an imbalance in the oral resident microbiota, leading to the emergence of potentially pathogenic bacteria. The oral surfaces are also constantly bathed by two important physiological fluids, the saliva and the gingival crevicular fluid. These fluids are essential for the maintenance of the oral ecosystems by providing water, nutrients, adherence,

and antimicrobial factors (Dewhirst, F.E., et al, 2010). Oral diseases seem to appear after an inbalance among the indigenous microbiota, leading to the emergence of potentially pathogenic microorganisms (Roberts, A.P. and Kreth, J. 2014). To define the process involved in caries and periodontal diseases, it is necessary to understand the ecology of the oral cavity and to identify the factors responsible for the transition of the oral microbiota from a commensal to a pathogenic relationship with the host (Patangia, D.V., et al, 2022). The regulatory forces influencing the oral ecosystem can be divided into three major categories: host related, microbe related, and external factors (Fan, X ., 2018). The present review describes the oral ecosystems, the major factors that might control the oral microbiota, the basic aspects of the secretory immune system, and the biological functions of SIgA and finally focuses on experiments related to the role of IgA in the microbial ecology of the oral cavity. To present an overall picture of the current knowledge of oral microbial ecology (Li, Y.; 2022).

CONCLUSIONS

Oral microbial flora have a very important role in maintenance homeostasis of the ecosystem in the oral cavity. It is crucial for clinicians to be aware of this fact and they should focus their treatment toward control of this flora rather than eliminating it. A thorough knowledge of the normal and altered flora and the mechanics behind how the change can happen and what it might lead to would give us a fair idea of how various oral diseases could be controlled and preventive strategies be developed. This review showed that the oral microbiota can affect oral diseases and affect the health of the whole body. It is important to improve oral health by altering the oral microbiota through developing oral probiotics and enhancing body health and reduce the load of bacteria in the oral cavity of a subject and improve oral micro-ecology homeostasis. Because, when the microbial equilibrium is broken (imbalance), in a process called dysbiosis, the pathogens thrive and diseases occur. Due to this realization about the oral microbiota, several new methods based on the modulation of the oral microbiota that aim at maintaining a healthy body ecosystem.

Abstract
Diadema setosum (*D. setosum*) is a species of sea urchin commonly known as the long-spined sea urchin, found in tropical Indo-Pacific waters. It is easily recognizable by its long, sharp, black spines, which can grow up to 30 cm in length and are venomous. In this study, PVA (polyvinyl alcohol) polymer network hydrogel was prepared using lipids extracted from *D. setosum* gonads. Fatty acid composition of the extract was analyzed by GC-MS. Swelling behavior, zeta potential and stability of *D. setosum* extract based PVA (PVA- *D. setosum*) were investigated. Zeta potential, size distribution, and structural characterization of the hydrogel were evaluated. PVA-*D. setosum* were also tested for antifungal activity and biocompatibility. Biocompatibility test was evaluated by MTT test (3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide) using mouse fibroblast cells. In the study, PVA-*D. setosum* hydrogel showed antifungal activity with 5.4 mm inhibition zones against *Candida glabrata* and 3.2 mm inhibition zones against *Candida parapsilosis*. These findings suggest that bioactive PVA-D. *setosum* hydrogel has potential applications in wound dressings, food coatings and agricultural materials due to its antifungal and non-cytotoxic effect properties.
Keywords: Polyvinyl alcohol, *Diadema setosum,* lipid extract, hydrogel

INTRODUCTION

Hydrogels are semi-liquid and slightly rigid structures composed of cross-linked hydrophilic polymer networks. The type and density of cross-linking points directly influence the mechanical properties and overall architecture of the three-dimensional network, enabling the formation of various hydrogel types (Ahmed, 2015). Tailored to specific applications, hydrogels can be engineered to possess diverse functional properties such as high fluid absorption, prevention of body fluid loss, bacterial barrier formation, and oxygen permeability (Lim et al., 2009). Hydrogels based on polyvinyl alcohol (PVA) are particularly valued for their flexibility and mechanical robustness, making them suitable for a wide range of biomedical applications including implants, artificial organs, drug delivery systems, and wound dressings (Husain et al., 2018).

Recent research has focused on incorporating peptides and lipids into hydrogels due to their bioactive properties, especially their antimicrobial potential (Mwangi et al., 2019). Marine-derived lipids, recognized for their safety and antibacterial activity, are abundant in tropical marine ecosystems. In this study, lipids extracted from the gonads of *Diadema setosum*—a sea urchin species—were utilized in hydrogel formulations to evaluate their antimicrobial and anti-amylase activities. The gonads, which are the reproductive organs of sea urchins, are rich in ω-3 polyunsaturated fatty acids (LC-PUFA), known for their immunomodulatory and immune-boosting effects (Padang et al., 2019; Murzina et al., 2021).

Bioactive hydrogels were developed by combining PVA, which can independently form gels, with lipid extracts from *D. setosum* gonads to investigate the resulting physicochemical and functional properties. The volatile components of the lipid extract were analyzed using Gas Chromatography–Mass Spectrometry (GC-MS). The hydrogels' characterization, antifungal properties, and effects on fibroblast cells were also systematically investigated.

DRAFT

MATERIALS AND METHODS

Provide **Lipid Extraction from *D. setosum*, GC-MS Analysis, and Hydrogel Preparation**

Lipids were extracted from *Diadema setosum* gonads using a Soxhlet apparatus, followed by solvent removal using a rotary evaporator. The obtained lipid extract was analyzed by (GC-MS) as described by Erdogan Eliuz et al. (2022).

Polyvinyl alcohol (PVA) solution was prepared by dissolving 30% (w/w) PVA in distilled water. The solution was heated to approximately 90°C and maintained at this temperature for 5 minutes to ensure complete dissolution. After cooling, the lipid extract was added at a 1:1 ratio (PVA:lipid, v/v), and the mixture was homogenized for 5 minutes using a high-speed homogenizer. To enhance gel formation, the mixture underwent three freeze–thaw cycles by freezing at −30°C and then thawing at 25°C, as reported by Boran et al. (2024).

Characterization of PVA/*D. setosum* Hydrogels

The hydrogels' stability, particle size distribution, zeta potential, and swelling behavior were evaluated to the methodology described by Eliuz et al. (2024).

Biological Activity of *D. setosum*-Based Hydrogels

The antifungal activity and cytotoxicity of the PVA/*D. setosum* hydrogels were assessed.

Antifungal Activity

The antimicrobial potential of the *D. setosum* lipid-containing hydrogels was evaluated using the well diffusion method. The fungal strains used in this study were *Candida glabrata* and *Candida parapsilosis*. Prior to testing, the fungal strains were inoculated on Sabouraud Dextrose Agar at 35°C for 18–24 hours. After incubation, fresh colonies were harvested for testing. The fungi were spread evenly onto Mueller-Hinton Agar plates. Wells of 6 mm diameter were punched into the agar and filled with 40 µL of the test formulations. The agar plates were incubated at 35°C for 24 hours. Zones of inhibition were analysed in millimeters using the Images programme. Sterile ultra distilled water was used as the negative control. All tests were performed in triplicate to ensure reproducibility (Erdogan Eliuz, 2022).

Evaluation of Fibroblast Cell Proliferation via MTT Assay

Human dermal fibroblast cells (PCS-201-012™) were sourced from the American Type Culture Collection (ATCC) and cultured in RPMI medium enriched with 10% fetal bovine serum (FBS) and 1% penicillin-streptomycin. The cells were incubated at 37°C under a humidified atmosphere containing 5% CO_2. When cultures reached approximately 80–90% confluency, cells were passaged using a 0.25% trypsin-EDTA solution at a 1:3 split ratio.

Cell viability and proliferation were evaluated using the MTT assay, a colorimetric technique that relies on the conversion of MTT into insoluble formazan crystals by metabolically active mitochondria. After 24 hours of initial cell seeding, hydrogel extracts were added at final concentrations of 0.05, 0.1, 0.2, 0.5, and 1 mg/mL. Untreated wells served as negative controls and were considered to represent 100% cell proliferation. After a 72-hour incubation period, 10 µL of MTT solution was added to each well, followed by a further 4-hour incubation. The resulting formazan crystals were dissolved with a solubilizing reagent, and absorbance was measured at 570 nm using a microplate reader (Thermo Labsystems, Franklin, MA, USA). Proliferation rates were determined by comparing the absorbance values to those of the control group (Öztaş et al., 2024).

RESULTS and DISCUSSION

GC–MS Analysis of *D. setosum* Extract

The dominant volatile compounds identified in the *D. setosum* extract by GC–MS were hexadecanoic acid (26.30%), 5,8,11,14-eicosatetraenoic acid (20.07%), ethyl stearate, tetradecanoic acid, (E)-9-octadecenoic acid, ethyl oleate, 5,8,11,14,17-eicosapentaenoic acid, palmitic acid, and E-11-hexadecenoic acid. Additionally, the GC analysis revealed the presence of palmitic acid, stearic acid, trans-9-elaidic acid

(C18:1), cis-9-oleic acid (C18:1), trans-linolelaidic acid (C18:2), n-6 linoleic acid (C18:2), arachidonic acid (C20:4), and eicosapentaenoic acid (EPA, C20:5n3).

Stability, Particle Size Distribution, Zeta Potential, and Swelling Behavior of *D. setosum* Hydrogels

In this study, a fragmented gel model was initially formed using PVA alone (Figure 1A). Upon the addition of *D. setosum* lipid extract, further formulation development was conducted based on changes in elasticity and viscosity. Among the tested formulations, the hydrogel type that demonstrated optimal structural integrity and consistency after lipid incorporation (Figure 1B) was selected for subsequent experiments.

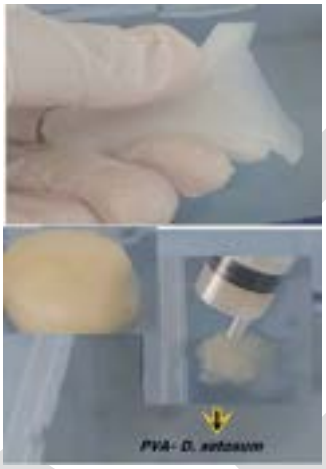

Figure 1. PVA (A), PVA. *D.setosum* hydrogel (B).

In our study, the zeta potentials of PVA–*D. setosum* and pure PVA hydrogels were found to be –43.3 ± 1.1 mV and –58.6 ± 0.04 mV, respectively ($p < 0.05$). The viscosities of both PVA–*D. setosum* and blank hydrogels were measured as 0.8872, indicating no statistically significant difference (Table 1).

Table 1. Zeta potential and particle size distribution values of *D. setosum* hydrogels based on polymer

	PVA- *D. setosum*	**PVA**
Zeta (mV)	-43,3^{a}±1,1	-1,3^{b}±0,1
Dispersant (RI)	1,330^{a}±0,0	1,330^{a}±0,0
Viscosity (cP)	0,8872^{a}±0,0	0,8872^{a}±0,0
Particle size (d nm)	427,4^{a}±2,8	385^{a}±2,8

Statistical differences were evaluated within the same row. Identical letter symbols indicate no significant difference ($p < 0.05$).

The particle size distribution of the PVA–*D. setosum* hydrogels is shown in the graph below (Figure 2) ($p < 0.05$). The particle size distribution of the PVA–*D. setosum* hydrogel was determined to be 427.4 d.nm

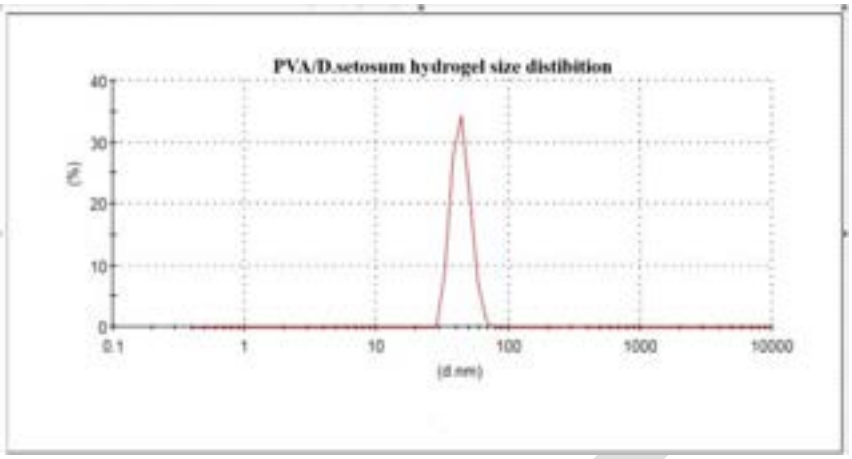

Figure 2. Particle size distribution of PVA–*D. setosum* hydrogel

Water absorption capacity was measured at 5, 10, and 15 minutes, and the amount of absorbed water was calculated as a percentage (Figure 3). Within the first 5 minutes, both *D. setosum*-loaded and blank hydrogels exhibited significantly higher water absorption compared to time zero.
In the PVA hydrogel, swelling percentages relative to time zero were $340^{b} \pm 9.19\%$, $343.3^{b} \pm 6.6\%$, and $346.7^{b} \pm 11.0\%$ at 5, 10, and 15 minutes, respectively ($p < 0.05$). Conversely, the PVA/*D. setosum* hydrogel showed swelling percentages of $120^{a} \pm 8.0\%$, $18.2^{a} \pm 5.0\%$, and $1.5^{a} \pm 1.0\%$ at the same time points ($p < 0.05$).

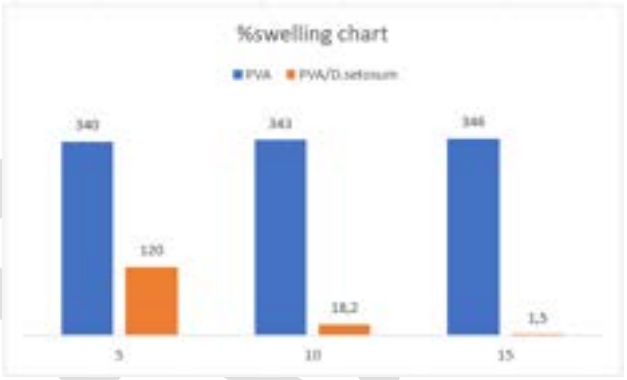

Figure 3. Time-dependent water absorption capacity of PVA and PVA/*D. setosum* hydrogels ($p < 0.05$).

The homogeneity and stability of lipids through gelation or emulsification are closely related to zeta potential and particle size distribution (Eliuz and Ayas, 2024). In this study, the hydrogels demonstrated a homogeneous distribution, with the PVA–*D. setosum* hydrogel exhibiting a zeta potential of -43.3 ± 1.1 mV. It is well established that zeta potentials between –30 mV and +30 mV are indicative of stable systems (Eliuz et al., 2024). PVA hydrogels are known to have high swelling capacities (Shi et al., 2016). The swelling behavior of the PVA–*D. setosum* hydrogels showed a 120% increase within the first 5 minutes, indicating significant water retention. Therefore, PVA hydrogel alone statistically exhibits a considerably higher swelling potential compared to other hydrogels.

Antifungal Activities of *D. setosum* Hydrogels

The antifungal activities of the PVA/*D. setosum* ethanol extract, assessed by agar well diffusion assay, are presented in Figure 4. The extract showed inhibition zones of 19.4 mm and 7.2 mm against *Candida glabrata* and *Candida parapsilosis*, respectively (Table 3).

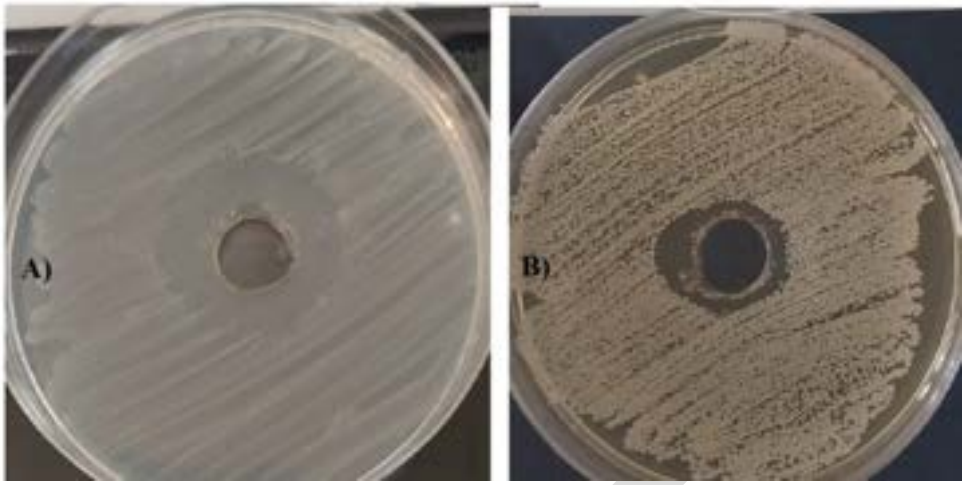

Figure 4. Antimicrobial activity of *D. setosum* hydrogel against pathogens: A) *Candida glabrata*, B) *Candida parapsilosis*.

D. setosum hydrogels exhibited strong antimicrobial activity against all tested microorganisms ($p < 0.05$). The PVA/*D. setosum* hydrogel showed inhibition zones of 5.4 mm against *C. glabrata* and 3.2 mm against *C. parapsilosis* (Table 3).

Table 3. Inhibition zone (mm) values of *D. setosum* extract and hydrogels.

Microorganism	***D. setosum* extract**	**PVA-*D. setosum* hydrogel**	**Antibiotic**	**PVA**
C,glabrata	$19{,}4^{b} \pm 1{,}1$	$5{,}4^{bc} \pm 1{,}1$	$15{,}4^{a} \pm 1{,}5$	0± 0,0
C,parapsilosis	$7{,}2^{a} \pm 3{,}1$	$3{,}2^{ac} \pm 3{,}1$	$9{,}1^{b} \pm 1{,}5$	0± 0,0

Different letters ("a", "b") within the same column indicate statistically significant differences. Fluconazole (250 µg/mL) was used for fungi.

The predominant components of *D. setosum* identified by GC-MS analysis were hexadecanoic acid (26.30%) and 5,8,11,14-eicosatetraenoic acid (20.07%). These results showed similarities with the limited number of studies available in the literature. Muhammad et al. (2020), in their GC-MS analysis of gonad extracts, identified compounds such as n-hexadecanoic acid, (Z)-9-octadecenoic acid methyl ester, tetradecanoic acid, pentadecanoic acid, and oleic acid. There are very few inhibition studies related to sea urchin gonads reported in the literature. In one study, the methanol extract of sea urchin gonads showed no effect against *Enterococcus faecalis* ATCC 29212, *Klebsiella pneumoniae*, and *Candida albicans* ATCC 10237, but exhibited strong inhibition (14 mm) against *Staphylococcus aureus* ATCC 25923 (El-Sayed et al., 2020). In contrast, our study demonstrated significant effectiveness against *Candida* species.

Cytotoxicity of PVA/*D. setosum* Hydrogel on Fibroblast Cell Lines

The proliferation of fibroblast cells treated with PVA/*D. setosum* hydrogel was measured as 205% ± 0.3, 200% ± 0.2, and 180.71% ± 0.3 at concentrations of 1, 0.5, and 0.2 mg/mL, respectively (Figure 5).

DRAFT

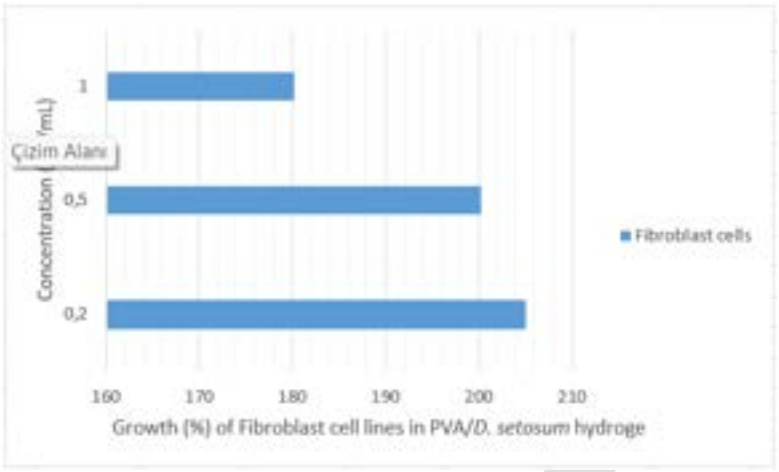

Figure 5. The proliferation of fibroblast cells treated with PVA/*D. setosum*

The *D. setosum*-based hydrogel induced a dose-dependent increase in human fibroblast proliferation without exhibiting cytotoxic effects. This aligns with previous findings showing enhanced neural stem cell proliferation by *Strongylocentrotus purpuratus* (sea urchin) ovary extracts. It is hypothesized that EPA and palmitic acid in sea urchin extracts may exert mitogenic effects via activation of the PPARγ pathway. This study is the first to report that *D. setosum* gonad hydrogel promotes up to a two-fold increase in human fibroblast proliferation in a dose-dependent manner, suggesting its potential for wound healing and tissue regeneration applications (Carroll et al., 2020; Roncoroni et al., 2024).

CONCLUSION

This study demonstrated that the incorporation of *D. setosum* lipid extract into PVA hydrogels produces stable, homogeneous gels with favorable physicochemical properties, including a zeta potential indicative of colloidal stability and moderate swelling behavior. The GC–MS analysis identified bioactive fatty acids such as hexadecanoic acid and eicosatetraenoic acid, which likely contribute to the observed strong antifungal activity against *Candida* species. Importantly, the PVA/D. setosum hydrogel enhanced human fibroblast proliferation in a dose-dependent manner without cytotoxic effects, highlighting its promising potential for biomedical applications such as wound healing and tissue regeneration. These findings support the therapeutic value of *D. setosum* extracts in hydrogel formulations and warrant further investigation into their clinical applications.

Abstract

This study explores the influence of ultrasonic-assisted dispersion of functionalized cellulose nanocrystalline (CNC) into epoxy matrix coatings on their anti-corrosion performance. The study shows a direct relationship between the regular dispersion of CNCs and the enhanced corrosion resistance of the resulting CNC/epoxy nanocomposite coatings. The request of high frequency ultrasonication remarkably improved the dispersion value, achieving a corrosion current rate (CR) of 5,437x10^{-3} mpy and a charge transfer resistance (R_{ct}) of 69,40x10^{3} Ω, both significantly superior to those observed in CNC/epoxy coatings prepared without ultrasonic treatment and in pristine epoxy matrix. The morphological, structural, and mechanical characteristics of the nanocomposite coatings were assessed through scanning electron microscopy (SEM), Fourier-transform infrared spectroscopy (FTIR), and microhardness testing. The findings demonstrate that a robust CNC-epoxy matrix interface enhances corrosion protection and mechanical properties.

Keywords: Nanocomposite Coating, Epoxy, Ultrasonic, Anti-corrosion Resistance.

1. Introduction

Epoxy resins are significantly employed as a protective barrier against metallic alloys due to their excellent mechanical strength, chemical resistance, and excellent adhesion properties. However, their inherent brittleness and susceptibility to microcracking can pose a risk to long-term anti-corrosion performance, specifically in environments with aggressive conditions. Current research has focused on improving the properties of epoxy coatings by integrating nanomaterials such as graphene, metal oxides, cellulose nanocrystals, and cellulose nanofibers with epoxy resin (Lin et al. 2022) (Dhoke et al. 2009) (Xu et al .2020)(Trache et al. 2024)

Recently, the opinion has been made that the perfect design of a nanocomposite involves nanoparticles, nanoplates, and nano crystallites dispersed homogeneously inside the epoxy resin, which could lead to an enhancement in their mechanical, thermal, and anticorrosion properties (Das et al. 2018). The dispersion state of these nanofillers has been the key challenge to reaching their full potential in enhancing their properties. To yield a high content with well-dispersed nanofillers, ultrasound-assisted mixing of the solution has evolved as one of the choices for the fabrication of epoxy nanocomposites with excellent properties (Zaghloul et al. 2023).

Cellulose nanocrystalline (CNC) is extracted from natural cellulose sources, exhibits remarkable mechanical strength, biodegradability, great aspect ratio, and surface benefits, making it a favourable candidate for eco-friendly reinforcement with epoxy (Habibi et al. 2010). Nevertheless, the effective dispersion of CNCs in an epoxy matrix remains one of the challenges due to their aggregation and tendency to cluster. Ultrasonic-assisted dispersion has been shown to be a reliable technique to overcome this restriction, promoting uniform spreading and strong matrix-cellulose nanocrystalline interfacial bonding (Wang et al. 2024).

DRAFT

This study aims to evaluate the influence of high-frequency ultrasonic technique on the dispersion of CNCs and their integrity with the epoxy matrix and the subsequent effect on the anti-corrosion properties of the nanocomposite CNC-epoxy coatings via electrochemical impedance spectroscopy (EIS) and potentiodynamic polarization (Tafel) measurements.

2. Experimental details

2.1. Preparation of nanocomposite CNC-epoxy Coatings

The epoxy resin was first mixed with functionalized CNCs at a particular weight percentage 2wt% CNCs, 3ml epoxy, and 1.5ml epoxy hardener Ethanol was used as a solvent and diluent for the epoxy at a rate of 5 ml. to accomplish efficient dispersion, the nanocomposite mixture suffered stirring and pursued an ultrasonic action at a frequency of 45 kHz for 30 minutes using a bath-type ultrasonicator. A reference sample was prepared without ultrasonic action for comparison. Subsequently, the hardener was added, and the formulations were applied onto pre-treated mild steel substrates using a standardized coating method. Curing was performed at ambient temperature for 48 hours. **Figure (1)** shows the effect of the ultrasonic waves approach on the dispersion of cellulose nanocrystals inside the epoxy matrix.

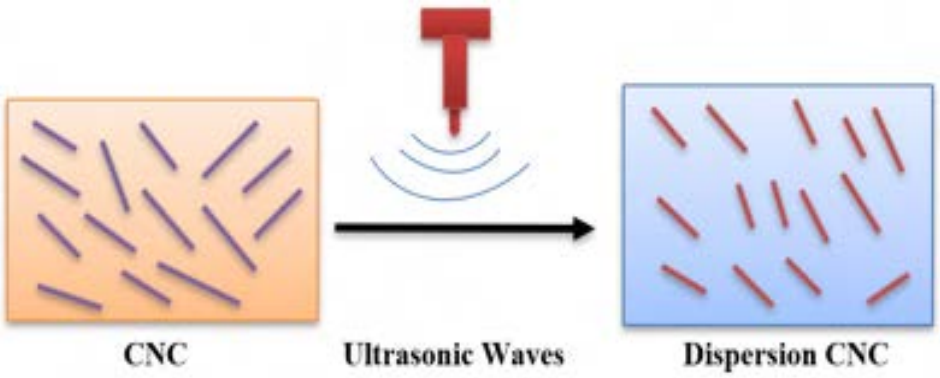

Figure 1: Effect of Ultrasonic-Assisted dispersion

2.2. Characterization Techniques

In this study, the micromorphology images were shown by means of a scanning electron microscope (A ZEISS Gemini SEM ULTRA PLUS) and recognizing chemical bonds in the molecules of nanocomposite material by generating an infrared absorption spectrum via applying Fourier transform infrared spectroscopy (Bruker ALPHA II, Bruker Corporation), and measure the microhardness of the prepared coating via Brinell test (A Qness Q10A from QATM).

2.3. Electrochemical measurements

Electrochemical characterization of the coated samples was performed using a three-electrode electrochemical cell linked to Potentiostate Framework (Gamry-Model 1000B) to evaluate their electrochemical behavior of the potentiodynamic polarization performance (Tefal plots) and the electrochemical impedance spectroscopy (Nyquist plots), both of which provided valuable insight into the protective capabilities of the coated samples.

3. Results and Discussion

3.1. Micromorphology Analysis

Figure 2 (a) shows the micromorphology of epoxy resin coating, which appears as regular homogeneity with micro-pores on its surface. **Figure 2 (b)** shows the micromorphology of the CNC-epoxy nanocomposite coating that was untreated by ultrasonication, which exhibited a dispersion of the CNC weave within the epoxy matrix, with lots of agglomeration places. **Figure 2 (c)** shows the micromorphology of the CNC-epoxy nanocomposite coating that was treated by ultrasonication, which revealed that the

ultrasonically dispersed CNC-treated sample exhibited a homogeneously distributed CNC weave within the epoxy matrix, with minimal agglomeration compared to untreated samples. Furthermore, the elemental composition involving the proper CNC within the epoxy matrix is accomplished via applying the Energy-dispersive X-ray spectroscopy spectra as shown in **Figure 2 (d)**. From micromorphology image results, high-frequency ultrasonic treatment proved critical for accelerating the break-up of CNC agglomerates and achieving better CNC dispersion.

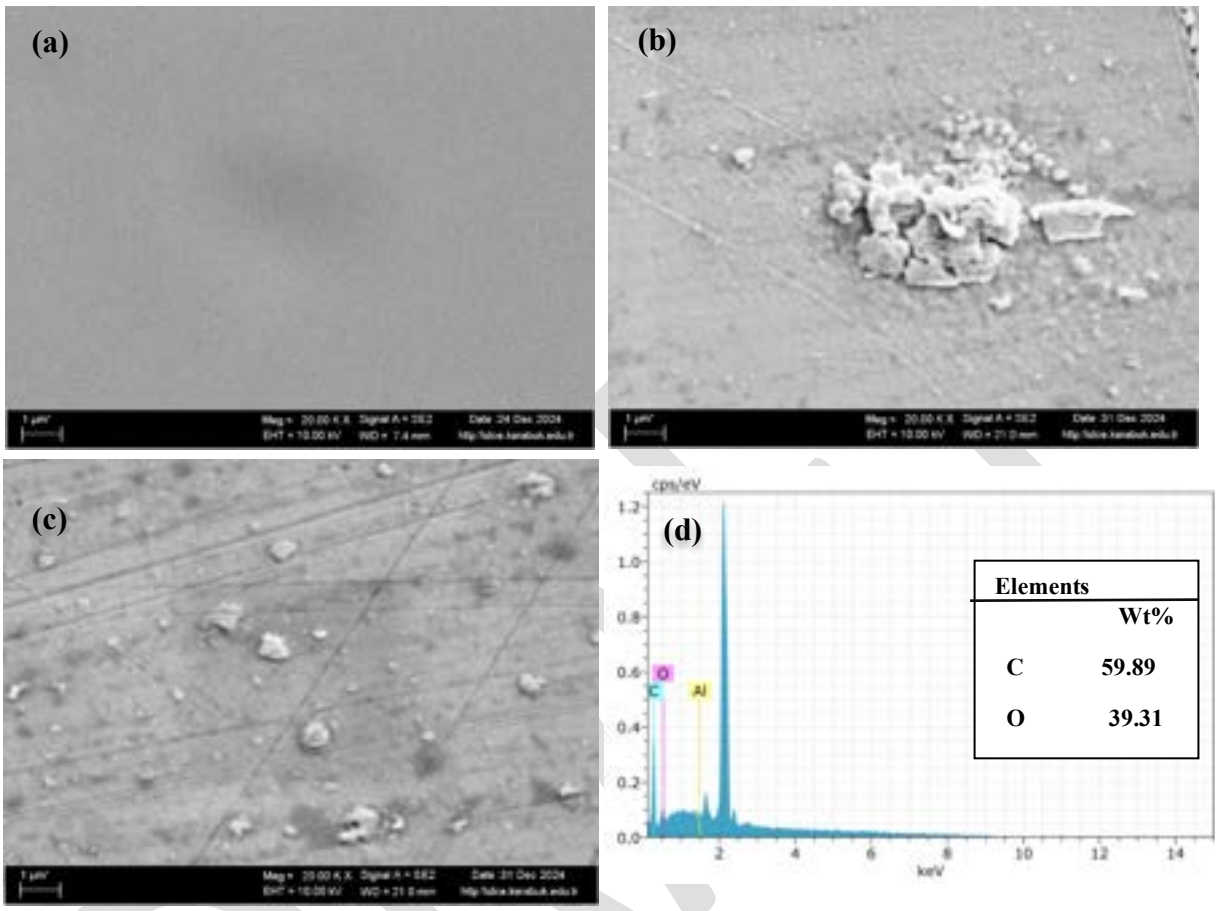

Figure 2. Images for SEM analysis (a) Epoxy coating, (b) EP+CNCs nanocomposite coating without Ultrasonics, **(c)** EP+CNCs nanocomposite coating with Ultrasonics, and (d) Energy-dispersive X-ray spectroscopy spectra

3.2. FTIR Analysis

To recognize chemical bonds in the molecules of the nanocomposite coating using the Fourier transform infrared spectroscopy (FTIR) spectra, as shown in **Figure 3**. Pure epoxy and epoxy/CNC nanocomposites samples were analyzed via FTIR spectra. The spectrum of the ~~epoxy matrix composite~~ shows a characteristic absorption at 857.7 cm^{-1}, indicating out-of-plane C-H vibrations, and at 505.7 cm^{-1}, indicating C-O-C bond vibrations, and representing moisture absorption(Muralishwara, et al. 2022). Significant changes in the absorption results were observed at 1017.8 cm^{-1} and 1296.4 cm^{-1}. These values were more pronounced in the epoxy/CNC nanocomposite, indicating the vibrations of the C-O-C and C-OH bonds in CNC (Reale Batista al.et 2018). This designates a chemical and physical interaction between the epoxy and CNC, as the results showed a decrease in intensity at 3392.4 cm^{-1} in the epoxy/CNC nanocomposite. This reflects the formation of hydrogen bonds between the OH in the CNC and the epoxy(Hu et al., 2021). This study found that the integration of the epoxy matrix with CNC leads to improved interactions between the compounds and improved material properties such as water resistance, durability, and corrosion resistance.

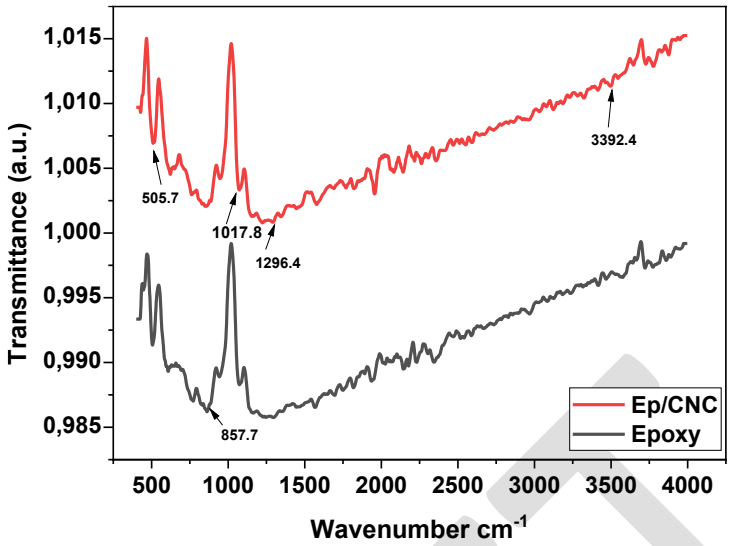

Figure 3 FTIR spectra of (Epoxy) (EP+CNCs)

3.3. Microhardness test

The microhardness test was performed, and the results were tabulated in **Table 1** for the pure epoxy, the CNCs/ Epoxy without Ultrasonic, and the CNCs/ Epoxy with Ultrasonic. The results showed that the hardness value of the sample coated with pure epoxy was 29.3 HV. When compared with the CNCs/Epoxy sample, the microhardness value increased to 32.4 HV. While CNCs/ Epoxy with Ultrasonic sample showed the highest value of the microhardness test results, around 34.8 HV. This indicates that the ultrasonic approach enhances the mechanical properties of the coating through the dispersion of the nanomaterial in a pure Epoxy matrix. These results are consistent with previous works of literature. (Mohamed, al.et. 2018).

DRAFT

3.4. Electrochemical Corrosion Performance

3.4.1. Potentiodynamic Polarization Performance (Tefal Curves)

The potentiodynamic polarization (Tefal) plots, as shown in **Figure (4)**, describe the electrochemical behavior in a corrosive environment. Tefal plots are used for studying the corrosion performance of coated samples. The electrochemical corrosion data of various coated samples are presented in **Table 2**. The pure epoxy-coated sample had the greatest corrosion current density Icorr = 106 nA/cm² and the most negative corrosion potential Ecorr = -725 mV, indicating the lowest corrosion resistance when compared to two other samples. The corrosion rate of 40,89 x 10^{-3} mpy further confirms that the pure epoxy-coated sample is very prone to electrochemical degradation. Within the Epoxy/CNC nanocomposite-coated sample without ultrasonics, improvement in corrosion resistance was attained. The corrosion current density is 46 nA/cm² and a notable corrosion potential of -534 mV, which shows a shift toward a positive potential. Its lower corrosion rate of 17,83 x 10^{-3} mpy, confirms that the presence of the CNCs is significantly effective as a reinforcement material for corrosion avoidance. The Epoxy/CNC nanocomposite coated sample with ultrasonics showed excellent corrosion resistance, with a corrosion current density of 14.10 nA/cm² and an impressive corrosion potential of -235 mV, which shows a significant shift toward a more positive potential. The corrosion rate decreased to 5.437 x 10^{-3} mpy, demonstrating superior corrosion protection compared to the results of the coated sample without ultrasonics. This indicates that the ultrasonic waves greatly disperse CNCs on the pure epoxy matrix, then prevent the agglomeration and microcracking trends, which is considered a critical rule to increasing the anti-corrosion route.

DRAFT

Table 2 Dynamic polarization results (TAFEL) for pure epoxy, EP/CNC+Out Ultrasonic, EP+CNCs+With Ultrasonic

Coated samples	icorr (nA/cm2)	Ecorr (mV)	Corrosion rate (mpy)
Pure Epoxy	106,0	-725,0	40,89e-3
EP+ CNC+Out ultrasonic	46,0	-534,0	17,83e-3
EP+CNC+with ultrasonic	14,10	-235	5,437e-3

3.4.2. Electrochemical Impedance Spectroscopy (EIS)

The electrochemical impedance spectroscopy (Nyquist plots), as presented in **Figure 5** (a, b, c), provides a comparative analysis of the electrochemical behavior in a corrosive environment. Nyquist plots are used for studying the corrosion performance of coated samples through building the equivalent circuit model using Gamry software, as shown in **Figure 5** (d). The equivalent circuit successfully fitted the experimental EIS data, including the coating resistance Rc, charge transfer resistance Rct, solution resistance Rs, constant phase element for the CPEc, and double-layer capacitance CPEdl of various coated samples, as presented in Table 3. The epoxy-coated sample shows low charge transfer resistance (Rct) with a value of 10.25 x 10^3 Ω, and a high CPEdl with a value of 25.73 x 10^{-5}(Masadeh .et al, 2005), indicating the formation of a double layer capacitance at the interface. These two values signify a poor ability to resist corrosion. The epoxy/CNC-coated sample without ultrasonics enhances corrosion resistance via improvement in Rct. Moreover, the increase in Rct with the value of 36.33 × 10^3 Ω and lowered CPEdl of 50.33 x 10^{-6}. represents approval of the influence of the CNCs with more compact, less porous, and excluding microcracking on the epoxy matrix, which denotes improving anti-corrosion. The epoxy/CNC-coated sample with ultrasonics enhances corrosion resistance with considerable improvement in Rct of 69.40 x 10^3 Ω, which contributes to superior corrosion resistance. The further decrease in CPEdl value of 23.48 x 10^{-6} (Zhu et al., 2024). indicates better barrier properties and less ionic mobility within the coated sample. These significant values of Rct and CPEdl compared to the coated sample without the ultrasonic treatment denote that ultrasonic waves contribute significantly to increasing corrosion resistance.

DRAFT

5. Conclusions

This study highlights the capability of functionalizing the dispersion effectiveness of the cellulose nanocrystals (CNCs) for enhanced protective barriers in a pure epoxy matrix. Incorporating cellulose nanocrystals into the epoxy matrix via high frequency ultrasonic-assisted dispersion significantly improved the uniform distribution of CNCs in pure epoxy, creating a robust anti-corrosion barrier and defect-minimized nanocomposite coatings alongside a corrosive environment.

Abstract
Accurate and rapid tracking of the global maximum power point in photovoltaic systems under partial shading conditions remains a critical challenge. In this study, an artificial neural network-assisted voltage reference-guided perturb and observe method is proposed to enhance global maximum power point tracking performance. Twelve irradiance inputs, representing segmented regions of the photovoltaic module, are classified into global maximum power point voltage bands using a feedforward artificial neural network trained on a large irradiance dataset generated through thirty different distribution profiles. The predicted voltage reference is subsequently utilized as a guidance signal, around which the classical perturb and observe algorithm operates to adjust the operating point of the photovoltaic system. Simulation results under dynamically varying irradiance conditions demonstrate that the proposed method significantly outperforms the conventional perturb and observe algorithm in both locating the global operating voltage and maximizing power extraction. The voltage reference-guided strategy rapidly identifies and stabilizes within the appropriate voltage bands, thereby minimizing energy losses and reducing steady-state oscillations. Furthermore, the normalized performance index achieved using the artificial neural network-predicted reference voltage closely approaches the ideal global maximum power point tracking scenario. These findings suggest that the proposed method offers a computationally efficient and highly robust solution, particularly suitable for optimizer-type photovoltaic systems that require fast and reliable global maximum power point tracking.

INTRODUCTION

The increasing demand for clean and sustainable energy has positioned photovoltaic (PV) systems as a vital component in modern power generation. However, the inherently nonlinear current-voltage (I-V) characteristics of PV arrays (Olayiwola et al., 2024), combined with their dependence on dynamic environmental conditions such as solar irradiance and temperature, necessitate the continuous optimization of their operating point. Maximum Power Point Tracking (MPPT) algorithms play a crucial role in ensuring that PV systems extract the maximum available power under all operating conditions (Abidi et al., 2023).

Among various MPPT strategies, classical methods such as Perturb and Observe (P&O) and Incremental Conductance (IncCond) are the most widely adopted due to their simplicity, ease of implementation, and minimal computational requirements (Rezk et al., 2017; Mao et al., 2020). Nevertheless, these conventional algorithms exhibit several limitations, especially under rapidly changing atmospheric conditions or partial shading scenarios. Specifically, the P&O method often suffers from steady-state oscillations around the maximum power point (MPP) (Eltawil & Zhao, 2013) and may experience slow convergence or incorrect tracking (Devarakonda et al., 2022) when abrupt changes in irradiance occur.

In practical PV systems, bypass diodes are integrated into modules to mitigate the adverse effects of partial shading and to protect individual cells from damage due to reverse bias conditions. When shading occurs, bypass diodes conduct current around shaded sections, preventing hotspots and significant power losses. However, the activation of bypass diodes introduces multiple local maxima on the P-V curve, complicating the task of MPPT algorithms (Murtaza et al., 2014). Classical methods like P&O, which typically rely on local gradient information, may become trapped in a local maximum rather than locating the true global MPP (Winston et al., 2018). This increases the complexity of achieving optimal power extraction and highlights the need for more sophisticated tracking strategies capable of coping with such multi-peak scenarios.

To address the inherent challenges of conventional MPPT approaches, a wide variety of enhancements have been explored in recent years. Adaptive step-size techniques have been introduced to accelerate convergence while minimizing oscillations around the operating point by dynamically adjusting the perturbation magnitude according to system conditions (Amir et al., 2017; Soni et al., 2023; Zhou et al., 2021). In addition, variable step-size methods combined with perturbation suppression strategies have been proposed to avoid unnecessary oscillations when the system is operating near the true MPP (Harrison et al., 2022).

Hybrid strategies, which combine features from multiple MPPT methods, have been developed to improve robustness across diverse environmental scenarios. For instance, the integration of fuzzy logic controllers with classical algorithms has enabled more intelligent decision-making by replacing crisp thresholds with gradual transition rules (Rezoug et al., 2018). Metaheuristic optimization techniques, including particle swarm optimization (PSO), grey wolf optimization (GWO), and genetic algorithms (GA), have also been extensively investigated for global maximum power point (GMPP) tracking, particularly under partial shading scenarios where multiple local maxima exist (Naseem et al., 2021; Xiao et al., 2025; Yousaf et al., 2025). These algorithms are capable of escaping local optima and exploring the search space more effectively than gradient-based methods. Furthermore, model predictive control (MPC) frameworks (Priyadarshi et al., 2025; Li et al., 2025) have been proposed to anticipate future system behavior and optimize control actions accordingly, leading to improved transient and steady-state responses. By formulating an optimization problem over a prediction horizon, MPC-based MPPT approaches offer predictive adjustment of the operating point, enhancing tracking performance under dynamic environmental variations.

Artificial neural networks (ANNs) have also been widely employed to improve MPPT performance, especially under complex and rapidly changing operating conditions. ANN-based methods can learn the nonlinear relationship between environmental parameters (such as irradiance and temperature) and the optimal operating point, enabling fast and direct estimation of the MPP without iterative perturbations (Roy et al., 2021; Kota & Bhukya, 2019). While ANNs can significantly speed up tracking and reduce steady-state oscillations, their effectiveness strongly depends on the quality and comprehensiveness of the training data, and they may require retraining if the system characteristics change. As a result, there remains a significant interest in developing MPPT strategies that balance enhanced performance.

In this study, an ANN-assisted voltage reference-guided P&O method is developed to improve global MPPT performance in PV systems subjected to partial shading conditions. A detailed irradiance scenario generation framework is introduced, enabling the classification of segmented irradiance inputs into distinct global MPP voltage bands. A feedforward ANN is trained to predict the appropriate reference voltage cluster based on these irradiance profiles. The predicted reference voltage is subsequently used to guide a classical P&O algorithm. The effectiveness of the proposed method is validated through comprehensive simulations under dynamically varying irradiance profiles, and its performance is compared against conventional P&O and ideal reference-guided tracking.

GENERATION OF INPUT IRRADIANCE PROFILES

Accurately modeling the spatial variability of solar irradiance across PV modules is crucial for a performance evaluation, especially under non-uniform operating conditions. In order to represent such variability, the PS-M72-405 PV module, consisting of 72 series-connected cells and three integrated bypass diodes, is selected as the reference module for the simulations. To emulate localized irradiance variations across the module surface, a segmentation approach is adopted whereby every six cells are assigned a distinct irradiance value, resulting in twelve independent irradiance inputs per scenario. A total of 30,000 unique irradiance scenarios are generated to comprehensively cover a wide range of environmental conditions and module responses.

The irradiance values for each scenario are drawn according to thirty distinct sampling profiles, as illustrated in Figure 1. These profiles are designed to follow uniform random distributions with varying weightings across the irradiance range of 100 W/m² to 1000 W/m². Specific profiles emphasized low irradiance conditions, high irradiance conditions, or introduced mid-range dominance, thereby capturing different degrees of shading, partial cloud cover, and clear-sky conditions. Each histogram depicted in Figure 1 corresponds to a different irradiance distribution pattern used in the generation process. This

structured variability ensures that the generated dataset provides a rigorous testing environment for subsequent MPPT evaluations.

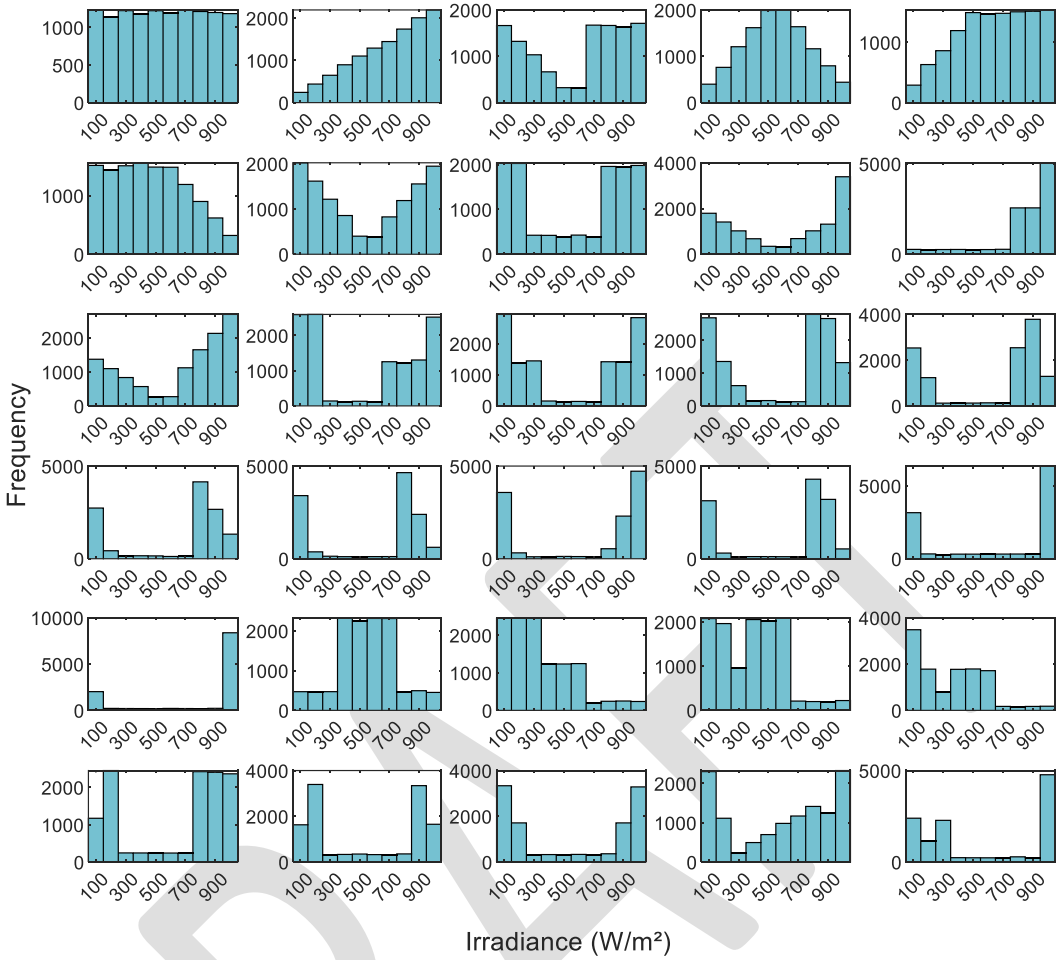

Figure 1. Histogram visualization of input irradiance variability

DETERMINATION OF GLOBAL MAXIMUM POWER POINT VOLTAGES

To determine the global MPP voltages under the generated irradiance scenarios, detailed simulations are conducted using the Simscape Solar Cell model within the MATLAB/Simulink environment (MathWorks, 2023a). The Solar Cell block provides a physics-based representation of a PV cell by solving the nonlinear I–V characteristics according to the single-diode equivalent circuit model (MathWorks, 2023b). Key parameters such as photocurrent, saturation current, series resistance, shunt resistance, and temperature-dependent effects are inherently incorporated, enabling highly accurate electrical behavior modeling under varying irradiance and temperature conditions. Throughout all simulations, the module temperature is assumed to be constant at 45 °C.

In the simulation framework, each irradiance scenario is fed into a set of Solar Cell blocks corresponding to the module's segmented structure. For each scenario, the full I–V curve is generated by systematically sweeping the terminal voltage across the operational range. From the resulting I–V characteristics, the global MPP is identified by locating the voltage corresponding to the highest product of current and voltage. The extracted global MPP voltages from all 30,000 irradiance scenarios are then statistically analyzed to assess their distribution and clustering behavior. Figure 2 presents the histogram of the global MPP voltages obtained from the simulations, while Table 1 summarizes the statistical properties of the identified voltage clusters.

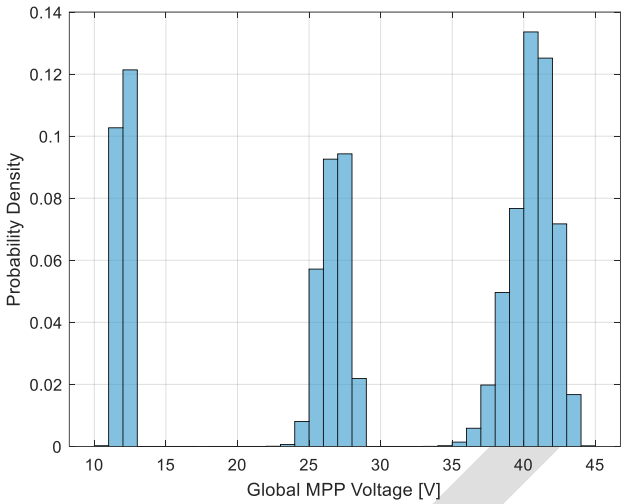

Figure 2. Histogram of global MPP voltages

As depicted in Figure 2, the global MPP voltages predominantly fall into three distinct bands centered around approximately 12 V, 27 V, and 39 V. This clear band formation is indicative of the module's intrinsic structural configuration combined with the effects of partial shading patterns and the activation of bypass diodes. Specifically, the first band, located around 12 V, corresponds to scenarios where two bypass diodes are conducting, effectively isolating a major portion of the module from active power generation. The second band, centered near 27 V, represents intermediate shading conditions in which one bypass diode is activated, partially limiting the module's contribution to the overall output. Finally, the third band, observed around 39 V, reflects near-uniform irradiance conditions where no bypass diodes are triggered, allowing the entire module to contribute fully to power production

Table 1 provides a detailed statistical characterization for each cluster, including expected value, standard deviation, variance, and median. The relatively low standard deviations within each cluster highlight the consistency of global MPP voltages under similar shading conditions, further validating the strong banded behavior observed in the histogram.

Table 1. Interval-based statistical summary of MPP voltage

	Expected value	Standard deviation	Variance	Median
Cluster 1	12.05	0.36	0.13	12.02
Cluster 2	26.71	0.94	0.89	26.78
Cluster 3	38.83	0.92	0.85	39.00

DEVELOPMENT OF THE ANN-BASED IRRADIANCE PROFILE CLASSIFIER

Accurately and rapidly identifying the operating voltage corresponding to the global MPP under diverse irradiance conditions is critical for efficient PV system operation. To achieve this, an ANN model is developed to directly map input irradiance profiles to predefined global MPP voltage clusters as shown in Figure 3. The input to the ANN consists of twelve irradiance values, each representing the irradiance received by every six-cell segment of the PV module. The output is defined as the corresponding global MPP voltage cluster, categorized into three distinct bands previously identified through statistical analysis.

DRAFT

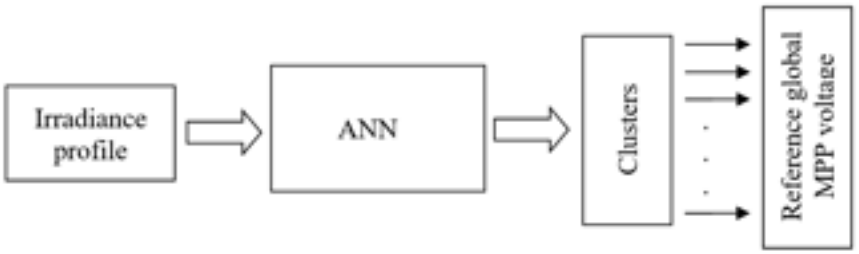

Figure 3. Voltage reference mapping using ANN-based irradiance profile classification

For training the ANN, a large dataset is prepared by combining multiple irradiance scenarios generated under thirty different distribution profiles. Each input vector is normalized using min-max scaling to improve the training performance and convergence rate. The output labels are discretized into three classes based on the GMPP voltage bands, and one-hot encoding is applied to structure the classification targets appropriately. The network architecture employs a feedforward pattern recognition structure comprising three hidden layers with 40, 32, and 32 neurons, respectively. A cross-entropy loss function is utilized as the optimization objective, and the network is trained using a backpropagation algorithm for 1000 epochs. An independent external test dataset consisting of 6000 samples is constructed similarly for final evaluation. Following training, the performance of the ANN is evaluated through various metrics. The evolution of the cross-entropy loss over epochs demonstrates stable and consistent convergence behavior. Additionally, prediction confidence is analyzed over the test dataset, with most samples achieving a confidence level close to 1. The resulting classification accuracy on the independent test set exceeds 93%, indicating robust generalization capability of the trained model. Figure 4 presents the distribution of prediction confidences for the test samples.

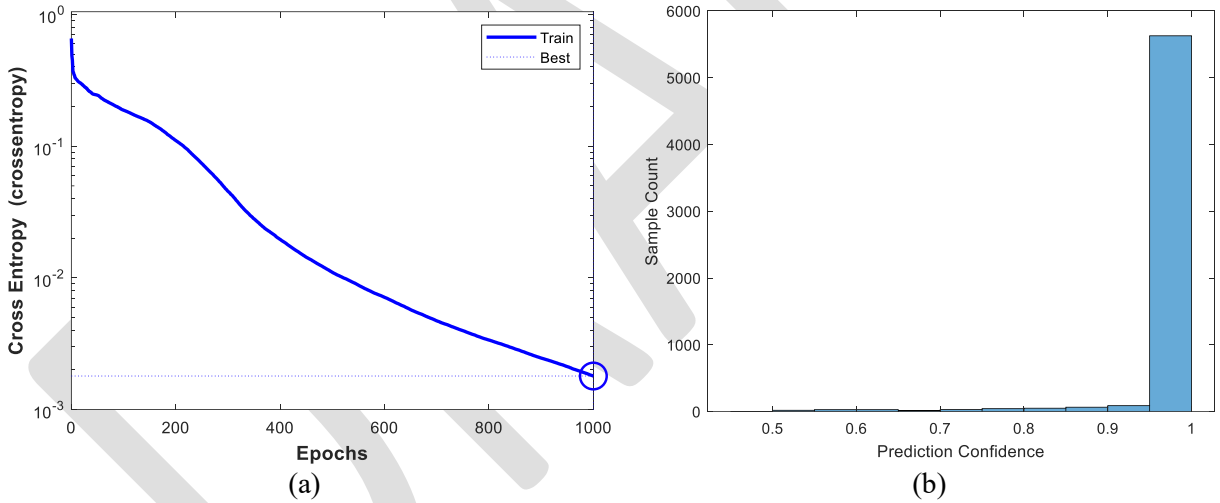

Figure 4. (a) Training performance based on cross entropy, (b) Prediction confidence for test data

IMPLEMENTATION AND PERFORMANCE EVALUATION OF THE PROPOSED METHOD

The final stage of the study involves the implementation of the proposed global MPPT strategy within the MATLAB/Simulink environment. The overall system structure is depicted in Figure 5. In this setup, the irradiance profile, representing the segmented irradiance levels across the PV module, is fed into a trained ANN. The ANN then predicts the global MPP voltage cluster based on the irradiance input. This predicted voltage reference is subsequently utilized as a guidance signal by the DC-DC converter, around which the classical P&O algorithm operates to adjust the operating point of the PV system.

DRAFT

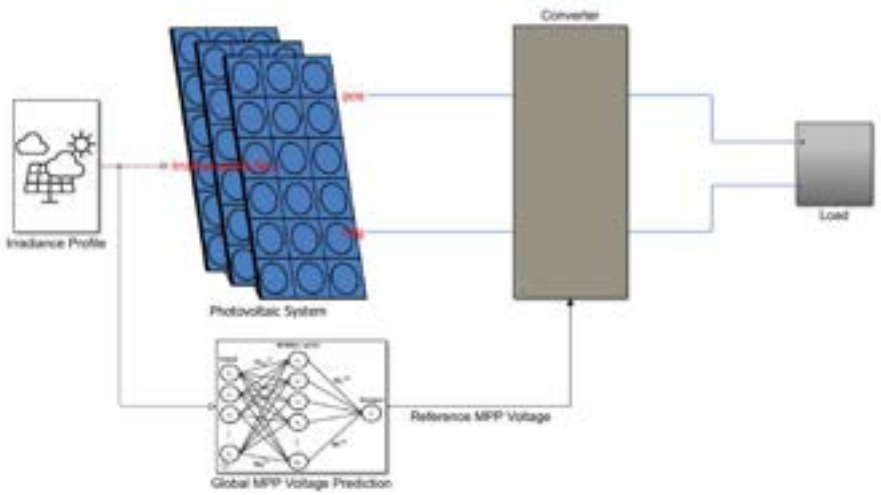

Figure 5. Global MPPT system implemented in MATLAB/Simulink

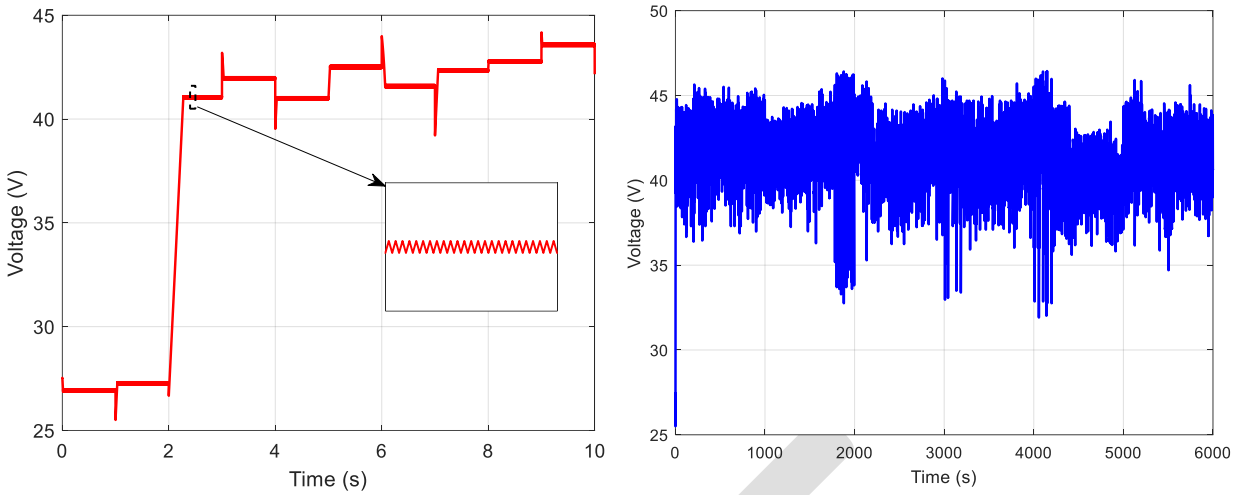
To evaluate the effectiveness of the proposed voltage reference-guided MPPT approach, three different operational cases are considered:

- The classical P&O method.
- The voltage reference-guided P&O method using the ANN-predicted reference voltages.
- An idealized voltage reference-guided P&O method using the true GMPP voltages obtained directly from exhaustive offline analysis.

Figures 6 and 7 present the dynamic behavior of the PV system under classical perturb and observe (P&O) MPPT control. In Figure 6(a), which shows the voltage profile over the first 10 samples, it is evident that the P&O algorithm adjusts the operating voltage gradually through discrete perturbations. The inset magnifies a region where small oscillations occur around the MPP. Over the full dataset, as seen in Figure 6(b), the voltage trajectory exhibits substantial fluctuations, particularly under rapidly changing irradiance conditions. This behavior highlights the classical P&O method's inherent limitation, as it often fails to stabilize at the true global MPP due to its reliance on local gradient information.

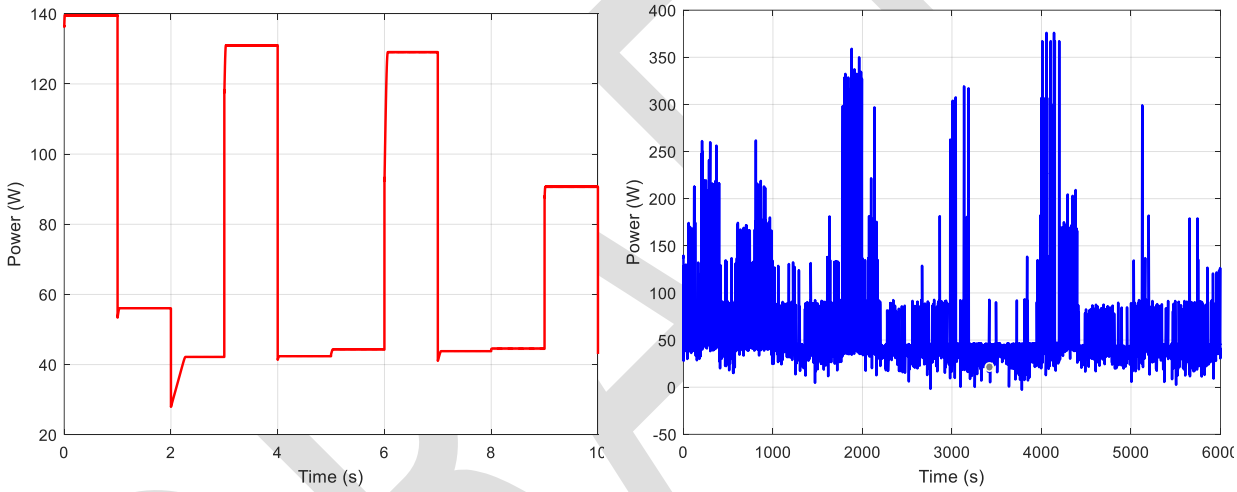
Correspondingly, Figure 7 illustrates the instantaneous power output of the system under classical P&O control. In Figure 7(a), stepwise variations in output power align with the perturbation steps observed in the voltage profile. However, over the entire dataset shown in Figure 7(b), the power output exhibits pronounced fluctuations and frequent power losses, primarily resulting from the algorithm's inability to rapidly and reliably track the true global MPP under partial shading scenarios.

DRAFT



(a) (b)

Figure 6. Voltage profile of the PV system under P&O MPPT: (a) first 10 samples, (b) entire dataset

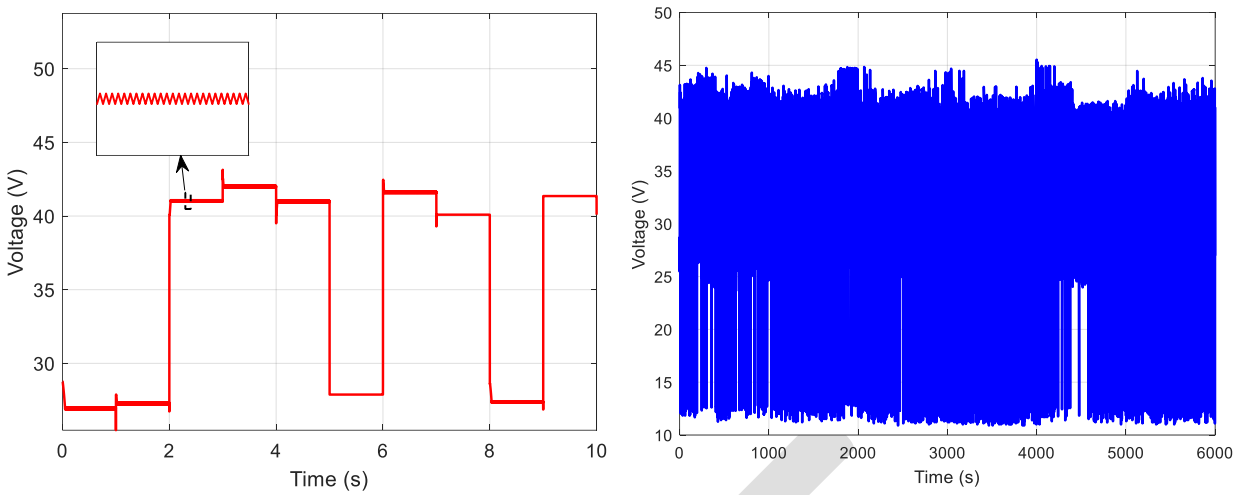


(a) (b)

Figure 7. Instantaneous power output of the PV system under P&O MPPT: (a) first 10 samples, (b) entire dataset

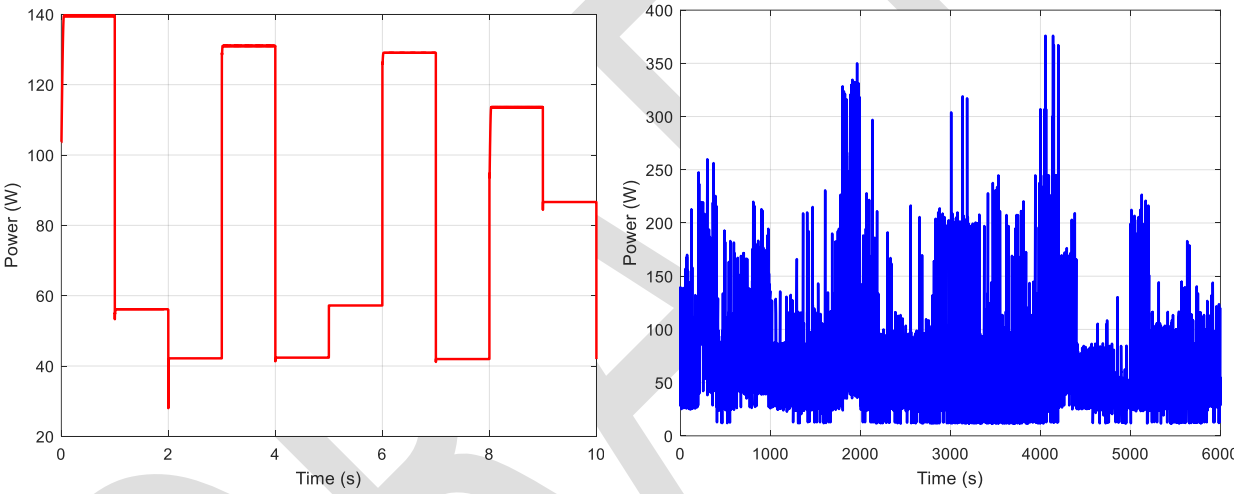
In contrast, Figures 8 and 9 demonstrate the system performance when the voltage reference-guided P&O method is employed. Figure 8(a) shows that the system rapidly steps toward the artificial neural network-predicted reference voltage without the need for extensive perturbation, leading to faster convergence and more accurate voltage tracking. Unlike the classical P&O method, the proposed strategy accurately identifies and stabilizes within the distinct voltage bands associated with the global MPPs. Over the full dataset, as presented in Figure 8(b), the voltage profile remains significantly more stable, with discrete transitions that correspond directly to changes in the irradiance conditions rather than continuous oscillatory behavior around local operating points.

Similarly, Figure 9 presents the corresponding instantaneous power output results. In Figure 9(a), it is observed that the system promptly reaches high power levels following irradiance transitions, reflecting the effectiveness of the voltage reference in guiding the MPPT process. Over the full dataset shown in Figure 9(b), the power output maintains a consistently higher average level with substantially reduced fluctuations compared to the classical P&O method.



(a) (b)

Figure 8. Voltage profile of the PV system under voltage reference-guided P&O: (a) first 10 samples, (b) entire dataset



(a) (b)

Figure 9. Instantaneous power output of the PV system under voltage reference-guided P&O: (a) first 10 samples, (b) entire dataset

To quantitatively assess the tracking performance, a normalized performance index is defined according to the following equation:

$$Normalized\ performance\ index = \frac{1}{P_{rated}^{1000W/m^2,\ 25°C}} \int_0^t P_{out}(\tau) d\tau$$

where $P_{rated}^{1000W/m^2,\ 25°C}$ denotes the rated output power of the PV system under standard test conditions, and $P_{out}(\tau)$ represents the instantaneous output power at time τ. Figure 10 compares the evolution of the normalized performance index over the entire simulation horizon for the three strategies. As clearly observed, the voltage reference-guided P&O method using the ANN prediction closely follows the ideal case with minimal deviation, demonstrating a significant improvement over the classical P&O method. In contrast, the classical P&O control exhibits substantial performance degradation, particularly under rapidly varying irradiance conditions, due to its inherent local search mechanism and inability to relocate the global MPP efficiently. These results highlight the effectiveness of the proposed ANN-assisted voltage reference-guided strategy in achieving near-optimal global power tracking performance while maintaining simplicity and low computational burden.

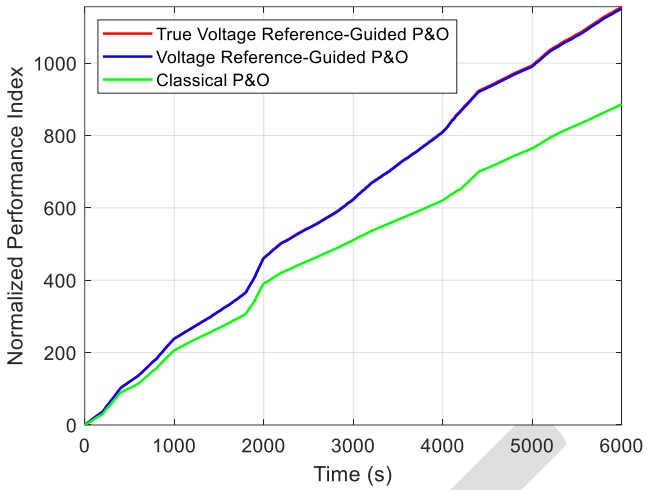


Figure 10. Normalized performance index comparison

CONCLUSION

This study presents an ANN-assisted voltage reference-guided MPPT strategy to address the limitations of classical P&O algorithms under partial shading conditions. By classifying irradiance inputs into distinct voltage bands corresponding to the global MPP, the proposed method enables the system to rapidly relocate and stabilize at near-optimal operating points. Simulation results demonstrate that the voltage reference-guided perturb and observe method significantly improves voltage tracking accuracy and power extraction compared to the conventional perturb and observe method, particularly under dynamically changing irradiance profiles. The normalized performance index achieved using the ANN predictions closely matches the ideal GMPP tracking scenario, highlighting the robustness and effectiveness of the approach. Given its simplicity, low computational burden, and strong tracking performance, the proposed method offers a promising alternative for optimizer-type photovoltaic systems, particularly those operating in environments prone to partial shading.

Abstract

Phosphate is considered an important biogenic element and a key contributor to eutrophication in aquatic ecosystems, existing in both dissolved and adsorbed forms. There is a growing need for inexpensive, portable, repeatable, highly sensitive, and field-deployable sensors with a wide detection range to monitor the quality of food and environmental samples. This work aims to develop an electrochemical phosphate sensor using a carbon paste electrode modified with reduced graphene oxide doped with copper ions (rGO@Cu/CPE) for phosphate detection, with the goal of achieving high sensitivity, a broad detection range, simplicity, and high repeatability. Phosphate was quantified by a voltammetric technique through the electrochemical reduction of the molybdophosphate complex in a 0.05 mol L^{-1} sulfuric acid (H_2SO_4) solution. The analytical parameters, including the pH of the working solution (H_2SO_4), the adsorption duration of the complex, and the content of molybdate, were optimized. A linear response for phosphate ion detection was observed in the range of 1.3 mg/L to 19.6 mg/L. The detection limit was determined to be approximately 0.05 mg/L, and the response time of the rGO@Cu/CPE sensor was about 10 seconds. Thus, this study presents the fabrication of a portable, low-cost, easy-to-use, biodegradable, and rapid phosphate ion sensor (rGO@Cu/CPE) suitable for in situ and real-time monitoring of food and water quality.

Keywords: *voltammetric method, reduced graphene oxide, doped copper ions, carbon paste electrode, phosphate sensor, molybdophosphate complex*

INTRODUCTION

The determination of the inorganic phosphate ion is especially important in the field of environmental, clinical, and food analysis. Inorganic phosphate is one of several major environmental contaminants. The detection of the levels of this contaminant is of utmost importance in the treatments of waste-water for our daily life (Rahman et al., 2005). All trace materials used in food preparation or preservation that improve food flavor, appearance, or other attributes are referred to as food additives. Natural food additives are now progressively being replaced by artificial, synthetic ones. There are also numerous issues with food additives, such as misuse, overuse, and even toxicity (Wu et al., 2022). Food additives are intentionally incorporated into food products to influence their physical, chemical, biological, or sensory characteristics for technological purposes during manufacturing, processing, preparation, treatment, packaging, shipping, or storage (Milešević et al., 2022; Velázquez-Sámano et al., 2019).

The crucial role of phosphate in the effects of excessive dietary intake (Watanabe et al., 1988) and the assessment of phosphate levels in bodily fluids for diagnosing hyperparathyroidism, Vitamin D deficiency, and Fanconi syndrome (Kawasaki et al., 1989) are also widely recognized. Moreover, numerous biological activities are associated with ATP hydrolysis, necessitating the monitoring of released inorganic phosphate ions to enhance comprehension of the mechanisms underlying specific intracellular reactions and signaling processes (Salins et al., 2004). Consequently, the necessity for a cost-effective and selective approach to accurately assess phosphate ion concentration in various sample matrices is evident.

Total phosphorus is measured by a number of analytical techniques, including chromatographic methods like high-performance liquid chromatography and ion chromatography, which provide exact separation and quantitation (Colero and Galceran, 2005). Fluorescence-based techniques, having high sensitivity and specificity, are particularly amenable to trace-level analysis (Kröckel et al., 2014). In addition, spectrophotometric methods are widely applied since they are efficient in determining phosphorus levels in different sample matrices (Li et al., 2022; Nakatani et al., 2008; Neves et al., 2008). Among

spectrophotometric techniques, the phosphomolybdenum blue (PMB) technique is the most commonly used for measuring dissolved phosphate. The method consists of the reaction of ammonium molybdate, ascorbic acid, and antimony potassium tartrate in an acidic medium to produce the Keggin anion of PMB. The reaction is as follows (Warwick et al., 2013; Wei et al., 2021):

$$7PO_4^{3-} + 12Mo_7O_{24}^{6-} + 72H^+ \rightarrow 7PMo_{12}O_{40}^{3-} + 36H_2O \quad (1)$$

The concentration of phosphate in a sample can be determined by measuring the absorbance of the resulting PMB complex by spectrophotometry.

Though spectrophotometric techniques are commonly employed in phosphate determination in food sample, they are usually interfered with and also involve cumbersome sample preparation. Electrochemical techniques, on the other hand, provide improved selectivity, sensitivity, and portability for on-site measurement because of the fast reaction of the phosphomolybdate ions at the electrode surface (Berchmans et al., 2012; Wei et al., 2021). The electrochemical reaction is as follows:

$$PMo_{12}O_{40}^{3-} + nH^+ + ne^- \rightarrow [H_nPMo_{12}O_{40}]^{3-} \quad (2)$$

The application of voltage to the electrode nicely reduces the phosphomolybdenum blue complex, enabling qualitative and quantitative analysis. Moreover, electrochemical methods are low-cost, rapid, and easily miniaturized, rendering them quite suitable for real-time monitoring applications (Pan et al., 2009; Wei et al., 2021).

As effective as traditional techniques are, their costliness and time-consuming nature present a challenge. Electrochemical strategies present an attractive complement due to their rapid, inexpensive, and convenient nature towards phosphate detection (Mahmud et al., 2020; Wei et al., 2021). Numerous studies have explored the use of electrochemical techniques with carbon-based sensors for detecting phosphate in both food and environmental samples. For example, Kolliopoulos et al. (2015) utilized screen-printed electrodes (SPEs) combined with a modified spectrophotometric approach to electrochemically detect dissolved phosphate. In electroanalysis, graphene-based electrodes find extensive application as the active sensor material (Arvas et al., 2018). Excellent features like high surface area, aspect ratio, porosity, electrical conductivity, and mechanical stability (Madurani et al., 2020; Jaafar et al., 2018) define graphene-based materials. Among these materials, graphene oxide (GO) is especially fascinating since it generates stable aqueous solutions by means of several oxygen-containing functional groups (e.g., epoxy, hydroxyl, and carboxyl) (Neklyud et al., 2017). GO is an insulating substance unlike graphene; nonetheless, it becomes conductive when reduced to its related form, reduced graphene oxide (rGO). By means of several reduction techniques—thermal, chemical, or electrochemical—each generating variable degrees of reduction, rGO can be manufactured. Consequently, one usually obtains a mixture of rGO and GO (Mazzara et al., 2020).

This study aims to build an electrochemical carbon paste sensor modified with reduced graphene oxide doped with copper ions (rGO@Cu/CPE) for the detection of phosphates in real samples, including food and environmental water. The increasing usage of phosphates in processed meat products necessitates their accurate detection for quality control and consumer safety. The high conductivity of reduced graphene oxide (rGO), combined with the catalytic effect of copper, enhances electron transfer between the rGO@Cu and the carbon paste electrode. Consequently, the sensor exhibited an extensive detection range from 1.3 to 19.6 mg/L and a high sensitivity of 9.03 µA/mg/L. The goal of this project is to develop a fast, reliable method for analyzing phosphate levels in real food samples by optimizing detection parameters and thoroughly testing the system.

EXPERIMENTAL

Reagents and Chemicals

All experimental reagents and materials used in this study were of analytical grade, sourced from Sigma-Aldrich and Merck (Merck KGaA, Darmstadt, Germany). A high-purity phosphate standard (PO_4^{3-}) KH_2PO_4 was obtained from Carlo-Erba and stored under refrigeration at 4°C to maintain stability. Different concentrations of phosphate ion solutions were prepared by diluting the high concentration of standard stock solution. Additionally, a freshly prepared stock solution of ammonium molybdate (0.1 mmol L^{-1}) was prepared using high-purity reagents and kept refrigerated at 4°C to maintain stability and prevent degradation. Double-distilled water was used for the preparation of all solutions to ensure high purity and reproducibility. The supporting electrolyte solutions were prepared using sulfuric acid (H_2SO_4) and nitric acid (HNO_3), both with 99% purity and obtained from Merck. Potassium chloride (KCl), necessary for

electrolyte preparation, was acquired from Aldrich. For electrode modification, synthetic graphite powder with a particle size of 71–90 µm was sourced from Alfa Aesar (99.9% purity), while paraffin oil (Olio di Vaselina) was purchased from Zeta Farmaceutici. For the preparation of modified sensors rGO@Cu/CPE, additional chemicals were utilized. Reduced graphene oxide (rGO) was synthesized using graphite oxide obtained from Sigma-Aldrich, reduced with ascorbic acid (Sigma-Aldrich, ≥99% purity). Copper nanoparticles (CuNPs) used for electrode modification were synthesized using copper (II) sulfate pentahydrate ($CuSO_4 \cdot 5H_2O$, Merck, 99%) and sodium borohydride ($NaBH_4$, Sigma-Aldrich, ≥98%). All reagents were stored and handled following standard laboratory protocols to ensure accuracy and reproducibility in experimental results.

Apparatus

All electrochemical measurements were performed using a PalmSens4 potentiostat–galvanostat, wirelessly connected to a personal computer via Bluetooth and controlled through dedicated three-electrode system software. The CPE and modified rGO/CPE, rGO@Cu/CPE sensors used in this study served as the working electrodes, while a platinum wire was used as the counter electrode, and an Ag/AgCl/KCl (3M) electrode functioned as the reference electrode. The electrochemical analysis of phosphate (PO_4^{3-}) was conducted using voltammetric technique, including cyclic voltammetry (CV) and square wave voltammetry (SWV).

Electrodes Preparation

Preparation of rGO/CPE Sensor

The rGO/CPE sensor was prepared by mixing 1.00 g of carbon powder (particle size: 70–90 µm), 0.100 g of rGO, and 300 µL of paraffin oil. The mixture was then ground using a mortar and pestle for 30 minutes until a homogeneous paste was obtained. To immobilize the rGO into the carbon paste matrix, the composite electrode material was stored in a refrigerator at 4°C for 24 hours before use. This allowed the paste to stabilize and the rGO to be properly integrated into the carbon matrix. Than the prepared materials were packed into a plastic syringe with an 8 mm internal diameter, containing a 9.5 mm copper wire as the external electrical contact.

Preparation of rGO@Cu

A total of 0.472 g of $CuSO_4 \cdot 5H_2O$ and 0.102 g of graphene oxide (previously synthesized) were weighed and transferred into a 75 mL beaker containing 20 mL of distilled water**.** The mixture was stirred using a magnetic stirrer at level 4 for 2 hours to ensure proper dispersion. Following this, the suspension was placed in an ultrasonic bath at room temperature for 4 hours to enhance uniform mixing. The resulting dispersion was then divided into two 14 mL test tubes and centrifuged at 5000 RPM for 5 minutes. The obtained precipitate was dried in a thermostatic oven at approximately 80°C until a gel-like mass was formed. The dried composite was stored in a filter paper in a dry environment for further use.

Preparation of rGO@Cu /CPE Sensor

The rGO@Cu/CPE sensor was prepared by mixing 1.00 g of carbon powder (particle size: 70–90 µm), 0.100 g of the synthesized rGO@Cu composite, and 300 µL of paraffin oil. Initially, the carbon powder and paraffin oil were mixed, followed by the addition of the rGO@Cu composite. The mixture was then ground using a mortar and pestle for 30 minutes until a homogeneous paste was obtained. The prepared paste was packed into a plastic syringe with an 8 mm internal diameter, containing a 9.5 mm copper wire as the external electrical contact. For comparison, an unmodified CPE was prepared using the same procedure but without the addition of rGO@Cu. Before electrochemical measurements, the electrode surface was smoothed on a glass surface, and after partial removal of the paste, the surface was renewed by polishing.

RESULTS AND DISCUSSIONS

Electrochemical behavior of Phosphomolybdate complex at modified rGO@Cu/CPE sensor

The electrochemical reduction capability of the phosphomolybdate reflects the sensing performance of the modified electrodes. The high surface area of rGO and excellent catalytic performance of copper doped into rGO/CPE were used to enhance the sensing performance of the CPE electrode. The electrochemical behavior of phosphomolybdate complex was investigated in sulfuric acid media 0.05 mol L^{-1}, 0.1 mmol L^{-1} molybdate using square wave voltammetry at bare CPE, rGo/CPE and rGO@Cu/CPE modified sensors, in presence of 3.1 mg/L phosphate.

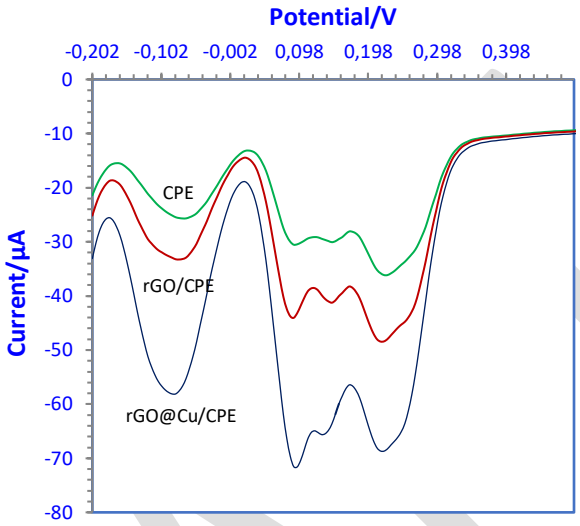

Figure. 1. SWVs of bare CPE, rGO/CPE, and rGO@Cu/CPE in a solution containing 0.1 mmol L^{-1} molybdate, and 0.05 mol L^{-1} H_2SO_4 solution (pH 1.3) in the presence of 3.1 mg/L phosphate, using the potential range of 800 to − 200 mV, with a amplitude of 50 mV/ s and frequency 30 Hz

Figure 1 illustrates the voltammograms of phosphomolybdate at bare CPE, rGO/CPE and rGO@Cu/CPE sensors, in the presence of 3.1 mg/L phosphate recorded at 0.1 mmol L^{-1} molybdate, and 0.05 mol L^{-1} H_2SO_4 solution (pH 1.3). It was observed that three consecutive reductions peak were observed at around +220 mV (I), 100 mV (II) and -100 mV (III), respectively. This is due to polyphosphomolybdate isomerizes into two different forms α (α-$[PMo_{12}O_{40}]^{3-}$) and β (β-$[PMo_{12}O_{40}]^{3-}$) as reported (Nagul et al, 2015). As shown in Figure. 1, the bare CPE electrode exhibited a low reduction peak (III) current in presence of 3.1 mg/L PO_4^{3-} compared with modified rGO/CPE and rGO@Cu/CPE sensor. However, the rGO@Cu/CPE electrode exhibited the highest reduction peak current (III), showing that the phosphomolybdate reduction peak current at the rGO@Cu/CPE electrode increased compared with bare CPE and rGO/CPE, respectively. These results indicate that the significant increase in the reduction peak current of rGO@Cu/CPE is caused by the synergistic rGO and copper ions doped in rGO, with rGO providing a larger surface area and a considerable number of active sites, while Cu provides good catalytic effect in phosphomolybdate performance.

Analytical performance of rGO@Cu/CPE Sensor

Optimization of experimental parameters

Effects of adsorption time

The effect of adsorption time of phosphomolybdate was optimized (Figure 2). The Square Wave Voltammograms reduction peak at -100 V was recorded in solutions containing 10.6 mg/L phosphate with adsorption times ranging from 60 s to 600 s.

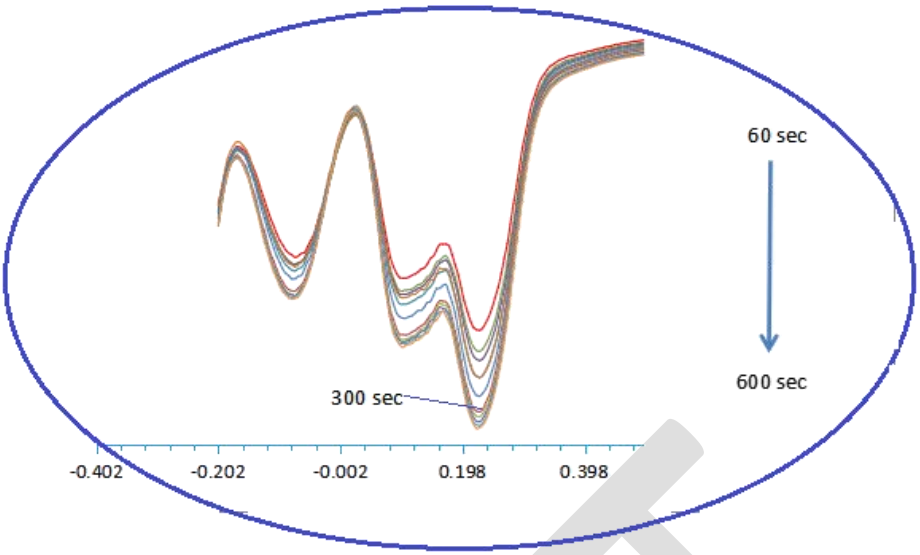

Figure 2. SWV of rGO@Cu/CPE at different adsorption times from 60 s to 600 s, at 0.1 mmol L^{-1} molybdate, 0.05 mol L^{-1} H_2SO_4 solution in the presence of 10.6 mg/L phosphate concentrations.

The cathodic peak current gradually increased with the adsorption time of phosphomolybdate from 60 s to 300 s, however, when the time was further raised from 300 s to 600 s, the increase of stripping current was not obvious, which is mainly due to the saturation of phosphomolybdate adsorption on the electrode surface. Therefore, it was enough for 300 s to detect phosphate and suitable for the requirement of rapid detection.

Effects of pH and molybdate concentration

In order to optimize the square wave voltammetry of the electroactive phosphomolybdate complex formed by the reaction between phosphate and molybdate salt to form the Keggin anion ($PMo_{12}O_{40}^{3-}$) (Joaca et al., 2011), the influence of pH and molybdate concentration were investigated.

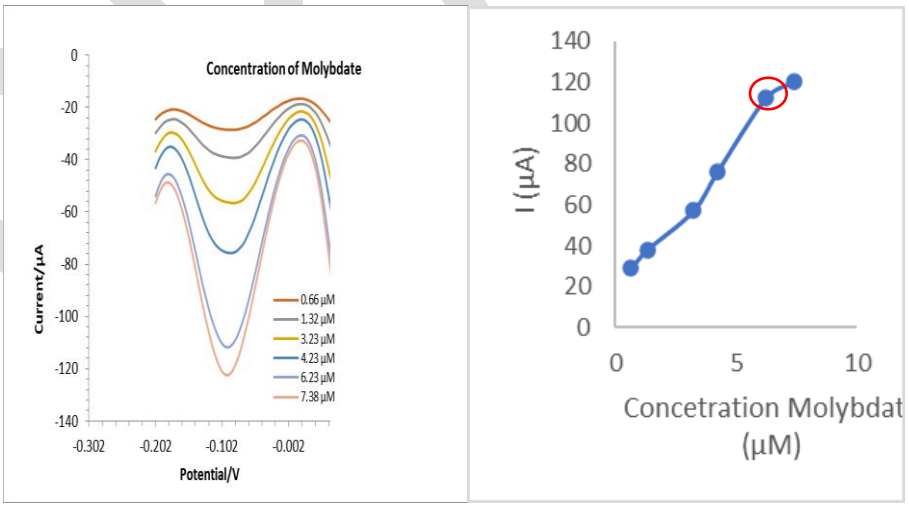

Figure 3. Current response to different concentration of molybdate containing 10.6 mg/L phosphate at pH 1.3

The effect of the molybdate concentration from 0.66 to 7.38 µM at pH 1.3 was studied by SW-Voltammetry. The obtained results shown in Figure 3 revealed that the highest value of reductive peak current at potential - 100 mV was achieved with the molybdate concentration of 6.23 µM.

It was also evaluated the SWV signal obtained with rGO@Cu/CPE sensor for determination of phosphate in 6.23 µM molybdate using pH value between 0.3 to 3.0. As shown in Figure 4, the variation of current

for phosphate solution with the concentration of 10.6 mg/L at different pH, the best results were obtained at pH around 1.3. At the pH higher than 1.3, more time was required for the formation of heteropolyacids (Du et al., 2011). Therefore, the reductive peak current of molybdophosphate was decreased when pH was higher than 1.3.

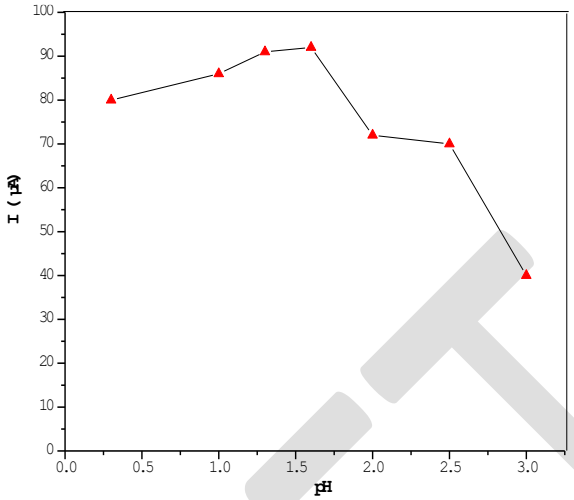

Figure 4. Variation of current measured by SWV as a function of pH (from 0.3 to 3.0) for molybdophosphate complex containing 10.6 mg/L phosphate

Calibration curve

The calibration curve of the proposed sensor rGO@Cu/CPE for phosphate ion quantification was obtained using square wave voltammetry as a detection technique. The concentration and stability of complex depend on numerous parameters such as the concentration of molybdenum (VI) and phosphate anions, the acid concentration, the reaction time and temperature. Figure 5 shows the SW voltammograms and corresponding calibration curve for different phosphate ions concentration. According to mechanism the two isomers have very close oxidation/reduction potentials and as reported in (Ueda et al., 2013), in the registered SW-Voltammograms three peaks can be found. The first and second are relative to the redox processes of the β-$[PMo_{12}O_{40}]^{3-}$ anion, while the second and third are due to the redox processes of α-$[PMo_{12}O_{40}]^{3-}$.

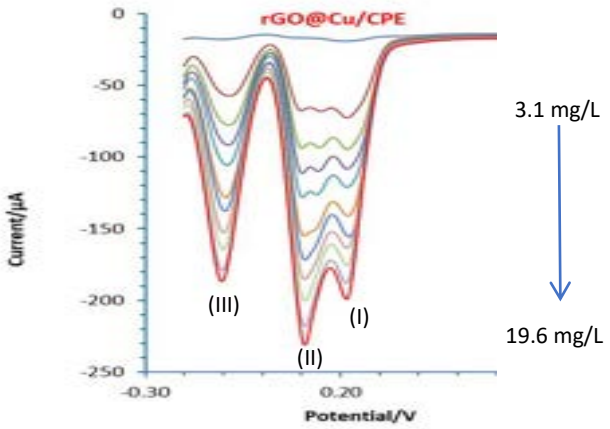

Figure 5. SWV of rGO@Cu/CPE in 0.05 mol L^{-1} sulfuric acid and 0.1 mmol L^{-1} ammonium molybdate at different phosphate concentrations from a range of potential scan 800 mV to -200 mV, amplitude 50 mV/S and frequency 30 Hz.

The clearest reduction peak for phosphate ion concentration in the SWV curves was observed at −100 mV (Peak III), corresponding to the electrochemical reduction of Mo (IV) to Mo (II). For this peak couple, higher selectivity and sensitivity toward variations in phosphate ion concentration were noted. Consequently, the peak current of this reduction (III) was used as the sensor readout.

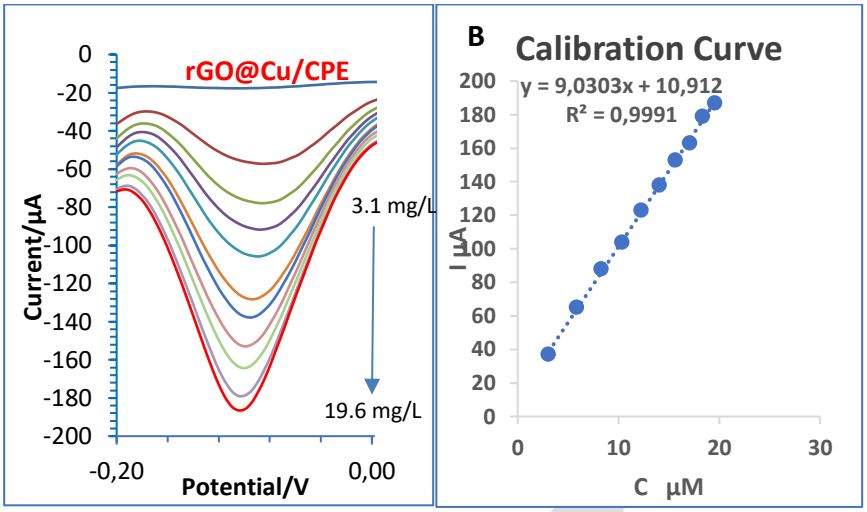

Figure. 6 (A) Square wave voltammograms of rGO@Cu/CPE at different phosphate concentrations (Peak III -100 mV) from 3.1 to 19.6 mg/L at 0.1 mmol L^{-1} molybdate, and 0.05 mol L^{-1} H_2SO_4 solution (B) Calibration curve for phosphate determination.

As shown in Fig. 6, the sensor current intensity response increases with phosphate concentration, so the cathodic current was corresponded to the target phosphate concentration, allowing a linear calibration of the rGO@Cu/CPE sensor for concentrations ranging from 3.1 to 19.6 mg/L. The limit of detection (LOD) of the sensor was calculated using the following equation:

$$LOD = 3.3 * SD/S \quad (3)$$

where SD is the standard deviation of the blank and S is the average sensor sensitivity yielding a calculated LOD of 0.05 mg/L.

Stability and Reproducibility

The stability of the rGO@Cu/CPE electrode was studied in a mixed solution containing 5 mM $K_3Fe(CN)_6$ and $K_4Fe(CN)_6$, using cyclic voltammetry. The results indicate that the modified electrode completely retained its initial response with an RSD of 2.7 % after storage for 30 days at room temperature, verifying that the rGO@Cu/CPE electrode has good stability. The good stability for rGO@Cu/CPE can be attributed the well combination of rGO doped with copper, which resulting in a more stable composite material.

In addition, the reproducibility of the rGO@Cu/CPE electrode was evaluated using three electrodes independently modified using the same method in 3.1 mg/L phosphate solutions, showing an RSD of 4.2%. This indicates that different rGO@Cu/CPE electrodes exhibit negligible differences in SWV response.

CONCLUSIONS

This work reports for the detection of phosphate ions with an electrochemical sensor based on a carbon paste electrode modified with reduced graphene oxide doped with copper ions (rGO@Cu). The incorporation of nanomaterials rGO@Cu into the carbon paste electrode (CPE) produced a quite sensitive sensor, with a sensitivity of 9.03 µA/mg/L for the electrochemical detection of phosphate ions. Adsorption time, sulfuric acid concentration (pH), and molybdate concentration were among several factors optimized to produce a high-performance, stable, and repeatable sensor. The rGO@Cu/CPE sensor with a detection limit (LOD) of 0.05 mg/L, allowed phosphate ion detection over a broad linear range, from 3.1 mg/L to 19.6 mg/L. Strong potential as a portable system for field deployment and real-time monitoring is presented by the proposed rGO@Cu/CPE sensor due to its low cost, simple fabrication, small size, and low equipment requirements.

Abstract

One of the most important concepts in axiomatic geometry is that of betweenness of points in an abstract metric space. It also plays a special role in distance (metric) geometry. Moreover, a metric structure on a lattice produces a rich theory on the concept of betweenness in arbitrary lattices. In this work, we first introduce the concepts of almost certainly betweenness and probably betweenness in a random metric space that is an abstract set on which the distance between two points is modelled via a random variable due to the randomness of the distances. Next, we introduce the concept of a random metric lattice via the notion of random positive valuation on a lattice. In this context, we also investigate a betweenness relation in random metric lattices. Finally, we examine the uniform continuity of the random positive valuation on a special lattice.

Keywords: almost certainly betweenness, probably betweenness, random positive valuation, random metric lattice.

1. INTRODUCTION

Distance geometry (or widely known as metric geometry) investigates the geometry of abstract spaces via the tools of a metric, and it is an active area of research interacting with many mathematical disciplines. Since Menger's work in 1928 (Menger, 1928) many results have been published on distance geometry. A well organized account of the basic concepts and results in this area can be found in e.g. Blumenthal (1970), Burago et al. (2001), Busemann (1942), Gromov et al. (2007) and Papadopoulos (2014).

On the other hand, random metric (RM) spaces are special classes of probabilistic metric (PM) spaces (see Schweizer and Sklar (1983)). The concept of an RM space was first introduced by Špaček (1956, 1960), and then studied in more detail (see, e.g. Brown (1972) and Guo (1999, 2001)). In an RM space, the distance between two points is a random variable. This approach to distances has some applications in physics and risk theory (see Roy (1998) and Guo et al. (2014), respectively).

Returning to distance geometry, we see that one of the most important concepts is that of betweenness of distinct points in a metric space. On the other hand, if we endow a lattice with a metric, this rises many problems related to the concept of betweenness on the lattice. In the current work, we first introduce the notions of almost certainly betweenness and probably betweenness in an RM space (for betweenness relations in a probabilistic metric space, we refer to Schweizer and Sklar (1983) where probability distribution functions are used instead of random variables). Next, we introduce the notion of random metric lattice via the concept of a random positive valuation on a lattice, which is a random generalization of positive valuation. In this context, we investigate a betweenness relation in random metric lattices. Finally, we examine the uniform continuity of the random positive valuation on a special lattice. When stating our new definitions and results, we have inspired from Birkhoff (1973), Blumenthal (1970) and Sherwood (1970). We think that the study of lattice structure and betweenness relations in an RM space may contribute to the algebra and geometry of RM spaces.

DRAFT

2. MATERIALS AND METHODS

In this section, we recall some of the basic concepts from Guo (1999, 2001) and Schweizer and Sklar (1983), related to our work.

Let $(\Omega, \mathcal{A}, P)$ be a probability space and $\omega \in \Omega$. Consider the following classes [almost surely $(a.s.)$ equivalent functions are identified]:

(i) $L_0(\Omega, \mathbb{R})$: The set of all equivalence classes of real random variables defined on Ω,
(ii) $L_0^+(\Omega)$: The set of all $\xi \in L_0(\Omega, \mathbb{R})$ with $\xi(\omega) \geq 0 \ \ a.s.$

$L_0(\Omega, \mathbb{R})$ is a vector space and its zero vector will be denoted as Θ, where $\Theta(\omega) = 0 \ \ a.s.$ For any $\xi, \zeta \in L_0(\Omega, \mathbb{R})$, we define $\xi \preccurlyeq \zeta \Leftrightarrow \xi(\omega) \leq \zeta(\omega)\ a.s.$ If $\xi \preccurlyeq \zeta$ but $\xi \neq \zeta$ we will write $\xi \prec \zeta$.

Definition 2.1 Let $(\Omega, \mathcal{A}, P)$ be a probability space, $\mathbf{S} \neq \emptyset$ and $\mathcal{X}: \mathbf{S} \times \mathbf{S} \to L_0^+(\Omega)$ be a mapping with $\mathcal{X}(p, q) = X_{pq}$ where $p, q \in \mathbf{S}$. If for every $p, q, r \in \mathbf{S}$ we have

(RM 1) $X_{pq} = \Theta \Leftrightarrow p = q$
(RM 2) $X_{pq} = X_{qp}$
(RM 3) $X_{pr} \preccurlyeq X_{pq} + X_{qr}$,

then the pair $(\mathbf{S}, \mathcal{X})$ is called a *random metric* (*RM*) *space* with base $(\Omega, \mathcal{A}, P)$. Moreover, the random variable X_{pq} is called the *random distance* between p and q.

Now let $(\mathbf{S}, \mathcal{X})$ be an RM space with base $(\Omega, \mathcal{A}, P)$. Then, given $p \in \mathbf{S}$, $\varepsilon > 0$ and $\lambda \in (0,1)$, the set $\mathcal{N}_p(\varepsilon, \lambda) = \{q \in \mathbf{S}: \ P(X_{pq} < \varepsilon) > 1 - \lambda\}$ is called the $(\varepsilon, \lambda) -$ *neighborhood* of p. The topology generated by these neighbourhoods is called the $(\varepsilon, \lambda) -$*topology* on $\mathbf{S}$.

Example 2.1 Let $(\Omega, \mathcal{A}, P)$ be a probability space and $(\mathbf{M}, d)$ a separable metric space endowed with a Borel $\sigma -$algebra. We identify $a.s.$ equivalent measurable mappings defined from Ω into $\mathbf{M}$ and denote the set of all equivalence classes of these mappings by $\mathbf{S}$. Consider the mapping $\mathcal{X}: \mathbf{S} \times \mathbf{S} \to L_0^+(\Omega)$ defined as $[\mathcal{X}(p, q)](\omega) = X_{pq}(\omega) = d(p(\omega), q(\omega))$ where $p, q \in \mathbf{S}$ and $\omega \in \Omega$. Thus $(\mathbf{S}, \mathcal{X})$ is an RM space with base $(\Omega, \mathcal{A}, P)$.

3. RESULTS AND DISCUSSION

In this section, we first introduce the concept of almost certainly betweenness.

Definition 3.1 Let $(\mathbf{S}, \mathcal{X})$ be an RM space and $p, q, r \in \mathbf{S}$ pairwise distinct. If $X_{pq} + X_{qr} = X_{pr}$ then we will say that q is *almost certainly between* p and r, and denote this by (pqr). Moreover, we will denote the set of all points of $\mathbf{S}$ almost certainly between p and r by $B(p, r)$.

Theorem 3.1 In an RM space $(\mathbf{S}, \mathcal{X})$, the relation of almost certainly betweenness has the following properties:

(a) (pqr) implies (rqp), which is the *symmetry of the outer points*.
(b) If (pqr) holds, then neither (prq) nor (qpr) holds, which is the *special inner point* property.
(c) If (pqr) and (prs) hold, then (pqs) and (qrs) hold, which is the property of *transitivity*.
(d) Given $p, r \in \mathbf{S}$, the set $B[p, r] = B(p, r) \cup \{p, r\}$ is closed in the $(\varepsilon, \lambda) -$topology, which is the *closure* property.

Proof. (a) Straightforward.

(b) Let (pqr) hold. Then $X_{pq} + X_{qr} = X_{pr}$. Now if (prq) holds, then we have $X_{pr} + X_{rq} = X_{pq}$. These two equalities give $X_{qr} = \Theta$, a contradiction to $q \neq r$. In a similar way, (qpr) cannot hold.

(c) Assume that (pqr) and (prs) hold. Now p, q, r, s are pairwise distinct except possibly q and s. But we must have $q \neq s$ since, on the contrary, (pqr) and (prq) both hold,which contradicts (b). Now $X_{pq} + X_{qr} = X_{pr}$ and $X_{pr} + X_{rs} = X_{ps}$ yield $X_{pq} + X_{qr} + X_{rs} = X_{ps} \preccurlyeq X_{pq} + X_{qs}$. On the other hand, we have $X_{qs} \preccurlyeq X_{qr} + X_{rs}$. Thus we get $X_{qr} + X_{rs} = X_{qs}$ and hence $X_{pq} + X_{qs} = X_{ps}$. This shows that (pqs) and (qrs) hold.

(d) Let $q \in \overline{B[p,r]}$, where $p, q, r \in \mathbf{S}$ are pairwise distinct. Since $\mathbf{S}$ endowed with the (ε, λ) −topology is first countable, there exists a sequence (q_n) in $B(p,r)$ such that $\lim_{n\to\infty} q_n = q$. Then we have $X_{pq_n} + X_{q_n r} = X_{pr}$ for all $n \in \mathbb{N}$. Now, since the random metric is uniformly continuous (see Brown, 1972), we get $X_{pq} + X_{qr} = X_{pr}$, i.e., $q \in B(p,r)$, which implies that $q \in B[p,r]$. ■

Example 3.1 Let $(\Omega, \mathcal{A}, P)$ be the Lebesgue probability space where $\Omega = [0,1]$. As in Example 2.1, identify $a.s.$ equivalent real random variables defined on Ω and denote the set of all equivalence classes of these random variables by $\mathbf{S}$. Consider the mapping $\mathcal{X}: \mathbf{S} \times \mathbf{S} \to L_0^+(\Omega)$ defined as $[\mathcal{X}(p,q)](\omega) = X_{pq}(\omega) = |p(\omega) - q(\omega)|$ where $p, q \in \mathbf{S}$ and $\omega \in \Omega$. Thus $(\mathbf{S}, \mathcal{X})$ is an RM space. Now let us define $p: [0,1] \to \mathbb{R}$ by

$$p(\omega) = \begin{cases} 2\omega, & if\ 0 \leq \omega \leq \frac{1}{2} \\ -2\omega + 2, & if\ \frac{1}{2} \leq \omega \leq 1 \end{cases},$$

$q: [0,1] \to \mathbb{R}$ by $q(\omega) = 1$ for each $\omega \in [0,1]$ and $r: [0,1] \to \mathbb{R}$ by $r(\omega) = 0$ for each $\omega \in [0,1]$.
Then we have $X_{qp}(\omega) + X_{pr}(\omega) = X_{qr}(\omega)$ for every $\omega \in \Omega$, and hence we get (qpr).

Now we introduce another type of betweenness which is significantly different from almost certainly betweenness.

Definition 3.2 Let $(\mathbf{S}, \mathcal{X})$ be an RM space and $p, q, r \in \mathbf{S}$ pairwise distinct. If $0 < P\{\omega \in \Omega: X_{pq}(\omega) + X_{qr}(\omega) = X_{pr}(\omega)\} < 1$, then we will say that q is *probably between* p and r, and will denote this by $(p\widetilde{q}r)$.

We know by Theorem 3.1 (b) that if (pqr) holds, then neither (prq) nor (qpr) holds. However, this is not the case in the setting of probably betweenness as can be seen in the following example.

Example 3.2 Let $(\Omega, \mathcal{A}, P)$ be the Lebesgue probability space where $\Omega = [0,1]$. We will consider the RM space given in Example 3.1. Define $p: [0,1] \to \mathbb{R}$ by

$$p(\omega) = \begin{cases} -2\omega + 1, & if\ 0 \leq \omega \leq \frac{1}{2} \\ 2\omega - 1, & if\ \frac{1}{2} \leq \omega \leq 1 \end{cases},$$

$q: [0,1] \to \mathbb{R}$ by $q(\omega) = 1$ for each $\omega \in [0,1]$ and $r: [0,1] \to \mathbb{R}$ by $r(\omega) = 2\omega$ for each $\omega \in [0,1]$. Then we have $X_{pq}(\omega) + X_{qr}(\omega) = X_{pr}(\omega)$ for every $\omega \in \left[\frac{1}{2}, 1\right]$. Hence we get $(p\widetilde{q}r)$. Moreover, we have $X_{pr}(\omega) + X_{rq}(\omega) = X_{pq}(\omega)$ for every $\omega \in \left[\frac{1}{4}, \frac{1}{2}\right]$. Thus $(p\widetilde{r}q)$ holds. Similarly, we have $X_{qp}(\omega) + X_{pr}(\omega) = X_{qr}(\omega)$ for every $\omega \in \left[0, \frac{1}{4}\right]$. Thus $(q\widetilde{p}r)$ holds.
Throughout the following, we will study on lattices. For convention, let us denote a lattice by $(\mathbf{L}, \leq, \vee, \wedge)$ where $\leq$ is the partial order on $\mathbf{L}$, $\vee$ and $\wedge$ are the join and meet operations on $\mathbf{L} \times \mathbf{L}$, respectively. If $p, q \in \mathbf{L}$ with $p \leq q$ but $p \neq q$ we will write $p < q$.

Definition 3.3 Let $(\mathbf{L}, \leq, \vee, \wedge)$ be a lattice and consider the mapping $f: \mathbf{L} \to L_0^+(\Omega)$ satisfying the following axioms:
(RPV 1) $p, q \in \mathbf{L}$ and $p < q$ implies that $f(p) \prec f(q)$,
(RPV 2) For all $p, q \in \mathbf{L}$ we have $f(p \vee q) + f(p \wedge q) = f(p) + f(q)$.

Then the mapping f will be called the *random positive valuation* on $\mathbf{L}$ and it will be denoted by $f(p) = [p]$. A lattice $\mathbf{L}$ endowed with a random positive valuation will be denoted by $(\mathbf{L}, [\cdot])$, briefly.

Example 3.3 Let $\mathbb{R}_+^n = \{(p_1, \dots, p_n) : p_1, \dots, p_n \geq 0\}$ and endow $\mathbb{R}_+^n$ with the coordinatewise ordering $p = (p_1, \dots, p_n) \leq q = (q_1, \dots, q_n) \Leftrightarrow p_i \leq q_i$ for all $i = 1, \dots, n$. Now let $\xi_1, \dots, \xi_n \in L_0^+(\Omega)$ where each $\xi_i \neq \Theta$, and consider the random linear combination $[p] = p_1\xi_1 + \cdots + p_n\xi_n$. Then the pair $(\mathbb{R}_+^n, [\cdot])$ is a lattice with a random positive valuation.

Theorem 3.2 Let $(\mathbf{L}_1, [\cdot]_1)$ and $(\mathbf{L}_2, [\cdot]_2)$ be lattices with random positive valuations $[\cdot]_1$ and $[\cdot]_2$, respectively. Then $\mathbf{L}_1 \times \mathbf{L}_2$ is also a lattice with a random positive valuation defined by $[(a, b)] = [a]_1 + [b]_2$, where $(a, b) \in \mathbf{L}_1 \times \mathbf{L}_2$.

Proof. (RPV 1) Let $(a, b), (c, d) \in \mathbf{L}_1 \times \mathbf{L}_2$ with $(a, b) < (c, d)$, that is, $a \leq c$ in $\mathbf{L}_1$ and $b \leq d$ in $\mathbf{L}_2$ but $(a, b) \neq (c, d)$. Then $[(a, b)] = [a]_1 + [b]_2 \prec [c]_1 + [d]_2 = [(c, d)]$.

(RPV 2) $[(a, b) \vee (c, d)] + [(a, b) \wedge (c, d)] = [(a \vee c, b \vee d)] + [(a \wedge c, b \wedge d)]$
$= [a \vee c]_1 + [b \vee d]_2 + [a \wedge c]_1 + [b \wedge d]_2 = [a]_1 + [c]_1 + [b]_2 + [d]_2 = [(a, b)] + [(c, d)]$. ■

Theorem 3.3 Let $(\mathbf{L}, [\cdot])$ be a lattice with a random positive valuation. For $p, q \in \mathbf{L}$ define $\mathcal{X}: \mathbf{L} \times \mathbf{L} \to L_0^+(\Omega)$ by $\mathcal{X}(p, q) = X_{pq} = [p \vee q] - [p \wedge q]$. Then the pair $(\mathbf{L}, \mathcal{X})$ is an RM space.

Proof. (RM 1) If $p = q$, then it is clear that $X_{pq} = \Theta$. Conversely, let $X_{pq} = \Theta$. Then we have $[p \vee q] = [p \wedge q]$, and since $(p \wedge q) \leq (p \vee q)$ we get $p \wedge q = p \vee q$ from (RPV 1). Thus $(p \wedge q) \leq p$ and $p \leq (p \vee q) = p \wedge q$ imply that $p \wedge q = p$. Similarly, we have $p \wedge q = q$, and thus $p = q$.

(RM 2) Straightforward.

(RM 3) Let $p, q, r \in \mathbf{L}$. Then we have $[p \vee r] + [q] \preccurlyeq [p \vee q] + [q \vee r]$. Moreover, we can write $[p \wedge q] + [q \wedge r] \preccurlyeq [p \wedge r] + [q]$. Combining these relations we get
$[p \vee r] - [p \wedge r] \preccurlyeq [p \vee q] - [p \wedge q] + [q \vee r] - [q \wedge r]$, that is, $X_{pr} \preccurlyeq X_{pq} + X_{qr}$. ■

Remark. In Theorem 3.3, the RM space $(\mathbf{L}, \mathcal{X})$ induced by $[\cdot]$ will be called a *random metric (RM) lattice*.

Theorem 3.4 Let $(\mathbf{L}, [\cdot])$ be a lattice with a random positive valuation and $(\mathbf{L}, \mathcal{X})$ be the RM lattice induced by $[\cdot]$. If $p \leq q \leq r$ in $\mathbf{L}$, then we have (pqr).

Proof. We can write $X_{pq} = [p \vee q] - [p \wedge q] = [q] - [p]$. Similarly, we have $X_{qr} = [r] - [q]$ and $X_{pr} = [r] - [p]$. Thus we get $X_{pq} + X_{qr} = X_{pr}$, i.e., (pqr). ■

Theorem 3.5 The random positive valuation on the lattice $(\mathbb{R}_+^n, [\cdot])$ is uniformly continuous.

Proof. We recall from Example 3.3 that given $p = (p_1, \dots, p_n) \in \mathbb{R}_+^n$, we define $[p] = p_1\xi_1 + \cdots + p_n\xi_n$, where $\xi_1, \dots, \xi_n \in L_0^+(\Omega)$ and each $\xi_i \neq \Theta$. Now consider the RM lattice $(\mathbb{R}_+^n, \mathcal{X})$ induced by $[\cdot]$, where $\mathcal{X}(p, q) = X_{pq} = [p \vee q] - [p \wedge q]$, given $p = (p_1, \dots, p_n)$, $q = (q_1, \dots, q_n) \in \mathbb{R}_+^n$. We will show that for each $\varepsilon > 0$ and $\lambda \in (0,1)$ there exist a $\delta > 0$ and an $\alpha \in (0,1)$ such that whenever $P(X_{pq} < \delta) > 1 - \alpha$ we have $P(|[p] - [q]| < \varepsilon) > 1 - \lambda$. To this end, let $\varepsilon > 0$ and $\lambda \in (0,1)$ be given. Now we have
$X_{pq} = [p \vee q] - [p \wedge q] = [(p_1 \vee q_1, \dots, p_n \vee q_n)] - [(p_1 \wedge q_1, \dots, p_n \wedge q_n)]$
$= (p_1 \vee q_1 - p_1 \wedge q_1)\xi_1 + \cdots + (p_n \vee q_n - p_n \wedge q_n)\xi_n = |p_1 - q_1|\xi_1 + \cdots + |p_n - q_n|\xi_n$.
On the other hand, we have
$|[p] - [q]| = |(p_1 - q_1)\xi_1 + \cdots + (p_n - q_n)\xi_n| \leq |p_1 - q_1|\xi_1 + \cdots + |p_n - q_n|\xi_n$. If $X_{pq} < \delta$, then $|[p] - [q]| < \delta$. This implies that $P(|[p] - [q]| < \delta) > 1 - \alpha$ whenever $P(X_{pq} < \delta) > 1 - \alpha$. Now choose $\delta = \varepsilon$ and $\alpha = \lambda$. This gives $P(|[p] - [q]| < \varepsilon) > 1 - \lambda$, as desired. ■

4. CONCLUSION

In the current work, we have first introduced the concepts of almost certainly betweenness and probably betweenness in an RM space. Next, we have introduced the concept of an RM lattice via the notion of a random positive valuation on a lattice. In this context, we have also investigated a betweenness relation in RM lattices. Finally, we have examined the uniform continuity of the random positive valuation on a special lattice. A further study can be the investigation of topological properties of RM lattices.

Abstract

Introduction: Medical students face many challenges in adapting to a healthy lifestyle due to their busy schedules and academic demands.
Objectives: This study aims to assess eating habits, physical activity, and health-related behaviors among medical students, identifying factors influencing unhealthy behaviors.
Methods: The study included 213 students (78.9% female) from the University of Medicine, Tirana, who completed a questionnaire. Data were analyzed using SPSS v27.
Results: The average age of participants was 20.2 ± 1.5 years. Results showed that 7% of students were underweight, 69.8% had normal weight, and 22.1% were overweight or obese. The average sleep duration was 5.9 ± 1.5 hours at night, and 67.6% of students napped during the day when possible. 43% of students did not have breakfast daily. Fast food and energy drinks were consumed 1-2 times per week. Physical activity was limited, with 48.1% exercising less than one hour per week. Half of the students felt stressed due to academic demands. Students with more sleep problems felt more distracted and insecure about their mental health ($p = 0.000$). Furthermore, those who slept more were less likely to engage in physical activity ($p = 0.005$).
Conclusions: The results suggest that despite knowledge of healthy lifestyles, students often do not implement these practices, which may pose significant challenges to their professional careers.
Keywords: Students; medicine; eating habits; physical activity; health; lifestyle.

1. Introduction

The university period is a transformative phase during which students establish lifelong habits that significantly affect their health and well-being. Medical students, in particular, face unique challenges due to their demanding academic schedules, stress, and irregular daily routines, which often lead to poor dietary patterns, low physical activity, and an overall unhealthy lifestyle (Palatty et al., 2013; Haq et al., 2016). Despite having extensive theoretical knowledge about healthy behaviors, many medical students struggle to apply these principles in practice. Globally, the prevalence of overweight and obesity among young adults has been steadily increasing. According to the Behavioral Risk Factor Surveillance System (BRFSS, 2021), individuals aged 18–29 are particularly vulnerable to adopting unhealthy lifestyle behaviors that contribute to weight gain and related health issues. Poor eating habits, such as the consumption of high-calorie, nutrient-poor foods and the low intake of fruits, vegetables, and fiber, are common among students (Ganasegeran et al., 2012; Williams et al., 2019). Combined with physical inactivity, these behaviors significantly elevate the risk for chronic conditions such as cardiovascular disease, type 2 diabetes, and certain cancers (Racette et al., 2005; Tafoya et al., 2017). Numerous studies have shown that medical students frequently experience high levels of stress and sleep disturbances, both of which negatively impact their lifestyle choices (Palatty et al., 2013). Even though they understand the importance of regular physical

activity, many report limited time or motivation to exercise due to academic pressure (Williams et al., 2019). This dissonance between knowledge and behavior is concerning, as the habits formed during medical school are likely to persist into their future careers and influence their ability to model and promote healthy behaviors to patients (Haq et al., 2016). This study aims to assess the eating habits, physical activity levels, and overall lifestyle of medical students at the University of Medicine in Tirana in 2025. By identifying current behaviors and potential risk factors, the study seeks to provide insights that can inform targeted interventions and health education strategies. Ultimately, promoting healthier lifestyles among medical students is essential - not only for their personal well-being but also for their credibility and effectiveness as future healthcare providers.

2. Materials and Methods

2.1 Study Population and Data Collection

The study was conducted between January and March 2025 at the University of Medicine in Tirana, Albania, involving 500 medical students across all academic years. Participants were informed about the study's purpose and data confidentiality, with the assurance that they could withdraw at any time without consequences. Only fully completed questionnaires submitted on time were included in the analysis, resulting in 213 valid responses. A specially designed questionnaire was distributed via Google Forms, consisting of sociodemographic and anthropometric data, dietary intake (fruits, vegetables, meat, eggs, fish, sweets, and fast food), and information on eating habits, stress, sleep, physical activity, and consumption of coffee, tea, and carbonated drinks, etc.

2.2 Statistical Analysis

Data were analyzed using SPSS Statistics (version 27). Descriptive statistics, including mean and standard deviation (SD), CI, were calculated. Body Mass Index (BMI) was derived from self-reported height and weight and classified according to WHO guidelines. Non-parametric tests, including Spearman's correlation, Mann–Whitney U, and Kruskal–Wallis, were applied to analyze relationships and differences between variables with a significance level of $p \leq 0.05$. Logistic regression analysis was used to assess the impact of risk factors on health outcomes, with the odds ratio (OR) indicating the strength of the association: $OR < 1$ signifying a risk factor, $OR = 1$ indicating no association, and $OR > 1$ indicating a protective factor for health.

2.4 Ethical Approval

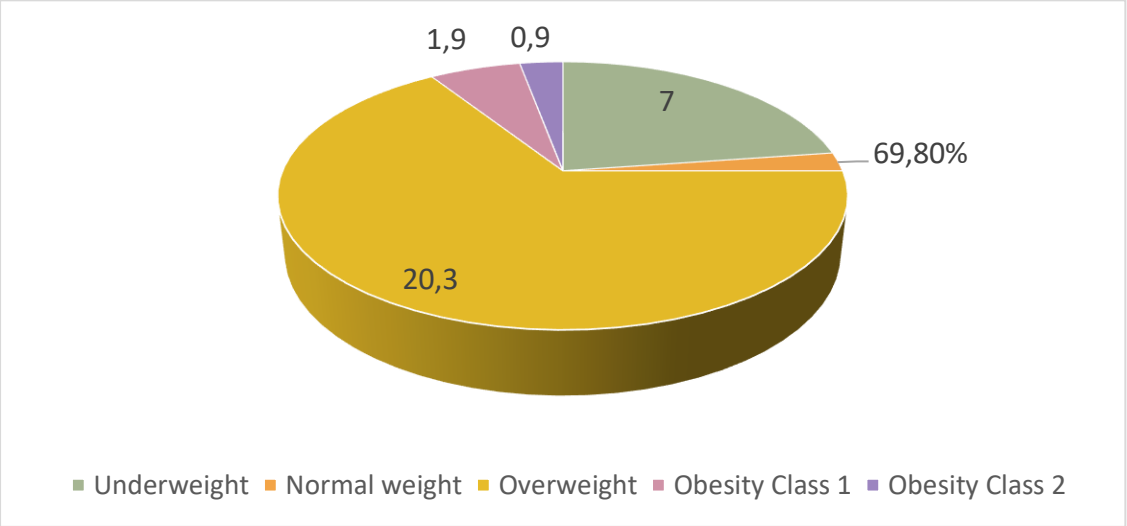
The study was conducted in accordance with the Declaration of Helsinki, and the questionnaire was approved by Assoc.Prof. Loreta Kuneshka. All participants provided informed consent prior to their participation, and all data were treated with strict confidentiality.

3. Results

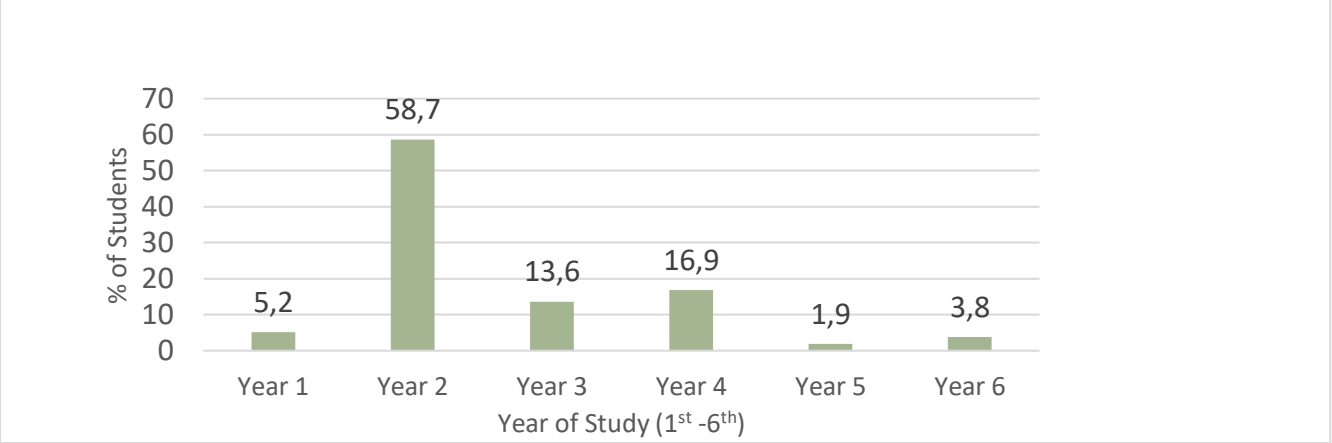
3.1 Socio-Demographic, Anthropometric, and Medical Data

The study sample consisted of 213 students, with the majority being female participants (78.9%, N=168). The median age group was 18-21 years, with a median age value of 21 years, and the average age was 20.2±1.51 years. According to the academic year, 5.2% were in the first year, 58.7% in the second year, 13.6% in the third year, 16.9% in the fourth year, 1.9% in the fifth year, and 3.8% in the sixth year. BMI evaluation showed that 7.0% were underweight, 69.8% had normal weight, 20.3% were overweight, 1.9%

had class 1 obesity, and 0.9% had class 2 obesity. The average BMI of the students was 22.63 ± 3.40 kg/m²; 95% CI: 22.170–23.091.



Graph 1. BMI Classification Among Medical Students



Graph 2. Distribution of Students by Year of Study

Table 1: Descriptive Statistics for BMI

Statistics		**Value**
Sample size (n)		213
Mean (Average)		22.63 kg/m²
BMI	Male	24.75 kg/m²
	Female	22.06 kg/m²
Standard Deviation		± 3.40 kg/m²
Minimum		16.5
Maximum		36.6
95% Confidence Interval		22.170 – 23.091 kg/m²
BMI by Age Group	18-21 years old	22.67
	22-24 years old	22.25
	25-27 years old	24.95

3.2 Association Between BMI and Other Variables

There was a statistically significant difference in BMI between male and female students ($r = 0.32$, $p < 0.001$). No significant difference in BMI was found between different age groups ($r = -0.02$, $p = 0.272$). Higher academic stress was associated with lower BMI ($r = -0.151$, $p = 0.028$). Additionally, students who felt uncertain about their mental health had lower BMI, with a negative correlation found ($r = -0.206$, $p = 0.003$). Students who were more satisfied with their current weight tended to have a more balanced BMI ($r = 0.287$, $p < 0.001$). Lastly, students with higher BMI were less likely to follow diets ($r = -0.314$, $p < 0.001$).

3.3 Satisfaction with Weight and Health Assessment

Students were asked about their satisfaction with their body weight. The majority expressed satisfaction (43.2%, N=92). Regarding health, most students reported feeling good (46.5%, N=99), while a small number had chronic conditions such as chronic tonsillitis, chronic sinusitis, irritable bowel syndrome, and chronic body acne, each with the same percentage (0.5%).

3.4 Food Consumption

The students were asked to estimate the consumption of foods in each food group: fruits, vegetables, dairy products, meat, eggs, sweets, and fast food. Table 2 below shows the consumption frequency of certain food categories, such as fruits, meat, and dairy, vegetables during a week. The graphic representation of consumption of fruits, meat, and dairy products, vegetables are presented in Graph 3.

DRAFT

Table 2. Fruit, vegetables, meat, and dairy products.

Food Item	**Frequency (M ± SD) ***	**Total (*N* = 213)**
Fruits	3.23 ± *1.026*	Daily-30.0% (n=64), 3-4 times/week-31.0% (n=66), 1-2 times/week- 25.4% (n=54), no consumption-2.3% (n=5).
Vegetables	3.20 ± *0.778*	Daily-34.7% (n=74), 3-4 times/week-44.1% (n=94), 1-2 times/week- 18.3% (n=39), no consumption-0.5% (n=1).
Meat	2.63 ± *0.718*	Daily-9.9% (n=21), 3-4 times/week-45.1% (n=96), 1-2 times/week- 41.8% (n=89), no consumption-2.8% (n=6).
Dairy	3.18 ± *0.971*	Daily-37.1% (n=79), 3-4 times/week-31.0% (n=66), 1-2 times/week- 22.5% (n=48), no consumption-3.8% (n=8).

* Means (M)and standard deviations (SD).

Graph 3. Consumption of fruits, vegetables, meat, and dairy products

The data reveal generally positive trends in students' dietary habits, particularly in fruit and vegetable intake, though improvement is still needed. Around 30% of students consume fruit daily, and 31% eat it 3–4 times per week. For vegetables, 34.7% consume them daily, and 44.1% eat them 3–4 times weekly. Meat consumption is common, with 45.1% eating it 3–4 times per week and 41.8% 1–2 times weekly. Milk is also widely consumed, with 37.1% drinking it daily. Fish intake is notably lower, as 72.3% eat fish only 1–2 times per week, and 24.4% do not consume it at all. Eggs are more frequently included in the diet, with 37.6% eating them 3–4 times weekly. Sweets and fast food are regularly consumed—41.3% eat sweets 1–2 times per week, and 61.0% consume fast food at the same frequency. **Correlation analysis** (Spearman's rank) shows significant positive relationships between healthy dietary behaviors. Fruit consumption correlates strongly with vegetable intake ($r = 0.423$, $p < 0.001$) and moderately with fish consumption ($r = 0.184$, $p = 0.007$). Higher fruit intake is also associated with increased physical activity ($r = 0.189$, $p = 0.006$), regular breakfast consumption ($r = 0.234$, $p = 0.001$), and consistent meal timing ($r = 0.229$, $p = 0.001$). Similarly, vegetable intake is linked to regular meals and higher meat consumption. Fish consumption is positively associated with both fruit and meat intake. These findings suggest that healthy habits tend to cluster—students who make one healthy choice are more likely to engage in other beneficial behaviors, indicating a broader pattern of health-conscious living.

3.5 Liquid Intake: Carbonated Drinks, Tea, Coffee, Energy drinks

Regarding carbonated drinks, 37.6% of students reported never consuming them, while 40.4% consumed them 1-2 times a week. A smaller percentage, 17.4%, drank them 3-4 times a week, and only 4.7% drank them every day. For tea, 31% of students never drank it, while 40.4% had it 1-2 times a week, 17.8% 3-4 times a week, and 9.9% consumed it daily. In coffee consumption, 39.9% of students never drank coffee,

14.6% consumed it 1-2 times a week, 11.7% 3-4 times a week, 25.8% drank it daily, and 8% several times a day. As for energy drinks, 50.2% never consumed them, 27.2% had them 1-2 times a week, 13.1% 3-4 times a week, 8.5% daily, and 0.9% several times a day.

3.6 Physical Activity

Data on physical activity showed a variety of habits among students. The median activity level was 1–3 hours per week, with a median value of 2.915 hours per week and an average of 94.93±72.2 minutes, or 1.58±1.2 hours per week. Approximately 24.9% (N = 53) of participants reported engaging in physical activity every day. The most common activities were walking (53.5%), going to the gym (23.9%), running (5.16%), and cycling (4.2%), with the remainder participating in sports like basketball, volleyball, and yoga. Furthermore, 86.4% (N = 184) of students reported walking every day, either for school or leisure. However, 53.05% (N = 113) did not engage in moderate or vigorous activities such as running, swimming, or gym exercises. Regarding frequency, 48.36% (N = 103) of participants exercised less than one hour per week, 60% (N = 128) exercised 1–3 hours per week, 27% (N = 57) exercised 3–5 hours per week, and 23% (N = 49) exercised for more than 5 hours per week. Physical activity was significantly associated with several factors. Males engaged in more physical activity than females ($r = -0.281$, $p < 0.001$). Students who were more stressed exercised less ($r = -0.273$, $p < 0.001$), and those who felt insecure about their mental health also exercised less ($r = -0.158$, $p = 0.021$). Additionally, more physically active students consumed more fruits ($r = 0.189$, $p = 0.006$), while students who skipped breakfast tended to exercise more ($r = -0.162$, $p = 0.018$). A negative association was also found between daily physical activity and hours of moderate activity per week ($r = -0.289$, $p < 0.001$). More physical activity was linked to less sleep ($r = -0.197$, $p = 0.004$), and students who ate at regular times tended to engage in less physical activity ($r = -0.24$, $p < 0.001$).

DRAFT

3.7 Sleep

The median class for sleep duration among students is 5–6 hours per night, with 51.6% (N=110) falling into this category. The median value is 5.203 hours, and the average sleep duration is 5.906 ± 1.468 hours per night. According to the Mann-Whitney U test, there is no statistically significant difference in sleep duration between males and females. A majority of students, specifically 67.6% (N=144), reported preferring to sleep in the afternoon when possible, while 35.7% (N=76) indicated that they experience sleep problems. Sleep duration is associated with several factors. Students who engage in more physical activity tend to sleep less ($r = -0.197$, $p = 0.005$), and those who consume more energy drinks also tend to have shorter sleep durations ($r = -0.190$, $p = 0.005$). More sleep is linked to fewer reported sleep problems ($r = -0.246$, $p < 0.001$). Interestingly, students who eat at regular meal times tend to sleep less ($r = -0.188$, $p = 0.006$), which may be due to a more structured and busier daily routine.

3.8 Stress

The majority of students experience frequent stress due to academic and student life pressures, with 57.7% feeling stressed "very often" and 32.4% several times a week. Most students manage stress by talking with friends or family (41.3%), while others rely on physical activity (17.8%) or do not have a preferred method (33.8%). Stress is significantly associated with lower BMI ($r = -0.151$, $p = 0.028$), being female ($r = 0.349$, $p < 0.001$), and engaging in less physical activity ($r = -0.273$, $p < 0.001$). It is also linked to greater mental insecurity ($r = 0.363$, $p < 0.001$), higher consumption of sweets ($r = 0.222$, $p = 0.001$), poorer eating habits ($r = 0.136$, $p = 0.047$), and more sleep problems ($r = 0.188$, $p = 0.006$). Additionally, there is a near-significant association between stress and fast food intake ($r = 0.129$, $p = 0.060$).

3.9 Dietary Choices and Lifestyle: Diet, Regular Eating Schedules, Meal Frequency

One-third of students (36.2%, N = 76) follow diets to lose weight, with more females than males adhering to such diets. More than half of the students had irregular eating schedules (64.8%, N = 138). The meal most commonly skipped was breakfast, compared to lunch and dinner (56.8%, 8.5%, and 31.5%, respectively).

3.10 Logistic Regression Analysis: Health Assessment

Through logistic regression analysis, the relationship between various factors and students' health, categorized as either good or poor, was examined. The odds ratio (Exp(B)) and p-values for each variable show how each factor influences health. Eating at home during the week ($Exp(B) = 1.292$, $p = 0.031$), fruit consumption ($Exp(B) = 1.461$, $p = 0.014$), physical activity ($Exp(B) = 1.293$, $p = 0.004$), sleep hours per night ($Exp(B) = 1.918$, $p = 0.028$), and satisfaction with current weight ($Exp(B) = 1.067$, $p = 0.012$) are positive factors associated with good health. On the other hand, consumption of sweets ($Exp(B) = 0.819$, $p = 0.005$), consumption of fast food ($Exp(B) = 0.545$, $p = 0.012$), sleep problems ($Exp(B) = 0.07$, $p = 0.033$), academic/student stress ($Exp(B) = 0.881$, $p = 0.022$), and insecurity about mental health ($Exp(B) = 0.977$, $p = 0.016$) are negative factors linked to poorer health.

4. Discussion

The findings of this cross-sectional study, involving 213 medical students—168 females and 45 males—mirror international trends that show a growing female majority in medical education (Medical Schools Council, 2020). Regarding body mass index (BMI), 7.0% of participants were underweight, 69.8% had normal weight, 20.3% were overweight, and 2.8% were classified as obese. These values are consistent with other international studies, including those from Brazil and Romania, which show a similar distribution

of BMI among medical students (Federal University of Paraíba, 2019; Magdalena et al., 2019). Dietary habits observed in the study raise concerns. An overwhelming majority of students reported frequent consumption of fast food (85.9%) and sweets (94.8%), which is higher than figures reported in studies conducted in Serbia and other regions (Gazibara et al., 2013). This pattern is not unique to Albania, as similar trends have been documented in various countries and are often attributed to stress and limited time for meal preparation among medical students (Ganasegeran et al., 2012; Smith & Leggat, 2019). Although these students are knowledgeable about nutrition, their actual dietary behaviors reflect the pressures of medical school life. Sleep duration was also found to be inadequate, with students averaging 5.9 ± 1.47 hours of sleep per night, falling short of the 7-hour minimum recommended by the American Academy of Sleep Medicine. This aligns with prior studies showing that sleep deprivation is prevalent among medical students and is associated with poor mental health and academic difficulties (Palatty & Krishnan, 2013; Band & Lee, 2019). In terms of physical activity, while 86.4% of participants reported walking daily, more than half (53.05%) did not engage in moderate or vigorous physical activities such as running, swimming, or going to the gym. Only a subset met the World Health Organization's recommendation of at least 150 minutes of moderate physical activity per week (Izawa et al., 2021). Additionally, consistent with global findings, male students were more likely to participate in physical exercise than their female counterparts (Wall & Choi, 2019; Keating et al., 2005. These findings highlight the importance of integrating wellness initiatives and stress management programs into medical curricula to promote healthier lifestyles among future healthcare providers.

5. Conclusions

Medical students possess substantial knowledge about healthy living, yet many struggle to apply it due to the demanding nature of their training. This gap between knowledge and practice is concerning, given their future role in promoting public health. Unhealthy habits—such as poor diet, lack of physical activity, and inadequate sleep—are common and often driven by stress and irregular schedules. To support student well-being, a comprehensive, health-oriented university campus is essential, ideally integrated with the “Mother Teresa” University Hospital Center. This campus should offer student healthcare services, mental health support, wellness facilities, nutritious food options, and accessible digital and transport systems. Such an environment would encourage students to prioritize both academic success and personal health—critical skills for their future roles as healthcare providers.

Abstract

Orofacial praxis skills (face, mouth and tongue movements) are critical for speech, social interaction, and general adaptability. These types of movements are rather challenging in children suffering from autism spectrum disorder (ASD), which hinders them undergoing expressive speech and interaction with other people. In this context, this article discusses the orofacial praxis deficits in children suffering from ASD, particularly the neglect of the motor planning deficits caused by the neurological, sensory and social factors. Numerous studies point out difficulties for children with ASD in praxic imitation and in verbal or nonverbal communication containing sequentially organized orofacial movements. These issues are not simply due to lack of muscle strength; they stem from an impaired motor planning system. On the other side, differential diagnosis of orofacial praxis skills requires assessment of a motor execution versus motor planning problem using tools like the Verbal Motor Production Assessment for Children and the Kaufman Speech Praxis Test for Children. Deficit focused therapy for orofacial praxis skills such as motor-based therapies including the PROMPT technique, oromotor therapy, and augmentative and alternative communication (AAC) strategies has greater impact on patient outcomes. With parental engagement, the effectiveness of the intervention is further enhanced through increased naturalistic practice opportunities. Despite gaps in longitudinal studies, less is known about neuroimaging, and comparative intervention research, progress in understanding orofacial praxis concerning ASD has advanced. Therefore, if orofacial praxis deficits are treated early and effectively, not only is there potential for better outcomes related to advancing speech in those with ASD, but also for enhancing broader social and cognitive outcomes. Praxia skills are not only crucial for developing the autism spectrum but they also deepen the understanding of strategies that better respond to the developmental potential of individuals on the autism spectrum.

Keywords: orofacial praxis, autism spectrum disorder, neurodevelopment, assessment, communication.

INTRODUCTION

The importance of recognizing developmental disorders as early as possible is increasing due to the clearly defined enhanced benefits of striking the fundamental core of the issues at hand. In this line, some areas which are part of the early developmental assessment include orofacial praxis skills, defined as planning and executing the coordinated movements of the face, mouth, and tongue which has been pinpointed as markers for neurodevelopment. In addition, Belmonte, et al (2013) claims that children diagnosed with autism spectrum disorder (ASD) tend to show deficits in areas which include motor skills, communication skills, and emotions and socialization. Therefore, orofacial praxis skills are largely accepted as prerequisite not only for speech, but also for various social interaction and social communication. Orofacial praxis skills are critical to devise treatment plans at enabling children with ASD improve their speech-language skills.

MATERIAL AND METHODS

This article uses an extensive literature review to gather information pertaining to the orofacial praxis skills of children with Autism Spectrum Disorder (ASD). For this review, peer-reviewed journal articles, clinical case studies, and pertinent textbooks published between 2008 and 2024 were sourced from academic databases like PubMed, Scopus, and Google Scholar. The search was conducted with the terms “orofacial praxis,” “motor planning,” “autism spectrum disorder,” “speech development,” and “oromotor deficits.” The studies selected for the review were centered on the assessment, underlying neuroscience, and therapeutic approaches to motor planning orofacial tasks for children with ASD. To achieve a rigorous review, priority was given to primary research, clinical studies, and systematic reviews.

Literature Review

The Role and Importance of Orofacial Praxis

Praxis is often described as the capacity to formulate and enact new motor behavioural actions. According to Fournier, et al (2010) orofacial praxis refers to the planning and execution of mouth, lip, tongue, jaw movements either as a NVU center and C center. These activities are critical for carrying out fundamental tasks such as eating, swallowing, making facial movements, and most importantly, producing speech. Speech is one of the most complex motor tasks involving high level of precision in the timing, degree, coordination and sequencing of the movements of the mouth and face. Problems with orofacial praxis may cause a breakdown in these activities leading to a variety of communication problems including: childhood apraxia of speech (CAS), articulation problems, and even dificulties with feeding. In children with ASD, orofacial praxis difficulties could worsen existing language deficits and complicate social interactions, given communication impairments are core diagnostic features. In addition, nonverbal orofacial movements like smiling, pouting, and tongue protruding are important for nonverbal communication. Deficits in these abilities may limit a child's ability to socially interact, recognize other's emotions, or express their emotions which may further trap them in a world that is already socially difficult.

Orofacial Praxis Deficits in Children with Autism Spectrum Disorder

Children diagnosed with ASD often showcase a decline in fine motor and gross motor skills, as well as oromotor functions. Gernsbacher et al (2008) study documents the main problems this population encounters with controlling the orofacial apparatus, such as initiating, organizing, and coordinating orofacial movement. Unlike children who have primary speech disorders, these children tend to have more diffuse and extensive motor planning disruption. A notable feature of many children with ASD is the gap between their functioning level of receptive language and expressive language skills. Some researchers argue that this discrepancy is mainly due to an orofacial apraxic deficit. The subtleties of motor planning and the sequencing of movements relevant to articulation can make speech extremely difficult to produce for some children, even though they understand complex verbal instructions. Alongside speech problems, children with autism spectrum disorders (ASD) frequently display difficulties with nonverbal face-related movements. Jones, L. (2008) in his research highlights that many children with ASD cannot easily imitate basic facial movements or gestures, even when asked to do so. This is a crucial deficit because it impacts not only the child's speech abilities, but also their core ability to express emotions and intentions which are central to social interaction.

Assessment of Orofacial Praxis in Autism Spectrum Disorder

Whiteside, S. P., (2015) mentions that clinicians are familiar with the VoCab VMPAC and the Kaufman Speech Praxis Test for Children as systematic measures of oromotor planning abilities. As such, the multifactorial condition of motor planning difficulties justifies that such would call for a comprehensive evaluation, one that is more than the child's orofacial reflexes within structured play, but also includes studying the orofacial movement in functional tasks to give a better picture of the child's abilities. Content Emerging out of Clinical Assessment would be the capacity of the child to imitate individual orofacial motions with several other intermediary actions-like multi-step sequences, nonverbal gestures, and polysyllable voiced utterance-involve, particularly for determining movements related to speech. To derive specific expected outcomes from interventions would, among other things, depend on the correct evaluation of orofacial praxis skills in children with ASD and require specific techniques and tailored treatments. Clinically, it would also involve being able to discriminate two groups among those with a motor-sequencing disorder-those with a planning disorder within a tight timeframe and space (praxis) and those with inactive muscles or paralysis (execution). An activity deficit-and certainly not weakness-would be advanced as a claim for a child who is capable of executing a movement but cannot initiate it.

Factors Influencing Orofacial Praxis in Children with Autism Spectrum Disorder

As Bhat, at al (2011) point out, there are many different factors interfering with orofacial praxis deficits in children with ASD. Movement abilities in an individual has been looked into using neuroimaging assessment studies of activation from planning motor areas like premotor cortices, cerebellum, and basal ganglia. The pets' evidence found the tendency of children with autism for abnormal oroband facial motor acts resulting in an issue either to activate or to coordinate motor oroband and face muscles. Herein lies further complication, as overlaps with other conditions like DCD or Childhood Apraxia of Speech and the

autism spectrum are fairly common. Most notably, this shows that some set kids in the spectrum are indeed restricted socially and cognitively, and suffer from major planning and executing deficits. Sensory processing difficulties also come into play. Hypersensitivity and hyposensitivity to touch, especially about the mouth and face, are typical in children with ASD. Such sensitivity would not allow a child to engage normally in orofacial actions, including eating, mouthing toys, or imitating facial expressions, thus depriving children of opportunities for acquiring simple oromotor skills. Social and motivational factors must also be taken into consideration. Reduced social motivation, which is typical for ASD, typically also means less spontaneous imitation and social interaction involving orofacial movements, which occurs even less frequently. Hence, such children pass up on those practice opportunities which eventually lead to further worsening of the initial motor planning deficits.

Therapeutic Implications

Ways to treat orofacial praxis deficits are significant for enhancing the communication skills of children with autism spectrum disorders. Motor-based speech therapy, like the PROMPT method, use tactile-kinesthetic cues to assist the child with the orofacial movements during speech. LeBarton, E. S., and Iverson, J. M. (2013) in his study indicate that PROMPT aids in motor learning by providing sensory feedback that facilitates planning and sequencing movements. Other forms of treatment should also be useful. These treatments usually include repetitive practice of single as well as combined facial movements in a particular order, series or pattern, which increase in difficulty as the child becomes more adept. Activities include exercises or actions for blowing bubbles, lip puckering, tongue lateralization, and producing speech sounds which are blended into words and phrases. Where there is marked delay in expressive language skills, augmentative and alternative communication (AAC) systems may be implemented. Picture exchange systems, sign language, or even speech generating devices offer an alternative form of communication that greatly aid in reducing frustration and increasing social participation while speech skills are still being developed. Another important factor of successful intervention is the parental involvement in supporting therapy sessions. Parents knowing in advance what orofacial movements need to be elicited during interactions like meals, playtime, or stories to their children increases the child's daily practice of these skills. Parents also can have their children engage with exaggerated facial expressions, playful mouth movements, learning theatre where learning is devoid of pressure, still mastering motor skills.

4. RESULTS AND DISCUSSION

The literature review findings suggest that children diagnosed with Autism Spectrum Disorder (ASD), face profound challenges with orofacial praxis impacting both verbal and non-verbal communication skills. Research suggests that these deficits are associated with impaired motor planning and not due to muscle weakness, stemming instead from atypical neural functioning in the cerebellum or premotor cortex. The studies under review also highlight that early diagnosis using standardized assessment tools improves intervention effectiveness and accuracy. There is documented improvement in expressive speech as a result of motor oriented interventions, especially the PROMPT method and some oromotor strengthening exercises. In addition, caregivers and the use of augmentative and alternative communication (AAC) systems are critical for nurturing supportive communication. Notwithstanding the progress made, there is a need for further longitudinal and neurobiological studies to refine treatment individualization strategies for children with ASD.

CONCLUSION

Orofacial skill is an area of a child's development that impacts speech output, as well as social communication and general functioning. In children with autism spectrum disorder, the lack of orofacial skills severely impacts the ability to communicate and socialize. Apart from these challenges, there is a multitude of other pre-existing problems encountered which further complicates the matter. To address these gaps appropriately, precise evaluative measures and prompt remedial solutions within the mentioned frameworks serve to be very effective. Motor-based therapies, augmentation of communication methods, active participation of the guardians, as well as systematic oromotor exercises are examples of vital steps within a holistic intervention plan. With advancing understanding of the neurological and developmental factors associated with orofacial skills in cases of ASD, clinicians will have comprehensive frameworks that enable them to support the services enhancing the social and communicational engagement of children with autism. Shifting focus to the role of orofacial skills through working on the evidence-based strategies

aims for the betterment of communication and social behavior, thereby improving the quality of life for children suffering from Autism Spectrum Disorder.

ACKNOWLEDGMENTS

I want to express my heartfelt appreciation to the researchers and clinicians whose efforts have advanced the understanding orofacial activities among children diagnosed with autism spectrum disorder. I would like to direct my gratitude to the institutions and databases which made the relevant academic literature accessible. I thank my colleagues from the speech-language pathology and developmental psychology for their constructive comments and discussions during the preparation of this review. Finally, warm words of thanks go to the children with autism spectrum disorder and their families and caregivers, because their lived experiences form the basis of so much of the research and clinical work in this area.

Özet

Bazı adli olaylarda veya tüketime sunulan ürünlerde, örneklerin hem tür bazında hem de cinsiyet bazında tespit edilerek belirlenmesi istenilmektedir. Cinsiyet yönünden etlerin kalite ve satış fiyatları farklılıklarından dolayı tüketime sunulan etlerin hile yapılıp yapılmadığının belirlenmesi amacıyla cinsiyetlerinin tam olarak bilinmesi istenilmektedir. Moleküler temellere dayalı yapılan çalışmalar Amelogen (AMEL X ve AMELY) ve zinc finger geni (ZFX ve ZFY) varlıklarının ortaya konulması yanında gerçek zamanlı PZR yöntemi ile de gerçekleştirilmektedir. Bu çalışmanın amacı, farklı restriksiyon enzimi kullanılarak 5 farklı türde cinsiyetin belirlenebilmesinin araştırılmasıdır. Çalışmada 5 farklı türden (keçi, koyun, sığır, at ve köpek) erkek ve dişi hayvanlara ait laboratuvarımızda bulunan kan örneklerinden DNA izolasyonu gerçekleştirilmiştir. Daha sonra zinc finger genine (ZFX ve ZFY) spesifik primerler kullanılarak polimeraz zincir reaksiyonu (PZR) yöntemi ile yükseltgenmiştir. Yükseltgenen PZR ürünleri 6 adet restriksiyon enzimi (Eco31I, Eco32I, HindIII, MspI, NgoMIV ve SmaI) kullanılarak kesim işlemi gerçekleştirilmiş ve jel elektroforez yöntemi ile görüntülenmiştir. Çalışma sonucunda kullanılan türlerde PZR ürünü elde edilmesine rağmen restriksiyon enzimleri ile iki cinsiyette de kesim işlemi olmayıp herhangi bir farklı fragment tespit edilememiştir. Sonuç olarak, kullanılan enzimler bu türlerde tür ve cinsiyet tayini çalışmalarında kullanılamayacağı sonucu elde edilmiştir. İleri çalışmalarda tür sayısını artırılması ve farklı restriksiyon enzimleri de eklenerek çalışmaların genişletilerek yapılması önerilmektedir.

Investigation of sex determination using restriction enzymes in different species by PCR-RFLP method

Abstract

In some forensic cases or in products offered for consumption, it is desired to identify and determine the samples in terms of both species and gender. Due to the differences in the quality and sales prices of meat by gender, it is desirable to know the exact gender of the meat to determine whether the meat offered for consumption has been cheated or not. Studies based on molecular basis are carried out by real-time PCR method as well as revealing the presence of Amelogen (AMEL X and AMELY) and zinc finger gene (ZFX and ZFY). The aim of this study was to investigate sex determination in 5 different species using different restriction enzymes. In this study, DNA was isolated from blood samples of male and female animals from 5 different species (goat, sheep, cattle, horse and dog). Then, DNA was amplified by polymerase chain reaction using primers specific for zinc finger gene (ZFX and ZFY). The amplified PCR products were digested using 6 restriction enzymes (Eco31I, Eco32I, HindIII, MspI, NgoMIV and SmaI) and were visualized by gel electrophoresis. As a result of the study, although the PCR product was obtained in the species used, no different fragments were detected in both sexes with restriction enzymes. As a result, it was concluded that the enzymes used cannot be used in species and sex determination studies in these species. In further studies, it is recommended to increase the number of species and adding different restriction enzymes.

DRAFT

GİRİŞ

Hayvanlarda cinsiyetin önceden belirlenmesi özellikle spermden ya da embriyo aşamasında farklı yöntemler kullanılarak tespit edilmesi sonrasında besicilik ya da süt işletmeciliği yapacak olan yetiştiricinin eğilimine göre hangi cinsiyete sahip hayvan istiyorsa o kapsamda belirlenen cinsiyetteki sperm ya da embriyo belirlenip kullanılmaktadır. Bu kapsamda yapılan analizlerden spermanın cinsiyetinin belirlenmesinde en çok tercih edilen yöntem Flow Sitometre yöntemidir (Demirci, 2014). Embriyodan cinsiyetin belirlenmesinde ise kullanılan yöntemler ise sitogenetik yöntem, İmmünolojik yöntem (HY antijenin belirlenmesi), X kromozomuna bağlı enzim aktivasyonların saptanması, farklı cinsiyetteki embriyoların metabolik aktivitelerinin belirlenmesi ve Y kromozomuna özel DNA zincirlerinin kullanılarak moleküler yöntem ile tespit edilmesi olarak sıralanmaktadır (Şendağ ve ark., 2005).

Farklı türlere ait et ürünlerinin tüketime sunulması insanları aldatmaktadır. Özellikle din ve etik düşünceler kapsamında bu olayın istenilmesi söz konusu değildir. Cinsiyet yönünden etlerin kalite ve satış fiyatları farklılıklarından dolayı tüketime sunulan etlerin hile yapılıp yapılmadığının belirlenmesi amacıyla cinsiyetlerinin tam olarak bilinmesi istenilmektedir. Bu amaçla farklı hormon analizlerine dayanan immunokimyasal metotlar kullanılmakla birlikte DNA temelli PZR'a dayalı moleküler tanı yöntemleri de kullanılmakta hatta PZR tabanlı moleküler çalışmalar ile kolay ve ucuz olarak gerçekleştirilmektedir (Arslan ve ark., 2015). PZR yöntemi kullanılarak yapılan çalışmada rendering ürününde 5 farklı türe (kanatlı, ruminant, domuz, at ve karnivor) ait spesifik primerler kullanılmış ve üründe tür tayini belirlenmeye çalışılmıştır (Kurar ve ark., 2012). Yapılan diğer bir çalışma da ise piyasaya sürülen et ürünleri olan sucuk, salam, sosis ve köftede 6 farklı türe (sığır, koyun, tavuk, at, kedi ve domuz) ait spesifik primerler kullanılarak tür tayini araştırılması PZR yöntemi ile gerçekleştirilmiştir (Özşensoy ve Şahin, 2016).

Özellikle bazı adli olaylarda veya tercihe yönelik olarak da tüketime sunulan ürünlerin ve örneklerin hem tür bazında hem de cinsiyet bazında tespit edilerek belirlenmesi istenilmektedir. Adli vakalarda ya tanınmayacak halde olan bir canlıya ait kalıntılardan ya da olayın gerçekleştiği alandaki şüpheli materyalden yola çıkılarak tür, cinsiyet, yaş vs. özelliklerin belirlenmesi gerekmektedir. Tanınamayacak halde olan insanlara ait en önemli kalıntıların pelvis ve kafatası kemikleri, diğer kemikler ve dişler olduğu ve bunlardan yola çıkarak kişinin ırkı, yaşı ve cinsiyeti belirlenmeye çalışılmaktadır. Bu alanda çalışan ve kemik ve yumuşak doku örnekleri üzerinden kimlik tespiti yapan Adli Antropoloji bilimi adli soruşturmalara katkı sağlaması yönünden ön plana çıkmaktadır. Bu alanda farklı yöntemler kullanılarak ilgili tespitlerin yapılması gerçekleştirilmektedir (Babacan, 2020; Yerli ve ark., 2021). Şüpheli bir olayda ise farklı kalıntılardan yola çıkarak tür, cinsiyet gibi özelliklerin belirlenmesi istenilmektedir. Mesela bir kemik ya da doku parçası bulunduğunda ya da avlanması yasak bir hayvanın avcılar tarafından parçalanması sonucu şüphelinin üzerindeki kan vs. lekeler gibi numune örneklerinden insan mı hayvan mı ya da hangi hayvana ait olduğu gibi soruların cevabı alınmaya çalışılmaktadır. Bozulmamış ve tür ayrıma neden olacak kemik özellikleri belirlenebilirse kolaylıkla çözüle bilirken bu ayrımların olmadığı organik kalıntılarda ise DNA temelli moleküler yöntemler kullanılmaktadır.

Moleküler temellere dayalı yapılan çalışmalar Amelogen (AMELlX ve AMELY) ve zinc finger geni (ZFX ve ZFY) varlıklarının ortaya konulması yanında gerçek zamanlı PZR yöntemi ile de gerçekleştirilmektedir. Bu kapsamda birçok araştırma yapılmıştır. Yapılan bir çalışmada Kayseri ilinde satışa sunulan sığır et ürünlerinden 30 örnek alınmış ve Y kromozomuna özgü genlere spesifik 2 farklı primer seti kullanılarak PCR yöntemi ile araştırma yapılmış ve 15 tanesinin erkek 15 tanesinin dişi cinsiyete ait olduğu belirlenmiştir (Arslan ve ark., 2015).

Bu çalışmanın amacı ZFX-Y yöntemi ile birlikte 5 farklı türde, 6 farklı RE kullanılarak hem tür ayrımının hem de tür bazında cinsiyet ayrımının yapılıp yapılamayacağının PZR-RFLP yöntemi ile araştırılmasıdır.

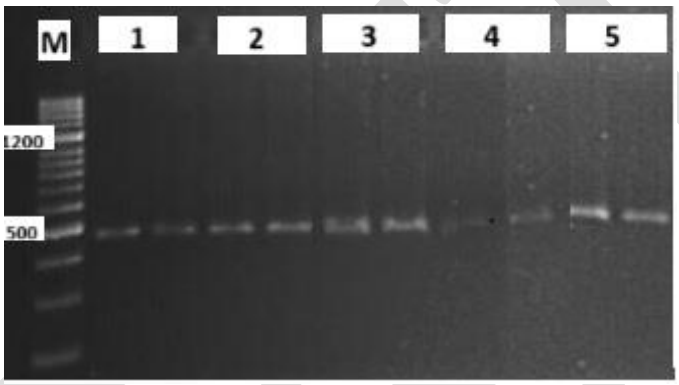
MATERYAL VE METOD

Çalışma kapsamında daha önceden laboratuvarımızda bulunan 5 farklı türden (keçi, koyun, sığır, at ve köpek) erkek ve dişi hayvanlara ait kan örneklerinden standart fenol-kloroform yöntemi (Sambrook ve ark., 1989) ile DNA izolasyonu gerçekleştirilmiştir. İzolasyonu sonrası DNA'ların kalite ve miktarları nanodrop spektrofotometre ile ölçülmüştür. DNA örnekleri daha sonra zinc finger genine (ZFX ve ZFY) spesifik primerler (Aasen ve Medrano, 1990) kullanılarak polimeraz zincir reaksiyonu yöntemi ile yükseltgenmiştir. PZR profili ve protokolü olarak daha önce kullanılmış olan yöntem kullanılarak işlemler gerçekleştirilmiştir (Özşensoy, 2018). Yükseltgenen PZR ürünleri 6 adet restriksiyon enzimi (Eco31I, Eco32I, HindIII, MspI, NgoMIV -MroNI- ve SmaI) kullanılarak kesim işlemi gerçekleştirilmiş ve jel elektroforez yöntemi ile

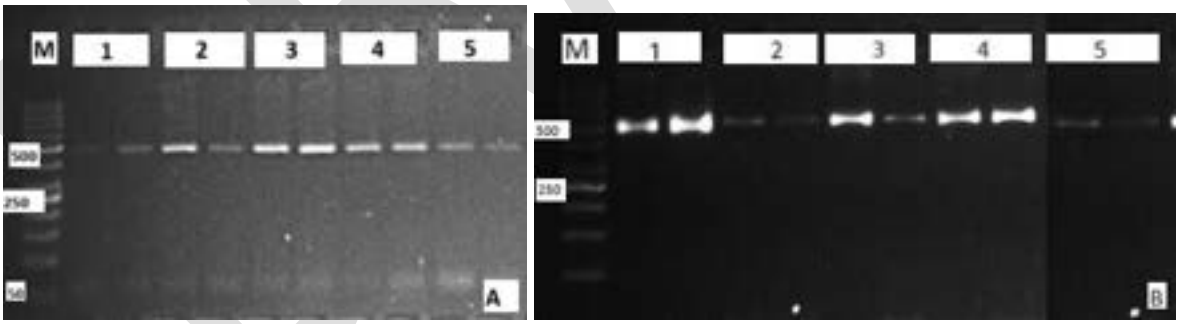
görüntülenmiştir. Kesim işlemi için; 10 µl PZR ürünü, 1 µl FastDigest restriksiyon enzimi (10 U / µl), 2 µl enzim buffer ve 18 µl bidistile su olmak üzere toplamda 31 µl olacak şekilde hazırlandı. Restriksiyon enzimleri için hazırlanan örnekler ise 37 °C'de 20 - 25 dk. bekletilmiştir. Restriksiyon enzim kesimi sonucu elde edilen ürünler %2.5 agaroz gel elektroforezinde 100 V da 60 - 85 dk. süre ile ayrıştırıldı ve 365 nm UV'de görüntülendi.

BULGULAR ve TARTIŞMA

Çalışma kapsamında 5 farklı türe ait erkek ve dişi hayvanlardan kan örneklerinden DNA elde edildikten sonra hem tür hem de tür bazında cinsiyet yönünden bir ayrım yapılıp yapılamayacağı 6 farklı RE ile kesim işlemi yapılarak araştırılmıştır. DNA örnekleri ilgili primerler ile çoğaltılarak tüm örneklerde PZR ürünü elde edilmiştir (Şekil 1). PZR ürünleri elde edildikten sonra tüm örnekler RE'ler ile kesim işlemine tabi tutularak elektroforezde görüntülenmiştir (Şekil 2 ve 3). Çalışma kapsamında kullanılan RE'ler ile kesim işlemi sonucunda hem türler hem de türlerin erkek dişi örnekleri arasında herhangi bir farklılık tespit edilememiştir.

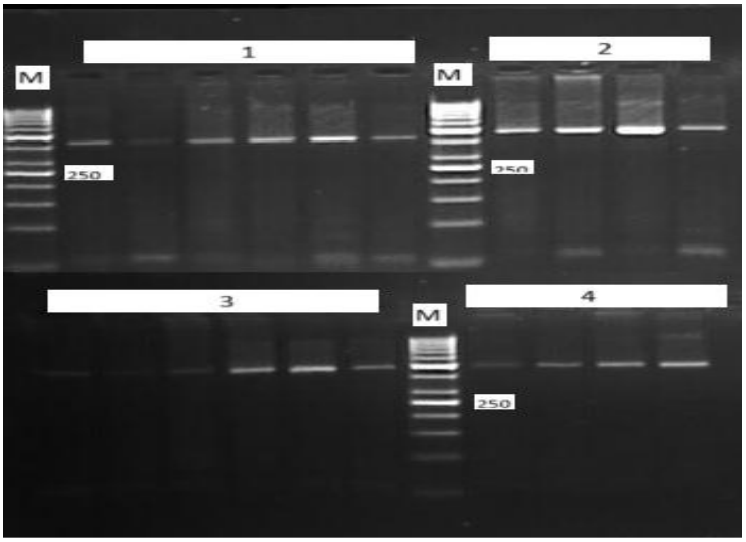


Şekil 1. Türlerin spesifik primer ile PZR sonucu; M: 100 bp marker, 1: teke-keçi, 2: koç-koyun, 3: tosun-inek, 4: aygır-kısrak, 5: erkek-dişi köpek



Şekil 2. Türlerin a) SmaI b) MspI RE'ler ile kesim sonucu;

M: 50 bp marker, 1: teke-keçi, 2: koç-koyun, 3: tosun-inek, 4: aygır-kısrak, 5: erkek-dişi köpek



Şekil 3. Türlerin diğer RE'ler ile kesim sonucu; M: 50 bp marker, 1: HindIII, 2: Eco32I, 3: Eco31I, 4: MroNI (NgoMIV)

Çalışmada kullanılan ZFY/ZFX primerinin insan, sığır, koyun ve keçide DNA örneklerinden cinsiyetin tanımlanmasında hızlı ve faydalı bir metot olduğu ve 447 veya 445 baz uzunluğunda bir bölgeyi çoğalttığı bildirilmiştir. Ayrıca bu çalışmada 8 farklı RE enzimi kullanılmış ve bu enzimlerden 3 tanesinin insan (HaeIII), koyun (SacI), keçi (SacI) ve sığırlarda (PstI) cinsiyet tayininde kullanılabileceği bildirilmiştir (Aasen ve Medrano, 1990). Başka bir çalışmada ise ilgili primerin sırtlanlarda cinsiyetin tespit edilmesinde kullanılabileceği PZR ve enzim kesimi ile belirlenmiştir. Sırtlanlarda 448 baz uzunluğunda bir bölgenin çoğaltıldığı Pst1 ve Taq1 enzimleri kesim işlemi sonucunda iki cinsiyet arasında kesim farklılığı olduğu ve cinsiyetin belirlenmesinde kullanılabileceği bildirilmiştir (Schwerin ve Pitra, 1994). Bu çalışmada 5 farklı türde ilgili primer kullanılmıştır ve her türde yaklaşık 450-500 baz uzunluğunda bir bölgenin PZR ile çoğaltıldığı tespit edilmiştir. Bu çalışmada diğer çalışmalarda kullanılmayan 6 tane farklı RE enzimi kullanılmış fakat bu enzimler yönünden türlerde herhangi bir cinsiyet ayrımı yapılamamıştır. MspI enzimi kullanan çalışma (Aasen ve Medrano 1990) ile benzer şekilde bu çalışma da herhangi bir kesim elde edilememiştir.

Farklı çalışmalarda farklı RE'ler kullanılarak türlerde cinsiyet tayini çalışmaları yapılmıştır.

SONUÇ

Bu sonuçlara göre bu 6 RE'nin çalışılan 5 türde tür ve cinsiyet ayrımında kullanılamayacağı tespit edilmiştir. İlgili çalışmadan sonra farklı türlerinde eklenerek ve enzim sayısının daha fazla artırılarak tekrar çalışmalar yapılması önerilmektedir.

Abstract
In this paper, a comparison between manual and automation testing methods is conducted within the scope of user interface (UI) testing. To achieve a comprehensive evaluation, multiple metrics have been utilized to analyze each method from various perspectives. Initially, the user interfaces were identified, and corresponding test scenarios were developed. These scenarios were then executed manually and through automated scripts. To ensure reliability and generalizability of the results, the login functionalities of three different web applications were chosen for analysis. Numerical analyses based on selected metrics revealed critical insights regarding the relative advantages and disadvantages of each testing method. Ultimately, the findings of this study offer valuable guidance for companies and projects in deciding which testing approach manual or automated would be most beneficial according to their specific needs.
Keywords: Software Testing, Manual Testing, Test Automation.

INTRODUCTION

Today, software systems form the essential components of numerous industries, including finance, defense, and marketing. As reliance on software systems continues to grow, ensuring their quality has become increasingly critical. The testing phase of a software project plays a key role in verifying that user requirements are met and in evaluating overall system quality. Indeed, software quality can only be accurately assessed through rigorous software testing (K. Sneha and G. M. Malle, 2017).

Software testing is primarily conducted using two distinct methods: manual testing and automation testing. Manual testing is straightforward to implement and does not necessitate extensive technical knowledge. Conversely, automation testing requires proficiency in coding and initial integration efforts. Although manual testing is simple to begin with, repeated execution, particularly during regression testing, can become costly and time-consuming. Despite the initial setup complexities, automation testing often provides substantial long-term benefits, such as efficiency gains and reduced human error. Nevertheless, many organizations hesitate to adopt automation testing, typically preferring traditional manual approaches.

Regression testing is conducted to verify that software updates, such as new feature implementations, bug fixes, or modifications, do not negatively affect existing functionalities. The primary purpose of regression testing is to ensure that previously functioning parts of the software continue to perform correctly after changes are introduced. Identifying, analyzing, and resolving regression-related issues represent some of the most time-consuming tasks in software development, especially within large-scale, production-level systems (S. Badihi, et al., 2023). Automated regression testing significantly enhances test efficiency, accelerates feature deployment, and minimizes the potential for human errors (G. da Silva and R. de Souza Santos, 2023). By automating regression testing, teams can conduct frequent test cycles, promptly identify defects, and maintain continuous integration and continuous delivery (CI/CD) practices effectively (A. Akin et al., 2018). Thus, automated regression testing is essential for improving software quality, stability, security, and overall user experience, playing a crucial role in streamlining and accelerating the software development lifecycle.

In this study, manual and automation testing methods were compared on the time metric**.** In future studies, this comparison will also be compared on metrics such as team and skill requirements, reporting quality, automated start capability, suitability for different platforms, coverage, reliability, cost. Additionally, the research investigates which testing method might prove more beneficial depending on the nature and requirements of different software projects. The issue of selecting the testing method based on the project is addressed as a gap in literature. While continuing with manual testing makes sense for short-term projects, it is suggested that transitioning to automation testing would be beneficial for long-term and continuously

DRAFT

developed projects. This approach emphasizes the importance of choosing testing methods based on the project's requirements and continuity. The whole flow of the evaluation framework is given in Figure 1.

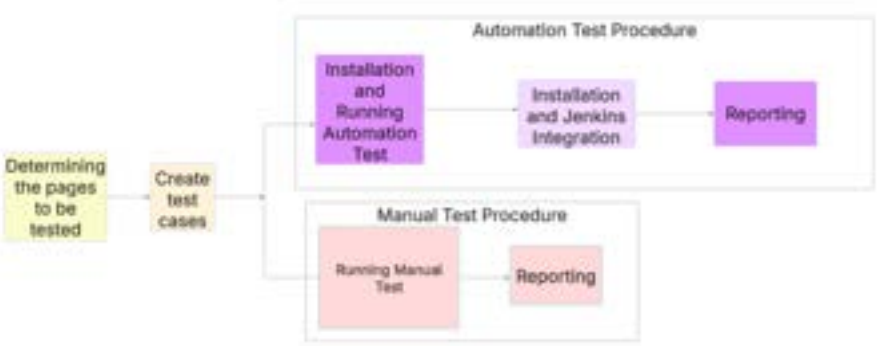

Figure 1. Test Process

MATERIALS AND METHODS

Test Process
Determining the pages to be Tested & Create for Test Cases
A total of 33 test cases were prepared to evaluate all these metrics. These test cases were designed for the user login pages of three popular websites.
Writing these 33 test cases took a total of 2 days. These pages are educational platforms offering training on various technical subjects.
Many websites conduct "human or robot" tests on login pages. If the entity making the request is identified as a robot instead of a human, the IP is blocked from accessing the application. Such sites typically include large and expensive companies, which prevent automation tools (considered robots) from running on their systems. As a result, these sites cannot be used for test automation.
The three educational platforms listed above, however, do not have high sensitivity regarding "human or robot" detection on their login pages. Additionally, these platforms are well-known and widely used by many people. This ewb pages are Codecademy (https://www.codecademy.com/login), Khan Academy (https://tr.khanacademy.org/login) and edX (https://authn.edx.org/login).
For these reasons, the login pages of these three different web pages were chosen for testing.

1.1.1 Why was the "login page" test chosen?

Login pages are the first point of interaction between a user and a software application or website, making them critically important. The proper functioning of the login page impacts many factors, including user experience, security, and overall functionality. The test cases were prepared using a template in Excel. This template included all the essential fields that should be present in a test case.

1. Test Case ID: This is the identifier for the test case. It is expected to be an abbreviation of the tested class. It is useful to include a number in each test case. For example, for a user login interface, the test cases could be named UserLogIn, and the IDs for these test cases could be 1ULI, 2ULI, 3ULI, etc.
2. Test Case Name: This is a short and descriptive name for the tested function. For example, for testing how a system reacts when a user enters an invalid password, the test case name could be LogInWithWrong.
3. Test Case Steps: These are the sequential steps required to perform the test.
4. Input: This is the field where the values entered during the test (which could be strings or integers) are written.
5. Expected Result: This is the result expected to be obtained based on the software requirements.
6. Actual Result: This is the output obtained after performing the test case steps.
7. Result: This indicates whether the test cases have passed or failed. A "Pass" result is given if the actual result matches the expected result. A "Fail" result indicates a discrepancy between the expected and actual results.

8. Notes: If there is any additional information related to the test case, it is written in this field.

The prepared test cases are common for both automated and manual testing. Therefore, the cases were first executed manually. Subsequently, the automation scripts were written, and the cases were executed using automation.

Running Manual Test
After manual execution, the time taken to execute each case in seconds was recorded, and the total duration required to complete all tests was calculated. The web pages were tested one by one on three different search engines, and the time required for each execution was calculated as Table 1.

Table 1. The time spent running manual tests in each search engine. (man/second)

	EDX	KHAN	CODEACADEMY
MOZILLA	265	275	291
FIREFOX	263	281	304
WEBKIT	293	292	319

1 Iteration: Total: 2,583 seconds -> 43 **man/minutes**

Weekly Deployment: Average of 6 test environment deployments + 1 production deployment

7 deployments x 43 minutes = 301 **man/minutes**

Monthly: 1,204 **man/minutes**

In 2 Months: 2,408 **man/minutes**

In 6 Months: 7,224 **man/minutes**

In 12 Months: 14,448 **man/minutes** -> 240 hours -> (Dividing by 8 gives the number of workdays, assuming 1 workday = 8 hours)

240 / 8 = 30 workdays -> equivalent to one and a half months of manpower.

Thus, the annual manpower cost for a project with only 33 test cases amounts to one and a half months of workdays.

Installation and Running Automation Test
After the manual test executions, preparations for automation testing were made. For this purpose, the first step was to decide which tool would be used for writing the automation scripts. Playwright was used as the automation tool for writing software test cases. It is a relatively new test automation framework developed by Microsoft, released in 2019. It is open-source and specifically designed for testing modern web applications. Playwright excels at testing dynamic content and modern JavaScript applications. It is used to simulate user interactions on web pages, write automated tests, and perform validations. Playwright is relatively easy to set up compared to other tools. It does not require dependency installation to get started. Using the command npx playwright install, the necessary dependencies are installed automatically. The tool is free and does not incur additional costs.

Companies generally show resistance when transitioning from manual to automated testing. To minimize this resistance, it is crucial for the team to quickly learn and implement automation testing. For all these reasons, after extensive research, **Playwright** was chosen as the automation tool. In this project, the approach was based on a tester without advanced software knowledge. To enable basic-level automation coding with Playwright, a Playwright training course was followed.

Approximately **6 hours** of Playwright training was undertaken. This training was in the form of a video tutorial on writing Playwright code using **TypeScript**.
Completing the installation and finishing the training video took **2 weeks.**

Coding the **33 test cases** that were initially written at the beginning of the project with Playwright took **3 days.**

Two crucial aspects for test automation with Playwright, which are evaluated based on two different metrics, are highlighted below:

```
tests > TS khanacademyAdv.test.ts > ...
1  import { chromium, firefox, webkit, expect, test } from "@playwright/test";
2
3  // Tarayıcıları tanımlıyoruz
4  const browsers = {
5      chromium: chromium,  // Google Chrome
6      firefox: firefox,    // Mozilla Firefox
7      edge: webkit,        // Microsoft Edge (webkit ile temsil edilir)
8  };
```

Figure 2. Running three different search engines

At this point, one of the strongest features of the Playwright tool, the ability to run tests on three different browsers simultaneously, was utilized. Using the relevant commands on Figure 2, the tests were run on Chrome, Firefox, and Edge browsers. Testing your web page across different browsers ensures a safer, user-friendly, and professional product. With browser compatibility tests, you can identify and resolve potential issues users may encounter on various browsers in advance.

```
TS playwright.config.ts > config > testMatch
1  import { defineConfig, devices } from '@playwright/test';
2  import type { PlaywrightTestConfig } from '@playwright/test';
3  import { on } from 'events';
4
5
6  const config: PlaywrightTestConfig = {
7    testMatch: ["tests/edxAdv.test.ts"],
8  use: {
9        headless:false,
10       screenshot:"on",
11       video: "on"
12 },
```

Figure 3. Taking Screen Shot from test cases

With Playwright's capabilities, screenshots of each executed test case were taken using a concise piece of code on Figure 3. These screenshots were automatically downloaded to the desktop. They provided test engineers with easy access to information about how the test was performed and whether it passed or failed.

These screenshots allow all test engineers in the team to identify problematic cases and make comments. Visual evidence is provided to developers. These screenshots can be added to test reports to improve their quality. This feature offers a good solution for the "Actual Result" phase in test cases, as it clearly shows the test outcomes.

Jenkins Integration

Jenkins is a no-cost, open-source solution for continuous integration (CI) and continuous delivery (CD) that does not require any additional expenses. The goal of modern CI/CD practices is to streamline the process of validating and deploying code updates rapidly by automating tasks such as code integration, testing, building, and deployment in software development pipelines. Jenkins plays a crucial role in simplifying DevOps workflows, allowing development teams to enhance their speed and productivity. It is capable of automatically running code from the IDE and initiating these executions without the need for manual input. The tool offers a user-friendly interface to display the time taken and results of test cases. Additionally, Jenkins is compatible with reporting tools like Allure, which facilitate the generation of detailed and informative reports. In advanced automation testing processes, using a tool like Jenkins has become

indispensable. **Learning Jenkins,** setting it up, and implementing it into the Playwright project took **1 week.**

Initially, the scripts did not execute successfully. The reason was that the **CPU power was insufficient** to handle parallel test executions. To address this issue, a custom function was developed to **reduce script load**, resulting in a more readable script. With the optimized script, the CPU was able to handle the test executions. One of the greatest benefits of Jenkins is **automated triggering**. As shown in the image below, the Jenkins trigger is set to **21:00**. This ensures that as long as the server from which the code is pulled is active, test executions will start every evening at **21:00.** At the end of all test cases, an **intuitive schema** was presented on the user interface, as shown Figure 3. Each **pipeline step** was displayed to the user in a detailed manner, enhancing the **readability** of the results.

Figure 3. Jenkins Pipelines

COMPARISON

Automation Test

After the training was completed, the time cost for **test case writing, learning and installing Playwright, coding, learning Jenkins, Jenkins implementation,** and **automation test case execution** columns, as shown Table 2, will be **0 minutes**, resulting in **no additional time cost.** The **test case execution time** for automated test cases is **0** because the execution is initiated **automatically outside of working hours** without utilizing human resources. In **20 days,** the **coding and automation** processes were completed, and the scripts were written.

Table 2. The time spent for Automation Test.

	Writing test cases	Lerning and Installation of Playwright	Coding	Learning Jenkins	Implemantation of Jenkins	Running Test Case with Automation
TIME	2 days	10 days	3 days	3 days	2 days	-

20 days * 8 hours/day * 60 minutes/hour = 9,600 man/minutes of total elapsed time.
(Assuming one working day is 8 hours)

Manual Test

Table 3 shows the total time spent on tests performed using the manual testing method.

Table 3. The time spent for Manual Test.

	Writing test cases	Running Test Case Manually
TIME	2 days	43 minutes

2 days * 8 hours/day * 60 minutes/hour + 43 minutes = 1003 man/minutes of total elapsed time. *(Assuming one working day is 8 hours)*

Comparison of Manual and Automation Tests Timing

Table 4. Timing of manual and automation tests implementation

Scenario	Manual Testing	Automation Testing
Initial setup & 1st run	1,003 mins	9,600 mins
2nd run	43 mins	-
1 month (daily tests, 7*4 runs)	7*4*43 =1,204 mins	-
6 months (daily tests, 7*24 runs)	7*24*43 =7,224 mins	-
7 months (daily tests, 7*28 runs)	7*28*43 =8,428 mins	-
8 months (daily tests, 7*32 runs)	7*32*43 =9,632 mins	-

Manual testing is initially much faster; however, during the continuous testing process required by regression testing, the same tests must be executed repeatedly. At this point, for a platform where deployments and test case executions are conducted daily, the time spent on **manual testing** in an **eight-month period** would **offset** the time spent on **automated testing.** The total times for manual and automation tests on Table 4 are given for comparison.

Additionally, this case considers a situation where the company has **just transitioned to automation** and is working with **automation and automation methods for the first time.**

However, once **automation methods** are learned, they can be applied to all future projects. Therefore, the time cost analysis should be based on a scenario where automation methods have already been learned and can be applied **directly,** rather than a scenario where these methods are being learned for the first time. In this case, the applicable automation test times are provided in Table 5.

Table 5. The time spent for Automation Test after Acquired Knowledge

	Writing test cases	Lerning and Installation of Playwright	Coding	Learning Jenkins	Implemantation of Jenkins	Running Test Case with Automation
TIME	2 days	-	3 days	-	-	-

5 days * 8 hours/day * 60 minutes/hour = 2,400 man/minutes of total elapsed time. *(Assuming one working day is 8 hours)*

In contrast, the time spent on manual testing will remain constant at 1,003 minutes.

2 days * 8 hours/day * 60 minutes/hour + 43 minutes = 1,003 man/minutes

This comparison highlights that while the initial time cost for automation is higher (2,400 minutes), the manual testing time remains fixed at 1,003 minutes for each execution cycle. As the number of cycles increases, the cumulative time cost for manual testing will surpass the one-time automation setup cost, demonstrating the long-term efficiency of automated testing.

Table 6. Timing of manual and automation tests implementation after Acquired Knowledge

	MANUAL TEST	AUTOMATION TEST
Running 1	1003 mins	2400 mins
Running 2	43 mins	-
Running 7*4 (1 month)	7*4*43 =1204 mins	-
Running 7*8 (2 month)	7*8*43 =2408 mins	-

After the acquired knowledge, utilizing the existing automation infrastructure of the company becomes much faster and starts to yield results much faster than manual testing in a very short time. As can be seen from the table above, when automation testing is created for the software, the time spent on creating automation is amortized within 2 months, and the company starts to make a profit. Manual testing is time-consuming, particularly during regression testing, and proves to be costlier than automation testing in the long run (K. R. Halani el al., 2021).

RESULTS AND DISCUSSION

This study compares automation and manual testing methods in software testing. This comparison has been the subject of many academic studies. Manual and automation tests have advantages over each other in different areas (H. Uslu et al., 2022).

When the literature is reviewed, one gap is identified: In real-life scenarios, should a company transition to automation testing in software testing, or should it continue with manual testing?

The process began by first writing test cases that would be used for both manual and automation testing. The test cases created are common for all testing processes and were not created separately. A total of 33 test cases were created for the login pages of three popular educational platforms. The reason for testing the login pages is that every application includes a login page, which is an indispensable component for any application. Instead of a test case document that only contains the test name and fail/pass status, all relevant sections were included, so that anyone reading the test case can easily repeat the test and understand what was done in the test.

Afterwards, these test cases were executed manually, and the total time spent was calculated. Once the manual execution process and the time and cost calculations were completed, an infrastructure was created to run the same test cases using automation.

There are many software testing automation tools available to accelerate interface testing. In addition to these tools, new automation tools are still being developed. Although Selenium is one of the most popular tools for web interface automation, it remains traditional and cumbersome compared to newer technologies (A. Antonczak and B. Bylina, 2024). Instead, the Playwright tool, which provides faster adaptation, has been used. The benefits of this tool are explained in section 1.3.

One of the greatest benefits of automation testing is its ability to integrate with CI/CD tools. This allows tests to be executed without human intervention and time loss. Many different articles have discussed the features provided by Jenkins tools and how test automation works seamlessly with less manual effort (A. Deshpande et al., 2021).

Preparing all test cases at once and executing them manually took a total of 1003 man/minutes. The same calculation could not be directly applied for automation testing, as an infrastructure had to be set up for automation tests. The setup of the infrastructure and the execution of the test cases once took a total of 9600 man/minutes.

When looking at the initial costs, manual testing was performed with a profit of 86.55%. However, the cost of automation testing is zero once the initial cost is eliminated.

When examining the table in Table 4, it is observed that the initial cost of manual software testing is much lower. However, as the same test cases are executed continuously, the initial cost for automation testing is amortized. In this study, it has been proven that for a company deploying and testing daily in different environments, automation amortizes its initial cost within a six-month period, and after six months, every executed test case results in profit.

After all these experiments and proofs, manual and automation testing methods in software testing are compared with different metrics in Section 5.

The transition to automated testing allowed for parallel execution of tests, providing more detailed test results with step-by-step screenshots, and reducing man-hours and execution time. Through test automation, the frequency of running regression tests increased, and human errors were detected earlier. Additionally, test automation provides more detailed test results (such as recorded screenshots) compared to manual testing.

Tests were automatically executed after code changes with continuous integration or at scheduled times. This allows for much faster feedback by only reviewing the failed tests in the test results. It can be determined which deployment code changes caused the failed regression tests.

As a result, automation testing is initially costly. However, as repetitive tests like regression tests are conducted, this cost is amortized over time, and companies start making a profit in the ongoing process. Once a fully automated test system is established, the company will eventually be fully profitable. Additionally, the reason for the high initial cost is the effort required to set up the automation infrastructure in a company that lacks an automation culture (Table 2).

When a company starts a new project, if it is expected that the project will not remain as research and development but will instead be a long-term project, the company should create an automation test plan for that project. If the company already has an automation infrastructure, there will be no initial cost when creating an automation plan for new projects. In this case, starting automation testing for the mentioned project will be much easier and more feasible.

However, for some projects, it is uncertain whether they will be sold or go live. For these types of projects, starting automation might be risky. This is because initiating automation testing is costly, and if the project does not go into production and will not require continuous integration or maintenance, it would be unnecessary to incur this initial cost.

CONCLUSION

In this study, manual and automated testing methods were evaluated based on several critical metrics. The findings indicated that neither method is universally superior; rather, each approach exhibits distinct advantages and disadvantages, depending on specific project characteristics and requirements. A categorical recommendation advocating exclusively for either manual or automated testing would therefore be inaccurate.

For long-term, continuously evolving projects requiring frequent regression testing such as enterprise applications, banking systems, e-commerce platforms, and defense software the advantages of automation testing are clearly demonstrated. Automated testing accelerates test execution cycles, reduces repetitive tasks, and significantly lowers the cumulative costs and efforts associated with ongoing regression testing. Consequently, companies engaged in sustained software development projects should strongly consider adopting automation testing as part of their standard processes.

Conversely, for short-term, experimental, or uncertain-duration projects such as proof-of-concept studies, research-driven initiatives, hackathons, or projects with unclear future development manual testing remains more practical. Given the high initial setup time, cost, and training investments required for automation, these projects generally do not benefit from automation, as repetitive regression tests may be infrequent or unnecessary. In such contexts, manual testing remains cost-effective and straightforward. An essential insight derived from this research is that the selection between manual and automated testing methods must be strategically determined at the outset of each project, considering factors such as project duration, complexity, budget constraints, team skillsets, and expected frequency of regression testing.

Further research may investigate automation testing scalability with significantly larger test suites, assessing performance degradation, infrastructure requirements, and potential efficiency bottlenecks. With advances in AI and machine learning, future research should explore integrating AI-based test-case generation and execution methods to improve automation efficiency, coverage, and effectiveness.

Abstract
The aim of this study was to determine the length-weight relationships, some body performance values and Mediterranean stomach content fullness values of 5 different lessepsian species distributed along the western coast of Turkey with current data. The range values showing the total length and total weight values of a total of five species and 102 individuals according to their sexes were determined. The results of Fulton condition values were determined for five fish species in the study: the lowest condition value was found in *Fistularia petimba* (0,05±0,01), while the highest was found in *Sargocentron rubnum* (1,72±0,18). It is clearly understood that *S. rubnum* is quite well developed in terms of condition among the condition values of the lessepsian fish species in the region. Additionally, *S. luridus* (b: 3,02), *S. rubnum* (b: 3,26), *L. scleratus* (b: 3,14) and *F. petimba* (b: 3,79) had positive allometric growth (b>3), while *P. miles* (b: 2,20) had negative allometric growth (b<3). Variations in *b* values are primarily influenced by a range of biotic and abiotic factors, including species-specific characteristics, sexual dimorphism, habitat conditions, dietary composition, seasonal changes, sample size, gonadal development, and individual length metrics. During the examination of the stomach contents of the individuals, it was determined that all the species in this study mostly fed on crustacean species and some smaller fish species. This study provides information on some invasive species in the Western Mediterranean of Türkiye.

Keywords: Lessepssian fishes, Lentgh-Weight, Mediterranean, Turkey.

INTRODUCTION

Over the past decade, increasing sea surface temperatures have been strongly linked to the global proliferation of non-native marine species. The Mediterranean Sea, in particular, has emerged as one of the most heavily impacted regions by these biological invasions. (Zenetos et al., 2010). The migration of these species towards the Mediterranean Sea occurs passively with the increase in water temperature as well as the increase in maritime transportation and trade from the Red Sea. Although the number of lessepsian fish species in the Turkish coast is reported to be 33 (Bilecenoglu et al., (2002), this number has increased significantly in recent years. In this study, the aim was determining the sexes as well as the length-weight relationships, some body performance values and Mediterranean stomach content fullness values of 5 different lessepsian species distributed along the western coast of Türkiye.

Figure 1. Underwater imaging of some lessepsian species from Western Mediterranean of Turkey (Original by Kosan. S)

DRAFT

MATERIALS AND METHODS

The study was carried out on 5 (*Siganus luridus*, *Fistularia petimba, Pterois miles*, *Lagocephalus sceleratus*, and *Sargocentrum rubnum*) different species of lessepsian fish caught by local fishing vessel from the western Mediterranean waters of Turkey. The study was conducted between December to January 2024. A total of 102 fish were used in the study, determining the length-weight relation, the sexes and stomach content. Individual samples were measured for total length (TL) to the nearest 1 mm using a measuring board and weighed to the nearest 0.01 g using an electronic scale in the laboratory. Length–weight relationship parameters (a and b) were estimated by linear regression analysis on log-transformed data ($W = aL^b$) where "a" is the intercept (coefficient related to body form), and "b" is the slope of the linear regression (exponent indicating the growth type). The determination of growth type in fish is determined according to the state of the length-weight relationship.

Figure 2. Fish samples from laboratory

RESULTS and DISCUSSION

Totals of 102 fish specimens representing 5 species and 5 families were sampled. *b* value equal to 3 indicates isometric growth while values different from 3 indicate allometric growth. According to Froese (2006), the excessive proportional increase in length in relation to weight increase in fish is indicated by b<2,5, while b>3,5 indicates that the increase in weight takes an excessive proportional value in relation to the growth in length. Accordingly, in our study; *F. petimba* (b: 3,79), *S. rubnum* (b: 3,26), *L. scleratus* (b: 3,14) and *S. luridus* (b: 3,02) had positive allometric growth (b>3), while *P. miles* (b: 2,20) had negative allometric growth (b<3) (Table 1).

Table 1. Lentgh-weight relationship and average condition values of the species during winter

Species	r^2	*b*	*Relationship*	*a*	*Fulton-K*
F. petimba	0,98	3,79	(+)allometric	0,01	0,05+0,01
S. rubnum	0,81	3,26	(+)allometric	0,01	1,72+0,18
L. sceleratus	0,99	3,14	(+)allometric	0,01	1,19+0,11
S. luridus	0,21	3,02	(+)allometric	0,01	1,44+0,34
P. miles	0,7	2,2	(-) allometric	1,2	1,19+0,18

Table 2. Lentgh-weight ranges and t values between sexes for each species

F. petimba	**n**	**Total Length (cm) Range**	**Total Weight (g) Range**
Female	26	43,3-86,1	24,67-388,92
Male	4	53,3-72	70,66-198,62
p		p>0,05	p>0,05
t		0.21	0.15

S.rubnum	**n**	**Total Length (cm) Range**	**Total Weight (g) Range**
Female	14	13,9-17,6	42,25-99,75
Male	4	14,8-16,2	48,72-93,27
p		p>0,05	p>0,05
t		0.09	0.44

L.sceleratus	**n**	**Total Length (cm) Range**	**Total Weight (g) Range**
Female	11	12,6-35,7	18,96-668,79
Male	3	12.6-15.5	22,15-44,42
p		p>0,05	p>0,05
t		0.18	0.22

S.luridus	**n**	**Total Length (cm) Range**	**Total Weight (g) Range**
Female	14	15.5-21.2	11,96-155.55
Male	4	16.3-17.6	57.73-83.21
p		p<0,05	p>0,05
t		0.03	0.11

P.miles	**n**	**Total Length (cm) Range**	**Total Weight (g) Range**
Female	16	25,5-33,4	222,81-517,03
Male	6	28.6-35.5	308.31-462.57
p		p>0,05	p>0,05
t		0.06	0.1

Table.2 shows the range values showing the total length and total weight values of 102 individuals according to species and their sexes. According to the t-test results, it was determined that the females of *F. petimba, S.rubnum, L. sceleratus, S. luridus* had larger length values than the males in terms of the total length (TL) values of the species distributed in the region ($P < 0.05$). Similarly, it was determined that the females of all the species in this study had more weight than the males in terms of their total body weight (W) ($P < 0.05$).

Figure 3. Stomach contents of *P. miles, F. petimba* and *S. rubnum*

During the examination of the stomach contents of the 102 individuals of different species, it was determined that the stomachs of female *S. luridus* were %100 full, and female *L. sceleratus* were 90,91% full and %9,09 empty. In the other hand the stomachs of female *S. rubnum* were only %28,57 full.

Food pieces belonging to the crab and shrimp species found in the stomach contents of *Siganus luridus*, *Pterois miles*, *Lagocephalus sceleratus* and *Sargocentrum rubnum.* Some small fish species found in the stomach of *Fistularia petimba*.

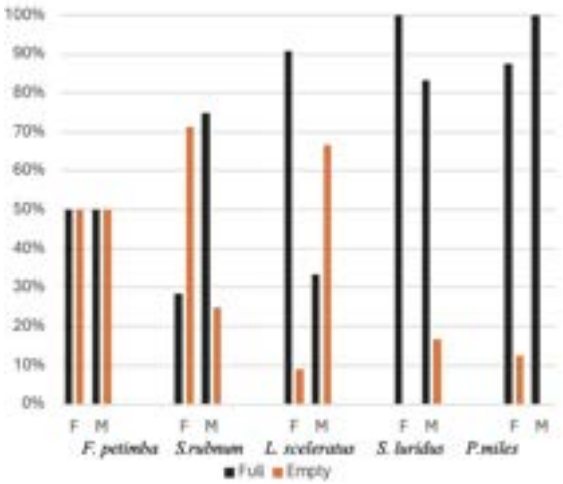

Figure 4. Stomach fullness values in species in the study.

One of the most important factors in the migration of invasive species from the Suez Canal to the Mediterranean Sea is sea water temperature. According to the data obtained, the lowest temperature was 15.9 °C in February and the highest temperature was 20 °C in July (Figure 5). Temperature data shows that the sea water temperature has increased significantly compared to last year.

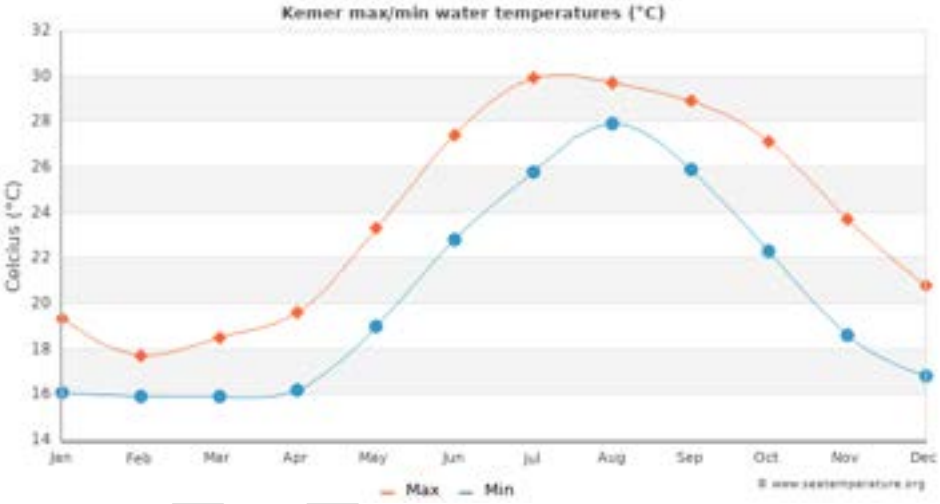

Figure 5. Water temperature changes in 2024 at Kemer, Antalya Bay (https://www.seatemperature.org/middle-east/turkey/kemer.htm)

Table 3. Water temperatures during collecting samples.

	Average	min	max
December	18.8	16.8	20.8
January	17.7	16.1	19.3
February	16.8	15.9	17.7

CONCLUSION

In this study, *S. luridus* (b: 3,02), *S. rubnum* (b: 3,26), *L. scleratus* (b: 3,14) and *F. petimba* (b: 3,79) had positive allometric growth (b>3), while *P. miles* (b: 2,20) had negative allometric growth (b<3). The differences in *b* values can be attributed to various factors, including species, sex, habitat, diet and nutrition, stomach fullness, season, sample size, sampling method, gonad development, physical condition, and the length of individuals (Tesh, 1971; Wootton, 1998). Therefore, it is thought that several of these factors had an effect in our study. It is clearly understood that *F. petimba* is quite well developed in terms of condition among the condition values of the lessepsian fish species in the region. Accordingly, the differences between the average condition values may be due to the differences in the size of the fish species as well as the differences in the habitats where the fish are distributed (Froese, 2006). In conclusion, according to the condition values of 5 lessepsian species in this study, it can be said that *F. petimba* individuals have very favorable conditions in terms of finding food (50% fullness) and feeding with crustaceans and fish

species in the research area. This study provides up-to-date data on the length-weight data and body performance values of invasive species in the region and the growth rates of fishes. We believe that these results will be beneficial for regional fisheries.

Abstract
This study focuses on the automatic recognition and classification of named entities in Turkish magazine news using deep learning techniques. Due to the complex morphology and agglutinative structure of Turkish, Named Entity Recognition (NER) presents unique challenges. Three different deep learning models were trained and evaluated using both BIO and NONE-BIO annotation schemes, resulting in six experimental setups. The models aim to identify entities such as person, event, date, relationship, location, and organization within sentences extracted from magazine news that exhibit stylistic diversity. A domain-specific, manually annotated dataset was created, and preprocessing steps such as syntactic analysis were applied to enhance model performance.

Evaluation metrics included accuracy, precision, recall, F1-score, and support. Comprehensive visual analyses were also conducted, including class distribution analysis, confidence scores, confusion matrices, error heatmaps, F1 score graph, performance radar charts, precision-recall curves, and t-SNE embeddings. To improve interpretability and transparency of model predictions, LIME (Local Interpretable Model-agnostic Explanations) analysis was applied, examining the features influencing each model's decisions. Results demonstrate that transformer-based models, especially BERT variants, effectively handle the linguistic complexity and variability of Turkish magazine news.

This research contributes to Turkish natural language processing by providing a domain-specific dataset, a comparison of multiple models and annotation schemes, and extensive performance visualizations. Findings highlight the critical role of contextual word embeddings in improving NER accuracy in Turkish. Moreover, the study reveals the potential of deep learning for automating information extraction from unstructured media content, with applications in media monitoring, automated news processing, and information retrieval systems.
Keywords: Named Entity Recognition, Turkish, Magazine News, Information Extraction, Natural Language Processing, Text Classification

INTRODUCTION

Named Entity Recognition (NER) is the task of identifying and classifying entities such as persons, locations, dates, organizations, and events in unstructured text. While numerous studies have been conducted in languages like English, this task poses unique challenges in morphologically rich and agglutinative languages, particularly Turkish. The morphological complexity of Turkish complicates the determination of entity boundaries and classification.

In recent years, transformer-based deep learning models have achieved significant success in sequence labeling tasks such as NER. Models like BERT leverage attention mechanisms to effectively capture contextual information, thereby improving performance. However, adapting these models to Turkish, and particularly to domains such as magazine news, requires careful consideration due to the structural characteristics of the language and the domain-specific challenges.

In this context, the study by Kılıç (2023), which presents a named entity recognition and explainability-oriented analysis on Turkish sports news texts, served as an inspiration for this study in terms of both methodological approach and domain-specific focus.

In addition to Kılıç's work, various studies in the literature have explored Turkish NER across different domains. For example, Abdullahi et al. (2025) developed a deep learning-based NER framework for Turkish radiology reports and demonstrated that BioBERTurk achieved the highest F1 score (80.1%). Aras et al. (2021) compared BiLSTM and Transformer-based models for Turkish NER and showed that

Transformer-based architectures provided superior performance due to their ability to model long-range dependencies. In the social media context, Okur et al. (2018) applied semi-supervised learning with word embeddings to noisy and informal Turkish Twitter data, yielding effective results. These diverse efforts underscore the growing interest in Turkish NER and the importance of evaluating models in both formal and informal textual domains.

This study focuses on the automatic recognition and classification of named entities in Turkish magazine news. Magazine news, characterized by informal language, diverse entity types, and high linguistic variability, presents a particular challenge. To address this, a domain-specific, manually annotated dataset was created, and three different deep learning models were trained using both BIO and NONE-BIO annotation schemes, resulting in six experimental configurations.

Prior to model training, preprocessing steps such as syntactic analysis were applied to provide richer structural information to the models. Model performance was evaluated using metrics including accuracy, precision, recall, F1-score, and support. Furthermore, extensive visual analyses including confusion matrices, error heatmaps, F1 score graphs, radar charts, precision-recall curves, and t-SNE embeddings were performed to better understand model behavior. To enhance explainability and reveal the reasoning behind predictions, the LIME (Local Interpretable Model-agnostic Explanations) method (Ribeiro, Singh, & Guestrin, 2016) was also employed, which provides local explanations by approximating the model decision boundary around individual predictions.

This research makes significant contributions to Turkish natural language processing by comparing domain-specific datasets and multiple model-annotation approaches. The results underscore the critical role of contextual word embeddings in improving NER accuracy in Turkish. Additionally, the study highlights the potential of deep learning for automated information extraction from unstructured media content, with practical applications in media monitoring, news processing, and information retrieval systems.

MATERIALS AND METHODS

In this study, a Named Entity Recognition (NER) dataset was created using Turkish celebrity news headlines. The dataset incorporates tokens and vocabulary sourced primarily from the Turkish Headlines Dataset by Guven (2021), complemented with additional domain-specific terms to better capture the unique linguistic characteristics of celebrity news. The dataset was manually annotated according to the BIO (Beginning, Inside, Outside) tagging format to ensure accurate entity boundary detection. The annotation schema includes the following entity types relevant to the domain: PERSON, LOCATION, NUMBER/DATE, ORGANIZATION, MOVIE/TV, SONG/ALBUM, EVENT, SOCIAL_MEDIA, AWARD, RELATIONSHIP, and HEALTH. To ensure reproducibility, the dataset was randomly divided into training and test sets using a fixed random seed value of 42. The final corpus consists of 702 sentences for training and 175 sentences for testing. Each sentence was tokenized by separating words with spaces, and each token was individually aligned with its BIO label. The data was stored in a CoNLL-like format where each word is paired with its corresponding label, ensuring compatibility with standard NER workflows.

To evaluate model performance, three different pretrained transformer-based models were selected: dbmdz/bert-base-turkish-128k-uncased (dbmdz, 2020), google-bert/bert-base-multilingual-cased (Google Research, 2019), and xlm-roberta-base (Facebook AI, 2019). These models represent various architectures with differing tokenization strategies and multilingual capabilities. The dbmdz/bert-base-turkish-128k-uncased model, specifically trained for Turkish, outperformed the other multilingual and English-centric models.

Model training was performed using the HuggingFace Transformers library with the AutoTokenizer and AutoModelForTokenClassification components. The data was tokenized and processed with careful alignment between words and BIO format labels, using subword tokenization strategies to fit the models' expectations. Training and evaluation utilized HuggingFace's Trainer class alongside TrainingArguments parameters. The training was configured with a learning rate of 2e-5, batch size of 8, weight decay of 0.01, and conducted over 4 epochs. Evaluation was performed at the end of each epoch.

After training completion, the model and tokenizer files were saved. For testing, predictions were generated on tokenized sentences and probability scores computed using the softmax function. Token-level predictions were realigned to word-level labels using an offset-mapping based alignment algorithm, thus recovering accurate BIO tags at the word level.

Model performance was analyzed both quantitatively and qualitatively. Confusion matrices were used to visualize misclassifications, while classification reports provided precision, recall, and F1 scores for each entity type. Macro F1 scores of the three models were compared using radar charts.

High-dimensional model embeddings were reduced to two dimensions using t-distributed stochastic neighbor embedding (t-SNE) to examine how well the models grouped entities such as PERSON, EVENT, and AWARD based on their contextual representations. Precision-recall curves were drawn per entity to assess model sensitivity and specificity at various confidence thresholds. Histogram analyses of label distributions were prepared to evaluate class imbalance in the dataset.

Finally, Local Interpretable Model-Agnostic Explanations (LIME) analyses were conducted on selected test examples to interpret model decision-making processes. This method highlighted which tokens had the greatest influence on the model's predictions, shedding light on its contextual reasoning. Such insights guided both error analysis and future directions for model improvement and annotation refinement.

Overall, this work holistically demonstrates the effectiveness of Turkish and multilingual transformer-based models for named entity recognition tasks in the noisy and colloquial language of celebrity news, supported by code-based training procedures, comprehensive evaluation, and interpretability approaches.

RESULTS

In this study, the named entity recognition (NER) performances of three transformer-based models were comparatively examined on a dataset of Turkish entertainment news. These models include dbmdz/bert-base-turkish-128k-uncased (DBMDZ), google-bert/bert-base-multilingual-cased (Google BERT), and xlm-roberta-base (XLM-RoBERTa). The models were evaluated under two annotation schemes: None-BIO and BIO.

Under the None-BIO tagging scheme, the DBMDZ model achieved the highest performance. On a test set comprising 2,220 tokens, it demonstrated strong overall performance with 95% accuracy and a weighted average F1 score of 0.95. The most notable result was the 0.99 F1 score for the PERSON class. Other categories such as NUMBER/DATE, MOVIE/TV, and SOCIAL_MEDIA also performed consistently well, with F1 scores ranging between 0.93 and 0.95. These results highlight the model's effectiveness in distinguishing both common and domain-specific entity types. This balanced performance is visually supported by the radar chart (Figure 1), which clearly illustrates the model's consistent success across entity categories.

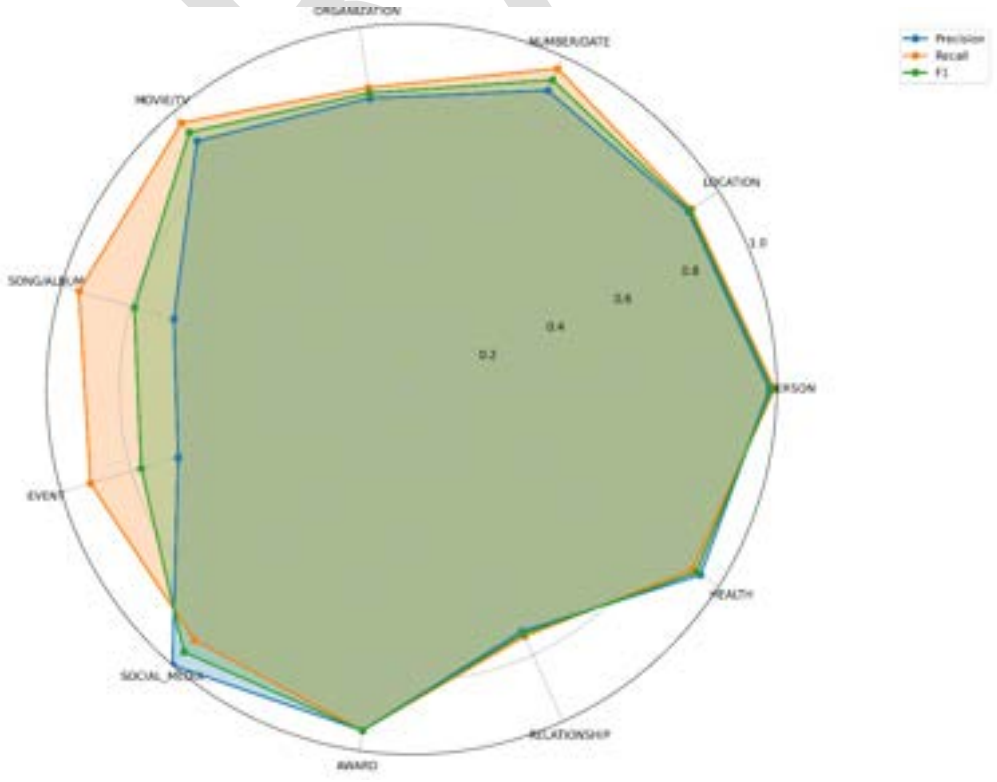

Figure 1. Performance Radar Chart by Entity Type (DBMDZ Turkish BERT, None-BIO)

The radar chart indicates that the model's precision, recall, and F1 scores are closely aligned across classes, suggesting not only accurate predictions but also stable performance across diverse entity types. While higher performance is evident in more frequent classes, reasonable results in less frequent ones like SONG/ALBUM and EVENT imply that the model can learn effectively even from limited samples. Overall, DBMDZ demonstrates strong potential as a reliable solution for Turkish entertainment news NER tasks.

The high precision and recall achieved by Google BERT for the NUMBER/DATE class are clearly illustrated in Figure 2.

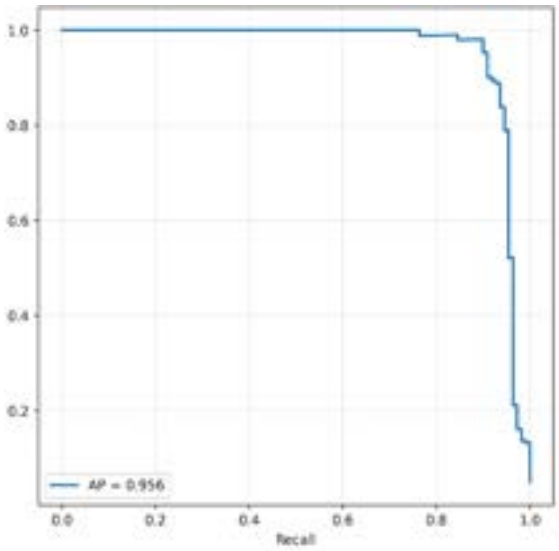

Figure 2. Precision-Recall Curve for the NUMBER/DATE Class (Google BERT, NONE-BIO)

Figure 3 presents the confusion matrix for the DBMDZ model under the None-BIO scheme. The model achieves over 95% accuracy in common categories such as "O" (Other), "PERSON," "NUMBER/DATE," "MOVIE/TV," and "SONG/ALBUM." However, performance dips to 74% and 83% accuracy in the "RELATIONSHIP" and "ORGANIZATION" categories, respectively.

DRAFT

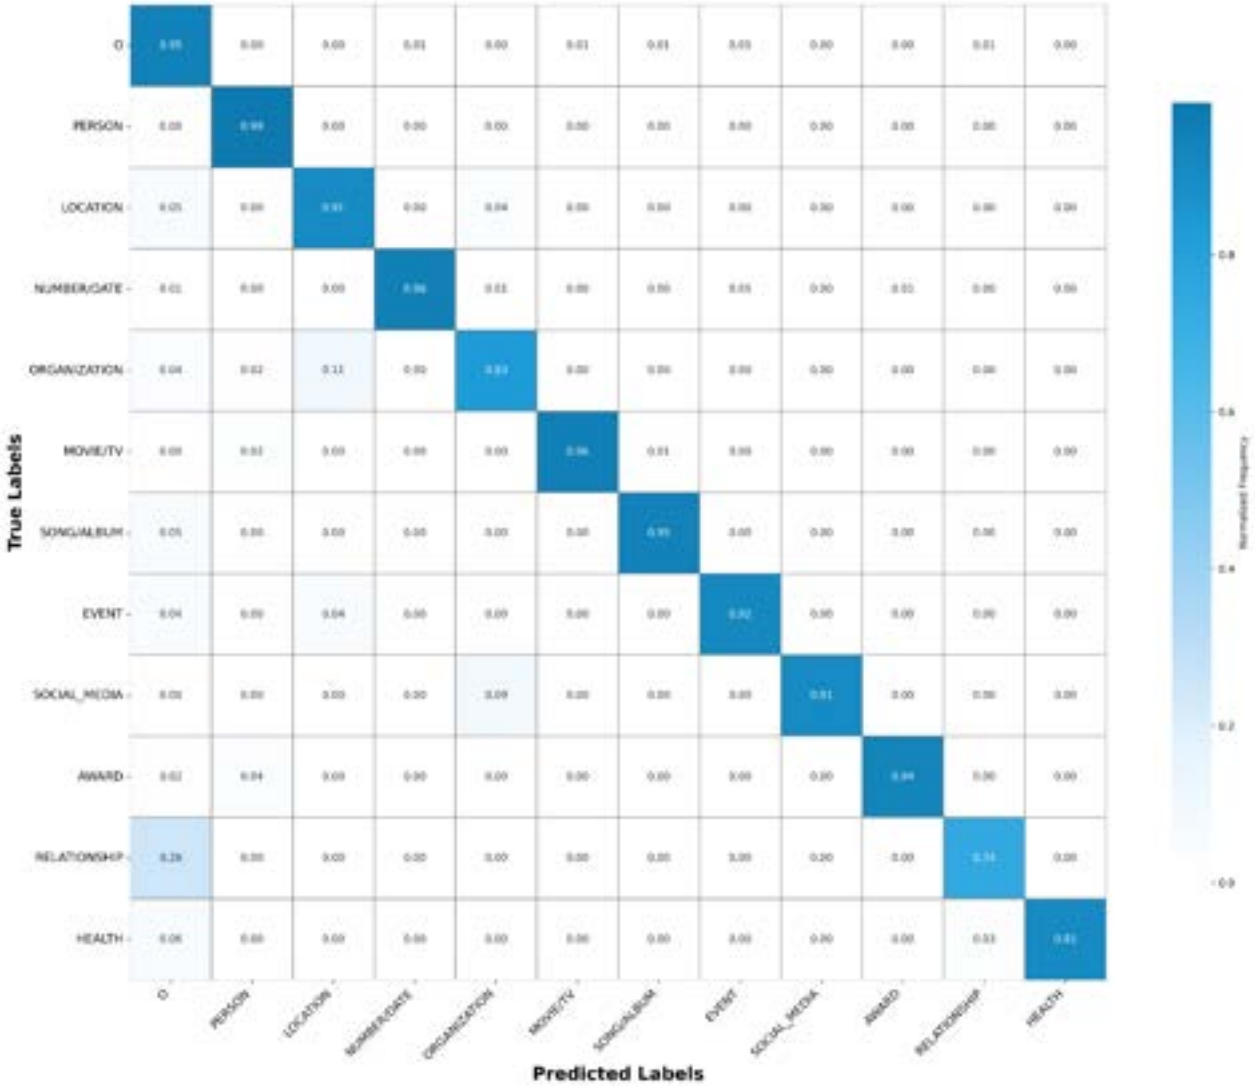

Figure 3. Confusion Matrix (DBMDZ Turkish BERT, None-BIO)

The confusion matrix reveals that while accuracy rates exceed 90% for most categories, the RELATIONSHIP class experiences a 26% confusion rate with the "O" class. Similarly, the ORGANIZATION class has an 11% confusion rate with LOCATION. Error rates for other categories remain below 5%. These findings highlight the model's strong general performance but also indicate areas that require further attention, especially for less frequent or semantically similar classes.

To address these challenges, increasing data diversity in weaker categories, enhancing annotation consistency, and implementing specialized feature engineering are recommended. Additionally, hyperparameter tuning and architectural modifications may further improve performance.

While the DBMDZ model shows strong results under the None-BIO scheme, Google BERT demonstrates notable advancements with the BIO annotation scheme, particularly in detecting entity boundaries and achieving high F1 scores across entity types.

Under the BIO scheme, Google BERT achieved a macro-average F1 score of 0.813, demonstrating superior capability in boundary detection. Figure 4 illustrates the top ten performing entity types for Google BERT, highlighting exceptional F1 scores, including a perfect 1.000 for the I-SOCIAL_MEDIA label and 0.980 for I-PERSON.

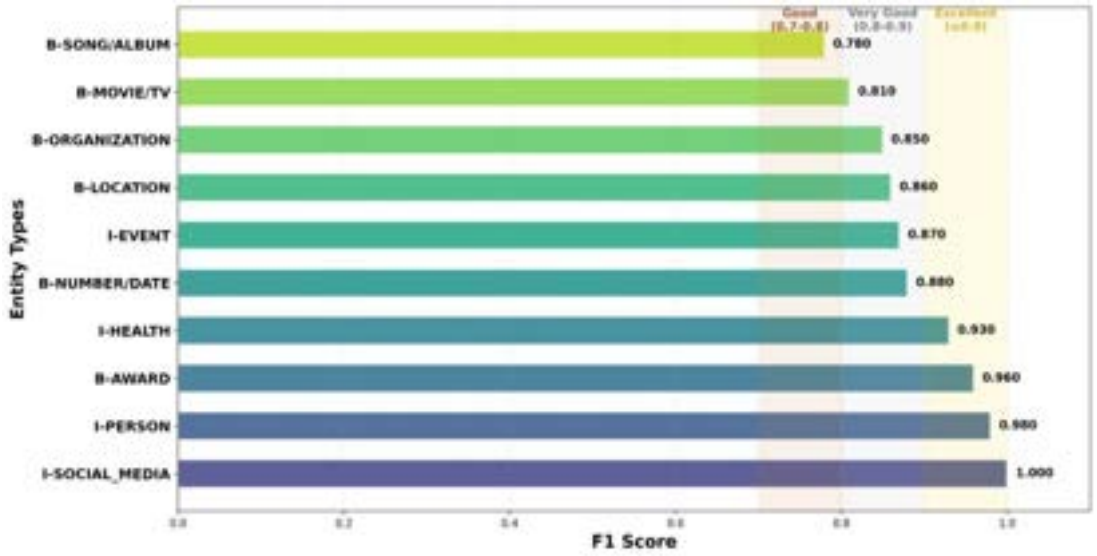

Figure 4. Top 10 Performing Entities F1 Score Graph (Google BERT, BIO)

The entity-level precision-recall curve of Google BERT under the BIO annotation scheme (Figure 5) highlights the model's stable and balanced learning process across various entity types. As a representative example, the B-PERSON class demonstrates a high Area Under the Precision-Recall Curve (AUC-PR) and a smooth curve trajectory, indicating that the model achieves both high precision and high recall. This suggests that Google BERT effectively distinguishes entity boundaries and accurately identifies multi-token entities. The consistently strong performance across classes supports the model's contextual understanding and reinforces its reliability in complex named entity recognition tasks.

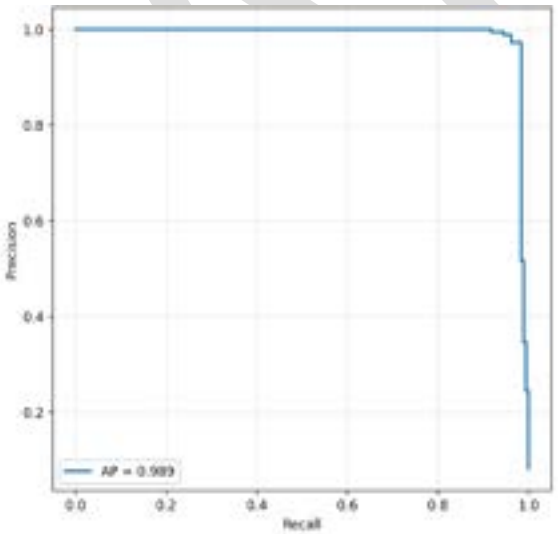

Figure 5. Precision-Recall Curve for the B-PERSON Class (Google BERT, BIO)

In addition, the t-SNE visualizations (Figure 6) offered compelling and visually intuitive evidence of the DBMDZ model's contextual learning capacity. Under the None-BIO tagging scheme, the model produced distinctly defined and well-separated clusters for various entity types based on their contextual embeddings. This level of separation was especially pronounced in less frequent and more specific categories such as AWARD, SOCIAL_MEDIA, HEALTH, and RELATIONSHIP, which appeared as compact and clearly isolated clusters. Likewise, more common entity types such as LOCATION, ORGANIZATION, and NUMBER/DATE also demonstrated well-delineated grouping. The presence of such sharply defined and semantically coherent clusters suggests that the model effectively captures the subtle linguistic distinctions inherent to the Turkish language, underscoring its strong potential for downstream tasks such as Named Entity Recognition.

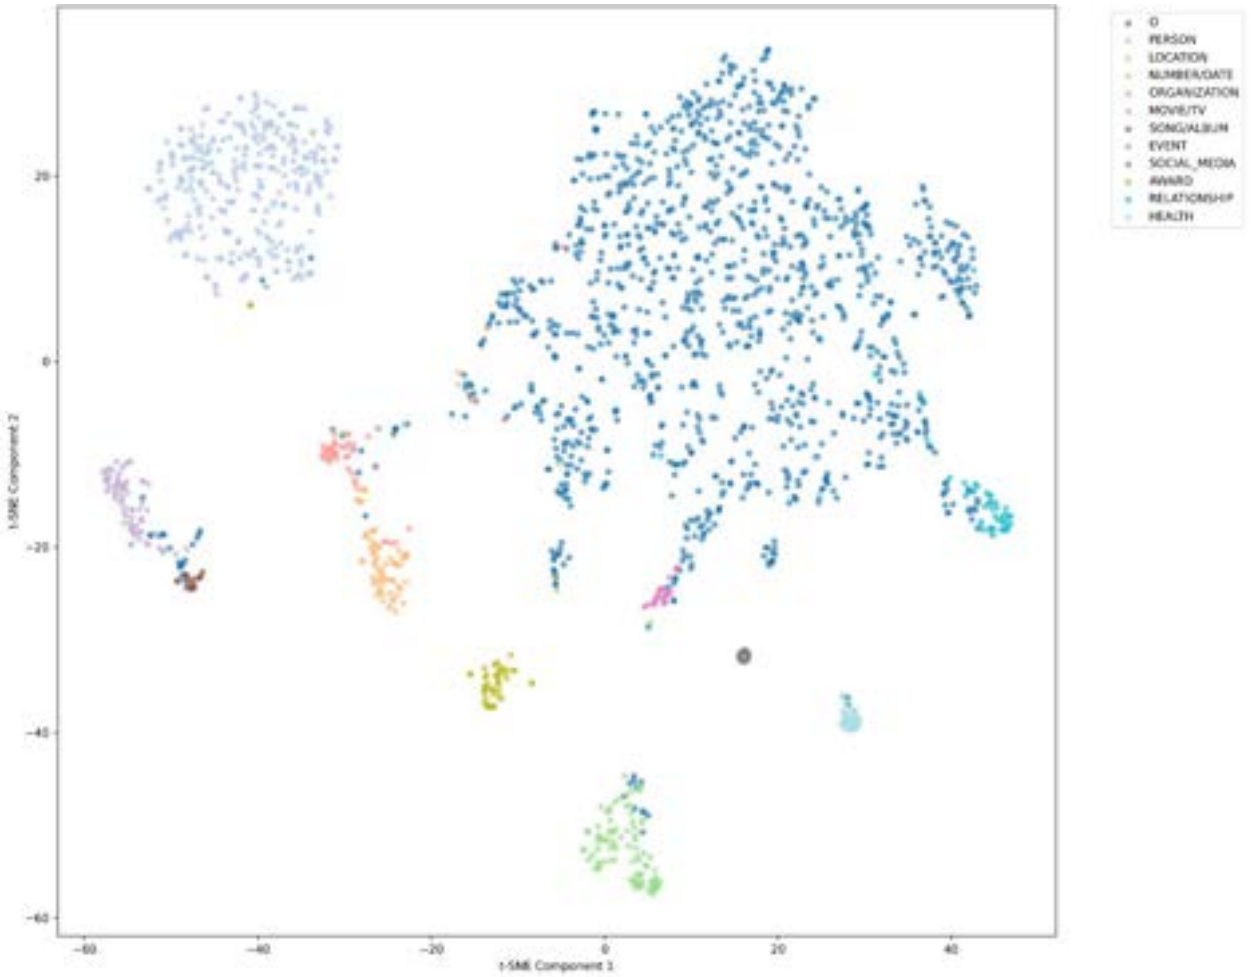

Figure 6. t-SNE Visualization of Entity Clusters (DBMDZ Turkish BERT, None-BIO)

Taken together, the experimental results reveal that the DBMDZ model performs most effectively under the None-BIO annotation scheme, whereas the Google Multilingual BERT model yields the best results in the BIO setting. These observations are further reinforced by a series of visual analyses, which capture the distinct learning behaviors and classification tendencies of the models across various entity types.

Beyond the detailed class-level evaluations presented above, Table 1 provides an aggregated overview of the models' overall performance, reporting key metrics such as Accuracy, Macro Precision, Macro Recall, Macro F1, and Weighted F1 scores. This comprehensive summary enables a robust comparison of the models across different annotation strategies, offering insight into their generalization capabilities and their ability to handle the structural intricacies of the Turkish magazine NER task under both BIO and None-BIO tagging schemes.

Table 1. Average Performance Metrics of the Models

Model	Annotation Scheme	Accuracy	Macro Precision	Macro Recall	Macro F1	Weighted F1
DBMDZ	None-BIO	0.95	0.89	0.89	0.89	0.95
Google BERT	None-BIO	0.95	0.89	0.88	0.88	0.95
XLM-RoBERTa	None-BIO	0.88	0.88	0.85	0.85	0.94
DBMDZ	BIO	0.85	0.74	0.66	0.68	0.85
Google BERT	BIO	0.93	0.83	0.82	0.82	0.93
XLM-RoBERTa	BIO	0.89	0.50	0.50	0.48	0.87

Finally, to evaluate the explainability of the model's decisions, LIME (Local Interpretable Model-Agnostic Explanations) analyses were conducted, particularly focusing on correctly classified examples. In the analysis of a sample sentence, the word "Suadiye" emerged as the most positively contributing token for the B-PERSON class. This indicates that the model can successfully distinguish person names. Similarly, tokens like "Geçtiğimiz" and "yılın" were observed to provide meaningful contributions to the B-NUMBER/DATE label. For other classes, contribution scores were generally low or neutral, and in some cases even negative. Notably, the low contribution scores observed for classes such as B-HEALTH, B-RELATIONSHIP, and B-SOCIAL_MEDIA are naturally interpreted as a result of the absence of expressions belonging to these entity types in the sentence. These analyses highlight both the strengths and limitations of the model in more detail and underscore the need for data augmentation, especially for underrepresented classes.

DISCUSSION

The findings of this study demonstrate that the performance of Named Entity Recognition (NER) on Turkish entertainment texts is significantly influenced by both the choice of model and the annotation scheme employed. Notably, models pre-trained specifically for Turkish exhibit better adaptation to the language's morphological complexity, resulting in superior performance. The BIO annotation format has proven critical for precise boundary detection of entities, with models showing more consistent and balanced performance under this scheme. This supports the preference for BIO tagging in practical applications where accurate entity boundary identification is essential. Performance differences among models indicate that multilingual architectures may struggle to effectively capture the nuances of Turkish morphology. Furthermore, the lower performance observed in rare entity classes highlights challenges related to data imbalance and class heterogeneity. These issues underscore the importance of future work focusing on data augmentation, improved annotation consistency, and model optimization. Overall, this study provides valuable insights for the Turkish NER domain, emphasizing the necessity of selecting methods tailored to the specific linguistic and application context to achieve optimal results.

CONCLUSION

This study presents a comprehensive evaluation of the named entity recognition (NER) capabilities of three transformer-based models applied to Turkish celebrity news data. The models were assessed under two different annotation schemes: BIO and None-BIO.

Under the None-BIO labeling scheme, the dbmdz/bert-base-turkish-128k-uncased model, which is pretrained specifically for Turkish, achieved the highest performance with 95% accuracy and a macro F1 score of 0.89. The model's success in categories such as PERSON, NUMBER/DATE, and SOCIAL_MEDIA suggests that language-specific pretraining significantly enhances performance on informal and domain-specific texts.

In contrast, the BIO annotation format, which requires more precise identification of entity boundaries, favored the Google Multilingual BERT model. This model achieved a macro F1 score of 0.82, indicating consistent and balanced recognition across different entity classes. These results point to the model's strength in learning complex contextual dependencies, which are crucial for boundary-sensitive tagging formats.

While XLM-RoBERTa exhibited strong accuracy under the None-BIO scheme, its performance declined notably in the BIO setting. As detailed in Table 1, the model's macro precision and recall scores dropped significantly, and confusion matrix analyses revealed frequent misclassifications in ORGANIZATION, EVENT, and SONG/ALBUM entities. This performance gap highlights the model's limited adaptability to the increased granularity imposed by BIO annotations.

Overall, the results summarized in Table 1 demonstrate that both model architecture and annotation scheme play critical roles in determining NER effectiveness. Macro-level metrics, which account for per-class performance independently of frequency, reveal that some models perform well in high-frequency categories but struggle with rare or complex entity types.

Improving NER outcomes in Turkish requires not only selecting robust model architectures but also designing annotation schemes and datasets that align with linguistic characteristics and domain-specific challenges. Future research should prioritize data augmentation for low-resource entity types such as AWARD and RELATIONSHIP, which are consistently underrepresented. Such efforts are expected to improve both predictive accuracy and the quality of interpretability tools like LIME, especially by supporting more stable and meaningful local explanations for rare entities.

ACKNOWLEDGEMENTS

I would like to express my sincere appreciation to my thesis advisor, Assistant Professor Dr. Mehmet Dikmen, for his guidance and contributions during the preparation of this study. His feedback and academic perspective were valuable in shaping the overall direction of the work. I am thankful for his support throughout the process.

Abstract
This study investigates the forecasting performance of ARIMA and Simple Exponential Smoothing (SES) methods in a multi-channel retail environment, focusing on the comparative analysis of traditional and e-commerce sales channels. Using monthly sales data from January 2023 to December 2024 for five distinct product groups produced by a polypropylene yarn manufacturer in Türkiye, the study evaluates model accuracy through the Symmetric Mean Absolute Percentage Error (SMAPE) metric. Forecasts were generated separately for each channel, and model parameters were optimized accordingly. Results reveal that the ARIMA(1,1,2) model consistently outperformed SES across all product groups, particularly in capturing irregular demand patterns and short-term fluctuations common in e-commerce data. While the dataset lacks strong seasonality and covers a limited time span, the findings underline the critical need for channel-specific forecasting strategies.

Keywords: Multi-channel demand forecasting, Forecasting model comparison, Synthetic yarn manufacturing

INTRODUCTION

In today's rapidly evolving retail environment, companies often operate across multiple sales channels, such as traditional physical outlets and emerging e-commerce platforms. Managing demand across these diverse channels has become increasingly critical for maintaining service levels, optimizing inventory, and maximizing profitability. However, the distinct dynamics of e-commerce—such as higher demand volatility, faster response expectations, and greater promotional sensitivity—necessitate a re-evaluation of conventional forecasting models [1] traditionally used for brick-and-mortar operations.

Accurate demand forecasting plays a pivotal role in aligning supply chain operations with customer expectations in a multi-channel setting. Traditional time series models like ARIMA and Exponential Smoothing have long been used to predict sales trends based on historical data. Nevertheless, the integration of e-commerce channels introduces new complexities, including seasonality shifts, shorter product life cycles [5], and greater variability in customer behavior. Therefore, it is essential to compare forecasting model performances separately across e-commerce and traditional channels to understand their respective predictive strengths and limitations.

This study aims to evaluate the forecasting accuracy for five product groups sold through both traditional and e-commerce channels. By applying ARIMA and Exponential Smoothing methods and measuring model performance using Symmetric Mean Absolute Percentage Error (SMAPE), the analysis seeks to determine whether e-commerce sales exhibit different forecasting challenges compared to conventional channels. The findings offer practical insights into how demand forecasting strategies can be adapted to better support multi-channel retailing environments.

METHODOLOGY

This study adopts a structured quantitative approach to evaluate demand forecasting performance across traditional and e-commerce sales channels. A dataset comprising monthly sales figures for five distinct product groups, categorized separately for each channel, serves as the foundation for the analysis. To ensure

comparability, the selected product groups exhibit consistent sales patterns across both channels, thus minimizing external variability due to product heterogeneity.

The forecasting models employed in this study are Autoregressive Integrated Moving Average (ARIMA) and Simple Exponential Smoothing (SES), both widely recognized for their robustness in time series prediction. ARIMA models are particularly suitable for capturing autoregressive behaviors, trends, and seasonality patterns [2] within the sales data, whereas Exponential Smoothing provides a flexible and computationally efficient method for short-term forecasting without requiring extensive model complexity. Model selection parameters for ARIMA, such as the order of autoregression (p), differencing (d), and moving average (q), are determined using a combination of Autocorrelation Function (ACF) and Partial Autocorrelation Function (PACF) plots, supplemented by model selection criteria such as Akaike Information Criterion (AIC). The smoothing parameter (α) for Exponential Smoothing is optimized based on minimizing forecast error within the training dataset.

Model performance is evaluated using Symmetric Mean Absolute Percentage Error (SMAPE), a scale-independent metric particularly well-suited for comparing forecast accuracy across datasets with varying magnitudes. SMAPE offers a normalized measure of error, mitigating the sensitivity issues associated with traditional MAPE in cases of low sales volumes. Forecasting experiments are conducted separately for traditional and e-commerce sales data for each product group, and comparative analyses are performed to highlight the differential forecasting challenges and model suitability across channels. The methodological framework is designed to yield insights into the structural differences in demand behavior between traditional and digital retail environments.

DATA DESCRIPTION

The dataset utilized in this study originates from a polypropylene synthetic yarn manufacturer operating in Gaziantep, Türkiye. It captures monthly demand figures for five distinct product groups. The data encompasses two parallel sales channels—traditional direct sales and e-commerce sales—providing a comprehensive basis for multi-channel demand analysis.

Covering the period from January 2023 to December 2024, the dataset consists of 24 monthly observations for each product group within each sales channel. Demand is recorded as the number of units sold per month in kilogram, ensuring temporal consistency across products and channels. Table 1 shows the actual demands for traditional Sales and e-commerce Sales in kg.

The selected product groups represent a diverse range of industrial applications, each exhibiting unique demand characteristics influenced by sectoral dynamics, seasonality, and customer behavior. This diversity allows for a robust evaluation of forecasting methods under varying demand conditions. The structured nature of the dataset—organized by product, channel, and month—facilitates time series analysis and enables systematic application of forecasting models tailored to the operational realities of multi-channel industrial manufacturing.

Simple Exponential Smoothing (SES) Methodology

In this study, the Simple Exponential Smoothing (SES) method is applied to forecast monthly demand for each product group across both traditional and e-commerce sales channels. SES is particularly suitable for data without a clear trend or seasonal pattern and is defined by the formula:

$$F_t = F_{t-1} + \alpha(A_{t-1} - F_{t-1}) \quad (1)$$

where F_{t-1} is the forecast for the previous period, A_{t-1} is the actual demand, and α\alphaα is the smoothing parameter between 0 and 1. To determine the optimal α value for each product group, multiple alpha values ranging from 0.1 to 0.9 were tested. The α value minimizing the Mean Squared Error (MSE) was selected for each product group separately by the formula:

The mean of the squared errors = (Demand - Forecast)^2 / number of forecast (2)

Forecasting was then conducted for a 24-month period, using the actual demand of the first month (January 2023) as the initial forecast value. This approach ensures that the smoothing parameters are tailored to each product's demand behavior across different sales channels, improving forecasting accuracy and reliability. So ,with the basis of choosing the minimum SSE , the best α values selected and then calculated the forecasts. Table 2 shows the best α values for each product group.

Table 2. Best α values for each product group

To evaluate the forecasting performance in this study, the Symmetric Mean Absolute Percentage Error (SMAPE) metric is utilized. SMAPE is particularly preferred over traditional Mean Absolute Percentage Error (MAPE) because it addresses issues arising from low or zero actual demand values, [3] which are common in multi-channel sales environments. SMAPE calculates the error as the ratio of the absolute difference between forecasted and actual demand to the average of the forecasted and actual values, thus self-limiting the maximum error to 200%. This approach ensures more stable and meaningful error evaluations, especially when dealing with low-volume e-commerce sales data. The SMAPE formula is defined as:

$$\textbf{SMAPE} = 1/N * \sum [|Fk - Ak| / ((Fk+Ak)/2)] * 100 \quad (3)$$

where F_k is the forecasted demand, A_k is the actual demand, and N is the number of periods. MAPE values were calculated for 24 months and shown in Table 4 below.

MAPE		10,11	10,42	11,59	9,04	13,30	32,12	34,75	31,76	25,87	31,43

After this calculation, noticed that there are undefined values due to zero actual demands and error rates were too high. After this attempt sMAPE was attempted. And also there is a second reason for sMAPE. sMAPE is generally used for zero demands or demands nearby zero. sMAPE calculated by formula below:

sMAPE = |Ft-At|/(At+Ft) (4)

Table 5. sMAPE Results of Calculations

Year	Month	Actual Demands for Traditional Sales (kg)					Actual Demands for E-Commerce Sales (via Web-site) (kg)				
		Greenhouse Twine	Carpet Yarn	Package Yarn	Bale Twine	Plastic Packaging Yarn	Greenhouse Twine	Carpet Yarn	Package Yarn	Bale Twine	Plastic Packaging Yarn
SMAPE		0,10	0,10	0,12	0,09	0,12	0,32	0,29	0,30	0,27	0,28

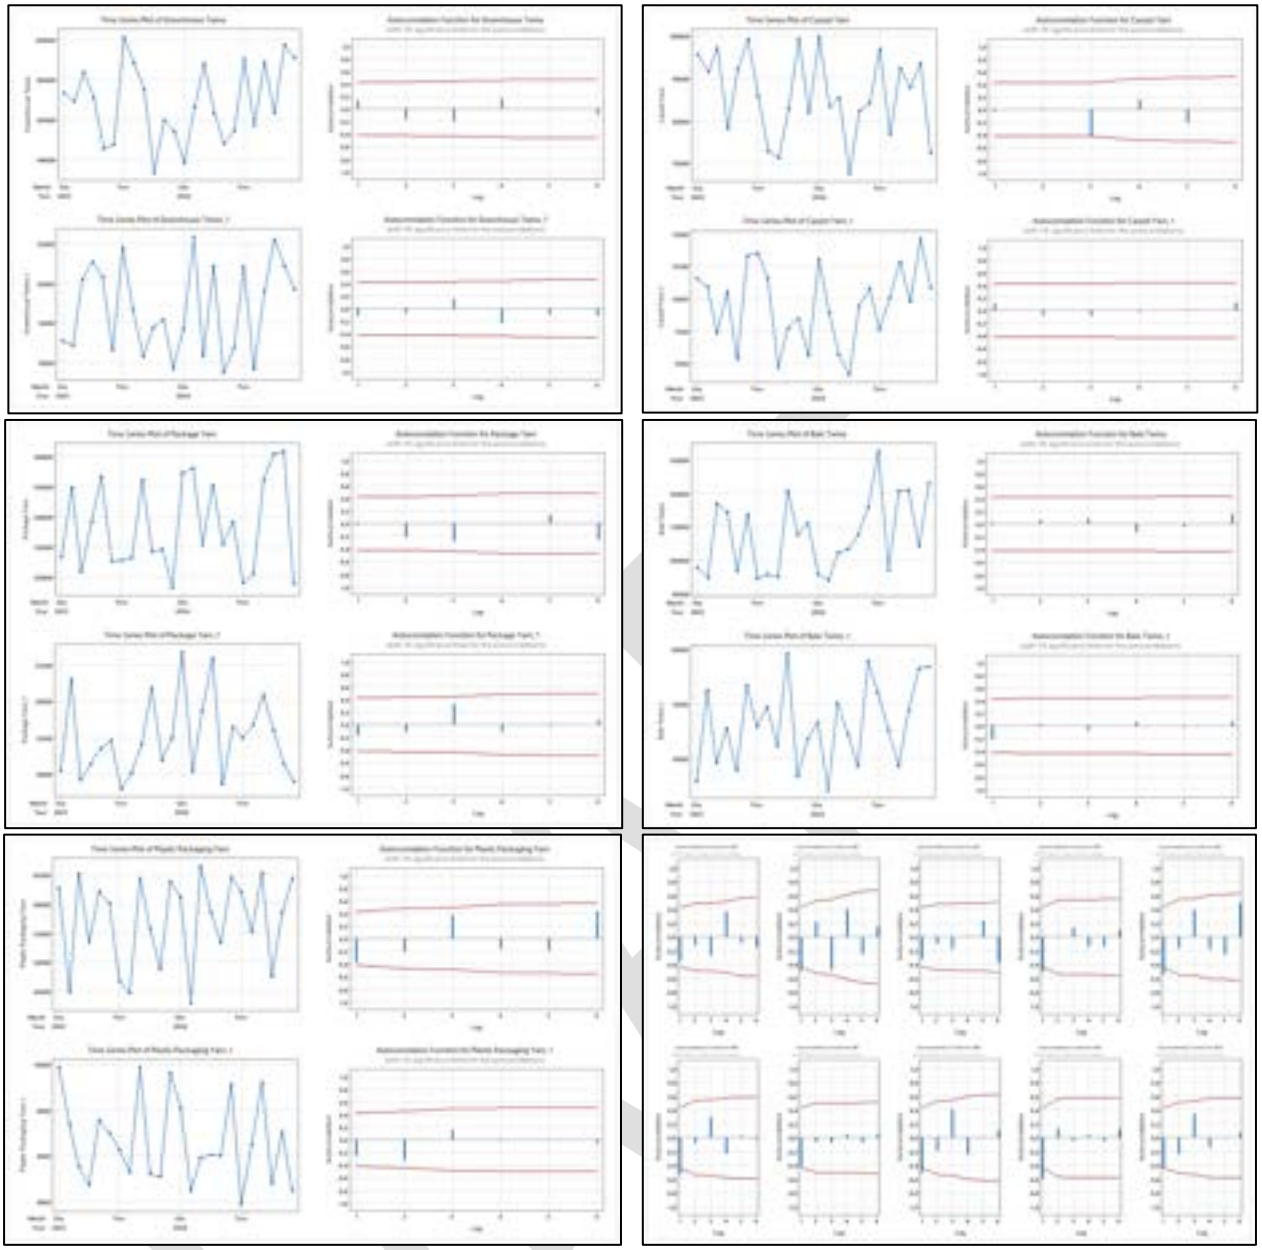
When this 2 methods (MAPE and sMAPE) are compared sMAPE's error rates is lower and more appropriate.

Autoregressive Integrated Moving Average (ARIMA) Methodology

In this study, ARIMA (AutoRegressive Integrated Moving Average) models are employed to forecast monthly demand across both traditional and e-commerce channels. ARIMA models are suitable for time series data that can be made stationary through differencing, which eliminates trends and stabilizes variance over time.

The modeling process follows the Box-Jenkins methodology, [4] involving four main steps: checking stationarity through data visualization, applying differencing if necessary, identifying appropriate AR (autoregressive) and MA (moving average) terms using ACF and PACF plots, and estimating model parameters. The selected ARIMA(p,d,q) models are then fitted to each product group's demand data separately.

Figure 1. Time Series Plots, ACF Plots and Differencing Graphs of Traditional & E-Commerce Sales



Given the relatively short time span of the dataset (24 months) and the lack of strong seasonal patterns, only non-seasonal ARIMA models are considered. Forecast accuracy is evaluated based on the model residuals and compared across product groups and sales channels to assess the reliability of the forecasts. Table 6 shows the time series plots, ACF graph and differencing of each product group.

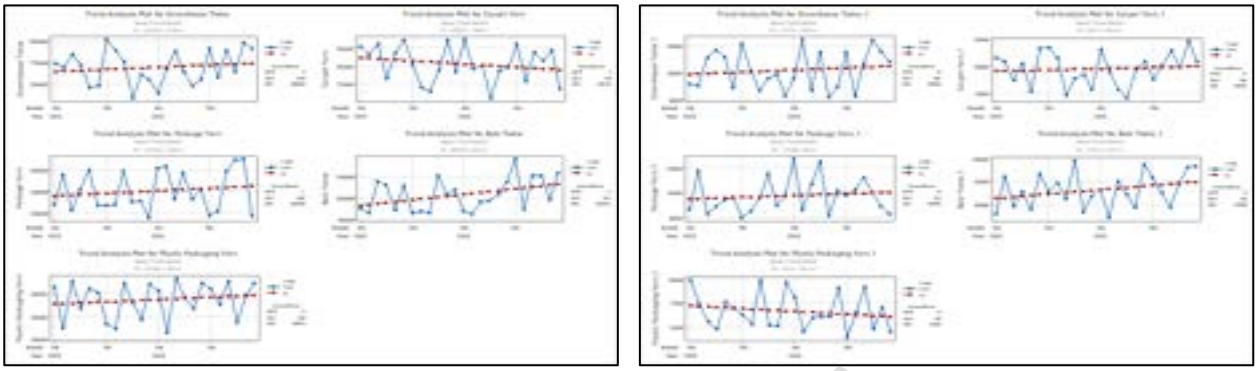


Figure 2. Trend Analysis of Traditional Sales & E-Commerce Sales

Trend analysis examined and no linear trend was found. In addition, time series plot shows of irregular movements. When the first of the series in order to define a model for the line must be stable(stationary). Autocorrelation must decide whether or not by looking at the series stationary.

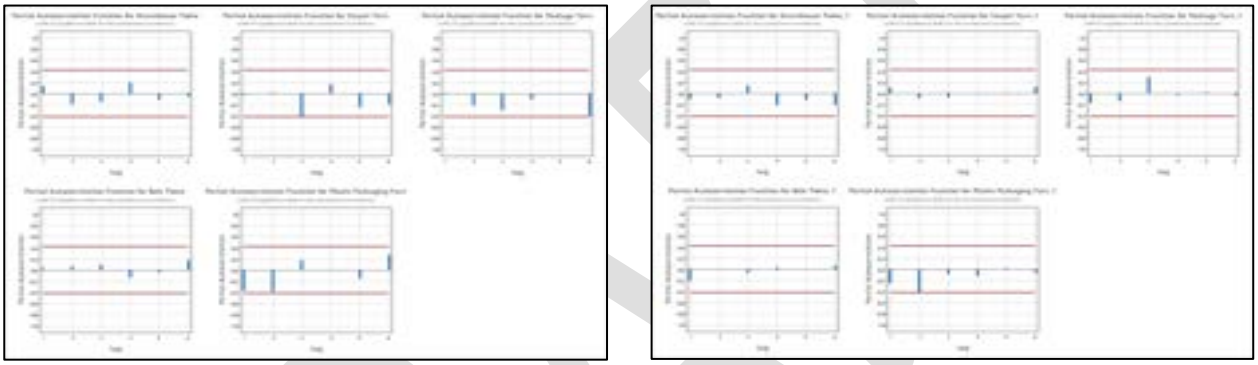

Figure 3. PACF Plots of Traditional Sales & E-Commerce Sales

The ARIMA(1,1,2) model was selected based on the characteristics of the demand data. First-order differencing (d=1) was applied to eliminate the trend and achieve stationarity. The presence of significant autocorrelations at the first lag and moving average effects up to the second lag, as observed in the ACF and PACF plots, justified the inclusion of one autoregressive term (p=1) and two moving average terms (q=2). This model effectively captures both the immediate and slightly extended dependencies [6] within the differenced series, allowing for accurate short-term forecasting across the examined product groups.

DRAFT

SMAPE VALUES	Actual Demands for Traditional Sales (kg)					Actual Demands for E-Commerce Sales (via Web-site) (kg)				
	Greenhouse Twine	Carpet Yarn	Package Yarn	Bale Twine	Plastic Packaging Yarn	Greenhouse Twine	Carpet Yarn	Package Yarn	Bale Twine	Plastic Packaging Yarn
EXPONENTIAL SMOOTING	0,10	0,10	0,12	0,09	0,12	0,32	0,29	0,30	0,27	0,28
ARIMA MODEL	0,09	0,09	0,11	0,08	0,10	0,27	0,26	0,29	0,21	0,22
BEST RESULTS	0,09	0,09	0,11	0,08	0,10	0,27	0,26	0,29	0,21	0,22

The results presented in Table 8 indicate that while two forecasting methods were tested, ARIMA(1,1,2) model consistently outperformed across all periods. Therefore, the ARIMA(1,1,2) model was selected for the final forecasting analysis. This finding aligns with previous research that used ARIMA models to forecast monthly sales in specific operational contexts, such as vending machine transactions, where similar patterns of irregular demand and short time series were observed [8].

DISCUSSION

The comparative analysis between ARIMA and Simple Exponential Smoothing (SES) across traditional and e-commerce sales channels highlights critical insights into demand forecasting in a multi-channel retail environment. The superior performance of ARIMA(1,1,2), particularly in the e-commerce channel, suggests that autoregressive models are more effective in capturing the volatility and irregularities commonly observed in online sales. This result aligns with prior studies emphasizing the importance of model flexibility when dealing with short-term demand fluctuations and non-stationary patterns.

The relatively weaker performance of SES may be attributed to its limited responsiveness to sudden demand shifts, especially in product groups with inconsistent sales histories. While SES is computationally simpler and often preferred for its ease of use, the findings indicate that such simplicity may come at the cost of reduced forecasting accuracy in dynamic environments like e-commerce.

It is also worth noting that the absence of strong seasonal patterns in the dataset may have reduced the potential advantage of seasonal ARIMA extensions or other seasonal models. Additionally, the limited time horizon (24 months) may constrain the generalizability of the results, though the consistency across product groups strengthens the reliability of the findings.

CONCLUSION

This study explored the demand forecasting performance across traditional and e-commerce sales channels for five different product groups produced by a polypropylene synthetic yarn manufacturer in Türkiye. Two established forecasting methods—Simple Exponential Smoothing (SES) and ARIMA—were applied and evaluated using the Symmetric Mean Absolute Percentage Error (SMAPE) metric to ensure reliable comparisons across sales environments with varying demand scales. Initially, SES models were tested by optimizing the smoothing parameter (α) for each product group; however, the presence of irregular demand patterns and the requirement for capturing more complex temporal dependencies led to the application of ARIMA models. After conducting stationarity checks and analyzing autocorrelation structures, the ARIMA(1,1,2) model was selected as the most appropriate model across all product groups. This model consistently achieved lower SMAPE values [7], indicating superior forecasting accuracy compared to SES models. The findings highlight the critical importance of selecting forecasting models that account for both channel-specific demand behaviors and underlying time series dynamics. Particularly in multi-channel retail environments, more flexible and data-responsive models like ARIMA can significantly improve forecast reliability and support more effective inventory and sales planning decisions for both, traditional and e-commerce operations [7].

➢ *ORAL PRESENTATION*

Bottled Drinking Water And Microbiological Quality

[1]Amilda Ballata, [2]Zenilda Cilaj

[1]Faculty of Natural Sciences, Department of Industrial Chemistry, University of Tirana, Tirana, Albania
[2]Chemist at National Food Authority, Shkodra, Albania

Abstract

In today's times, bottled drinking water is being considered as a safer alternative to tap water. The deterioration of the quality of network water, which can be a source of spread of pathogenic microorganisms and various diseases, has led to a significant increase in the consumption of bottled water. However, various studies have shown that even bottled water can be contaminated from a microbiological point of view. Sources of contamination can be the source of water, its treatment, the packaging process, the hygiene of equipment and personnel, as well as through packaging materials. This study aims to evaluate the microbiological quality of bottled drinking water marketed in markets. 13 randomly selected samples from different brands were analyzed. The evaluation was performed for total aerobic count, total coliform bacteria. Total Aerobic Mesophilic Count and total coliforms, was evaluated using standard pour plate methods of cultivation on appropriate media and incubation at temperatures of 30°C and 37°C. This study shows that bottled drinking water of domestic and foreign brands results in variable presence of total aerobic load, which indicates that the quality of bottled water is not stable and safe in accordance with the permitted limits. All samples result safe in terms of total coliform bacteria load. Referring to the results, the importance of more rigorous controls, continuous quality monitoring and compliance with food safety standards in order to prevent the potential risk of waterborne diseases is highlighted.

Keywords: bottled water, total coliform, drinking water, microbiological quality, etc.

INTRODUCTION

Drinking water is an essential element for human health. The deterioration of tap water quality, which can be a source of pathogenic microorganisms and various diseases, has led to a significant increase in the consumption of bottled water. [10]. For this reason, today, water safety is a priority for health institutions and international organizations. Due to the deterioration of tap water quality, there has been a significant increase in the consumption of bottled drinking water as a safer and more reliable alternative for consumers [12]. Referring to several studies, it has been found that even in natural bottled water we have the presence of pathogenic microorganisms that can come from various sources such as the water source, the treatment process, packaging, personnel hygiene, and storage and transport conditions [9],[11],[13]. Pathogenic microorganisms such as *Escherichia coli, Salmonella spp., Pseudomonas aeruginosa*, as well as some fungi and protozoa, have been identified in bottled water samples in many countries around the world [2],[5] Bacteria such as total coliforms and other heterotrophic microorganisms, can serve as indicators of microbial contamination and the safety of water for human consumption [4], for this reason, the assessment of these microbiological parameters of bottled drinking water is very important to prevent the spread of various waterborne diseases and to be in compliance with international standards [13]. This study aims to assess the presence of total aerobic microflora and total coliforms in samples of bottled drinking water, collected from the domestic market, of different brands, using standardized microbiological cultivation methods [4].

METHODS AND MATERIALS

Samples analyzed

In this study, 13 samples of natural, drinking, packaged, bottled water were analyzed. These samples were taken from different markets in the city of Tirana. They represent drinking water samples of different

domestic and foreign brands which were collected randomly and immediately analyzed in the laboratory. [7], [3], [6].

Estimation of total aerobic mesophilic and total coliform

Microbiological analysis was performed using the **standard pour plate technique**, in accordance with established microbiological methods [4], [1]. For this, the standard method of cultivation by pouring into petri dishes was used, respectively on standard agar /PCA medium. and selective MacConkey agar medium. From each water sample, 1ml of water was cultivated, in Petri dishes and incubated respectively at 30^0C for 48-72 hours and 37°C for 24 hours. The developed colonies were counted with a colony counter and the number was expressed as colony forming units per gram of homogenized sample (CFU g-1). CFU/ml = (number of colonies × dilution factor) / plate volume. Then, microscopic observation was made by preparing gram-stained preparation to determine the presence and morphology of bacteria.

RESULTS

In this study, 13 samples of bottled drinking water of domestic brands were analyzed: W1, W2, W3, W4, W5 W6, W7, W8 W9, and foreign brands: W10, W11, W12 W13.

Table 1 Microbiological results of water samples from domestic brands

Samples		**W1**	**W2**	**W3**	**W4**	**W5**	**W6**	**W7**	**W8**	**W9**
	Standard									
Total aerobic mesophilic bacteria at 30oC	<100 CFU/ml	2	0	2300	28	53	2350	2	108	1800
Total Coliform bacteria	0 CFU/250ml	0	0	0	0	0	0			

The total aerobic mesophilic bacteria load and total coliforms are two microbiological parameters for assessing the hygienic-sanitary quality of purified drinking water.

Referring to the table above, all samples have given a load of total aerobic microorganisms with the exception of sample M2, the highest load results in samples W6 (3000), W3 (2300), W9 (1800) CFU/ml and the lowest results in water samples W1 (2) W7 (2) CFU/ml. All water samples do not present a total coliform load.

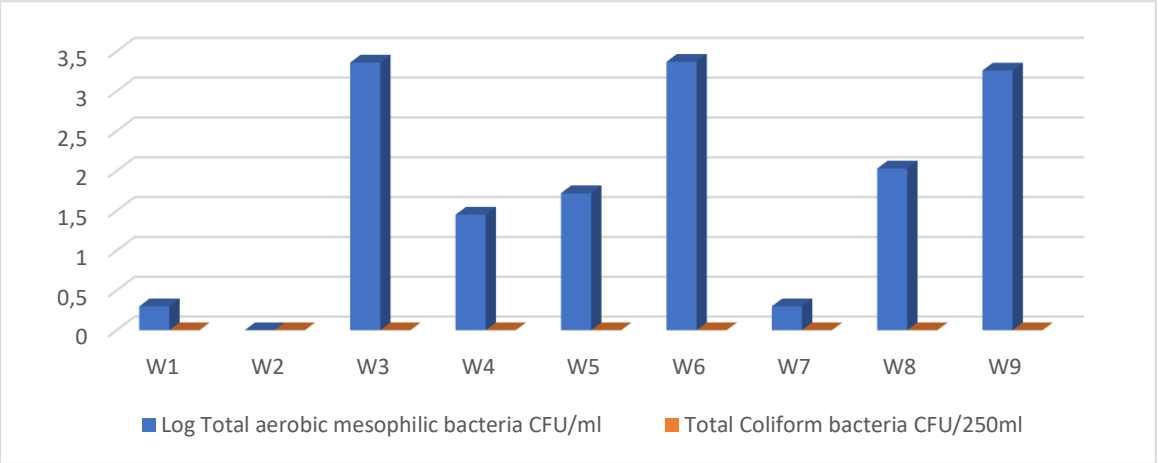
This load varies from 0-2300 CFU/ml, where samples W1, W2, W7 result in a very low load of total aerobic mesophilic bacteria, which is acceptable for clean packaged drinking water, while water samples W6, W3, W9 result in a very high load, which indicates that it may have resulted from problems related to the treatment process, packaging, packaging hygiene, equipment, personnel, or storage conditions. According to the standards and Codex Alimentarius it is seen that regarding the load of total aerobic mesophilic bacteria, samples W1, W2, W7 are within the permitted limits, samples W4, W5, W8 are close to the permitted limit while samples W3, W6, W9 are outside the permitted limit.

Referring to the load of total coliform bacteria, all samples comply with the permitted limits.

In conclusion, we can say that only samples W1, W2, W7 of domestic bottled drinking water result to be within the permitted limits, while samples W3, W9 result with a high load of total aerobic mesophilic bacteria at 30°C but the presence of total coliform bacteria. Sample W6 results to be the sample with the lowest microbiological quality as it shows very high loads of total aerobic mesophilic bacteria at 30°C.

DRAFT

The total aerobic mesophilic bacteria load varies from lowest to highest respectively: W2, W7, W1, W4, W5, W8, W9, W3, W6



Graphic 1 Graphical representation of log results of total aerobic mesophilic load for country bottled water brand samples

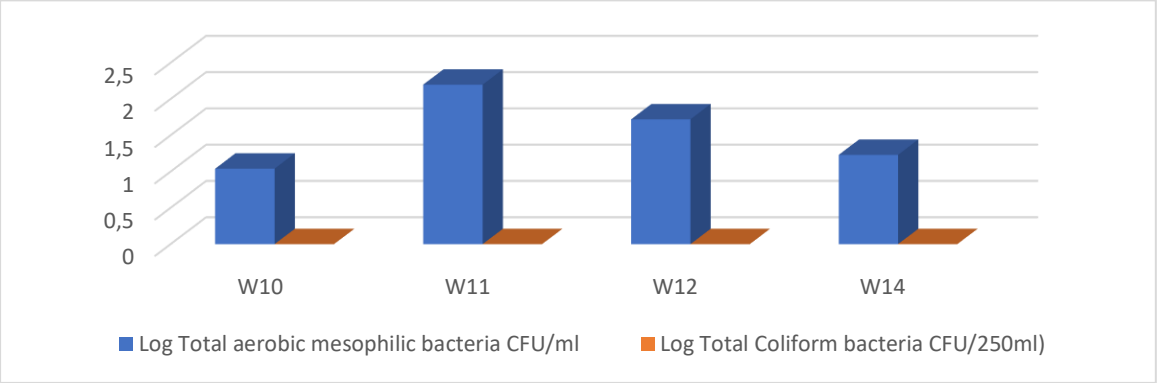
Table 2 Microbiological results of water samples from foreign brands

Samples		**W10**	**W11**	**W12**	**W13**
	Standard				
Total aerobic mesophilic bacteria at 30°C	<100 CFU/ml	11	158	52	17
Total coliform bacteria	0 CFU/250ml	0	0	0	0

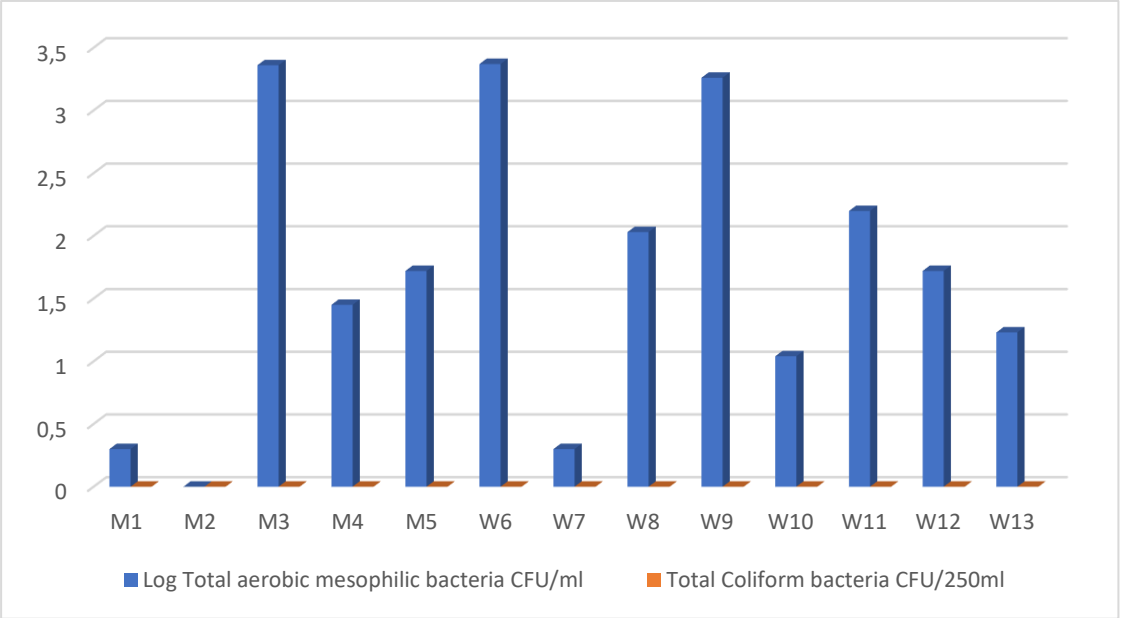
For the second group of packaged drinking water samples, of foreign brands, we find that all samples result in a total aerobic mesophilic bacterial load which varies from 11 CFU/ml to 158 CFU/ml. The sample with the highest load is respectively sample W1 (158) CFU/ml, W12 (52) CFU/ml, W13 (17) CFU/ml and the sample with the lowest load is respectively sample W10 (11) CFU/ml. According to the standard and the Alimentarius Code: we find that sample W10 has a very low load, W13 has a load within the allowed limit, W12 has a load close to the allowed limit, while sample W11 exceeds the allowed limit, which indicates the possibility of contamination or inappropriate storage conditions

Referenced to the total coliform bacteria load, all samples result in compliance with the permitted standard. All samples result in a load of 0 CFU/ml.

In conclusion, we can say that for this group of bottled water samples of foreign brands, samples W10, W12, W13 result within the permitted norms and can be included in the water class for drinking water very purified water. Only the water sample W11 results in a high load outside the permitted limit. All samples result in cleanness referred to the total aerobic bacteria load, so we can say that they are safe from fecal contamination.



Graphic 2. Graphical presentation of log results for foreign brand water samples



Graphic 3 Graphical presentation of log results of total aerobic mesophilic load for all bottled water samples

In general, from the above graphic, all samples of bottled drinking water have resulted in a load of total aerobic mesophilic bacteria with the exception of the sample of the domestic brand W2 (0 CFU/ml). The samples with the lowest load are the samples of the domestic brands W1 and W7 (2 CFU/ml), the samples with the highest load are the samples W6 (300CFU/ml) W3 (2300 CFU/ml) W9 (1800CFUml) and slightly lower the samples W11 (158CFUml) W8 (108 CFU/ml). This parameter varies from 0-3000CFU/ml from 100 to the order of 103 CFU/ml.

It is seen that the samples with the highest to lowest load result respectively to be W6, W3,W9, W11, W8, W12, W5, W4, W13, W10, W1, W7, W2, where within the allowed limit the samples result to be W2, W1, W7, W10, W13, W4, W5, W12, W8 and outside the allowed limit the samples result to be W3, W6, W9, W11.

This shows the importance of regular microbiological monitoring, improvement of the production line or controls regarding storage or transport conditions, etc.,

CONLUSIONS

The total aerobic mesophilic load for all studied samples varies from 0 to 3000CFU/ml. This parameter in some bottled drinking water samples results to be within the allowed limit below 100 CFU/ml (W1, W2, W7) while in some other samples (W6, W3 W9) above it.

The sample with the highest load results in bottled water samples of domestic brands W3 then W9 and the water sample with the lowest load results in sample W2 of the domestic brand, without any total aerobic mesophilic load.

The presence of total aerobic mesophilic bacteria indicates the possibility of contamination during the production process, storage, etc. and requires continuous monitoring and improvement of production, storage, etc. conditions to ensure consumer health.

This study shows that bottled drinking water of domestic and foreign brands results in variable presence of total aerobic load, which indicates that the quality of bottled water is not stable and safe in accordance with the permitted limits.

From the examination of the gram-stained preparations, the presence of gram-negative bacilli bacteria was observed.

All samples result safe in terms of total coliform bacteria load.

In conclusion, we can say that to ensure the microbiological quality of bottled drinking water, it is very important to control and rigorously monitor all stages of production, packaging, storage and transport of water to the consumer.

[2] Full-time Lecturer at Aldent University, Tirana

[3] Internal Lecturer at the Department of Public Health, Faculty of Medicine, University of Medicine, Tirana

[4] Dermatologist at the Specialties of the Pediatric Hospital, QSUNT, Tirana

Abstract

Tirana, as the capital of Albania, faces specific social and economic challenges that impact the health behaviors of adolescents. Urban factors, environmental influences, and the availability of harmful products may contribute to increased consumption of tobacco, alcohol, and drugs, alongside decreased physical activity. This study examines the health behaviors of adolescents in Tirana, focusing on tobacco, alcohol, drugs consumption, as well as levels of physical activity. A sample of 417 adolescents revealed that 22.98% consumed alcohol, while 8.29% smoked tobacco. This descriptive-analytical study is based on a structured questionnaire completed in January and February 2024. Data analysis was performed using the SPSS statistical package. Detailed analysis revealed a negative correlation between physical activity and alcohol consumption, indicating that adolescents who engaged in more physical activity reported lower levels of alcohol consumption ($p = 0.04$). Furthermore, positive correlations were observed between alcohol, tobacco, and drug use ($p < 0.001$). Parental education levels also influenced health behaviors, with adolescents from less educated parents consuming more alcohol ($p = 0.02$). These findings underscore the importance of promoting physical activity as a strategy to reduce the consumption of harmful substances. Recommendations include creating opportunities for engagement in various sports, forming school clubs focused on physical activities, encouraging extracurricular activities, providing educational sessions, and utilizing digital platforms to motivate youth.

Keywords: Health behaviors, physical activity, tobacco, alcohol, drugs.

1. Introduction

Health is a multifaceted concept, broadly defined by Dr. Andrija Štampar, a pioneer in social medicine, public health and formally adopted by the World Health Organization (WHO) in 1946 as “a state of complete physical, mental, social well-being and not merely the absence of disease or infirmity”. This holistic understanding of health recognizes that well-being extends beyond the absence of illness to include multiple interrelated dimensions such as physical, mental, emotional, social, spiritual, and environmental factors (Aggleton & Homans, 1987; Ewles & Simnett, 1999) (see Figure 1).

DRAFT

Figure 1: Dimensions of Health. Adapted from Aggleton & Homans (1987) and Ewles & Simnett (1999).

Adolescence, typically defined as the period between 10 and 19 years of age, represents a crucial stage of growth and transition from childhood to adulthood, involving profound physical, psychological, and social transformations. This period is characterized by increased vulnerability but also significant opportunities to influence lifelong health outcomes.

Adolescents account for over 16% of the global population and are central to achieving the Sustainable Development Goals (SDGs) by 2030. While this phase is often perceived as a time of good health, adolescents face a range of preventable health risks and challenges, including premature death, disease and injury. These challenges often stem from modifiable health behaviors such as tobacco use, alcohol consumption, drug use and low levels of physical activity (see Figure 2).

Fig 2: Determining Factors of Health

The patterns of behavior established during adolescence can have lasting impacts on health and well-being throughout life. Addressing these behaviors through targeted health education, accessible health services, supportive environments and youth engagement in decision-making is essential to promote healthy development. The Global Action for Measurement of Adolescent Health (GAMA) initiative highlights the importance of standardized health indicators to monitor adolescent health globally, supporting evidence-based policy and program development. By understanding the factors that influence adolescent health behaviors, researchers and policymakers can better design interventions that reduce risk factors and promote positive health outcomes. This study focuses on health behaviors among adolescents in Tirana, specifically examining smoking, alcohol use, drug consumption, and physical activity, aiming to contribute valuable insights for local and global health promotion efforts. The objective of this study is to analyze the health behaviors of adolescents in Tirana in 2024, focusing on tobacco use, alcohol consumption, drug use, body mass index (BMI), and physical activity levels. The analysis aims to identify social, environmental, and technological factors influencing these behaviors to provide recommendations for policies and

programs that support adolescent health and well-being. The study's specific objectives are to assess the prevalence of smoking, alcohol use, and drug consumption among adolescents aged 10 to 17 in Tirana, analyze the relationship between substance use and physical activity, and identify socio-economic and environmental factors influencing these behaviors. The study tests the following hypotheses: first, there is a significant association between alcohol consumption and tobacco use among adolescents; second, physical activity is negatively correlated with substance use (tobacco, alcohol, drugs); third, socio-economic factors such as parents' education level influence substance use behaviors; and fourth, the prevalence of overweight and obesity varies by age group, gender, and residence. Given the significant youth population in Tirana and the lack of recent local data, this study will provide crucial evidence to inform targeted interventions and policies aimed at improving adolescent health in the city and beyond.

2. Methodology

2.1 Study Population and Data Collection

This study is a descriptive-analytical investigation of adolescents' health behaviors in Tirana. Data were collected through a structured questionnaire administered during January and February 2024. The data collection instrument was a questionnaire based on existing literature and included questions related to physical activity, alcohol use, tobacco use and drug use. Participants were adolescents aged 10-17, recruited from three different schools in Tirana. The sample was randomly selected and consisted of 417 adolescents.

2.2 Statistical Analysis

Data analysis was performed using SPSS version 27, including descriptive analysis indicators such as frequencies in percentages and means. Analytical analysis involved correlation analysis and the construction of logistic regression models. Logistic regression was used to identify predictors of substance use. Correlation analysis assessed the relationships between socio-economic and demographic factors, such as age, residence, parents' education level and family income, with five indicators of risky health behaviors among adolescents: smoking, alcohol use, drug use, BMI and physical activity.

2.3 Ethical Approval

The study was conducted after obtaining ethical approval from the school institutions in the city of Tirana. Participants were informed about the purpose of the study and gave their consent to participate. The data were handled confidentially and used solely for research purposes.

3. Results

3.1 Socio-demographic Characteristics of the Sample

The socio-demographic profile of the sample of 417 adolescents is summarized in Table 1. The sample consisted of both male and female participants distributed across urban, semi-urban, and rural areas. Participants were categorized into two age groups, and parental education as well as household income levels were recorded to provide context on the socio-economic background. Additionally, Body Mass Index (BMI) classifications were determined to assess the nutritional status within the sample.

DRAFT

Table 1: Socio-Demographic Characteristics of the Sample

Variable	Category	Frequency (%)
Gender	Male	45.45
	Female	54.55
Residence	Urban	37
	Semi-urban	28
	Rural	35
Age group	10-12 years	40
	13-17 years	60
Parental Education	Primary (8 years)	30.95
	Secondary ((high school)	37.4
	Higher education (university Bachelor's)	22.3
	Postgraduate (Master's, Doctorate)	9.35
Income Level	Low	1.2
	Medium	66
	High	32.8
BMI Classification	Underweight	35.8
	Healthy weight	57.2
	Overweight	6
	Obese	1

3.2 Prevalence of Tobacco, Alcohol, and Drug Use Among Adolescents

Table 2: Prevalence of Tobacco, Alcohol, and Drug Use Among Adolescents

Substance	Age Group	Prevalence (%)
Tobacco Use	10-12 years	0.73
	13-17 years	7.56
Alcohol Use	10-12 years	1.47
	13-17 years	21.51
Drug Use	10-12 years	0
	13-17 years	11.1

3.3 Physical Activity

Table 3: Physical Activity Engagement, Activity Levels, and BMI by Age Group

Variable	Age Group 10-12 years	Age Group 13-17 years
Physical Activity Engagement	94.0%	88.6%
Not Engaged in Physical Activity	6.0%	11.4%
Most Common Activity Level	Moderate (53.3%)	Moderate (39.2%)
Average BMI	18.32 kg/m^2	21.14 kg/m^2

The majority of adolescents reported engaging in physical activity, with 94.05% of those aged 10-12 years and 88.75% of those aged 13-17 years participating regularly. Overall, 90.58% of the total sample were physically active. Males were more active than females, with 91.67% of boys and 84.09% of girls reporting physical activity. Regarding residence, activity levels were slightly higher in urban (88.75%) and semi-urban (88.53%) areas compared to rural areas (85.12%). Parental education showed relatively consistent physical activity rates across all categories, ranging from 86.64% to 87.40%. Similarly, family income levels did not show large differences in activity, with percentages between 86.55% and 88.89%. BMI classification revealed that overweight adolescents had the highest physical activity prevalence (92.31%), while underweight and obese adolescents showed slightly lower levels of activity (84.77% and 85.71%, respectively). Very few adolescents reported less than one hour or 1-2 hours of physical activity per day,

and none reported more than 2 hours daily. The correlation coefficients between physical activity and tobacco use (-0.068, p = 0.04), alcohol consumption (-0.5, p = 0.0395), and drug use (0.37, p = 0.049) are statistically significant (p < 0.05).

3.4 Hours Spent Watching TV and Eating While Watching TV

Among children aged 10-12, 35.8% spend less than 1 hour per day watching TV or using phones, 48.5% spend 1-2 hours, and 15.8% spend over 2 hours. For adolescents 13-17, only 13.1% spend less than 1 hour, 38.1% spend 1-2 hours, and 48.8% spend more than 2 hours. Eating while watching TV is reported by 54.7% of younger children and 23.5% of older adolescents. Conversely, 59.0% of younger and 19.8% of older adolescents do not eat during TV viewing. Eating while watching TV is more common among younger children.

3.5 Prevalence of Tobacco Use and Associated Sociodemographic Factors

The prevalence of tobacco use among adolescents varies significantly by age group, with only 0.73% of those aged 10-12 years reporting smoking compared to 7.56% in the 13-17 years group (p = .000). Males have a higher smoking prevalence (5.85%) than females (2.44%) with a significant difference (p = .008). No significant differences were found based on place of residence or parents' education level. Family income level also showed no significant association with smoking.

3.6 Prevalence of Alcohol Consumption and Its Association with Variables

The prevalence of alcohol consumption varied significantly by age group, with 1.47% of adolescents aged 10–12 reporting alcohol use compared to 21.51% in the 13–17 age group (P < 0.001). Overall, 22.95% of the total sample reported alcohol consumption. Significant gender differences were observed, with 14.67% of males and 8.30% of females reporting alcohol use (P < 0.001). Alcohol consumption was highest among urban adolescents (46.8%), followed by rural (40.4%) and semi-urban (12.8%) youths (P < 0.001). Parental education level was significantly associated with adolescent alcohol use; prevalence was higher among adolescents with parents having only an 8-year education (30.1%) compared to those with parents holding post-university degrees (2.2%) (P = 0.026). No significant association was found between alcohol use and family income level (P = 0.3). Logistic regression analysis indicated that alcohol consumption was significantly associated with tobacco use, with a coefficient of 1.868 (p = 0.002) and an odds ratio of 6.478, indicating that adolescents who consume alcohol have about six times higher odds of tobacco use.

3.7 Prevalence of Drug Use and Its Association with Variables

Among adolescents aged 10-12 years, no drug use was reported, while 11.1% of those aged 13-17 years reported having used drugs, showing a significant age-related difference (p < 0.001). Overall, 11.1% of the total sample reported drug use. Gender differences were significant (p = 0.005), with 9.65% of males reporting drug use compared to only 1.45% of females. Regarding residence, drug use was more common in urban (24.5%) and semi-urban (23.1%) areas than in rural areas (9.5%) (p = 0.045). Parental education levels showed varying prevalence rates, with the highest drug use reported among adolescents whose parents had 8-year education (36.4%) although this difference was not statistically significant. Family income level was not significantly associated with drug use (p = 0.70), with a prevalence of 11.54% among adolescents from middle-income families and 10.96% among those from high-income families.

3.8 Prevalence of Overweight and Obesity and Its Association with Variables

The prevalence of overweight and obesity varies by age group, gender, and residence. Among children aged 10-12 years, 2.40% were overweight and 0.60% obese, while in adolescents aged 13-17 years, these rates increased to 8.43% and 1.20%, respectively, showing a significant age-related difference (p < 0.001). Gender differences were also significant (p < 0.001), with boys having higher rates of overweight (11.64%) and obesity (1.59%) compared to girls (1.32% overweight and 0.44% obese). Regarding place of residence, urban children showed higher overweight (7.79%) and obesity (1.30%) rates compared to semi-

urban and rural areas, though this was not statistically significant (p = 0.08). In this sample, adolescents of parents with a higher educational level (post-university) have a higher prevalence of overweight and obesity compared to those with parents of lower educational levels; however, the difference is not statistically significant. Overall, 6.01%of the sample were overweight, and 0.96% were obese.

4. Discussion

The findings of this study provide important insights into the health behaviors of adolescents in Tirana and are largely consistent with both national and international trends. A clear age-related increase in the use of tobacco, alcohol, and drugs was observed, with the 13–17-year age group showing significantly higher prevalence compared to 10–12-year-olds. These patterns align with the Health Behaviour in School-aged Children (HBSC) 2021–2022 survey in Albania, which found that older adolescents are more likely to engage in risk behaviors as they transition into late adolescence (HBSC, 2022 [1]). Tobacco use was significantly higher among males than females in our sample (5.85% vs. 2.44%, p = 0.008), consistent with national data and WHO global trends that show persistent gender gaps in smoking behaviors (WHO, 2019 [5]; Reitsma et al., 2017 [6]). The increasing prevalence of tobacco use with age mirrors patterns documented in the Global Burden of Disease Study and highlights adolescence as a critical window for tobacco prevention efforts (Forouzanfar et al., 2015 [7]). Similarly, alcohol consumption was markedly higher among older adolescents (21.51%) and males (14.67%). These findings reflect HBSC data, which also show gender differences and increasing alcohol use with age. Importantly, our study observed a decline in the proportion of adolescents who report ever drinking alcohol, particularly among females, aligning with recent trends reported by HBSC and the WHO, where lifetime drunkenness among adolescents dropped significantly in the past decade (WHO, 2024a [2]). Nonetheless, the persistent gender gap and high levels of alcohol use among urban adolescents suggest a need for targeted interventions in urban environments. The association between alcohol and tobacco use in this study (OR = 6.478, p = 0.002) further supports the well-documented clustering of risk behaviors during adolescence (Conegundes et al., 2020 [3]; Jones et al., 2020 [4]). Cannabis use was reported by 11.1% of older adolescents, with a significant gender disparity (9.65% of boys vs. 1.45% of girls), consistent with both Albanian and international literature (HBSC, 2022 [1]; Johnston et al., 2012 [8]). These findings are concerning given the known associations between adolescent cannabis use and adverse mental health outcomes, including depression and anxiety in adulthood (Hengartner et al., 2020 [9]; Taylor et al., 2017 [10]). The higher prevalence of cannabis use among urban youth observed here suggests environmental or social influences that warrant further exploration. Despite encouraging levels of physical activity—especially among 10–12-year-olds (94%)—the overall figure (90.58%) still falls short of the WHO's recommended daily levels when considering duration and intensity (WHO, 2020 [15]; WHO, 2018 [17]). Globally, more than 80% of adolescents fail to meet recommended physical activity guidelines (Guthold et al., 2020 [16]), and sedentary behaviors such as prolonged screen time may offset the benefits of moderate activity. In our study, increased screen time and eating while watching TV were more prevalent among younger adolescents, which could contribute to unhealthy weight gain and reflect the early development of sedentary routines. The prevalence of overweight (6.01%) and obesity (0.96%) in our sample was relatively low but showed significant differences by gender and age, with older boys being most affected. These patterns are consistent with global data highlighting rising trends in adolescent obesity, especially among males in urban areas (Ng et al., 2014 [12]; Lister et al., 2023 [11]). Interestingly, adolescents with post-university-educated parents had a slightly higher prevalence of overweight and obesity, though not statistically significant. This is contrary to findings from some high-income countries but may reflect unique socio-cultural or economic dynamics in Albania. Crucially, our results show strong interconnections between multiple risk behaviors—tobacco, alcohol, and drug use—as previously emphasized in the Global Burden of Disease reports (Forouzanfar et al., 2015 [7]). These findings support calls for integrated, multi-behavioral prevention strategies. Interventions should be gender-sensitive, age-specific, and embedded in educational settings, as recommended in WHO's framework for adolescent health monitoring (WHO, 2024b [2]).

5. Conclusions

The data reveal a significant increase in tobacco, alcohol, and drug use from younger to older adolescents, with alcohol use being the most prevalent, underscoring the urgent need for early intervention. While most adolescents engage in physical activity, a notable proportion remain inactive. Sociodemographic factors,

including parents' education level and place of residence, significantly impact adolescents' health behaviors. Younger adolescents (10-12 years) tend to spend more time in passive activities and are more likely to eat while watching TV, whereas older adolescents (13-17 years) often skip meals during TV viewing. To address substance use among adolescents, it is essential to establish specialized rehabilitation centers offering tailored psychological support and comprehensive health services. Schools should implement educational programs to raise awareness about substance risks and promote healthy lifestyles. Additionally, support groups and counseling for adolescents and their families are vital. Policies must safeguard youth by ensuring access to rehabilitation without legal consequences and limiting exposure to substance-related advertising. Vocational training and employment opportunities should be provided to aid social reintegration. Public awareness campaigns and systematic monitoring are necessary to assess intervention effectiveness. In Albania, the lack of adolescent-specific rehabilitation facilities highlights the critical need for dedicated centers, as existing services primarily serve adults and may not be suitable for younger populations. Establishing specialized adolescent rehabilitation centers is therefore crucial to improve treatment outcomes and support recovery.

Özet
Günümüz kentlerinde ulaşım sistemleri, yalnızca hareketliliği sağlama işleviyle sınırlı kalmamakta; sürdürülebilirlik, erişilebilirlik ve kentsel yaşam kalitesi gibi çok boyutlu hedefler doğrultusunda yeniden yapılandırılmaktadır. Bu bağlamda, ulaşım odaklı kentsel modeller, farklı ölçeklerde ve planlama yaklaşımlarında kentsel mekânı dönüştürme potansiyeline sahip çerçeveler olarak öne çıkmaktadır. 15 Dakikalık Şehir, Toplu Taşıma Odaklı Gelişme ve Net Sıfır Karbon Şehri gibi modeller çeşitli kentsel bağlamlarda uygulanmış olsa da bu yaklaşımları karşılaştırmalı olarak ele alan çalışmalar sınırlıdır. Özellikle söz konusu modellerin planlama ilkeleri, sürdürülebilirlik boyutları ve bağlamsal uyarlanabilirliğine ilişkin literatürde sistematik bir değerlendirme eksikliği görülmektedir. Bu çalışma, ilgili boşluğu gidermek amacıyla söz konusu üç yaklaşımı kavramsal düzeyde karşılaştırmalı olarak analiz etmektedir. Araştırma kapsamında, her bir modelin temel ilkeleri, ulaşım vizyonları ve uygulama zorlukları; akademik literatür, uluslararası politika belgeleri, kentsel strateji raporları ve örnek vaka incelemeleri temelinde değerlendirilmektedir. Nitel karşılaştırmalı analiz yöntemi kullanılarak gerçekleştirilen inceleme sonucunda, her bir yaklaşımın avantajları, sınırlılıkları ve bağlamsal uyarlanabilirlik düzeyleri ortaya konmuştur. Çalışma, ulaşım odaklı kentsel yaklaşımlara ilişkin bütüncül bir anlayış sunarak akademik tartışmalara katkı sağlamayı ve Türkiye gibi gelişmekte olan ülkelerde uygulanabilecek stratejik sentezler için kavramsal bir temel oluşturmayı amaçlamaktadır.
Anahtar Kelimeler: Sürdürülebilir kentsel hareketlilik, Kentsel planlama modelleri, Karşılaştırmalı analiz

Comparative analysis of transport-oriented urban approaches

Abstract
In contemporary cities, transportation systems are no longer confined to the sole function of facilitating mobility; rather, they have increasingly been re-evaluated in accordance with multidimensional goals such as sustainability, accessibility, and urban quality of life. In this context, transport-oriented urban models have emerged as frameworks with the potential to reshape urban space across various scales and planning paradigms. Although models such as the 15-Minute City, Transit-Oriented Development (TOD) and, Net Zero Carbon City have been implemented in different urban contexts, comparative analyses of these approaches have remained scarce. In particular, the literature has lacked systematic evaluations regarding their planning principles, sustainability dimensions, and contextual adaptability.This study addressed this gap by conducting a comparative conceptual analysis of the aforementioned three models. Within a conceptual framework, the research examined the core principles, transportation visions, and implementation challenges of each model, drawing upon academic literature, international policy documents, urban strategy reports, and exemplary cases. Using a qualitative comparative methodology, the study identified and interpreted the advantages, limitations, and degrees of contextual adaptability associated with each approach. Ultimately, the study contributed to the academic discourse by offering an integrated understanding of transport-oriented urban models and by providing a conceptual foundation for strategic syntheses that may be applicable in developing countries such as Türkiye.
Keywords: Sustainable urban mobility, Urban planning models, Comparative analysis

GİRİŞ

Günümüzde küresel nüfusun yarısından fazlası kentsel alanlarda yaşamaktadır. Bu artışın da 2050 yılında yaklaşık %70 seviyesine yükseleceği tahmin edilmektedir (Birleşmiş Milletler İnsan Yerleşimleri Programı [UN-Habitat] 2020). Hızla artan kentsel nüfusa küreselleşme, iklim değişikliği ve teknoloji gibi çeşitli durumların da eklenmesiyle kentlerin sorunları ve fırsatları değişmeye başlamaktadır. Sera gazı

emisyonlarının artmasının en önemli nedenlerinden biri kentlerde gerçekleşen faaliyetlerdir. Kentler, ulaşım, inşaat ve imalat gibi sektörlerdeki yüksek enerji kullanımı nedeniyle küresel CO_2 emisyonlarının yaklaşık %60'ını oluşturmaktadır (Birleşmiş Milletler [UN], 2020). Bu yüksek etki oranı, kentlerin planlanması ve tasarımının küresel öneme sahip olmasının gerekliliğini ortaya koymaktadır.

Bu noktada, kentlerin yalnızca ekonomik üretim merkezleri değil; aynı zamanda sürdürülebilirlik, kapsayıcılık ve dayanıklılık açısından yeniden ele alınması gereken mekânlar olduğu daha görünür hale gelmektedir (Ekonomik Kalkınma ve İşbirliği Örgütü [OECD], 2020). Özellikle iklim değişikliğiyle mücadele ve kent sakinlerinin yaşam kalitesini artırma hedefleri doğrultusunda, ulaşım sistemlerinin planlama sürecindeki rolü giderek daha kritik hale gelmektedir. Kentsel ulaşım sistemlerinin gelişimi yalnızca hareketliliği artırmakla kalmaz; mekânsal yapı, sosyal bütünleşme, çevresel etki ve halk sağlığı üzerinde de belirleyici etkilere sahiptir (Gehl, 2010; Banister, 2008). Çünkü ulaşım sistemlerinin geliştirilmesi iş, eğitim ve hizmetlere erişimi kolaylaştırmanın yanında kentsel formu, halk sağlığını ve sosyal eşitliği de şekillendirmektedir (Marquet ve Miralles-Guasch, 2015). İklim değişikliği ve salgın hastalıklarda görüldüğü üzere, ulaşım ve arazi kullanımının düzenlenmesi, kentsel kırılganlıkları (trafik sıkışıklığı, kirlilik ve sosyal izolasyon yoluyla) artırabilir veya dayanıklılığı (seyahat talebinin azalması, yerel olanaklara erişim ve daha yeşil altyapı yoluyla) güçlendirebilir (Moreno ve ark., 2021; OECD, 2020).

Bu bağlamda, son yıllarda çeşitli ulaşım odaklı kentsel planlama yaklaşımları geliştirilmiştir. Her biri farklı ölçeklerde, sürdürülebilirlik boyutlarında ve yönetişim tarzlarında şekillenen bu modeller, kentsel yaşamın yeniden organizasyonuna dair alternatif vizyonlar sunmaktadır (Moreno ve ark., 2021; C40 Kentleri Ağı [C40 Cities], 2022; Krismawanti ve Destiawan, 2025). Bu çalışmada ise literatürde kavramsal çeşitliliği ve güncel uygulamalardaki karşılıkları dolayısıyla öne çıkan üç model seçilmiştir: 15 Dakikalık Şehir ve Toplu Taşıma Odaklı Gelişim (TOD) ve Net Sıfır Karbon Şehir.

Bu üç yaklaşımın seçilmesinde; farklı ölçeklerde (mikro, mezo, makro) ulaşım odaklılık sunmaları, güncel uygulamalara konu olmaları, kavramsal çeşitlilik ve karşılaştırma imkânı vermeleri ve Türkiye için sentez model üretimine elverişli olmaları etkili olmuştur. Bu üç modelin hem kuramsal düzeyde hem de pratikte birbirinden ayrışan özellikleri bulunduğu kadar, kesişim potansiyeli taşıyan yönleri de vardır.

Karşılaştırma ihtiyacı da tam bu noktada ortaya çıkmaktadır. 15 Dakikalık Şehir, temelde erişilebilirlik ve yerel yaşam kalitesine odaklanan mahalle ölçeğinde (mikro düzey) bir modeldir (Pozoukidou ve Chatziyiannaki, 2021; Moreno ve ark., 2021). TOD, genellikle toplu taşıma yatırımlarının yapıldığı koridorlar veya kentsel alt bölgeler boyunca ara (mezo) düzeyde faaliyet göstermektedir (Krismawanti ve Destiawan, 2025). Net Sıfır Karbon Şehirler ise sistemik dönüşümler (örneğin enerji tedariki, altyapı, arazi kullanım modelleri) gerektiren şehir çapında veya ulusal (makro) stratejilerdir (Hükümetlerarası İklim Değişikliği Paneli [IPCC], 2022; Seto ve ark., 2021). Yönetişim açısından ele alındığında, 15 Dakikalık Şehir ve TOD yerel planlama, topluluk katılımı ve kamu-özel sektör ortaklıklarına dayanma eğilimindeyken, Net Sıfır girişimleri genellikle üst düzey politika hedeflerine ve kurumlar arası koordinasyona bağlıdır. Bu modelleri sistematik biçimde karşılaştırmak, yalnızca farklı planlama düzeylerini anlamak açısından değil; aynı zamanda bu modellerin bir arada nasıl çalışabileceğini ve birbirlerini hangi noktalarda tamamlayabileceklerini analiz etmek açısından da önemlidir.

Ancak, bu yaklaşımların her birinin son dönemde artan popülaritesine rağmen, onları bütüncül ve sistematik biçimde karşılaştıran çalışmalar sınırlıdır. Mevcut literatürde, bu modeller genellikle tekil olarak ve çoğunlukla normatif düzeyde ele alınmakta; birbirleriyle ilişkileri ve karşılaştırmalı uygulanabilirlikleri göz ardı edilmektedir. Oysa plancılar ve politika yapıcılar için kavramsal bir sentez hem stratejik karar alma süreçlerinde hem de sahada uygulanabilir modellerin geliştirilmesinde büyük katkı sağlayabilir.

Bu bağlamda çalışma, 15 Dakikalık Şehir, TOD ve Net Sıfır Karbon Şehir modellerinin karşılaştırmalı kavramsal analizini yaparak bu boşluğu doldurmayı amaçlamaktadır. Başlıca araştırma soruları şunlardır:

- Her modelin belirleyici hedefleri, ilkeleri ve uygulama özellikleri nelerdir?
- Mekânsal ölçek, ulaşım vizyonu, arazi kullanımı, yönetişim ve sürdürülebilirlik sonuçları açısından nasıl farklılık gösterir ve örtüşürler?
- Bu farklılıklar, özellikle mikro (mahalle), mezo (koridor/bölge) ve makro (metropol/ulusal) ölçeklerde kentsel politika geliştirme süreçlerine ne tür içgörüler sunar?

Çalışmanın geri kalanı şu şekilde yapılandırılmıştır. Giriş bölümünün devamında her üç modelin tanımı, temel ilkeleri ve örnek uygulamalarının sunulduğu Ulaşım Odaklı Kentsel Yaklaşımlar bölümü yer almaktadır. Yöntem bölümünde, karşılaştırmalı kavramsal analiz yaklaşımı tanımlanmış ve çalışmada

kullanılan kriterler detaylandırılmıştır. Bu üç modelin benzerlikleri ve farklılıkları, tablo ve tematik analizler eşliğinde Karşılaştırmalı Analiz bölümünde değerlendirilmiştir.

Son bölümde ise, mikro, mezo ve makro düzeylerde her modelin uygulanabilirliği tartışılmış ve farklı kentsel bağlamlara uygun stratejik öneriler sunulmuştur. Bu yapısıyla çalışma, yalnızca literatüre katkı sunmakla kalmayıp; yerel yönetimler, şehir plancıları ve karar vericiler için bağlama duyarlı stratejilerin geliştirilmesinde pratik bir rehber olmayı da hedeflemektedir.

ULAŞIM ODAKLI KENTSEL YAKLAŞIMLAR

Ulaşım ağları, uzun süredir şehirlerin gelişimini şekillendirmektedir. Gehl (2010)'in belirttiği gibi, otomobil odaklı erken modern şehir planları yayılan, sürdürülemez şehirler ortaya çıkarmıştır. Günümüzün şehir plancıları alternatifler aramaktadır. Küresel düzeyde kentsel planlama yaklaşımı, özel araç kullanımını azaltan ve erişilebilir, insan odaklı kent mekânları üreten yeni modeller üzerine yoğunlaşmaktadır (Newman ve Kenworthy, 1999; 2006). Aşağıda üç modele ilişkin tanımlayıcı bilgiler yer almaktadır.

15 Dakikalık Şehir

Moreno ve ark. (2021) tarafından ortaya koyulan "15 Dakikalık Şehir" kavramı, COVID-19 sonrası kentlerin sürdürülebilirlik, dayanıklılık ve mekânsal kimlik hedeflerine ulaşabilmesi için önerilen bütüncül bir kentsel planlama yaklaşımıdır. Bu model, kent sakinlerinin yaşama, çalışma, alışveriş, sağlık, eğitim ve eğlence gibi temel ihtiyaçlarını 15 dakikalık yürüme veya bisiklet sürme mesafesinde karşılayabilmelerini hedeflemektedir (Moreno ve ark., 2021).

Modelin temelinde "krono-urbanizm" (chrono-urbanism) kavramı yer almaktadır. Bu, bireylerin yaşam kalitesinin, ulaşım için harcanan zamanla ters orantılı olduğunu savunmaktadır. Bu bağlamda, otomobil bağımlılığını azaltmak ve yerel yaşamı teşvik etmek önceliklidir. 15 Dakikalık Şehir modeli yoğunluk, yakınlık, çeşitlilik ve dijitalleşme olmak üzere dört ana bileşeni içermektedir. Uygun kentsel yoğunluk, kaynakların verimli kullanımını ve hizmetlere erişimi kolaylaştırırken, temel hizmetlerin ve olanakların konutlara yakın olması da günlük yaşamı kolaylaştırmakta ve ulaşım ihtiyacını azaltmaktadır. Diğer yandan karma kullanımlı alanlar ve sosyo-kültürel çeşitlilik, canlı ve kapsayıcı toplulukların oluşmasını desteklemektedir. Dijital teknolojilerin entegrasyonu ise uzaktan çalışma ve hizmetlere erişim gibi olanaklarla esnek yaşam biçimlerini mümkün kılmaktadır (Moreno ve ark., 2021). Bu model Paris'te uygulanmaya başlanmış olup yerel halk tarafından olumlu bir şekilde karşılanmıştır (Reid, 2020).

Toplu Taşıma Odaklı Gelişme (TOD)

Toplu Taşıma Odaklı Gelişme (TOD), arazi kullanımı ve toplu taşımayı entegre eden yerleşik bir kentsel stratejidir (Sung ve Oh, 2011). Kavram, 1990'lı yıllarda Amerika'da genel hatlarıyla ortaya çıkmış olup, 1993 yılında Calthorpe tarafından detaylı bir şekilde ele alınmıştır (Calthorpe, 1993).

Model, yüksek kapasiteli toplu taşıma (demiryolu vb.) istasyonları çevresinde yoğun, karma kullanımlı kalkınmayı teşvik etmektedir (Sung ve Oh, 2011). Tipik özellikleri arasında 400-800 metrelik yürüme mesafesindeki hizmet alanları, yaya dostu sokaklar, azaltılmış park yeri ve toplu taşıma merkezlerinde kümelenmiş konut, ofis ve mağazaların karışımı sayılabilir (Bajracharya ve ark., 2005).

TOD modelinde ulaşım yaklaşımı, toplu taşıma sistemlerini öncelikli hale getirmeyi amaçlamaktadır. Bu modelde, toplu taşıma araçları ile yaya ve bisiklet gibi motorsuz ulaşım biçimleri daha çekici ve kullanışlı hale getirilerek, bireylerin otomobil kullanımından uzaklaşması teşvik edilmektedir. Ulaşım düğüm noktalarında yaşanan otopark sorunlarına çözüm olarak, bireylerin özel araçlarını park edip toplu taşımaya geçiş yapabilecekleri aktarma merkezleri planlanmaktadır (Şengüler, 2023). Böylece TOD yalnızca ulaşım ve kent içi faaliyet akışını değil, aynı zamanda özel araçların kullanımını kademeli olarak azaltan hibrit bir gelişim modeli sunmaktadır.

Net Sıfır Karbon Şehri

Net sıfır karbon şehirler, küresel iklim krizine karşı ortaya konulan en ileri düzey kentleşme yaklaşımlarından biridir. Bu kavram, şehirlerin sera gazı emisyonlarını mümkün olan en düşük düzeye indirmesini ve geri kalan emisyonların doğrudan karbon giderimi veya dengeleme stratejileri ile sıfırlanmasını ifade etmektedir (Seto ve ark., 2021). Yani bir şehir ya da ülke hâlâ karbon salıyor olabilir, ancak bu salımı; karbon yutakları (ormanlar, sulak alanlar vb.), karbon yakalama teknolojileri, yenilenebilir enerji kaynaklarıyla ikame gibi yollarla telafi ediyorsa, net emisyon "sıfır" kabul edilmektedir. Bu

yaklaşım, yalnızca şehir sınırları içindeki emisyonları değil, aynı zamanda şehirlerin tedarik zincirleri ve tüketim alışkanlıkları gibi dolaylı emisyon kaynaklarını da kapsamaktadır (Seto, 2023). Bu nedenle bu tür şehirlerin planlamasında enerji, ulaşım, binalar, atık yönetimi, yeşil alanlar ve yönetişim gibi birçok alanda sistemik dönüşüm gereklidir (Dünya Ekonomik Forumu [WEF], 2021).

Model temelde, planlama, enerji ve teknolojiye odaklanmaktadır. Bu süreçte binalar ve sistemler enerji verimli hale getirilmekte veya yenilenebilir enerji kaynaklarıyla çalıştırılmakta ve karbon yutakları (parklar, yeşil altyapı) en üst düzeye çıkarılmaktadır (Fan ve Wei, 2022). Arazi kullanım politikaları, düşük emisyonlu bölgeleri ve entegre toplu taşıma-konut planlarını desteklemektedir. Ulaşım tarafında ise vizyon, karbon nötr mobilitedir. Modelde elektrikli toplu taşıma ve aktif ulaşım türlerine (elektrikli otobüsler, trenler, bisikletler) öncelik verilirken, fosil yakıtlı araçlar (genellikle düşük emisyonlu bölgeler aracılığıyla) aşamalı olarak kullanımdan kaldırılmaktadır (WEF, 2021).

Ancak net sıfır hedeflerine ulaşmak için yalnızca teknik dönüşüm yeterli değildir. Bu süreçte çok düzeyli yönetişim, toplum katılımı ve yenilikçi finansman modelleri gibi sosyal ve kurumsal bileşenler de etkili olmalıdır (Duan ve Kim, 2023; Seto ve ark., 2021). Şehirlerin kendi karbon ayak izini düzenli olarak ölçmesi ve stratejik planlarını bu verilere dayandırması, izleme-değerlendirme süreçlerini güçlendirecektir.

MATERYAL VE METOD

Bu çalışmada üç planlama yaklaşımını incelemek için karşılaştırmalı analiz yöntemi kullanılmıştır. Bu yöntem, kuramsal çerçeveleri veya politika paradigmalarını sistematik olarak karşılaştırmak amacıyla geliştirilen, nitel bir analiz yöntemidir. Kavramlar arası yapı, amaç ve öncelikleri analiz ederek benzerlikleri ve farklılıkları ortaya koymaktadır (Bulduklu, 2019; Neuman, 2013).

Bu yöntem kapsamında, ilgili yaklaşımların nasıl yapılandığı, hangi planlama ilkelerine dayandığı ve uygulamada ne tür stratejilerle somutlaştığı çok boyutlu bir çerçeveyle ele alınmaktadır. Analiz, literatür, politika belgeleri ve uygulama örneklerini temel alarak kavramsal düzeyde karşılaştırma yapmayı amaçlar (Aydın ve Hanağası, 2017). Böylece, her modelin özgün yönlerinin yanı sıra ortak temalar ve olası sentez alanları da açığa çıkarılabilir.

Çalışmada ilk olarak literatür taraması yapılmıştır. Literatür taraması sürecinde akademik çalışmalar, uluslararası kuruluşların teknik raporları, şehir strateji belgeleri ve uygulanan projelerin vaka çalışmalarından yararlanılmıştır. Karşılaştırmalı analizde kullanılan değerlendirme kriterleri de yine literatür taraması sonucunda elde edilmiştir. Bu kriterler doğrultusunda geliştirilen analitik çerçeve, bir sonraki bölümde üç planlama modelinin temel niteliklerinin sistematik biçimde karşılaştırılmasına temel oluşturmaktadır.

BULGULAR VE TARTIŞMA

Bu çalışmada analiz edilen 15 Dakikalık Şehir, TOD ve Net Sıfır Karbon Şehir yaklaşımları hem yapısal nitelikleri hem de uygulamaya dönük stratejileri bakımından birbirinden ayrışmakta, ancak aynı zamanda tamamlayıcı yönler de sunmaktadır. Tablo 1, bu üç yaklaşımın kavramsal düzeyde ve uygulama düzeyinde nasıl yapılandığını çok boyutlu olarak ortaya koymaktadır. Özellikle ölçek, planlama ilkeleri, yönetişim tarzı ve sürdürülebilirlik anlayışı açısından dikkat çekici farklar göstermektedir.

DRAFT

Tablo 1. Ulaşım Odaklı Kentsel Yaklaşımların Karşılaştırması

Kriterler	15 Dakikalık Şehir	Toplu Taşıma Odaklı Gelişme (TOD)	Net Sıfır Karbon Şehir
Temel Amaç	Yerel erişilebilirliği, yaşanabilirliği ve toplumun refahını en üst düzeye çıkarmak	Toplu taşıma merkezli gelişme	Sera gazı emisyonlarını net olarak sıfıra indirmek
Ana Hedef	Günlük ihtiyaçlara yürünebilir mesafede erişim	Toplu taşımaya erişim ile otomobil bağımlılığını azaltma	Enerji verimli, düşük karbonlu kentsel sistemler oluşturmak
Ölçek	Mikro (mahalle düzeyi)	Mezo (bölge/hat düzeyi)	Makro (şehir/ülke düzeyi)
Planlama İlkeleri	Karma kullanım, yakınlık, esneklik, çeşitlilik, kompaktlık	Yoğunluk, karma kullanım, erişim odaklı gelişme, yaya erişimi, transit odaklı tasarım	Enerji verimli altyapı, yeşil ulaşım, karbon dengeleme ve sistem dönüşümü
Ulaşım Perspektifi	Yürüyüş ve bisiklet öncelikli	Toplu taşıma sistemleri öncelikli	Karbon nötr ulaşım (elektrikli araçlar, toplu taşıma, aktif ulaşım vb.)
Alan Kullanımı	Mahalle merkezli, karma kullanımlı, yerel hizmetler	Ulaşım aksı boyunca yoğun konut ve ticaret	Düşük emisyon bölgeleri, entegre ulaşım-enerji-arazi kullanım planlaması
Teknoloji Vurgusu	Orta düzey (mekânsal düzenlemelerle birlikte dijital hizmet altyapısı)	Orta düzey (toplu taşıma teknolojileri, akıllı zaman çizelgeleri, trafik yönetimi vb.)	Yüksek düzey (Yenilenebilir enerji, akıllı şebekeler, elektrikli ulaşım teknolojileri vb.)
Yönetişim Modeli	Yerel katılım, topluluk temelli	Kamu özel iş birliği, bölgesel planlama	Çok düzeyli ve teknik odaklı, politika güdümlü
Sürdürülebilirlik Boyutu	Sosyal sürdürülebilirlik (eşitlik, yerel kimlik, refah ve kapsayıcılık)	Dengeli sosyal-ekonomik sürdürülebilirlik (ulaşım ve kalkınma entegrasyonu)	Çevresel sürdürülebilirlik (emisyon azaltımı, enerji dönüşümü, iklim hedefleri)

Her üç modelin en ayırt edici farkı, mekânsal ölçek ve organizasyon düzeyidir. 15 Dakikalık Şehir, belirgin biçimde mahalle düzeyine odaklanan, yerel erişilebilirlik ve topluluk yaşamını önceleyen bir yaklaşımdır. Bu modelde kent, kendi kendine yeten, çok işlevli ve yürünebilir mahallelere ayrılarak, günlük ihtiyaçların kısa mesafelerle karşılanması hedeflenmektedir (Moreno ve ark., 2021). Hizmetlerin ve konutların blok ya da semt ölçeğinde yeniden yapılandırılması sayesinde, bireylerin hareket ihtiyacı azaltılırken, kentsel yaşanabilirlik güçlenmektedir. Buna karşılık Net Sıfır Karbon Şehir yaklaşımı, tüm kentsel sistemi hatta gerektiğinde ulusal düzeyi de kapsayan makro ölçekte ele alan sistemik bir dönüşüm modelidir. Esas hedef, net sera gazı emisyonlarını sıfırlamak ve bu dönüşümü enerji sistemleri, altyapı ve mekânsal planlama süreçlerini yeniden yapılandırarak gerçekleştirmektir (Seto ve ark., 2021). Toplu Taşıma Odaklı Gelişim (TOD) modeli ise bu iki yaklaşımın arasında konumlanmakta; mekânsal olarak genellikle toplu taşıma aksları boyunca uzanan koridorlar ve bu koridorlar çevresindeki düğüm noktalarına odaklanmaktadır (Sung ve Oh, 2011). TOD, bir metro hattının hizmet alanı gibi mezo ölçekte işler ve merkezi olmayan ancak sistematik biçimde bütünleşmiş bir kentsel gelişim stratejisi sunmaktadır. Bu modeller, bağlama uygun biçimde birlikte uygulanarak çok düzeyli planlama çözümleri sunabilir. Örneğin, C40 Cities'in "Green and Thriving Neighbourhoods" programı kapsamında, 15 dakikalık şehir ilkeleriyle net sıfır karbon hedeflerini entegre eden mahallelerin pilot projeleri planlanmaktadır. Bu tür entegrasyonlar, çok düzeyli sürdürülebilir planlama için işlevsel bir sentez yaratabilir (C40 Cities, 2022).

Ulaşım ve arazi kullanım stratejileri açısından da modeller arasında yapısal farklar bulunmaktadır. Hem 15 Dakikalık Şehir hem de TOD modelleri, kompaktlık, karma kullanım ve erişilebilirlik gibi temel planlama ilkelerine dayanmaktadır. IPCC (2022) raporuna göre, bu tür planlama yaklaşımları, kentsel sera gazı emisyonlarını yaklaşık %25 oranında azaltma potansiyeline sahiptir. Her iki modelde de farklı işlevlerin fiziksel olarak kısa mesafelerde konumlandırıldığı ve bu sayede ulaşımın minimize edildiği bir yapı öne çıkmaktadır. Ancak ulaşım vizyonlarında belirgin ayrışma vardır: 15 Dakikalık Şehir modeli yürüyüş ve

bisiklet gibi aktif ulaşım türlerine öncelik verirken, TOD yaklaşımı esas olarak toplu taşıma kullanımını teşvik etmektedir. Net Sıfır Karbon Şehir modeli ise bu iki yönelimi bütünleştirerek hem aktif ulaşımı hem de elektrikli araçlarla desteklenen karbon nötr mobilite çözümlerini kapsamaktadır (Seto ve ark., 2021). Ayrıca, Net Sıfır yaklaşımı ulaşım kararlarını enerji altyapısı, teknolojik dönüşüm ve şehir ölçeğindeki sistem tasarımlarıyla doğrudan ilişkilendirmektedir. Türkiye'nin 2053 Net Sıfır vizyonunda da görüldüğü üzere, çok merkezli kent modellerinde sürdürülebilir mobilite bölgeleri oluşturularak bireysel araç kullanımının azaltılması amaçlanmaktadır (T.C. Ulaştırma ve Altyapı Bakanlığı, 2022; T.C. Strateji ve Bütçe Başkanlığı, 2023).

Yönetişim modelleri açısından da bu yaklaşımlar farklılık göstermektedir. 15 Dakikalık Şehir yaklaşımı, yerel yönetimlerin ve yurttaşların etkin katılımına dayanan aşağıdan yukarıya bir planlama biçimini benimsemektedir. Paris gibi örneklerde, mahalle düzeyinde yürütülen katılımcı süreçler bu modelin başarısında kritik rol oynamaktadır (Moreno ve ark., 2021). TOD modelinde ise yerel yönetimler, ulaşım otoriteleri ve özel geliştiriciler arasındaki koordinasyon, projelerin finansmanı ve uygulanmasında önemli bir rol oynamaktadır (Ulaşım ve Kalkınma Politikaları Enstitüsü [ITDP], 2017). Net Sıfır Karbon Şehir yaklaşımı ise çoğunlukla üst ölçekli politika yapıcıların yönlendirdiği, teknik uzmanlık ve devlet kurumlarının koordinasyonunu gerektiren yukarıdan aşağıya bir yönetişim yapısı üzerine kuruludur (Seto ve ark., 2021). Bu yönetişim farklılıkları, her modelin uygulama sürecindeki gereksinimlerini de belirlemektedir. Örneğin, 15 Dakikalık Şehir modeli, imar planı reformları, sosyal politika araçları ve yerel bütçelerle desteklenmeliyken; Net Sıfır modeli, altyapı yatırımları, düzenleyici reformlar ve büyük ölçekli finansman mekanizmaları gerektirmektedir.

Sürdürülebilirlik perspektifleri açısından bakıldığında, her modelin farklı ağırlık noktaları bulunmaktadır. 15 Dakikalık Şehir sosyal sürdürülebilirliği; kapsayıcılık, aidiyet ve topluluk yaşamını teşvik ederek ön plana çıkarmaktadır. TOD yaklaşımı daha çok mobilite verimliliği ve ekonomik kalkınmayı hedeflemekte; istasyon çevresinde oluşan kentsel kümelenmeler, ekonomik canlanmayı desteklemektedir (Cervero, 2004; Sung ve Oh, 2011). Net Sıfır Karbon Şehir yaklaşımı ise çevresel sürdürülebilirliği hedefleyerek emisyonların azaltılması, enerji verimliliğinin artırılması ve yeşil altyapı entegrasyonu gibi stratejileri temel almaktadır (IPCC, 2022). Bununla birlikte, bu vurgular mutlak ayrımlar değildir. C40 Cities'in (2022) de belirttiği gibi, 15 Dakikalık Şehir yaklaşımı aynı zamanda çevresel kazanımlar da sağlayabilir; araç kullanımının azalması ve hava kalitesinin artması buna örnektir. Benzer şekilde, TOD projeleri düşük gelirli bölgeleri hizmet ve ulaşım olanaklarına daha erişilebilir hale getirerek sosyal sürdürülebilirlik açısından da fayda üretebilir.

Sonuç olarak, bu analiz, her bir modelin farklı ölçeklerde belirli sorun alanlarına etkili çözümler sunduğunu ve hiçbir modelin tek başına evrensel bir çözüm olmadığını ortaya koymaktadır. 15 Dakikalık Şehir, mikro düzeyde yaşam kalitesine ve yerel erişilebilirliğe odaklanırken; TOD, mezo düzeyde verimli ulaşım ve mekânsal bütünleşmeyi desteklemektedir. Net Sıfır Karbon Şehir ise makro ölçekte sistemsel dönüşüm ve çevresel sürdürülebilirlik hedeflerini temsil etmektedir. Bu nedenle, bütüncül şehir planlama vizyonlarında, söz konusu modellerin bağlama duyarlı biçimde bir arada kullanılması, ölçekler arası geçişliliğin gözetilmesi ve senkronize stratejilerin geliştirilmesi önerilmektedir.

SONUÇ VE ÖNERİLER

Bu karşılaştırmalı çalışma, ulaşım odaklı kentsel planlama modellerinin çok ölçekli sürdürülebilirlik hedeflerine katkısını analiz ederek, farklı bağlamlarda nasıl uygulanabileceklerine dair kavramsal bir çerçeve sunmaktadır. 15 Dakikalık Şehir, TOD ve Net Sıfır Karbon Şehir yaklaşımları, kendi içlerinde farklı mekânsal ölçeklere, yönetişim yapısına ve sürdürülebilirlik önceliklerine sahiptir. Ancak bu farklara rağmen, bir araya geldiklerinde entegre bir mobilite ve kentleşme vizyonu oluşturma potansiyeli taşımaktadırlar.

Bu bağlamda, söz konusu modellerin uygulanabilirliği yalnızca kuramsal düzeyde değil, aynı zamanda farklı sosyo-mekânsal bağlamlara göre şekillenen politika stratejileri açısından da değerlendirilmelidir. Çalışmanın bu son bölümünde, bu yaklaşımların mikro (mahalle), mezo (koridor/bölge) ve makro (şehir/ulusal) düzeyde nasıl yapılandırılabileceği tartışılmakta; özellikle planlama ölçeği, sosyal eşitlik ve iklim taahhütleri açısından Türkiye gibi gelişmekte olan ülkelerdeki kentleşme dinamiklerine sahip bağlamlarda ne tür politika seçenekleri geliştirilebileceği değerlendirilmektedir.

Mikro düzeyde, yani mahalle ve semt ölçeğinde, 15 Dakikalık Şehir modeli doğrudan uygulanabilir bir yaklaşım sunmaktadır. Yerel yönetimlerin karma kullanımlı mahalle planlamasını teşvik etmesi; konut alanlarına küçük ölçekli ticaret, eğitim ve sağlık hizmetlerinin entegre edilebilmesi için imar düzenlemelerinde esneklik sağlaması gereklidir. Aynı şekilde, minimum otopark zorunluluklarının azaltılması, yaya altyapısının iyileştirilmesi ve bisiklet yollarının güvenli ve kesintisiz hale getirilmesi, bu yaklaşımın fiziksel altyapısını oluşturacaktır. Hizmetlerden yeterince yararlanamayan dezavantajlı semtlerin erişimini sağlamak amacıyla kamu tesisleri (örneğin parklar, toplum merkezleri ve sağlık ocakları), sosyo-mekânsal adalet ilkesi gözetilerek planlanmalıdır. Bu bağlamda, mahalle düzeyinde "erişilebilirlik denetimleri" yapılabilir ve Next Proximity Index gibi ölçüm araçları kullanılarak planlamaya yön verilebilir. Mahalle yaşamının desteklenmesi için kamu yatırımları ve katılımcı tasarım süreçleri, özellikle düşük gelirli bölgelerde toplumsal bütünleşmeyi artırabilir.

Mezo düzeyde, yani ulaşım koridorları ve bölgesel alanlarda, TOD yaklaşımı stratejik bir rol üstlenmektedir. Özellikle raylı sistem hatları, metro ve banliyö tren hatları etrafında yoğun, karma kullanımlı ve yaya öncelikli gelişim alanları oluşturmak TOD'un temel hedeflerindendir. Transit merkezleri çevresinde özel planlama bölgeleri belirlenerek, bu alanlarda geliştiricilere imar kolaylığı, yoğunluk bonusları veya vergi teşvikleri sunulabilir. İstanbul gibi metropol alanlarında Marmaray hattı, Metrobüs koridoru veya yeni metro hatları çevresinde TOD bölgeleri oluşturulabilir. TOD uygulamaları yalnızca mekânsal planlama ile sınırlı kalmamalı, aynı zamanda ilk ve son kilometre ulaşımı da kapsamalıdır; bu amaçla park et & devam et sistemleri, bisiklet paylaşımı ve yaya bağlantılarının entegrasyonu sağlanmalıdır. Belediyeler arası koordinasyonun güçlendirilmesi, TOD bölgelerinin planlanması ve yönetimi için kritiktir. Türkiye'nin Uzun Vadeli İklim Stratejisi'nde öngörüldüğü gibi, sürdürülebilir mobilite bölgeleri oluşturulurken şehirlerarası planlama iş birliklerine ve ortak finansman modellerine de ihtiyaç duyulmaktadır. Haliç Metro Köprüsü örneğinde olduğu gibi, TOD yatırımları yalnızca ulaşımı değil, çevresel ve ekonomik canlanmayı da tetikleyebilmektedir.

Makro düzeyde, yani şehir, metropol ve ulusal ölçekte, Net Sıfır Karbon Şehir yaklaşımı uzun vadeli stratejiler açısından önem arz etmektedir. Türkiye'nin 2053 Net Sıfır hedefi ve İstanbul'un 2050 yılına kadar karbon nötrlüğe ulaşma taahhüdü, altyapıdan enerjiye, mobiliteden yapı stoğuna kadar çok katmanlı dönüşüm gerektirmektedir. Ulaştırma sektörünün elektrifikasyonu (elektrikli otobüs filoları, şarj altyapısı), kamu binalarında yenilenebilir enerji sistemlerinin yaygınlaştırılması ve mevcut yapıların nZEB standartlarına göre yenilenmesi bu kapsamda öncelikli adımlardır. Ayrıca, karbon tutma kapasitesini artırmak amacıyla yeşil altyapının (örneğin kentsel ormanlar ve sulak alanlar) genişletilmesi gerekmektedir. Yeni ulaşım projeleri çevresel etki açısından değerlendirilerek, Banister'in (2008) sürdürülebilir mobilite paradigmasına uygun biçimde alternatif düşük karbonlu ulaşım seçenekleriyle birlikte planlanmalıdır. Net sıfır hedeflerine ulaşılabilmesi için çok düzeyli yönetişim mekanizmalarının uyumlaştırılması da zorunludur. Ulusal iklim yasaları, bölgesel ulaşım planları ve yerel yönetmeliklerin birbiriyle bütünleşik hale gelmesi gerekmektedir. Bu doğrultuda hazırlanan İstanbul Sürdürülebilir Kentsel Hareketlilik Planı (SUMP), Net Sıfır yaklaşımını uygulamada örnek teşkil edecek bir stratejik doküman olarak değerlendirilebilir. Yürüyüş ve bisiklet modları için hedefler belirleyen bu plan, yeni toplu taşıma hatlarında TOD ilkelerini zorunlu hale getirerek farklı modellerin bir arada uygulanmasını mümkün kılmaktadır.

Sonuç olarak, bu çalışmada analiz edilen üç yaklaşımın her biri kendi düzleminde güçlü yönlere sahip olup, birleşik ve bağlama duyarlı şekilde uygulandığında sürdürülebilir kent vizyonuna katkı sağlayabilir. Mikro ölçekte 15 Dakikalık Şehir yaşam kalitesini artırırken; mezo ölçekte TOD ulaşım verimliliğini ve kentsel yoğunluğu optimize eder. Makro ölçekte ise Net Sıfır modeli, yapısal dönüşüm ve çevresel sürdürülebilirlik için stratejik bir çerçeve sunar. Bu çalışma, bu modellerin birbirinden ayrı değil, bir bütünün parçaları olarak düşünülmesi gerektiğini ortaya koymaktadır. Karar vericiler ve şehir plancıları için burada sunulan karşılaştırmalı kavramsal analiz, ölçek odaklı sentezler kurarak daha adil, dirençli ve düşük karbonlu kentlerin inşası için stratejik bir yol haritası işlevi görebilir.

Bununla birlikte, çalışmanın bazı sınırlılıkları bulunmaktadır. Öncelikle, analiz yalnızca üç kavramsal modele odaklanmakta ve diğer alternatif kentsel ulaşım yaklaşımlarını kapsam dışı bırakmaktadır. Ayrıca, değerlendirme ağırlıklı olarak literatür ve politika belgelerine dayandığı için uygulama düzeyindeki bağlamsal farklara ilişkin daha derinlemesine ampirik veri içermemektedir. Gelecek araştırmalarda, bu modellerin farklı şehirlerdeki uygulamalarına ilişkin karşılaştırmalı saha çalışmaları yapılması, yerel aktörlerin algılarının analiz edilmesi ve politikaların sonuçlarının değerlendirilmesi, kavramsal çerçevenin

pratikle ne ölçüde örtüştüğünü ortaya koymak açısından faydalı olacaktır. Ayrıca, bu yaklaşımların sosyal eşitlik, toplumsal cinsiyet ve mekânsal adalet gibi temalarla kesişimini inceleyen disiplinlerarası araştırmalar da sürdürülebilir kentleşme literatürüne önemli katkılar sağlayabilir.

Özet

Kara taşıtları, fosil yakıt kullanımı nedeniyle çevreye ve insan sağlığına zararlı emisyonlar yaymaktadır. Bu çalışmada, Muş ili şehir içi taşımacılığında kullanılan araçların enerji ihtiyaçlarının karşılanmasına yönelik yenilenebilir enerji kaynaklarına (YEK) dayalı bir çözüm önerisi sunulmuştur. Önerilen sistem; güneş panelleri (FV), rüzgâr türbinleri (RT), elektrolizör, batarya depolama sistemi (BDS) ve hidrojen tankından (HT) oluşan bir hidrojen yakıt ikmal istasyonu şeklinde tasarlanmıştır. Optimizasyon sonucunda, 7567 kW gücünde FV paneller, her biri 20 kW olan 63 adet RT, 600 kW kapasiteli bir elektrolizör ve 11.007 kWh kapasiteli bir batarya sisteminin en uygun yapılandırma olduğu belirlenmiştir. Enerji üretiminin %75'i PV panellerden, %25'i ise rüzgâr türbinlerinden sağlanmaktadır. Sistemin net bugünkü maliyeti (Net Present Cost - NPC) 26,9 milyon dolar olarak hesaplanmıştır. Araçların yıllık yakıt maliyeti 839.530 dolar olup, sistemin 25 yıllık ömrü boyunca toplam 20,988 milyon dolar yakıt tüketimi öngörülmektedir. Motorin fiyatlarındaki artış ve enflasyon oranları göz önünde bulundurulduğunda, sistemin kendini daha kısa sürede amorti edeceği öngörülmektedir. Tasarlanan mikro şebeke sayesinde yıllık yaklaşık 2.106 kg CO_2 salımı engellenmiş olacaktır. Önerilen sistemin yaygın olarak uygulanması durumunda, kara taşıtlarının neden olduğu emisyonlarda belirgin bir azalma sağlanabileceği sonucuna varılmıştır.

Anahtar Kelimeler: Güneş, Rüzgâr, Hidrojen, Mikro şebeke, Emisyon

Microgrid design for hydrogen fuel refueling station for urban transportation vehicles; the case of Muş province

Abstract

Land vehicles emit harmful emissions to the environment and human health due to their use of fossil fuels. In this study, a renewable energy-based solution is proposed to meet the energy needs of urban transportation vehicles in Muş, Turkey. The proposed system is a hydrogen fueling station designed as a microgrid consisting of photovoltaic (PV) panels, wind turbines (WT), an electrolyzer, a battery storage system (BSS), and a hydrogen tank (HT).According to the optimization results, the most suitable configuration includes 7,567 kW of PV panels, 63 WTs each with a capacity of 20 kW, a 600 kW electrolyzer, and a battery system with a capacity of 11,007 kWh. The system generates 75% of its energy from PV panels and 25% from wind turbines. The net present cost (NPC) of the system is calculated to be $26.9 million. The annual fuel cost for the vehicles is estimated at $839,530, and the total fuel cost over the system's 25-year lifetime is projected to be $20.988 million. Considering the increase in diesel prices and inflation rates, the system is expected to pay for itself in a shorter period. Additionally, the designed microgrid is projected to prevent approximately 2,106 kg of CO_2 emissions annually. If implemented on a large scale, the proposed system has the potential to significantly reduce emissions from land transportation vehicles

GİRİŞ

Ulaşım sektörü, küresel karbon emisyonlarının en büyük ikinci kaynağıdır. Toplu taşıma araçları dünya çapında karbon emisyonlarının azaltılmasında önemli bir rol oynamaktadır. Toplu taşımanın gelişimi, karbon nötrlüğüne ulaşmak için kilit bir strateji olarak tanımlanmıştır. Çalışmalar, toplu taşıma geliştirme seviyesi ile karbondioksit (CO_2) emisyonları arasında ters orantı olduğunu göstermiştir. Diğer bir ifadeyle sektör karbon emisyonlarını azaltma potansiyeline sahiptir (Jing et al., 2022). Ulaşım sektörü, insan kaynaklı sera gazı emisyonlarının yaklaşık %15'ini teşkil etmektedir (Ferrer & Thomé, 2023). Toplu taşıma, özellikle sağlık yararlarını teşvik edebileceği ve sürdürülebilir şehirlere ve topluluklara katkıda bulunabileceği kentsel alanlarda emisyonları azaltmak için etkili bir strateji olarak kabul edilmiştir (Kwan

& Hashim, 2020; Ribeiro & Mendes, 2022).Toplu taşıma araçlarında karbon emisyonlarının azaltılması son derece önemlidir. Ulaşım sektörü küresel olarak sera gazı emisyonlarına önemli bir katkıda bulunuyor ve hidrojen(H2) yakıtı sürdürülebilir bir alternatif olarak önerilmektedir. Hidrojen yakıt hücreli elektrikli araçlarda (FCEV) kullanılabilir veya içten yanmalı motorlarda yakılabilir. Birçok ülke iklim dostu özellikleri nedeniyle hidrojenle çalışan araçların araştırma ve geliştirilmesini desteklemektedir (Akac et al., 2022). Hidrojen girişimleri, geleneksel toplu taşıma filolarının FCEV'lerle değiştirildiği küçük-orta ölçekli Avrupa şehirlerinde ve bölgelerinde uygulanmıştır. Ek olarak, yolcu demiryolu taşımacılığında yakıt olarak hidrojenin kullanılması, elektrikli olmayan demiryolu hatlarındaki emisyonları azaltmada umut vaat ediyor (Agarwal et al., 2023).Genel olarak, hidrojen yakıtı toplu taşıma araçlarındaki karbon emisyonlarını önemli ölçüde azaltma ve daha sürdürülebilir bir mobilite sektörüne katkıda bulunma potansiyeline sahiptir.

Bu çalışmada Muş ili şehir içi taşımacılık yapan araçların fosil yakıt tüketimini ve oluşturdukları emisyonu azaltmayı hedeflemektedir. Yenilenebilir enerji kaynaklarından oluşan sıfır emisyona sahip hidrojenle çalışan araçların kullanacakları bir yakıt ikmal istasyonu için mikro şebeke tasarımı yapılacaktır. Oluşturulan mikro şebekeye ait ekonomik ve çevresel etkileri incelenecektir.

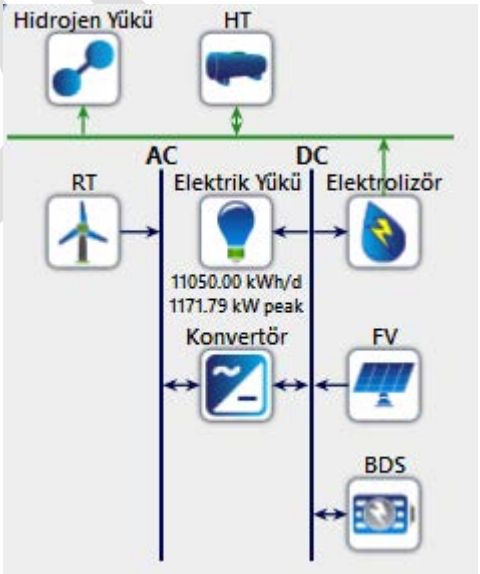
MATERYAL VE METOD

Muş ilinde, şehir içi yolcu taşımacılığında kullanılan motorin yakıtlı araçların neden olduğu karbon emisyonlarını azaltmaya yönelik olarak, bu araçların hidrojen yakıtlı araçlarla değiştirilmesi amacıyla, hidrojen ve elektrik ihtiyacını şebekeden bağımsız olarak karşılayabilecek bir yakıt ikmal istasyonu tasarlanmıştır. Bu kapsamda, HOMER Pro yazılımı kullanılarak yenilenebilir enerji kaynaklarına dayalı bir mikro şebeke modeli oluşturulmuştur.

HOMER Pro, Amerika Birleşik Devletleri Ulusal Yenilenebilir Enerji Laboratuvarı (NREL) tarafından geliştirilen ve şebekeye bağlı ya da şebekeden bağımsız enerji sistemlerinin teknik ve ekonomik analizini gerçekleştirmeye yönelik bir yazılım programıdır. Bu yazılım, hibrit yenilenebilir enerji sistemlerinin optimum tasarımı, boyutlandırılması ve planlanmasına olanak sağlamakta olup, gerçek verilere oldukça yakın sonuçlar üretebilmektedir(Akan, 2023; Shahzad et al., 2017).

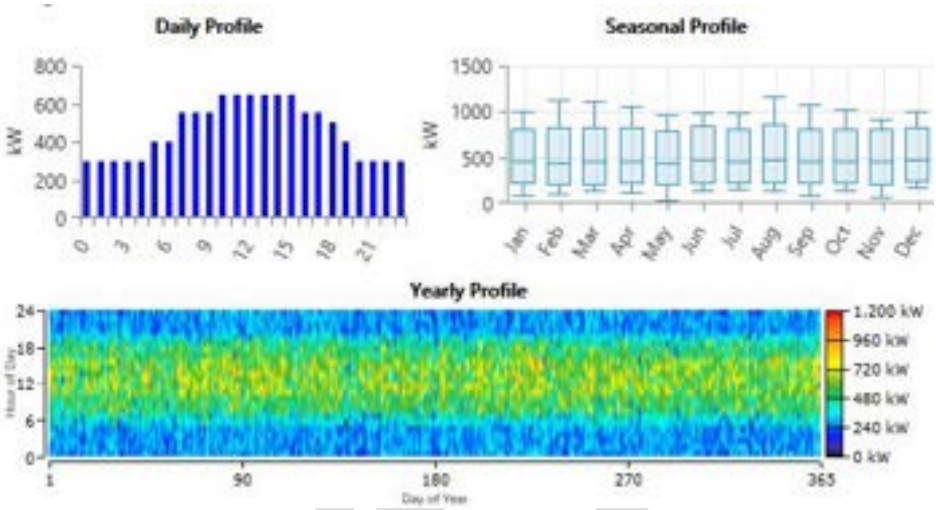
Mikro Şebeke Tasarımı ve Yük Profili

Muş ilinin karbon emisyonunu azaltmak için yolcu taşımacılıkta kullanılmak üzere üretilmiş sıfır karbon emisyona sahip 300 km menzile sahip 15 yolcu kapasiteli, 30 kW'lık FC, 33 kWh batarya ve 350 barda 4,5 kg hidrojen içeren bir tanka sahip örnek araç için sistem tasarımı yapılmıştır. İl merkezinde şehir içi taşımacılık sektöründe çalışan her biri günde 150 km yol kateden 124 dizel aracın günlük ortalama enerji tüketimi dikkate alınarak sistem tasarımı yapılmıştır. Söz konusu araçların H_2 yakıtını temin etmek amacıyla oluşturulan mikro şebeke tasarımı Şekil 1'de verilmiştir.



Şekil 1. Hidrojen ikmal istasyonu mikro şebeke modeli

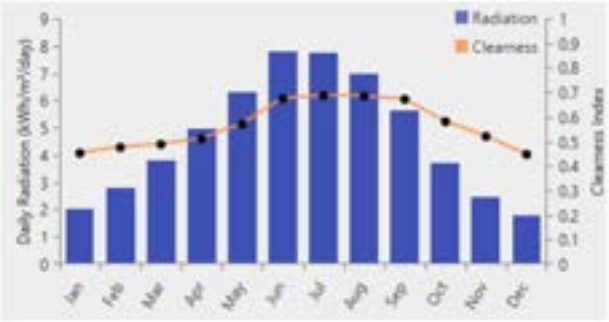
Önerilen araç modelinde, tam dolu bir hidrojen tankıyla (4,5 kg) 300 km menzil elde edilmektedir. Bu mesafe, aracın iki günlük çalışma süresinde kat ettiği toplam mesafeye karşılık gelmektedir. Dolayısıyla, bir aracın günlük 150 km yol yapabilmesi için yaklaşık 2,225 kg hidrojene ihtiyaç duyulmaktadır. Hidrojen üretimi için 1 kg hidrojen başına teorik olarak 33,2 kWh elektrik enerjisi gereklidir. Ancak, %85 verimliliğe sahip bir elektrolizör kullanılması durumunda, 1 kg hidrojen üretimi için gereken toplam enerji miktarı 39,1 kWh'ye yükselmektedir. Bu bağlamda, bir aracın günlük hidrojen ihtiyacını karşılamak için 87.975 kWh elektrik enerjisi gerekmektedir. Sistem kapsamında hizmet verecek olan toplam 124 aracın günlük hidrojen talebi göz önüne alındığında, bu değer 10.908,9 kWh olarak hesaplanmıştır. Bu veriler doğrultusunda, hidrojen yakıt ikmal istasyonunun günlük yük profili oluşturulmuş olup, bu profile Şekil 2'de yer verilmiştir.



Şekil 2. Yakıt ikmal istasyonu yük profili

Meteorolojik Veriler

Çalışmada kullanılan bölgesel meteorolojik veriler, HOMER Pro yazılımına entegre edilen NASA veri tabanından elde edilmiştir. Muş ili, yıllık ortalama 4,66 kWh/m²/gün düzeyinde güneş radyasyonuna ve 4,8 m/s ortalama rüzgâr hızına sahiptir. Bölgeye ait aylık güneş radyasyonu ve açıklık indeksi Şekil 3a'da, aylık ortalama rüzgâr hızı ise Şekil 3b'de sunulmuştur.



Şekil 3a. Muş ili güneş radyasyonu ve açıklık indeksi

Şekil 3b. Muş ili aylık rüzgâr hızı

Ekonomik hesaplama

Tasarlanan yakıt ikmal istasyonu kapsamında oluşturulan mikro şebekede kullanılan sistem bileşenlerine ait birim maliyet değerleri Tablo 1'de sunulmuştur. Bu tabloda; FV, RT, elektrolizör, BDS, HT ve yardımcı ekipmanlara ilişkin birim kurulum maliyetleri, bakım-onarım giderleri ile birlikte ayrıntılı olarak verilmiştir. Söz konusu maliyet değerleri, sistemin toplam kurulum ve işletme maliyetlerinin hesaplanmasında temel alınmış ve HOMER Pro yazılımında yapılan ekonomik analizlerde kullanılmıştır.

Tablo 1. Mikro şebeke bileşenlerinin birim maliyet değerleri

Bileşenler	Kurulum Maliyeti	Yenileme Maliyeti	Bakım ve Onarım	Yaşam Ömrü
FV	700 $/kW	700 $/kW	10 $/kW/yıl	25 yıl
RT (20 kW)	50000 $	40000 $	30 $/kW/yıl	20 yıl
Elektrolizör	1000 $/kW	1000 $/kW	0.1 $/kW/yıl	15 yıl
BDS	300 $/kWh	300 $/kWh	10 $/kW/yıl	15 yıl
H2 Tank	500 kg	500 kg	0	25 yıl
Konvertör	300 $/kW	300 $/kW	0	15 yıl

HOMER yazılımı, bir enerji sisteminin NPC'si, sistemin ekonomik ömrü boyunca oluşacak tüm maliyetlerin bugünkü değerinden, aynı süre zarfında elde edilmesi öngörülen tüm gelirlerin bugünkü değerinin çıkarılmasıyla hesaplamaktadır (Gökçek & Kale, 2018). Bu yaklaşım, yatırım, bakım-onarım, yakıt, değiştirme ve işletme giderlerini kapsayan tüm ekonomik parametreleri dikkate alarak sistemin toplam maliyet etkinliğini değerlendirmeyi amaçlamaktadır. HOMER Pro yazılımı, bu değerlendirmeyi belirli ekonomik formüller doğrultusunda gerçekleştirmektedir. Söz konusu değerlendirme kriterleri ve hesaplama yöntemleri, aşağıda (1)-(4) denklemleri aracılığıyla ifade edilmekte ve sistemin finansal fizibilitesini ortaya koymak üzere analiz edilmektedir (HOMER, 2016).

$$NPC = C_(ann, tot)/(CRF(d, Yr)) \quad (1)$$

$$C_{ann,tot} = C_{ann,cap} + C_{ann,rep} + C_{ann,O\&M} + C_{ann,fuel} - R_{ann,salv} \quad (2)$$

$$CRF = (d(1+d)^{Yr})/((1+d)^{Yr} - 1) \quad (3)$$

$$d = (i - f)/(1 + f) \quad (4)$$

BULGULAR ve TARTIŞMA

Muş ilinde şehir içi taşımacılık yapan araçların enerji ihtiyacını yenilenebilir enerji kaynakları ile karşılayarak sürdürülebilir bir çözüm sunmayı amaçlamaktadır. Yapılan analizler sonucunda, önerilen mikro şebeke için en uygun sistem bileşimi; 7.567 kW gücünde FV paneller, her biri 20 kW olan 63 adet RT, 600 kW kapasiteli bir elektrolizör ve 11.007 kWh kapasiteli bir batarya sisteminden oluşmaktadır. Üretilen enerjinin %75'i FV panellerden, %25'i ise rüzgâr türbinlerinden sağlanmaktadır. Sistemin net bugünkü maliyeti 26,9 milyon dolar olarak hesaplanmış olup; toplam kurulum maliyeti 14,8 milyon dolar, sistemin geri dönüşüm (yenileme) maliyeti 11,7 milyon dolar ve bakım-onarım maliyetleri ise 6,2 milyon dolar olarak belirlenmiştir.

Türkiye'de güncel motorin pompa fiyatı litre başına 48 TL olup, bu çalışmada 1 Amerikan doları karşılığı 38,86 TL üzerinden 1,3 dolar olarak kabul edilmiştir. Şehir içi taşımacılık yapan araçların yıllık yaklaşık 645.792 litre motorin tükettikleri varsayımına göre, yıllık yakıt maliyeti 839.530 dolara karşılık gelmektedir. Sistemin ekonomik ömrü 25 yıl olarak planlanmış olup, bu süre zarfında toplam 20,988 milyon dolar tutarında yakıt tüketimi öngörülmektedir. Motorinin yoğunluğu 0,86 kg/l ve 1 kg motorin tüketimi başına atmosfere 3,6 kg CO_2 salımı gerçekleştiği dikkate alındığında (Diler, 2006) , yıllık 555.381,12 kg motorin tüketimi sonucunda yaklaşık 2.106.372 kg (2.106 ton) CO_2 emisyonu oluşmaktadır.

Şehir içi ulaşım sektörü, kentsel yaşamın vazgeçilmez bir unsurudur. Ancak bu sektörde kullanılan fosil yakıtlar, atmosfere salınan sera gazı miktarını artırarak hem insan sağlığını olumsuz etkilemekte hem de çevresel sorunlara yol açmaktadır. Önerilen sistemin uygulanması, fosil yakıtlara olan bağımlılığın azaltılmasına ve çevresel yönetim stratejilerinin daha etkili planlanmasına katkı sağlayacaktır.

SONUÇ

TUİK 2024 verilerine göre Muş ilinde toplam 40.032 kayıtlı kara taşıtı bulunmaktadır(TUİK, 2024). Bu araçların önemli bir kısmı bireysel ulaşım amacıyla kullanılmakta olup, şehir içi taşımacılık hizmeti veren araç sayısı toplam araç sayısına kıyasla oldukça sınırlıdır. Türkiye'nin büyükşehirleri olan İstanbul, Ankara ve İzmir ile karşılaştırıldığında, Muş ilindeki kara taşıtı yoğunluğu oldukça düşüktür.

DRAFT

Günümüzde hidrojenli araçların kullanımı henüz yaygınlaşmamış olmakla birlikte, çevresel sürdürülebilirlik açısından bu teknolojilerin önemi giderek artmaktadır. Kara taşıtlarının neden olduğu çevresel kirlilik, sera gazı emisyonları ve fosil yakıt bağımlılığı gibi sorunların çözümüne katkı sağlamak amacıyla, hidrojen yakıt ikmal istasyonlarının kurulması stratejik bir adım olacaktır. Özellikle sıfır emisyon hedeflerine ulaşmak ve uzun vadeli çevre politikalarını desteklemek açısından, bu tür projelerin sadece Muş gibi gelişmekte olan illerde değil, büyük şehirlerde de yaygınlaştırılması büyük önem taşımaktadır.

Bu bağlamda önerilen mikro şebeke temelli hidrojen üretim ve yakıt ikmal istasyonu modeli, yenilenebilir enerji kaynaklarıyla entegre edilerek hem ekonomik hem de çevresel açıdan sürdürülebilir bir çözüm sunmaktadır. Söz konusu sistemin geniş çaplı uygulanabilirliği, kent içi taşımacılıktan kaynaklanan emisyonların azaltılmasına önemli ölçüde katkı sağlayacaktır.

Özet

Bu çalışmada, polivinil klorür (PVC) yüzeyler üzerinde uygulanan saf akrilik ve silika (SiO_2) ile güçlendirilmiş akrilik bazlı basınca duyarlı yapıştırıcı (PSA) sistemlerinin mekanik performansları karşılaştırmalı olarak değerlendirilmiştir. Üç farklı kalınlıkta (0,45 mm, 0,60 mm ve 1,00 mm) hazırlanan PSA filmleri PVC alt tabakalara uygulanarak 180° soyulma, kesme ve çekme testlerine tabi tutulmuş; elde edilen veriler, silika katkısının hem yapışma mukavemetini hem de kohezyonel dayanımı anlamlı ölçüde artırdığını göstermiştir. Saf PSA sisteminde ortalama soyulma kuvveti 4,3 N/cm iken, güçlendirilmiş sistemde bu değer 6,2 N/cm'ye ulaşmış; kesme ve çekme dayanımlarında da %25–30'luk artışlar gözlemlenmiştir. Sonuç olarak, silika katkılı akrilik PSA sistemlerinin, PVC yüzeyli zeminlerde uzun vadeli yapışma, termal kararlılık ve mekanik dayanım gerektiren endüstriyel uygulamalarda daha üstün performans sunduğu ortaya konmuştur.

Anahtar Kelimeler: Akrilik PSA, Güçlendirilmiş Akrilik PSA, PVC, 180° Soyulma testi, Kesme Dayanımı, Çekme Dayanımı

Comparative analysis of the mechanical properties of acrylic and silica (SiO_2)-reinforced acrylic-based pressure-sensitive adhesive tapes of different thicknesses on PVC surfaces

Abstract

In this study, the mechanical performances of pressure-sensitive adhesive (PSA) systems applied on polyvinyl chloride (PVC) surfaces were comparatively evaluated for two formulations: pure acrylic and silica (SiO_2)-reinforced acrylic. PSA films with three different thicknesses (0.45 mm, 0.60 mm, and 1.00 mm) were applied to PVC substrates and subjected to standardized 180° peel, shear, and tensile tests. The results revealed that silica reinforcement significantly improved both the adhesive strength and cohesive durability of the PSA systems. While the average peel strength of the pure PSA system was measured at 4.3 N/cm, the silica-reinforced system reached up to 6.2 N/cm; similarly, the shear and tensile tests showed a 25–30% increase in strength. Consequently, silica-reinforced acrylic PSA systems demonstrated superior performance for demanding industrial applications requiring long-term adhesion, thermal stability, and mechanical durability on PVC-based surfaces.

Keywords: Acrylic adhesive tape, Pressure sensitive adhesive, PVC, 180° Peel Test, Shear Strength, Tensile Strength

GİRİŞ

Yapıştırıcı kavramı, substrat yüzeylerinde kalıcı veya geçici olarak yapıştırma işlemiyle birleştirmek için uygulanan bir malzemedir. PSA, oda sıcaklığında, kuru formda ve kalıcı olarak yapışkan hale gelen ve çok daha az basınç uygulanmasıyla farklı yüzeylere sıkı bir şekilde yapışan viskoelastik bant türüdür. PSA'lar çok düşük basınç altında uygulanabilir ve daha sonra artan basınç kuvvetlerine karşı duyarsızdır. PSA bantlar viskoz ve elastik olduğu için sıvılar ve elastik katılar gibi davranırlar ve geçici olarak bağlanan parçacıklara sahiptirler. Esneklikleri, sıvılar gibi birbirleri boyunca kaymalarına olanak

tanır. Banta düşük basınç uygulandığında viskozitesi azalır ve yapıştırıcının mikroskobik düzeyde alt tabakaya akmasına neden olur. Bu nedenle, PSA bantlar uygulanan basınçla çeşitli alt yüzey tabakalara yapışma kabiliyeti vardır. Elastik özellikleri, substrat ile güçlü bir moleküller arası kuvvet oluşturacak şekilde viskozitesini yeniden kazanmasına yardımcı olur. PSA bantlar yüksek adhezyon ve kohezyon dengesine ve ayrıca mükemmel su direncine sahiptirler. PSA bantların son derece kritik yapışkan özellikleri soyulma yapışması ve yüksek kayma mukavemetine sahiptir. PSA bantlar, formülasyona bağlı olarak ultra çıkarılabilirden ultra yüksek yapışma gücüne kadar geniş bir yelpazede yer alırlar.

Yüksek performanslı PSA bantların pazar ve teknolojisi, mevcut ve yeni uygulama alanlarının artması sonucu hızla genişlemektedir. Kendinden yapışkanlı polimerlerin yapısı, arzu edilen doğal özelliklere sahip olmaları nedeniyle onları benzersiz kılar. Çeşitli yapıştırıcı türleri arasında PSA bantlar, yapısal yapıştırıcılar olarak nitelendirilmediği için tüketici tarafından çok yaygın bir şekilde kullanılmaktadır. PSA bantlar herhangi bir kimyasal reaksiyon olmadan temas halinde yüzeye yapışma özellikleri onları çeşitli uygulamalar için uygun kılar. Viskoelastik malzemeler olarak PSA bantlar, etiketler ve koruyucu filmler formları ile çeşitli uygulamalarda yaygın olarak uygulanmaktadır.

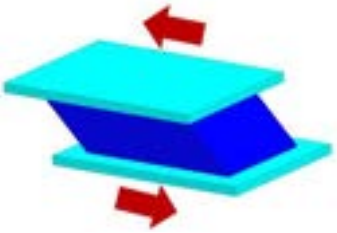
Basınca duyarlı yapıştırıcılara yönelik mevcut küresel talebin değeri yaklaşık 52 Milyar ABD Doları veya yılda kabaca 47 milyar metrekaredir. 47 milyar metrekare yüzölçümü kıyaslanması için 783.562 m2 olduğu düşünülürse küresel kullanma hacmi olarak bir fikir edinebilir. Yapışkan Bantlar Pazar Büyüklüğü 2021'de 47,2 milyar ABD Doları olarak değerlendirildi. Yapışkan Bantlar sektörünün 2022'de 49,7 Milyar ABD Dolarından 2030 yılına kadar 79,9 milyar ABD Dolarına çıkması ve tahmin dönemi boyunca %5,4'lük bir bileşik yıllık büyüme oranı (CAGR) sergilemesi bekleniyor. (2022 - 2030). Yapışkan bantlar otomotiv, elektronik, etiketleme, paketleme,,medikal gibi endüstrinin hemen hemen her sektöründe kullanılan akrilik basınca duyarlı bantların (PSA) kullanılması örnek olarak verilebilir bu nedenle PSA bantların artan kullanımı pazarın büyümesini hızlandırmaktadır.

PSA bantlar, kimyasal yapılarına göre türleri, kauçuk, akrilik, modifiye akrilik ve silikon bazlı formülasyonlarından olmak üzere dört temela türü vardır. Bu türlerin her biri farklı performans özellikleri sergiler. Bu araştırmada, Yüksek UV dayanımı, yaşlanmaya karşı stabil olması nedeniyle akrilik ve yüksek sıcaklık dayanımı ve hassas yüzeyler için silika (SiO_2) ile güçlendirilmiş akrilik PSA'lar, PVC yüzey üzerlerinde yapışma mukavemetlerini araştırmak için kullanılmıştır. PVC , hem esnek hem sert formlarda levha ve profil olarak yaygın bir şekilde kullanılan bir plastic türüdür. PSA sistemleriyle düzgün ve temiz bir yüzeye sahip olması, PSA kimyasal yapılarına uyumlu 0lması nedeniyle iyi bir şekilde bağlanır.

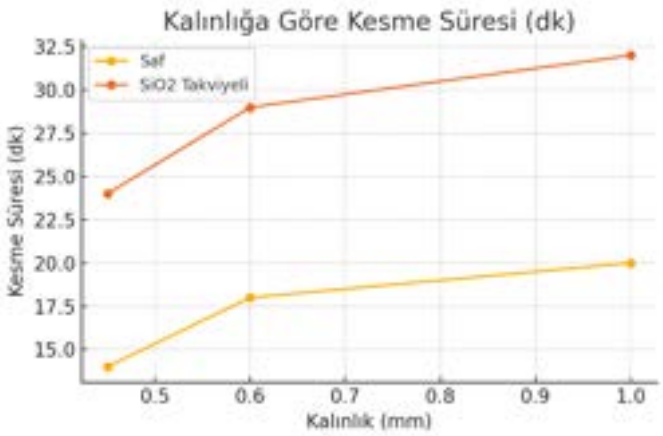
MALZEME VE METOT

Deneyde kullanılan malzeme olarak 0,45 mm, 0,60 mm ve 1,0 mm kalınlıklarda akrilik ve silica (SiO2) ile güçlendirilmiş akrilik PSA bantlarıyla PVC yüzey üzerinde her gruptan üçer adet olmak üzere 180º soyulma, Kesme ve Çekme testleri uygulanmıştır. Bütün testler, yapıştırma işlemi öncesi PVC yüzeyine zarar vermeyen izopropil alkol ile temizlenip 45 sn. kuruması beklendikten sonar yapılmıştır.

Kesme testleri, PSA bandın PVC yüzey üzerinde parallel yönde kayma kuvvetlerine karşı yapışma mukavemetini test etmek için kullanılır, kalıcı yük altında zamana bağlı kayma (crep) davranışını ölçmek amacıyla yapılır. PSA bant, PVC yüzeye düşük bir basınç altında PVC yüzeye yapıştırılır, yatay yönde 1kg (9,8 N) kuvveti uygulanır. Bant yüzeye paralel bir yönde kaymaya zorlanır. ASTM D3654 standartı dikkate alınır. T**est sıcaklığı ve bağıl nem, g**enellikle 23 ± 2 °C ve 50 ± 5 % bağıl nem koşullarında yapılır. Sonuç olarak, belli bir zaman içinde kopması ve meydana gelen bant uzaması, viskoelastik davranış gibi kalıcı deformasyonu ölçülür (Şekil 1).



Şekil 1. Kesme testi



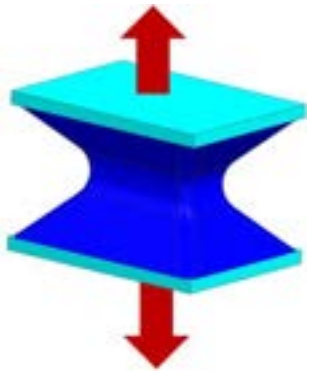
Şekil 2. Kalınlığa Göre Kesme Süresi (dk)

Grafikte hem akrilik hem de silica ile güçlendirilmiş akrilik PSA bantlarla yapılan soyulma testlerin kesme süresi (dk) ve malzeme kalınlığı (mm) arasındaki ilişkiyi göstermektedir (Şekil 2).

Her iki yapıştırıcı türünde de kalınlık arttıkça kesme süreside arttığı tespit edilmiştir. Bu daha kalın malzemelerin hacmi artar ve kesme işlemi kesme direnci yükselir. Bunun sonucunda kesme işlemi için daha fazla enerji ve zaman gerektirir (Tablo 1). Silika (SiO_2) takviyesi yapıştırma mukavemetini arttırmakta önemli bir rol oynamaktadır.

SiO2 takviyeli PSA bantlar, kalınlık arttıkça, kesme süreleri saf akrilik PSA banta göre daha dik eğim görülmektedir. Bu durum, **yük transfer mekanizması, takviye-matris etkileşimi, mekanik difüzyon etkisi** gibi ileri kompozit davranışlarıyla ilgili olabileceği düşünülmektedir.

Çekme testleri, PSA bant ile PVC alt tabaka arasındaki dikey yöndeki yapışma kuvvetini belirlemek amacıyla yapılır (Şekil 3). PSA bant, PVC yüzeye düşük basınçla yapıştırılır, uzunluk ve genişliği sırasıyla 25,4 mm x 25,4 mm boyutlarının oluşturduğu 645,16 mm^2 bir alanda, yüzeyler birbirinden dikey yönde 5 mm/sn hızda çekilir. Test ASTM D3330 standartına göre yapılır. T**est sıcaklığı ve bağıl nem, g**enellikle 23 ± 2 °C ve 50 ± 5 % bağıl nem koşullarında yapılır. Çekme hızı genellikle 300 mm/dak'dır (ASTM D3330). Test kuvveti 25 mm genişlikteki PSA bant için 20-50 N+. olarak uygulanır.



Şekil 3. Çekme testi

Şekil 4. Kalınlığa Göre Çekme Gerilmesi (MPa)

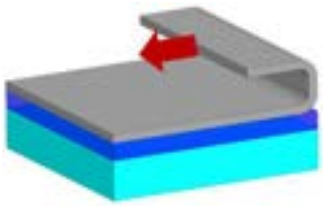
Grafikte hem akrilik hem de silica ile güçlendirilmiş akrilik PSA bantlarla yapılan çekme gerilmesi (MPa) bazında karşılaştırılmıştır (Şekil 4).

Tüm kalınlıklarda, SiO_2 takviyeli PSA bantlar saf akrilik PSA bantlara göre daha yüksek çekme gerilmesi göstermektedir. Bu durum, silika (SiO_2) partiküllerinin akrilik matris içerisindeki mekanik dayanımı artırıcı etkisini açıkça ortaya koymaktadır. Bunun sonucunda silika, yük aktarımında rol alarak matrisin deformasyonunu sınırlar ve bu sayede kopma öncesi daha yüksek çekme gerilmesine ulaşılır.

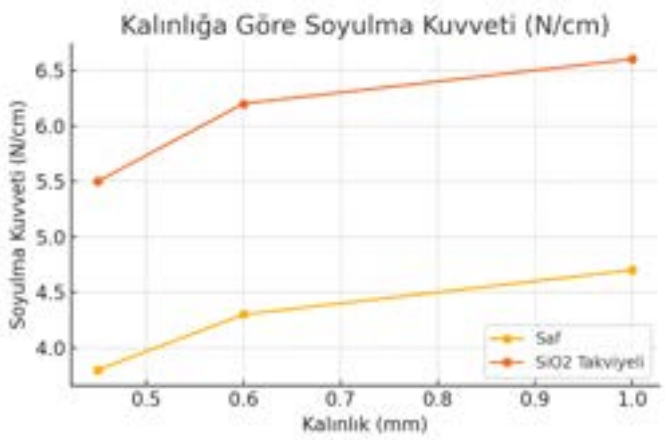
Saf akrilik PSA bantlarda kalınlık arttıkça malzemenin çekme direnci daha belirgin artış görülürken, silica takviyeli bantlarda görülen artış daha sınırlıdır. Bunun nedeni, SiO_2 katkı maddesinin etkisinin ince filmlerde daha belirgin olduğunu gösterir. Kalınlaştıkça matrisin deformasyonu artmaktadır.

İnce kalınlıktaki filmlerdeki, yapışma yüzeyi /alan oranının daha fazla olmasından ve lokal gerilme yoğunlaşmalarından dolayı çekme gerilmesi daha düşük seviyededir. Kalın yapıştırıcı tabakalarında yük dağılımı daha homojen olduğu için çekme mukavemeti artar.

Soyulma testleri, PSA bantın, PVC alt tabaka yüzeyinde bir açıyla soyularak ayrılma direncini ölçmek amacıyla yapılır (Şekil 5). Açı genellikle 180º olarak uygulanmakla birlikte 90º bir açıyla da yapılabilir. 180º soyulma testi, PSA bant, yüzeyi temizlenmiş PVC üzerine düşük bir basınçla yapıştırılır ve serbest ucu 180º açıda çekilir. Bu testte ASTM D3330 standartına riayet edilir. T**est sıcaklığı ve bağıl nem, g**enellikle 23 ± 2 °C ve 50 ± 5 % bağıl nem koşullarında yapılır. Çekme hızı genellikle 300 mm/dak'dır (ASTM D3330). Test kuvveti 25 mm genişlikteki PSA bant için 20-50+ N. olarak uygulanır.



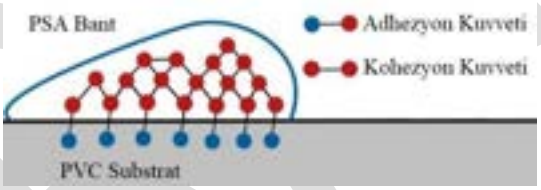
Şekil 5. 180º Soyulma testi



Şekil 6. Kalınlığa göre soyulma kuvveti ilişkisi

Grafikte hem akrilik hem de silica ile güçlendirilmiş akrilik PSA bantlarla 0.45 mm, 0.6 mm ve 1.0 mm gibi farklı kalınlıklarda yapılan 180º soyulma test kuvvetleri karşılaştırılmıştır ((Şekil 6). Her iki PSA bant üründe kalınlık arttıkça soyulma kuvveti artmaktadır. Bunun nedeni, belli bir kalınlıktaki yapışkan tabakaların homojen yüksek kohezyon kuvvetine sahip olduğu bu nedenle yük aktarımını daha iyi yaptığı sonucuna varılmaktadır.

SiO_2 partikülleri gibi inorganik takviyelere sahip PSA bantlar, saf akrilik bantlara göre daha yüksek soyulma kuvvetinin gösterme nedeni yapışma yüzeyinde mikromekanik kilit mekanizmasının oluşturmasındandır. SiO_2 partikülleri, yapışkan bütünlüğünde kohesive dayanımı arttırır, PVC yüzeyinde adhesive yapışma gücünü arttırarak kayma direncini yüksek seviyelere çıkar (Şekil 7)



Şekil 7. PSA bant ile PVC yüzey üzerinde moleküler yapışma mekanizması

BULGULAR VE TARTIŞMA

Araştirmada uygulanan 180° soyulma, kesme ve çekme testleri sonucunda, silika (SiO_2) ile güçlendirilmiş akrilik bazlı PSA bantların, saf akrilik PSA bantlara göre tüm kalınlıklarda daha üstün mekanik performans gösterdiği tespit edilmiştir. Silika katkısı, özellikle mikromekanik kilitlenme, matris-partikül etkileşimi ve yük transfer mekanizmaları sayesinde hem yapışma kuvvetini hem de kohezyonel dayanımı anlamlı şekilde artırmıştır. Kalınlık arttıkça tüm PSA bantlarda mukavemet değerleri yükselmiş; bu durum, viskoelastik enerji yayılımının ve yük dağılımının daha homojen hale gelmesiyle ilişkilendirilmiştir. Saf akrilik PSA bantlarda kalınlığa bağlı çekme ve kesme dayanımı daha belirgin artarken, silika takviyeli sistemlerde mukavemet yüksekliği daha kararlı ve yüzeyle daha güçlü bağ oluşturan bir yapı gösterdiği belirlenmiştir. Tüm bu bulgular, hem formülasyon hem de yapısal parametrelerin PSA bantların performansı üzerinde kritik rol oynamaktadır. Bu nedenle PSA bantların kullanım yerlerine göre önem taşıyan uygulamalarda silika katkılı PSA bantların önemi vurgulanmaktadır.

SONUÇ

PSA bantların performansı, kimyasal yapısı ve kalınlık parametrelerine göre önemli ölçüde değişkenlik gösterdiğini ortaya koymuştur. Özellikle silika (SiO_2) ile güçlendirilmiş akrilik PSA bantları, hem adhezyon hem de kohezyon yapışma dayanım bakımından saf akrilik bantlara göre üstün performans sergilediği tespit

edilmiştir. Elde edilen 180° soyulma, kesme ve çekme testi sonuçları; silika katkısının mikromekanik kilitlenme etkisi, matris-takviye etkileşimi ve yük aktarım davranışları sayesinde yapıştırıcı sistemlerin mekanik kararlılığını artırdığını göstermektedir. Ayrıca, PSA bant kalınlığının artmasıyla birlikte viskoelastik enerji yayılımı ve yük dağılımında meydana gelen iyileşmeler, mukavemet değerlerinde anlamlı artışlar sağlamıştır. Bu bulgular, akrilik PSA bantların performans optimizasyonunun sadece kimyasal modifikasyonla değil, aynı zamanda film kalınlığı gibi yapısal parametrelerin mühendislik düzeyinde kontrolüyle de geliştirilebileceğini göstermektedir. Sonuç olarak, silika takviyeli akrilik PSA bantlar, PVC alt tabakaların yer aldığı otomotiv, elektronik ve yapı endüstrileri gibi zorlu servis koşulları gerektiren uygulamalarda uzun ömürlü ve güvenilir bir yapıştırma çözümü sunabileceği sonucuna varılmıştır.

TEŞEKKÜR

Bu çalışmanın gerçekleştirilmesinde bilimsel ve teknik desteklerini hiçbir zaman esirgemeyen **ASAŞ Alüminyum Sanayi ve Ticaret A.Ş. PVC AR-GE Birimi**'ne, ayrıca değerli ekip üyelerine sağladıkları katkılardan dolayı içtenlikle teşekkür ederim.

Abstract
The aim of this study was to determine the scoby growth, physicochemical properties and antibacterial activity effects in kombucha tea prepared with sweetened black tea (KT) and kombucha tea prepared by adding different concentrations of lugol solution to the initial sweetened black tea. For this purpose, daily pH measurements were taken for all prepared kombucha samples and the effect of fermentation period on pH was determined. Scoby growth was investigated at the beginning, 4, 8, 12, 16 and 21st days. Antibacterial activities of kombucha prepared with 2% lugol solution and sweetened black tea (KT-L2) and kombucha prepared with sweetened black tea were investigated with Escherichia coli, Klebsiella pneumoniae, Enterococcus faecalis, P. Aeruginosa aeruginosa, Staphylococcus aureus by disk diffusion method on the 8th and 21st days of fermentation. Inhibition zones obtained with KTs were determined as 16 mm K. Pneumoniae, 13 mm P. Aeruginosa, 10 mm E. coli, 9 mm S. Aureus (43300), 9 mm E. Faecalis and 8 mm S. Aureus (29213). Parameters determining the antibacterial properties of KTs were determined. The properties and benefits of Kombucha tea were examined in detail.

Keywords: Kombucha tea, lugol solutions, scoby, antibacterial activity

INTRODUCTION

Traditionally, kombucha is prepared with green or black tea from the Camellia sinensis plant. The different types of tea (white, green, oolong and black) are obtained from the Camellia sinensis plant. The chemical composition of tea is quite complex as it contains different classes of chemical compounds, including alkaloids, phenols, proteins, minerals, vitamins and amino acids. Some of the metabolites found in kombucha tea consist of polyphenols, flavonoids, vitamins A, B, C, organic acids, ethanol and various enzymes. The composition and concentration of metabolites depend on the nutrient medium and fermentation time. As a result, the metabolic profile and biological activity of tea can vary greatly depending on the differences between different tea varieties, environmental influences, processing procedures and preparation methods, which in turn reflects its quality (Prasanth, M.I.et al. 2019) The functional properties of kombucha, such as antioxidant activities, are attributed to its phenols, such as epicatechin, epigallocatechin, epicatechin-3-gallate and epigallocatechin-3-gallate. Natural antioxidants, polyphenols, are commonly found in kombucha tea and can be increased through fermentation [6]. Polyphenols are secondary metabolites of plants and are often involved in defense against ultraviolet radiation or pathogen aggression.

Epidemiological studies and associated meta-analyses strongly suggest that long-term consumption of diets rich in plant polyphenols protects against the development of cancer, cardiovascular diseases, diabetes, osteoporosis, and neurodegenerative diseases. (Pandey, K.B. and S.I. Rizvi 2009) Polyphenols can be classified into different groups as a function of the number of phenol rings they contain and the structural elements that connect these rings. The main classes include phenolic acids, flavonoids, and lignans. (Kondratyuk, T.P. and J.M. Pezzuto,2004)

Lugol's solution is a mixture obtained by dissolving iodine and potassium iodide in water. It is a medicine and disinfectant used for a number of purposes(Ito, K. and T. Hirokawa, 2009). It is used in combination with antithyroid drugs to prepare the thyroid gland for surgical removal and to treat some overactive thyroid conditions (hyperthyroidism, thyroid storm)(Zimmermann, M.B., 2020**)** It can be applied to minor wounds such as needlesticks as a disinfectant. It can be used in small amounts for emergency disinfection of drinking water. The aim of the present study was (i) to evaluate the physicochemical profiles of kombucha produced from black tea; (ii) to examine the effects of Lugol's solution added to black tea at different concentrations

on kombucha tea over time; and (iii) to determine the antibacterial properties of the prepared kombucha teas.

MATERIALS AND METHODS

Preparation of Kombucha Tea

After boiling 1 L of pure water, 90 g of sugar was added and dissolved. Then, 8 g of black (bag) tea was added and brewed for 15 minutes. After removing the tea bags, the sweetened black tea solution was cooled to room temperature and 70 mL of previously fermented KT and scoby (symbiotic culture of bacteria and yeast) were added and the jar was closed with a clean paper towel. Kombucha tea was fermented by waiting for 0-21 days in a dark environment at room temperature.

Preparation of Lugol's Solution

5% Lugol's solution was prepared by dissolving 10 g of potassium iodide and 5 g of iodine in 100 ml of pure water. This prepared solution was stored in a dark bottle and in a dark environment. Lower percentage Lugol solutions were also obtained by diluting this 5% solution.

Preparation of Kombucha with Lugol's Solution

Sweetened black tea was prepared as mentioned above. After adding 0.5, 1, 2 and 5% Lugol solutions at 1% v/v ratio to the tea at room temperature, a scoby was placed on it, its mouth was closed with a clean paper towel and a rubber band, and it was kept in a dark environment at room temperature during fermentation.

Antibacterial Activity

In this part of the study, the inhibition zone of the prepared KTs synthesized was measured to determine their antimicrobial activities. The inhibition zone is a circular area around the antibiotic point where bacterial colonies do not grow. The inhibition zone is used to measure the sensitivity of bacteria to antibiotics.(Chen, C. and B.Y. Liu, 2000)

At the beginning of the microbiological procedures, the strain in the stock medium was revived in liquid [heart brain infusion broth, (Acumedia Manufactures, Inc. Lansing, Michigan, America)] media and incubated at 37 ºC for 24 hours. The reproduced bacteria were transferred to solid media and contamination controls were performed. They were stored at +4ºC until the day of the study. They were used by multiplying in liquid media 24 hours before the day of the study. Before each experiment, a turbidity adjustment of 0.5 McFarland was made with the KristalspecTM McFarland (Becton Dickinson & Company Loventon Circle, Sparks, MD 21152-0370, America) device. The 0.5 standard McFarland was used to develop the medium to provide bacterial growth in the amount of ($1.5x10^8$) colonyforming (CFU) mL^{-1} unit. Prepared KTs were used in antimicrobial analysis by loading 50 µL of liquid onto 6 mm diameter sterile empty antibiogram test disks (Bioanalyse) with sterile micropipettes. As solid media; Blood agar 5% sheep blood agar (Merck 1.10886) for E. Faecalis, S. Aureus and P. aeruginosa bacteria. Eosin Methylene Blue (EMB) agar was used in the production of E. coli strain.

Table1. Microorganisms used in our study

Microorganism Name	Strain Used
Escherichia coli	ATCC 25922
Klebsiella pneumoniae	ATCC 700603
Enterococcus faecalis	ATCC 29212
P. Aeruginosa	ATCC 27853
Staphylococcus aureus	ATCC 29213
Staphylococcus aureus	ATCC 43300

DRAFT

RESULTS AND DISCUSSIONS

Effect of fermentation time on pH

After adding 0.5, 1, 2 and 5% Lugol solutions to KT (1% v/v Lugol), the pH change against time was examined (Figure 1). It was observed that the pH change of KT prepared with 2 and 5% Lugol decreased rapidly in the first 2 days of fermentation, while the pH change of the others decreased until the 5th day and the change slowed down very much after the 5th day, almost becoming constant. The reason for this is that the acetic acid-producing bacteria and yeasts found in KT and scoby consume the sucrose added at the beginning and produce acids such as acetic acid and lactic acid, and the concentration of sucrose decreases greatly over time

Table 2. Abbreviations for KTs prepared by adding different concentrations of Lugol solutions

KT- L0.5	KT prepared with 0.5% lugol solution
KT- L1	KT prepared with 1% lugol solution
KT- L2	KT prepared with 2% lugol solution
KT- L 5	KT prepared with 5% lugol solution

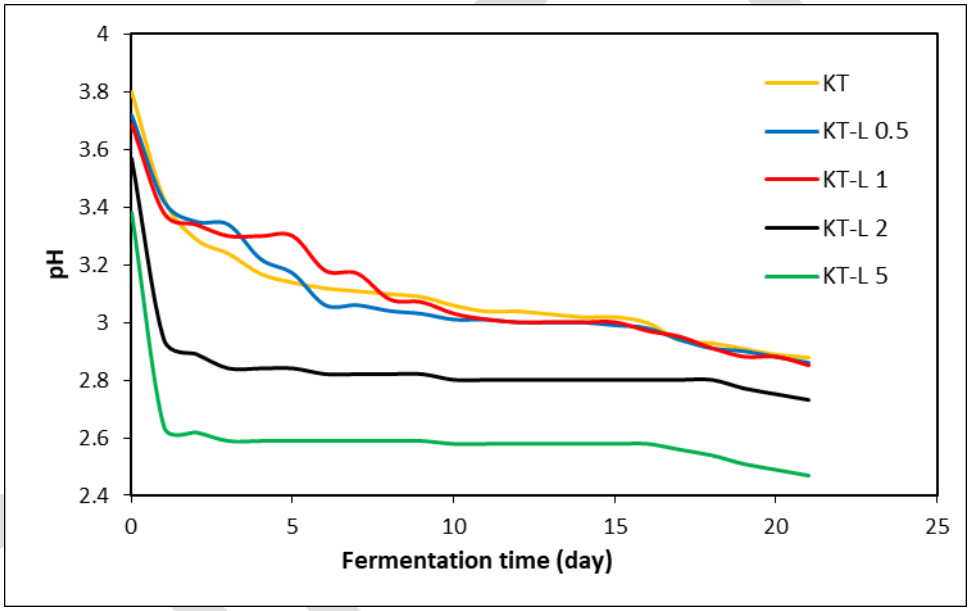

Figure 1. pH changes with fermentation times of KT and KT with lugol solution

In this part of the study, after adding 0.5, 1, 2 and 5% Lugol solutions to KT (1% v/v Lugol), the pH change against time was investigated (Figure 1). It was observed that the pH change of KT prepared with 2 and 5% Lugol decreased rapidly in the first 2 days of fermentation and that the change slowed down to almost constant after the 5th day. It was thought that this could be due to the high concentration of Lugol added, which caused the number of bacteria in the fermentation to decrease, or the bacteria and yeasts that produce acetic acid consumed the sucrose added at the beginning and produced acids such as acetic acid and lactic acid, and the concentration of sucrose decreased significantly over time.

Investigation of the effect of KT prepared with different concentrations of lugol solutions on scoby development

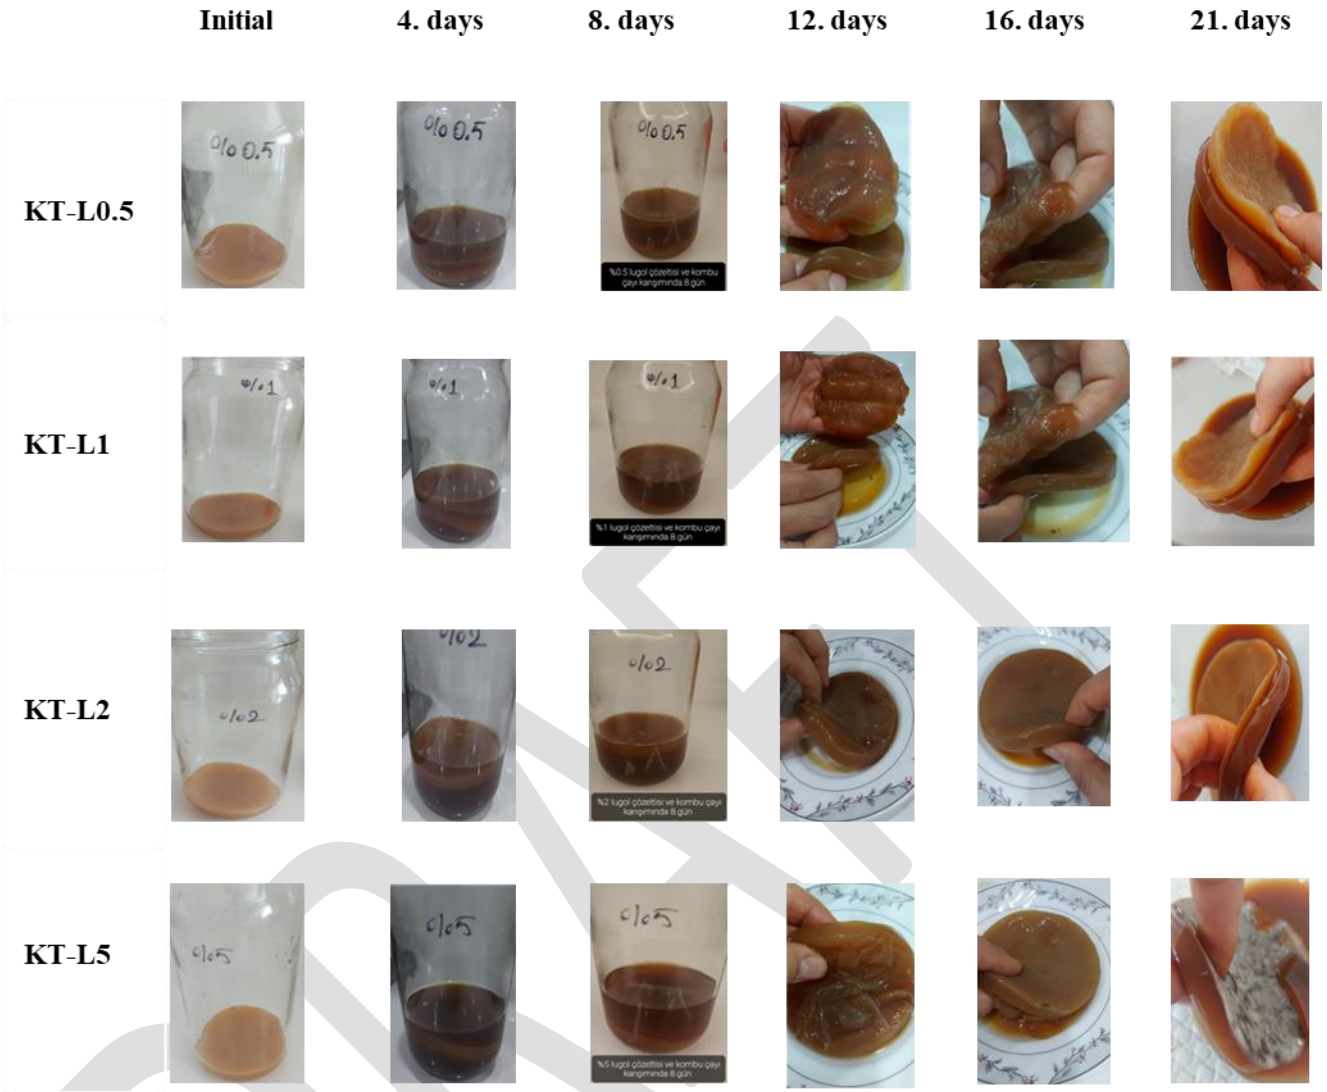

Figure 2. Investigation of the effect of KT prepared with different concentrations of Lugol solutions on scoby growth.

In Figure 2, the effect of 0.5, 1, 2 and 5% Lugol solution on scoby growth was investigated in KT prepared by adding it. The thicknesses of all scobys selected at the beginning were very close to each other. The change in scoby was examined on the 4th, 8th, 12th, 16th and 21st days of fermentation from the beginning. It was determined that in KT prepared without adding Lugol, bubbles formed on the surface on the 4th-5th day of fermentation, a new scoby formed on the 7th-8th day of fermentation, and as the fermentation period extended, the KM added on the first day of fermentation and the KM formed later continued to grow and thicken. This development process was followed with 5 different KTs. In KTs prepared by adding Lugol solution, it was observed that only small bubbles formed on the KT-L0.5 surface on the 4th day of fermentation, and there was no change in KT L1, L2 and L5 KMs. On the 8th day of fermentation, a shiny surface was observed on the surfaces of KT-L0.5, KT-L1 and KT-L2. Since this was an indicator of newly formed scoby, observation was made without removing the scoby from the KT. There was no change in KT-L5. On the 12th day, it was observed that a new scoby was formed in KT-L0.5 and KT-L1. On the 12th day of KT-L2, a fine shine and the membrane structure of the newly formed KT were seen on the surface of the first added scoby. On the 12th day of fermentation of KT-L5, wrinkling, color change thought to be due to iodine, and layering and separations in the initially added scoby were observed on the surface of the first added scoby. On the 16th day of fermentation, it was observed that the thickness of the scoby formed on the surfaces of KT-L0.5 and KT-L1 increased, and in KT-L2, a new layer was formed on the initial scoby surface and the scoby thickness increased. While there was mold and deformation on the edges in

KT-L5, it was observed that separation, layering and breakage increased in scoby. The color change caused by iodine became more apparent in all initial DMs. When the newly formed DMs were compared on the 21st day of fermentation, it was determined that the most developed scoby formed on the surfaces of KT and KT-L0.5, followed by KT-L1 and KT-L2, respectively. In KT-L5, it was observed that the surface was completely covered with mold. As the concentration of Lugol's solution increased, it was observed that the speed of scoby growth slowed down and in 5% Lugold, the scoby lost its vitality over time. It was thought that this was due to the antibacterial properties of lugol killing beneficial bacteria in the KT These analyses were repeated 5 times. Mold formation was observed in 3 analyses performed with 5% lugol solution, while mold formation was observed on the 24th and 25th days in 2 analyses. The reason for mold formation occurring at different times was initially thought to be related to the number of beneficial bacteria in the KT and the structure of the scoby[241, 244]. Since mold formation occurred in the KT prepared by adding 5% lugol solution, it was determined that this concentration was not suitable. In the development of mushrooms examined with teas prepared with 0.5%, 1%, and 2% lugol solutions, it was determined that the growth rate slowed down as the lugol solution concentration increased.

Antibacterical Activity

For K. pneumoniae bacteria, an increase in the inhibition zone was observed as the lugol concentration in KT increased and it was determined that lugol increased the antibacterial properties with KT for this bacteria. However, for all other bacterial species, a decrease in the inhibition zone and a decrease in the antibacterial effect were observed as the lugol concentration in KT increased. It is thought to be due to the damage of the Lugol solution to the fermentation bacteria.

Table 2. Inhibition zones of KTs prepared with different concentrations of Lugol's solution (Fermentation time 8 days)

Kombucha Tea	E.coli	P. Aeruginosa	S. Aureus (43300)	K. pneumoniae	S. Aureus (29213)	E. Faecalis
KT	10	13	8	9	7	9
KT-L0.5	8	11	8	9	6	9
KT-L1	7	9	8	12	6	7
KT-L2	6	7	9	16	6	7
